TYPE OF ASSEMBLY	REQUIRED ASSEMBLY RATING (hours)	MINIMUM FIRE DOOR AND FIRE SHUTTER ASSEMBLY RATING (hours)
Fire walls and fire barriers having a required fire-resistance rating greater than 1 hour	4 3 2 1 1/2	3 3[a] 1 1/2 1 1/2
Fire barriers having a required fire-resistance rating of 1 hour:		
Shaft, exit enclosure and exit passageway walls	1	1
Other fire barriers	1	3/4
Fire partitions:		
Corridor walls	1 0.5	1/3 [b] 1/3 ~~[b]~~
Other fire partitions	1 0.5	3/4 1/3
Exterior walls	3 2 1	1 1/2 1 1/2 3/4
Smoke barriers	1	1/3 [b]

a. Two doors, each with a fire protection rating of 11/2 hours, installed on opposite sides of the same opening in a firewall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
b. For testing requirements, see Section 715.4.3.

Reason: This code change provides for testing of a 20-minute door assembly, including the sidelight and transom panels, to NFPA 252 without hose stream, when the assembly is in a half-hour rated corridor or fire partition. Since a half hour wall tested to ASTM E119 is not required to be hose stream tested, there is no fire safety reason to require the door assembly component in that wall to meet a hose stream test.

In past code cycle testimony it has been suggested that there is a reason to treat sidelights and transoms differently than the glazing in the vision panel of the door, because combustibles can be stacked next to a sidelight (of course, that argument doesn't apply to the transom, because it is above the door). It has also been suggested that 20-minute tempered products are subject to "disintegration."

The first point is not a hose stream issue, but a radiant heat issue, and applying a hose stream test to products does not assure that they will block radiant heat from passing through the glazing and spreading the fire. Indeed, as seen by the test data in the supporting fire test video, http://www.safti.com/video/resist/resistive.html, one type of fire protection material, ceramic, transmits enough radiant heat in the first 20-minutes of fire exposure to cause spontaneous combustion. Wired glass, another fire protection product that can pass the hose stream test, likewise transmits dangerous levels of radiant heat during the early stages of a fire.

The second point simply isn't true, and was not substantiated by any test data showing alleged "disintegration." Specialty tempered products have undergone rigorous fire testing, and have proven to be effective fire protection materials by fire case history. Millions of square feet of these products have been used worldwide without any reports of the alleged "disintegration" alleged by opponents to this code change. Significantly, opponents of this code change have never come forward with any reported instances of failure.
The fact is, products not tested to the hose stream protect against fire equally as well as those that are tested.

This change also changes the test standard for sidelights and transoms back to NFPA 252 and UL 10C, which is the standard historically applied to door assemblies that include sidelights and transoms, and is consistent with the test protocol specified in NFPA 80. The application of NFPA 257 under the existing provision has caused confusion and impractical test methods for testing one door assembly to two different test standards.

In 20-minute window applications in half hour walls, there is no legitimate fire safety reason for requiring one element of the fire resistive construction to pass the hose stream test, where the half hour wall assembly and 20-minute door components do not pass that same test.

Cost Impact: The code change proposal will reduce the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: OKEEFFE-FS6-715.4.3.2

FS98–09/10
715.4.3.2, 715.4.3.2.1 (New)

Proponent: William F. O'Keeffe, representing SAFTIFirst

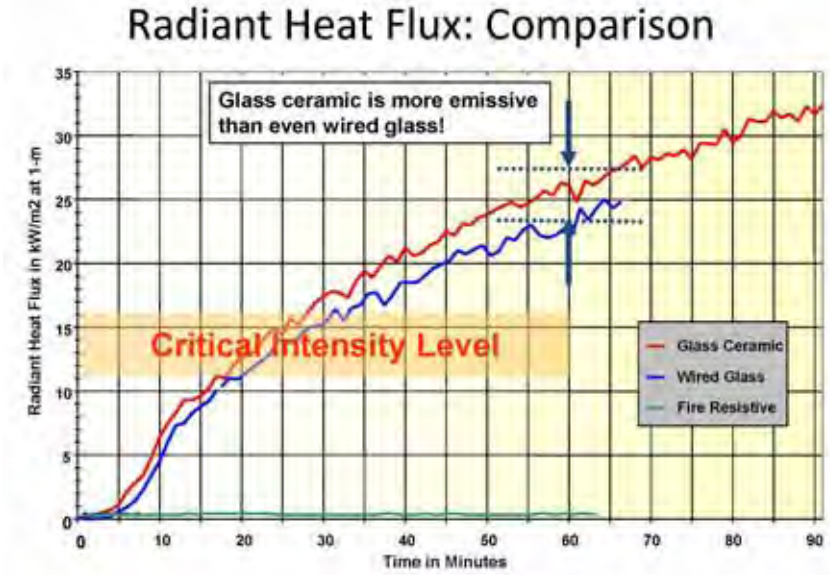
Revise as follows:

715.4.3.2 Glazing in door assemblies. In a 20-minute fire door assembly, the glazing material in the door itself shall have a minimum fire-protection rating of 20 minutes and shall be exempt from the hose stream test. Glazing material in any other part of the door assembly including transom lites and sidelites, shall be tested in accordance with NFPA 252 or UL10C ~~NFPA 257 or UL 9~~, including the hose stream test, in accordance with Section 715.5, subject to the limitations in Section 715.4.3.2.1.

715.4.3.2.1 Fire protection rated glazing in sidelites shall be limited to not more than 24"(610 mm) on either side of the door assembly measured from the edge of the door frame. Fire protection rated glazing in transoms shall be limited to not more than 24" in height and extending no more than 24" (610 mm) on either side of the fire door assembly, measured from the edge of the door frame. Fire resistance rated glazing tested as an assembly to ASTM E119 or UL 263 shall be permitted in excess of these limits where the fire resistance rating is equal to or greater than 1-hour.

Reason: Fire protection rated glazing materials do not protect against radiant heat. The unrestricted use of these materials in exit corridors in the large sizes for which they have been tested and listed threaten the life safety of building occupants attempting to exit past them in a fire.

Fire test data show that at 20 minutes of fire exposure, these materials transmit in excess of 10 kW/m^2, and at 10 minutes of fire exposure, transmit 5 kW/m^2. http://www.safti.com/video/resist/resistive.html See Cumulative Radiant Heat Data Chart, prepared by the test sponsor of the test depicted in the video, below. The Society of Fire Protection Engineers Fire Protection Engineering Handbook identifies a fairly obvious tolerance limit for exposure to radiant heat of 2.5 kW/m^2 due to unbearable pain. (See SFPE Handbook of Fire Protection Engineering, 2nd edition, page 2-114).



Also included as further support of this code change are two test reports from the Coast Guard testing of (1) Ceramic (FireLite) in steel bulkheads (Report No. CG-D-37-95), and (2) wired glass in steel bulkheads (Report No. CG-D-38-95). Temperature rise and radiant heat flux measurements were recorded. The tests were intended to measure radiant heat flux and surface temperature performance at 60 minutes.

The tests can be summarized as follows:

Wired Glass Test

The test of the wired glass panels resulted in glazing failure prior to 60-minutes, so radiant heat and temperature rise were only recorded up to the time of the wired glass failure.

Test 1
Heat flux at end of test (41:24 minutes) - 71 kW/m sq.
Surface temperature - wired glass temperature - 730 degrees C; steel frame - 540 degrees C

Test 2
Heat flux at end of test (37:46 minutes) - 48 kW/m sq.
Surface temperature - wired glass temperature - 730 degrees C; steel frame - 550 degrees C

Test 3
Heat flux at end of test (48:30 minutes) - 57 kW/m sq.
Surface temperature - wired glass temperature - 760 degrees C; steel frame - 585 degrees C

Conclusion on page 8 - As the window panes began to reach their melting point and flow out of the test frame, the recorded heat flux levels showed obvious increases. In all three tests, the recorded heat flux increased approximately 5-7 kW/m sq. until the wire glass fell out of the test frame and the test was terminated.

Ceramic (FireLite) Test
Test 1
Heat flux at end of test (60:00 minutes) - 75 kW/m sq.
Surface temperature - ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C
Test 2
Heat flux at end of test (60:00 minutes) - 69 kW/m sq.
Surface temperature - ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C
Test 3
Heat flux at end of test (60:00 minutes) - 73 kW/m sq.
Surface temperature - ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C

According to these test reports, the surface temperature is significantly higher on the glazing than it is on the steel frame. Also, the report notes that the radiant heat measurements taken that included the "cooler steel frame" were several percentages lower than the view that included just the glazing. (see Ceramic test report (Report No. CG-D-37-95), page 6.)

Limitations on area uses of fire protection glazing products is long overdue. In Europe, code regulators have recognized the need for restricting use of fire protection materials based on radiant heat hazards, particularly their use in egress paths. Reasonable limits protecting life safety are achieved by limiting the area of use in sidelights in exit corridors, permitting building occupants safe egress. This code change at the same time permits use in larger sizes of products that meet fire resistance radiant heat and temperature rise limits of ASTM E119, because those products do not transmit dangerous levels of radiant heat.

As stated in NFPA 80 (200&), Annex I:

"Because the present fire test standard, NFPA 257, does not require measuring and reporting temperature rise on the unexposed face of the glazing material or radiant heat transmission, glazing products tested to this standard have not been required to retard radiant heat transfer. However, these data are required in many European fire test standards. As a result, European building codes place limitations on the use of glazing in fire-resistant partitions inside buildings and require the use of insulating glazing in means of egress as well as where combustibles could be in close proximity. Research by Margaret Law, Bsc, Ministry of Technology and Fire Offices Committee, Joint Fire Research Organization, led to the development of such limitations in British building regulations."

This change also changes the test standard for sidelights and transoms back to NFPA 252 and UL 10C, which is the standard historically applied to door assemblies that include sidelights and transoms, and is consistent with the test protocol specified in NFPA 80. The application of NFPA 257 under the existing provision has caused confusion and impractical test methods for testing one door assembly to two different test standards. The change to NFPA 252 will improve safety in that the acceptance criteria for passing the hose stream test is more stringent under NFPA 252. NFPA 252 does not allow glass loss at the end of the hose stream test, compared to NFPA 257, which allows 30% perimeter loss, and 10% loss out of the center.

Bibliography

1. Test Report, Fire Performance of Three Wired Glazed Window Assemblies, Report No. CG-D-38-95
2. Test Report, Fire Performance Evaluation of Three A-O Glazed Window Assemblies, Report No. CG-D-37-95

Cost Impact: This code change will not increase construction costs, as fire protection materials are still permitted, and the cost of fire resistance products permitted for larger area uses is now comparable to safety rated fire protection products that pass hose stream testing.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: OKEEFFE-FS11-715.4.3.2.1

FS99–09/10
715.4.4 (New)

Proponent: William F. O'Keeffe, representing SAFTIFirst

Revise as follows:

715.4.4 (New) 20-Minute door assemblies in other fire partitions. Fire door assemblies required to have a minimum fire protection rating of 20-minutes where located on other fire partitions required to have a fire resistance rating of 0.5 in accordance with Table 715.4 shall be tested in accordance with NFPA 252 or UL 10C without the hose stream test. Glazing in the door vision panel, and in any other part of the door assembly, including transom lites and sidelites, shall be tested in accordance with NFPA 252 or UL 10C without the hose stream test, and shall have a minimum fire protection rating of 20 minutes.

(Renumber subsequent sections)

Reason: Table 715.4 provides for 1/3-hour door opening protection of "other fire partitions" with a half hour wall rating. However, there is not specific provision elsewhere in Chapter 7 that spells out the requirements, as there is for doors assemblies in corridors and smoke barriers, which are addressed in 715.4.2. This provides for testing of a 20-minute door assembly to NFPA 252 without hose stream. Since a half hour wall tested to

ASTM E119 is not required to be hose stream tested, there is no fire safety reason to require the door assembly component in that wall to meet a hose stream test.

In past cycles, during testimony concerning the application of the hose stream test to glazing, it has been suggested that there is a reason to treat sidelights and transoms differently than the glazing in the vision panel of the door, because combustibles can be stacked next to a sidelight (of course, that argument doesn't apply to the transom, because it is above the door). It has also been suggested that 20-minute tempered products are subject to "disintegration."

The first point is not a hose stream issue, but a radiant heat issue, and applying a hose stream test to products does not assure that they will block radiant heat from passing through the glazing and spreading the fire. Indeed, as seen by the test data in the supporting fire test video, http://www.safti.com/video/resist/resistive.html, one type of fire protection material, ceramic, transmits enough radiant heat in the first 20-minutes of fire exposure to cause spontaneous combustion. Wired glass, another fire protection product that can pass the hose stream test, likewise transmits dangerous levels of radiant heat during the early stages of a fire.

The second point simply isn't true, and was not substantiated by any test data showing alleged "disintegration." Specialty tempered products have undergone rigorous fire testing, and have proven to be effective fire protection materials by fire case history. Millions of square feet of these products have been used worldwide without any reports of the alleged "disintegration" alleged by opponents to this code change. Significantly, past opponents of this code change have never come forward with any reported instances of failure.

The fact is, products not tested to the hose stream protect against fire equally as well as those that are tested.

In 20-minute window applications in half hour walls, there is no legitimate fire safety reason for requiring one element of the fire resistive construction to pass the hose stream test, where the half hour wall assembly and 20-minute door components do not pass that same test.

Cost Impact: The code change proposal will reduce the cost of construction.

Analysis: Code change proposals FS99 and FS107 address hose stream testing requirements for 20 minute door assemblies in other fire partitions. The committee needs to make its intent clear with respect to these provisions.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: OKeeffe-FS2-715.4.4-New

FS100–09/10
715.4.4.1

Proponent: William F. O'Keeffe, representing SAFTIFirst

Revise as follows:

715.4.4 Doors in exit enclosures and exit passageways. Fire door assemblies in exit enclosures and exit passageways shall have a maximum transmitted temperature end point of not more than 450° F (250° C) above ambient at the end of 30 minutes of standard fire test exposure.

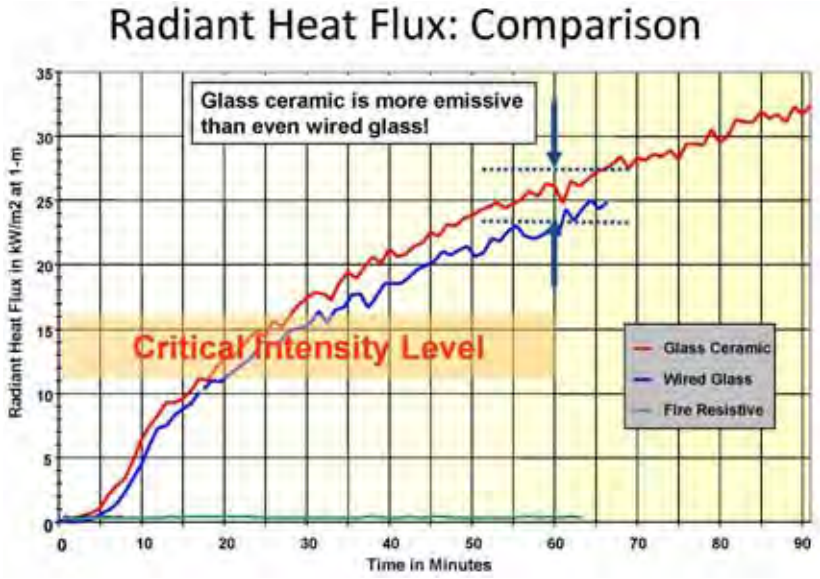
Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.1.2.

715.4.4.1 Glazing in doors. Fire-protection-rated glazing in excess of 100 sq inches (0.065 m^2) is not permitted. Fire-resistance rated glazing in excess of 100 sq inches (0.065 m^2) shall be permitted in fire door assemblies when tested as components of the door assemblies, and not as glass lights, and shall have a maximum transmitted temperature rise of 450° F (250° C) in accordance with 715.4.4.

~~**Exception:** The maximum transmitted temperature end rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

Reason: This code change will make the size limits fire protection glazing in 60-and 90-minute doors in exit enclosures and passageways consistent with size limits for 60-and 90-minute doors elsewhere in the code. The presence of sprinklers in the building does not eliminate the life safety and fire spread hazard posed by unrestricted transmission of radiant heat flux through large sizes of fire protection rated glazing panels in 60-and-90-minute doors, especially when those doors are protecting exit enclosures and exit passageways deemed essential for occupant life safety.

Fire test data show that at 45-minutes, fire protection rated products such as ceramics and wired glass transmit in excess of 20 kW/m^2. At 20 minutes of fire exposure, these materials transmit in excess of 10 kW/m^2, and at 10 minutes of fire exposure, transmit 5 kW/m^2. See http://www.safti.com/video/resist/resistive.html See Chart Cumulative Radiant Heat Energy Data Chart below, prepared by the test sponsor, Vetrotech SaintGobain. The Society of Fire Protection Engineers Fire Protection Engineering Handbook identifies a fairly obvious tolerance limit for exposure to radiant heat of 2.5 kW/m^2 due to unbearable pain. (See SFPE Handbook of Fire Protection Engineering, 2nd edition, page 2-114)



Included as further support of this code change are two test reports from the Coast Guard testing of (1) Ceramic (FireLite) in steel bulkheads and (2) wired glass in steel bulkheads. Temperature rise and radiant heat flux measurements were recorded. The tests were intended to measure radiant heat flux and surface temperature performance at 60 minutes. The tests can be summarized as follows:

Wired Glass Test

The test of the wired glass panels resulted in glazing failure prior to 60-minutes, so radiant heat and temperature rise were only recorded up to the time of the wired glass failure.

Test 1
Heat flux at end of test (41:24 minutes) - 71 kW/m sq.
Surface temperature - wired glass temperature - 730 degrees C; steel frame - 540 degrees C

Test 2
Heat flux at end of test (37:46 minutes) - 48 kW/m sq.
Surface temperature - wired glass temperature - 730 degrees C; steel frame - 550 degrees C

Test 3
Heat flux at end of test (48:30 minutes) - 57 kW/m sq.
Surface temperature - wired glass temperature - 760 degrees C; steel frame - 585 degrees C

Conclusion on page 8 - As the window panes began to reach their melting point and flow out of the test frame, the recorded heat flux levels showed obvious increases. In all three tests, the recoded heat flux increased approximately 5-7 kW/m sq. until the wire glass fell out of the test frame and the test was terminated.

Ceramic (FireLite) Test

Test 1
Heat flux at end of test (60:00 minutes) - 75 kW/m sq.
Surface temperature - ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C

Test 2
Heat flux at end of test (60:00 minutes) - 69 kW/m sq.
Surface temperature -ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C

Test 3
Heat flux at end of test (60:00 minutes) - 73 kW/m sq.
Surface temperature -ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C

According to these test reports, the surface temperature is significantly higher on the glazing than it is on the steel frame. Also, the report notes that the radiant heat measurements taken that included the "cooler steel frame" were several percentages lower than the view that included just the glazing. (see Ceramic test report, page 6.)

As further support, the following is a published listing of the ceramic product that was tested in the weblink video provided above, which shows a maximum tested area of 3627 sq. inches.

Product Designation: Keralite FR-F, Keralite FR-R, Keralite FR-L, Keralite
Thickness: 3/16 in. or 5/16 in. (5 or 8 mm)
Glazing Compound: closed cell PVC tape for 3/4 hr and 1 hr ratings. Kerafix ceramic tape for 1-1/2 hr ratings.
Furnace Pressure: Neutral and Positive

Rating	Application	Max Exposed Area of Glass (Sq In.)	Max Width of Exposed Glass (In.)	Max Height of Exposed Glass (In.)	Min Depth of Groove (In.)	Groove Width (In.)	Building Code Marking
1 hr.	Door	3627	46-1/2	78	5/8	5/16, 7/16	D-H-NT-60
1 hr.	Window, Transom, Sidelight	3627	46-1/2	78	5/8	5/16, 7/16	D-H-NT-60, OH-60

The use of this much glazing in a fire door protecting an exit enclosure or passageway is a threat to life safety, and should not be permitted.

Finally, the current provision, which appears to allow fire protection rated glazing to exceed 100 sq. inches when the building is sprinklered, was never intended by the proponent of the code change to the 2000 IBC that allowed fire resistance rated glazing that limited temperature rise to 450 F degrees to exceed 100 sq. inches. In the Draft 2000 IBC, there was one exception in the section specifying the requirements for temperature rise doors in exit enclosures and passageways, which applied to allow a non-temperature rise door when the building is sprinklered. The proposal submitted in 1998 that amended that section to allow fire resistance rated glazing to exceed 100 sq. inches when tested to limit temperature rise to 450- degrees F did not propose a second exception that would allow fire protection glazing to exceed 100 sq. inches when the building was sprinklered. However, when the monograph was published, a duplicate exception was printed, though never intended or proposed by the proponent of that code change.

The proponent of the 1998 code change intended this section to limit fire protection rated glazing to 100 sq. inches, consistent with the size limits provided by the legacy codes, and currently applicable in Section Section 715.4.7.1—regardless of whether the building is sprinklered. The same reasons for limiting fire protection glazing in 90-minute fire doors certainly apply in 60-minute exit enclosure and passageway fire doors.

As stated in NFPA 80 (2007), Annex I:

Traditional glazing materials have been prohibited from being used in fire windows in exit stair enclosures because of the concern for radiant heat transfer. Recently, the model building codes also incorporated requirements for limiting the temperature rise on the unexposed face of fire doors opening into exit stair enclosures in order to address the problem of heat transfer (both conducted and reradiated) that could expose evacuating occupants passing doors at each landing. Therefore, caution should be exercised when considering glazing materials with fire protection ratings of 60-minutes or more in such applications, since they can transmit excessive radiant heat into the exit stair enclosure. However, glazing materials with fire resistance ratings are suitable for such situations, since they have been tested to limit radiant heat transfer.

In sum, there is good reason to clarify that fire protection rated glazing is limited to 100 sq. inches in 1-hour exit enclosures and passageways, without an exception when automatic sprinklers are installed in accordance with Chapter 9 provisions. These exit enclosures and passageways are integral to life safety, and there is no justification for not providing for passive fire protection, protecting occupants from dangerous radiant heat levels from fully glazed exit enclosure doors, especially since the cost of fire resistance rated glazing is comparable to the cost of laminated safety-rated ceramics.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposals FS100 and FS107 propose similar revisions to Section 715.4.4.1. The committee needs to make its intent clear with respect to these provisions.

Public Hearing:

703.5, 715.4.7.3, 715.5.9, 1703.5.4 (New)

Proponent: William F. O'Keeffe, representing SAFTIFirst

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

PART I- IBC FIRE SAFETY

Revise as follows:

703.5 Fire-resistance-rated glazing. Fire-resistance-rated glazing, when tested in accordance with ASTM E 119 or UL 263 and complying with the requirements of Section 707, shall be permitted. Fire-resistance-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and the identifier "W-XXX," where the "XXX" is the fire-resistance rating in minutes. Such label or identification shall be issued by an agency and shall be permanently ~~affixed to~~ identified on the glazing.

715. 4.7.3 Labeling. Fire-protection-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required in Section ~~715.5.9.1~~ 715.4.7.3.1 that shall be issued by an approved agency and shall be permanently ~~affixed to~~ identified on the glazing.

715. 5.9 Labeling. Fire-protection-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required in Section 715.5.9.1 that shall be issued by an approved agency and shall be permanently ~~affixed to~~ identified on the glazing.

PART II- IBC STRUCTURAL

Add new text as follows:

1703.5.4 Method of labeling. Information required to be permanently identified on the product shall be acid etched, sand blasted, ceramic fired, laser etched, embossed or of a type that, once applied, cannot be removed without being destroyed.

Reason: This code change provides for a method of permanently identifying information required by the code on the label. The language for permanent identification is taken from Section 2403.1, which applies to the permanent identification of information on glazing required by Chapter 24. This clarifies that the same method of permanent identification applies to other labeling required in the code, and specifically, Chapter 7.

This change also makes an editorial correction to Section 715.4.7.3 by correcting the reference to 715.4.7.3.1, instead of the incorrect reference to 715.5.9.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: OKeeffe-FS5-703.5

FS102–09/10
715.5

Proponent: William F. O'Keeffe, representing SAFTIFirst

Revise as follows:

715.5 Fire-protection-rated glazing. Glazing in fire window assemblies shall be fire-protection rated in accordance with this section and Table 715.5. Glazing in fire door assemblies shall comply with Section 715.4.7. Fire-protection-rated glazing in fire window assemblies shall be tested in accordance with and shall meet the acceptance criteria of NFPA 257 or UL 9. Fire-protection-rated glazing shall also comply with NFPA 80. Openings in nonfire-resistance-rated exterior wall assemblies that require protection in accordance with Section 705.3, 705.8, 705.8.5 or 705.8.6 shall have a fire protection rating of not less than 3/4 hour.

Exceptions:

1. Wired glass in accordance with Section 715.5.4
2. Fire-protection-rated glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour fire-protection rating.

715.5.8 Interior fire window assemblies. Fire-protection-rated glazing used in fire window assemblies located in fire partitions and fire barriers shall be limited to use in assemblies with a maximum fire-resistance rating of 1 hour in accordance with this section.

715.5.8.1 Where 3/4–hour fire protection window assemblies permitted. Fire-protection-rated glazing requiring 45-minute opening protection in accordance with Table 715.5 shall be limited to fire partitions designed in accordance with Section 709 and fire barriers utilized in the applications set forth in Sections 707.3.6 and 707.3.8 where the fire-resistance rating does not exceed 1 hour.

715.5.8.2 Area limitations. The total area of fire-protection rated window~~s~~ assemblies shall not exceed 25 percent of the area of a common wall with any room.

Reason: This code change is a clarification that fire protection-rated window assemblies are subject to area limits. Since there are some window assemblies that are fire resistance rated to ASTM E119, this code change aids the user in clarifying that fire protection rated window assemblies are subject to these limits.

Cost Impact: The code change proposal will not increase the cost of construction.

715.5, TABLE 715.5.4

Proponent: William F. O'Keefe, representing SAFTIFirst

1. Revise as follows:

715.5 Fire-protection-rated glazing. Glazing in *fire window assemblies* shall be fire-protection rated in accordance with this section and Table 715.5. Glazing in *fire door* assemblies shall comply with Section 715.4.7. Fire-protection-rated glazing shall be tested in accordance with and shall meet the acceptance criteria of NFPA 257 or UL 9. Fire-protection-rated glazing shall also comply with NFPA 80. Openings in nonfire-resistance-rated *exterior wall* assemblies that require protection in accordance with Section 705.3, 705.8, 705.8.5 or 705.8.6 shall have a fire-protection rating of not less than ¾ hour. Fire protection-rated glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour fire-protection rating.

~~**Exceptions:**~~

1. ~~Wired glass in accordance with Section 715.5.4.~~
2. ~~Fire protection-rated glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour fire-protection rating.~~

~~**715.5.4 Wired glass.** Steel window frame assemblies of 0.125-inch (3.2 mm) minimum solid section or of not less than nominal 0.048-inch-thick (1.2 mm) formed sheet steel members fabricated by pressing, mitering, riveting, interlocking or welding and having provision for glazing with 1/4 inch (6.4 mm) wired glass where securely installed in the building construction and glazed with 1/4-inch (6.4 mm) labeled wired glass shall be deemed to meet the requirements for a 3/4-hour *fire window assembly*.Wired glass panels shall conform to the size limitations set forth in Table 715.5.4.~~

715.5.4 ~~715.5.5~~ Nonwired glass. Glazing ~~other than wired glass~~ in *fire window assemblies* shall be fire-protection-rated glazing installed in accordance with and complying with the size limitations set forth in NFPA 80.

~~For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm^2.~~

Reason: This code change deletes the exception for wired glass from complying with NFPA 257 test standards, and removes the Table as unnecessary to distinguish wired glass from other fire rated glazing products. NFPA 80, the underlying standard for fire doors and other opening protectives, has been revised to eliminate any special reference to wired glass, and wired glass is treated as any other fire rated glazing product.

The special prescriptive regulation of wired glass in steel frames is unnecessary if wired glass is tested to and listed as a fire rated window assembly. If wired glass in a steel frame cannot meet the performance criteria of NFPA 257, it should not be permitted in applications requiring fire rated protection.

Traditional wired glass is no longer allowed in fire doors because it does not meet CPSC safety glazing requirements located in Section 2406.1 of the IBC. Section 715.4.7.1 was revised last code cycle to delete reference to wired glass fire door size limits and the reference to Table 715.5.4. Accordingly Table 715.5.4 is confusing because it purports to prescribe permitted size limits for wired glass in doors which are no longer allowed in any size. The only valid application for wired glass is in fire assemblies in non-hazardous locations, and a table is not needed to prescribe those size limits.

Further, the Table is confusing to code users because there are now laminated and filmed safety wired glass products that have been tested to larger sizes, and are listed just as any other fire rated glazing product, to the maximum size tested, with dimensions as published in their individual listings.

Elimination of these special provisions also eliminates a product that would not comply with the marking and labeling requirements that have formed the basis of some confusion on the part of manufacturers and code officials and which a CTC task group worked hard to comprehensively address in between the last code change cycle and this one.

This code change also makes an editorial revision in stating the requirements for 1/3-hour rated fire windows in half hour walls as an affirmative requirement rather than as an exception.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: OKEEFFE-FS4-715.5

FS104–09/10
Table 715.5

Proponent: William F. O'Keeffe, representing SAFTIFirst

1. Revise as follows:

TABLE 715.5
FIRE WINDOW ASSEMBLY FIRE PROTECTION RATINGS

TYPE OF WALL ASSEMBLY		REQUIRED WALL ASSEMBLY RATING (hours)	MINIMUM FIRE WINDOW ASSEMBLY RATING (hours)
Interior walls:	Fire walls	All	NPa
	Fire barriers	> 1 1	NPa 3/4
	Smoke barriers	1	3/4
	Fire partitions	1 1/2	3/4 1/3
Exterior walls		> 1 1	~~1 1/2~~ NP[a] 3/4
Party wall		All	NP

NP – Not Permitted
a. Not permitted except fire resistance rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 715.2.

Reason: The purpose of this proposed change is to eliminate an anomaly in the table. Fire walls and Party walls do not permit a fire window assembly unless, (in the case of the fire wall), the window assembly is tested in accordance with ASTM E-119 or UL 263. The purpose of the fire wall or party wall is to prevent the spread of fire to the next building for a specified amount of time.

An exterior wall also is expected to prevent the spread of fire to the next exposure (building or structure) and may have a required fire resistance rating of 3 hours depending on the separation distance, occupancy group and/or type of construction. Being that the purpose of the level of fire resistance rating is the same, preventing the transmittal of fire from one building to another, the fire window assembly rating requirements should be the same. An additional consideration is why would a 1.5 hour rated window assembly be permitted in a 3 hour exterior wall when Table 715.4 would require a fire door or shutter to have a 3 hour rating in a 3 hour rated wall.

The proposal is also supported when comparing the "Exterior wall" category to the "Fire barriers" category.

The language added to Note a is editorial in that Section 715.2 only deals with fire-resistance rated glazing..

Cost Impact: Due to the wide availability of glazing meeting the requirements of Section 715.2 this proposal will not increase the cost of construction.

Analysis: Test standards ASTM E119 and UL 263 are currently referenced in the I-codes.

FS105–09/10
715.5.8

Proponent: William F. O'Keeffe, representing SAFTIFirst

1. Revise as follows:

715.5.8.1 Where 3/4–hour fire protection window assemblies permitted. Fire-protection-rated glazing requiring 45-minute opening protection in accordance with Table 715.5 shall be limited to fire partitions designed in accordance with Section 709 and fire barriers utilized in the applications set forth in Sections 707.3.6 and 707.3.8 where the fire-resistance rating does not exceed 1 hour, and shall be subject to Section 715.5.8.3.

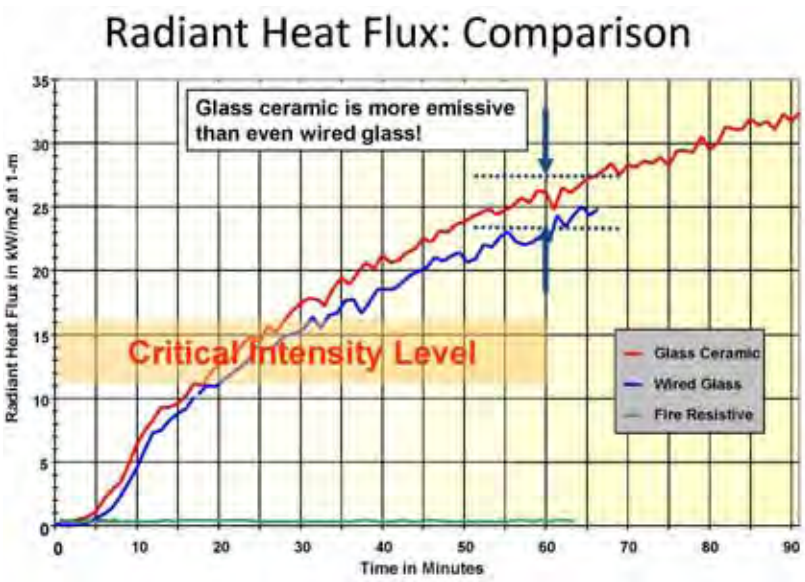
715.5.8.2 Area limitations. The total area of windows shall not exceed 25 percent of the area of a common wall with any room.

2. Add new text as follows:

715.5.8.3 Interior fire windows in fire barriers, corridors and smoke barriers. Fire protection-rated glazing in fire windows tested to NFPA 257 used in fire barriers, corridors and smoke barriers requiring a 1-hour fire resistance rating shall be limited to applications where the bottom edge of the window frame is a minimum of 36-inches above the finished floor surface. The bottom edge height of fire resistance rated glazing tested as an assembly to ASTM E119 or UL 263 and rated a minimum of 1-hour shall not be limited.

Reason: Fire protection rated glazing materials do not protect against radiant heat. The unrestricted use of these materials in exit corridors in the large sizes for which they have been tested and listed threaten the life safety of building occupants attempting to exit past them in a fire. Their unrestricted use in other fire barriers and partitions where combustibles may be stored next to them also contribute to fire spread. By restricting the use of these materials to above 36" from the floor, occupants can crawl underneath fire windows, and combustibles piled on the floor are not as likely to pose a threat to windows installed at this height.

Fire test data show that at 45-minutes, these products transmit in excess of 20 kW/m^2, at 20 minutes of fire exposure, these materials transmit in excess of 10 kW/m^2, and at 10 minutes of fire exposure, transmit 5 kW/m^2. http://www.safti.com/video/resist/resistive.html See below, Chart Cumulative Radiant Heat Energy Data Chart, prepared by the test sponsor of the test cited above. The Society of Fire Protection Engineers Fire Protection Engineering Handbook identifies a fairly obvious tolerance limit for exposure to radiant heat of 2.5 kW/m^2 due to unbearable pain. (See SFPE Handbook of Fire Protection Engineering, 2nd edition, page 2-114).



Also included as further support of this code change are two test reports from the Coast Guard testing of (1) Ceramic (FireLite) in steel bulkheads (Report No. CG-D-37-95), and (2) wired glass in steel bulkheads (Report No. CG-D-38-95). Temperature rise and radiant heat flux measurements were recorded. The tests were intended to measure radiant heat flux and surface temperature performance at 60 minutes.

The tests can be summarized as follows:

Wired Glass Test

The test of the wired glass panels resulted in glazing failure prior to 60-minutes, so radiant heat and temperature rise were only recorded up to the time of the wired glass failure.

Test 1
Heat flux at end of test (41:24 minutes) - 71 kW/m sq.
Surface temperature - wired glass temperature - 730 degrees C; steel frame - 540 degrees C
Test 2
Heat flux at end of test (37:46 minutes) - 48 kW/m sq.
Surface temperature - wired glass temperature - 730 degrees C; steel frame - 550 degrees C
Test 3
Heat flux at end of test (48:30 minutes) - 57 kW/m sq.
Surface temperature - wired glass temperature - 760 degrees C; steel frame - 585 degrees C

Conclusion on page 8 - As the window panes began to reach their melting point and flow out of the test frame, the recorded heat flux levels showed obvious increases. In all three tests, the recorded heat flux increased approximately 5-7 kW/m sq. until the wire glass fell out of the test frame and the test was terminated.

Ceramic (FireLite) Test

Test 1
Heat flux at end of test (60:00 minutes) - 75 kW/m sq.
Surface temperature - ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C
Test 2
Heat flux at end of test (60:00 minutes) - 69 kW/m sq.
Surface temperature - ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C
Test 3
Heat flux at end of test (60:00 minutes) - 73 kW/m sq.

Surface temperature - ceramic glass temperature - 800 degrees C; steel frame - 600 degrees C

According to these test reports, the surface temperature is significantly higher on the glazing than it is on the steel frame. Also, the report notes that the radiant heat measurements taken that included the "cooler steel frame" were several percentages lower than the view that included just the glazing. (see Ceramic test report (Report No. CG-D-37-95), page 6.)

Limitations on area uses of fire protection-rated glazing products is long overdue. In Europe, code regulators have recognized the need for restricting use of fire protection-rated glazing materials based on radiant heat hazards, particularly their use in egress paths. Reasonable limits protecting life safety are achieved by limiting the height of windows in exit corridors, permitting building occupants safe egress. The restriction on use in other fire barriers and fire partitions reduces the possibility of fire spread due to auto-ignition, which test data show can occur well before the 45-minute fire exposure to which fire protection-rated glazing products have been tested.

As stated in NFPA 80 (2007), Annex I:

"Because the present fire test standard, NFPA 257, does not require measuring and reporting temperature rise on the unexposed face of the glazing material or radiant heat transmission, glazing products tested to this standard have not been required to retard radiant heat transfer. However, these data are required in many European fire test standards. As a result, European building codes place limitations on the use of glazing in fire-resistant partitions inside buildings and require the use of insulating glazing in means of egress as well as where combustibles could be in close proximity. Research by Margaret Law, Bsc, Ministry of Technology and Fire Offices Committee, Joint Fire Research Organization, led to the development of such limitations in British building regulations.

This code change at the same time permits use in larger sizes of products that meet fire resistance radiant heat and temperature rise limits of ASTM E119, as those products do not transmit dangerous levels of radiant heat.

Bibliography

1. Test Report, Fire Performance of Three Wired Glazed Window Assemblies, Report No. CG-D-38-95
2. Test Report, Fire Performance Evaluation of Three A-O Glazed Window Assemblies, Report No. CG-D-37-95

Cost Impact: This code change will not increase construction costs, as fire protection-rated glazing materials are still permitted, and the cost of fire resistance products permitted for larger applications and next to the floor is now comparable to safety rated fire protection products that pass hose stream testing.

Analysis: Standard NFPA 257 is currently referenced in the I-codes.

1. Add new text as follows.

715.5.8.2 Where 1/3-hour fire protection window assemblies permitted. Fire-protection rated glazing in fire window assemblies in ½-hour fire -resistant rated fire partitions requiring 1/3-hour opening protection in accordance with Table 715.5 shall be exempt from the hose stream test.

(Renumber subsequent section)

2. Revise as follows.

TABLE 715.5
FIRE WINDOW ASSEMBLY FIRE PROTECTION RATINGS

TYPE OF ASSEMBLY		REQUIRED ASSEMBLY RATING (hours)	MINIMUM FIRE WINDOW ASSEMBLY RATING (hours)
Interior walls:	Fire walls	All	NP[a]
	Fire barriers	> 1 1	NP[a] 3/4
	Smoke barriers	1	3/4
	Fire partitions	1 1/2	3/4 1/3[b]
Exterior walls		> 1 1	1 1/2 3/4
Party wall		All	NP

NP = Not Permitted.

a. Not permitted except as specified in Section 715.2.
b. For testing requirements, see Section 715.5.8.2

Reason: New section 715.5.8.2 addresses 20-minute windows now specified in Table 715.5 for ½-hour fire partitions. Since the fire partition assembly tested to ASTM E119 for a ½-hour fire resistance rating is not subject to the hose stream test, and fire doors tested for 20-minutes as required in Table 715.4 are not subject to the hose stream test, for consistency in the code, the fire window component of a ½-hour fire partition should be likewise exempt from the hose stream test.

The Fire Safety Committee approved this proposal last code cycle, stating as a reason:

Committee Reason: Based on the fact that ASTM E119 does not require the hose stream test for partitions qualifying for a 30 minute fire rating and Section 715.4.3 allows 20 minute rated fire doors to be tested without the hose stream test, the committee agreed that the hose stream test was not required for a 20 minute rated fire protection window.

A public comment was submitted, and the Committee's decision was overturned. The Commenter submitted two reasons for overturning the code changes: One, that 20-minute windows are subject to fuel loads, and two, that 20-minute tempered products are subject to "disintegration."

The first point is not a hose stream issue, but a radiant heat issue, and applying a hose stream test to products does not assure that they will block radiant heat from passing through the glazing and spreading the fire. Indeed, as seen by the test data in the supporting fire test video, http://www.safti.com/video/resist/resistive.html, one type of fire protection material, ceramic, transmits enough radiant heat in the first 20-minutes of fire exposure to cause spontaneous combustion. Wired glass, another fire protection product that can pass the hose stream test, likewise transmits dangerous levels of radiant heat during the early stages of a fire.

The second point simply isn't true, and was not substantiated by any test data showing alleged "disintegration." Specialty tempered products have undergone rigorous fire testing, and have proven to be effective fire protection materials by fire case history. Millions of square feet of these products have been used worldwide without any reports of the alleged "disintegration" alleged by opponents to this code change. Significantly, opponents of this code change have never come forward with any reported instances of failure.

The fact is, products not tested to the hose stream protect against fire equally as well as those that are tested.

In 20-minute window applications in half hour walls, there is no legitimate fire safety reason for requiring one element of the fire resistive construction to pass the hose stream test, where the half hour wall assembly and 20-minute door components do not pass that same test.

Cost Impact: This will reduce the cost of construction.

1. Add new text:

SECTION 702 DEFINITIONS

Fire-rated glazing. Glazing with either a fire protection rating or a fire resistance rating.

2. Revise as follows:

SECTION 703 FIRE RESISTANCE RATINGS AND FIRE TESTS

703.5 Fire-resistance-rated glazing. Fire-resistance-rated glazing, when tested in accordance with ASTM E 119 or UL 263 and complying with the requirements of Section 707, shall be permitted. Fire-resistance-rated glazing shall bear a label ~~or other identification showing the name of the manufacturer, the test standard and the identifier "W-XXX," where the "XXX" is the fire-resistance rating in minutes. Such label or identification shall be~~ marked in accordance with Table 715.3 issued by an approved agency and shall be permanently affixed to the glazing.

SECTION 715 OPENING PROTECTIVES

715.1 General. (*No change to current text)*

715.2 Fire-resistance-rated glazing. Fire-resistance-rated glazing tested as part of a fire-resistance-rated wall assembly in accordance with ASTM E 119 or UL 263 and labeled in accordance with Section 703.5, shall be permitted

in fire doors and fire window assemblies where tested and installed in accordance with their listings and shall not otherwise be required to comply with this section.

3. Add new text as follows:

715.3 Marking Fire-Rated Glazing Assemblies Fire-rated glazing assemblies shall be marked in accordance with Tables 715.3, 715.5, and 715.6.

715.3.1 Fire-rated glazing that exceeds the code requirements. Fire-rated glazing assemblies marked as complying with hose stream requirements (H) shall be permitted in applications that do not require compliance with hose stream requirements. Fire-rated glazing assemblies marked as complying with temperature rise requirements (T) shall be permitted in applications that do not require compliance with temperature rise requirements. Fire-rated glazing assemblies marked with ratings (XXX) that exceed the ratings required by this code shall be permitted.

Table 715.3
Marking Fire-Rated Glazing Assemblies

Fire Test Standard	Marking	Definition of Marking
ASTM E119 or UL 263	W	Meets wall assembly criteria.
NFPA 257 or UL 9	OH	Meets fire window assembly criteria including the hose stream test.
NFPA 252 or UL 10B or UL 10C	D H T	Meets fire door assembly criteria. Meets fire door assembly "Hose Stream" test. Meets to 450º F temperature rise criteria for 30 minutes
	XXX	The time in minutes of the fire resistance or fire protection rating of the glazing assembly

~~715.3~~ **715.4 Alternate methods for determining fire-protection.** *(No change to current text)*

~~715.4.7~~ **715.5.8 Glazing material.** *(No change to current text)*

~~715.4.7.1~~ **715.5.8.1 Size limitations.** Fire-protection-rated glazing ~~used in fire doors~~ shall comply with the size limitations of NFPA 80, and as provided in sections 715.5.8.1.1 and 715.8.1.2.

~~**Exceptions:**~~

715.5.8.1.1 Fire-resistance-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1-hour. Fire-resistance-rated glazing tested to ASTM E119 or UL 263 and NFPA 252, UL10B or UL 10C shall be permitted in fire door assemblies located in fire walls and in fire barriers in accordance with Table 715.4 to the maximum size tested and in accordance with their listings.

715.5.8.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1-hour. Fire-protection-rated glazing shall be prohibited in fire walls and fire barriers except as provided in 715.5.8.1.2.1 and 715.5.8.1.2.2

715.5.8.1.2.1 Horizontal exits. ~~1. Fire protection rated glaing in fire doors located in fire walls shall be prohibited except where serving a fire door in a horizontal exit, a self closing swinging door shall be permitted to have a vision panel of not more than 100 square inches without a dimension exceeding 10 inches.~~ Fire-protection-rated glazing shall be permitted as vision panels in self-closing swinging fire door assemblies serving as horizontal exits in fire walls where limited to 100 square inches with no dimension exceeding 10 inches.

715.5.8.1.2.2 Fire barriers. ~~2.~~ Fire-protection-rated glazing ~~shall not be installed in fire doors~~ shall be permitted in fire doors having a 1-1/2-hour fire protection rating intended for installation in fire barriers, where limited to 100 square inches. ~~unless the glazing is not more than 100 square inches in area.~~

~~715.4.7.2~~ 715.5.8.2 Exit and elevator protectives. *(No change to current text)*

~~715.4.7.3~~ 715.5.8.3 Labeling. *(No change to current text)*

~~715.4.7.3.1~~ 715.5.8.3.1 Identification. *(No change to current text)*

~~715.4.7.4~~ 715.5.8.4 Safety glazing. *(No change to current text)*

(Renumber subsequent sections)

~~715.5.8~~ 715.6.8 Interior fire window assemblies. Fire-protection-rated glazing used in fire window assemblies located in fire partitions and fire barriers shall be limited to use in assemblies with a maximum fire-resistance rating of 1-hour in accordance with this section.

~~715.5.8.1~~ 715.6.8.1 Where ¾-hour fire-protection window assemblies permitted. Fire-protection-rated glazing requiring 45 minute opening protection in accordance with Table ~~715.5~~ 715.6 shall be limited to fire partitions designed in accordance with Section 709 and fire barriers utilized in the applications set forth in Sections 707.3.6 and 707.3.8 where the fire resistance rating does not exceed 1 hour. Fire-resistance-rated glazing assemblies tested in accordance with ASTM E119 or UL 263 shall not be subject to the limitations of this section.

~~715.5.8.2~~ 715.6.8.2 Area limitations. The total area of windows shall not exceed 25 percent of the area of a common wall with any room.

715.6.8.3. Where 1/3- hour fire-protection window assemblies permitted. Fire-protection-rated glazing shall be permitted in window assemblies tested to NFPA 257 or UL 9 in smoke barriers and fire partitions requiring 1/3-hour opening protection in accordance with Table 715.6

TABLE ~~715.5~~ 715.6
FIRE WINDOW ASSEMBLY FIRE-PROTECTION RATINGS

TYPE OF WALL ASSEMBLY	REQUIRED WALL ASSEMBLY RATING (hours)	MINIMUM FIRE WINDOW ASSEMBLY RATING (hours)	FIRE RATED GLAZING MARKING
Interior walls			
Fire walls	All	NP[a]	W-xxx[b]
Fire barriers	>1	NP[a]	W-xxx[b]
	1	NP[a]	W-xxx[b]
Incidental use areas (707.3.6), Mixed occupancy separations(707.3.8)	1	¾	OH-45 or W-60
Fire partitions	1	¾	OH-45 or W-60
	0.5	1/3	OH-20 or W-30
Smoke barriers	1	¾	OH-45 or W-60
Exterior walls	>1	1-1/2	OH-90 or W-XXX [B]
	1	¾	OH-45 or W-60
	0.5	1/3	OH-20 or W-30
Party wall	All	NP	Not Applicable

NP – Not Permitted

a. Not permitted except fire resistance rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 715.2

b. xxx = The fire rating duration period in minutes, which shall be equal to the fire resistance rating required for the wall assembly.

~~**715.5.9**~~ **715.6.9 Labeling.** Fire-protection-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required ~~Section 715.5.9.1~~ Table 715.6 that shall be issued by an approved agency and shall be permanently affixed to the glazing.

~~**715.5.9.1 Identification.** For fire protection-rated glazing, the label shall bear the following two-part identifiers: "OH – XXX." "OH" shall indicate that the glazing has been tested to and meets both the fire protection and the hose-stream requirements of NFPA 257 or UL 9. "XXX" shall indicate the fire-protection rating period, in minutes, that was tested.~~

a. Two doors, each with a fire protection rating of 1-1/2 hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
b. For testing requirements, see Section 715.5.3 ~~715.4.3~~.
c. Fire resistance rated glazing tested to ASTM E119 per section 715.2 shall be permitted, in the maximum size tested.
d. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 715.5.5.1.
e. Under the column heading "Fire rated glazing marking door vision panel", W refers to the fire-resistance rating of the glazing, not the frame.

Reason:
(Heilstedt) The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Labeling of Fire Rated Glazing". The scope of the activity is noted as:

Identify root causes of problems selecting, specifying, installing, and inspecting fire protective and fire resistive glazing and other assembly components including the frames. Propose identification requirements and other related code changes.

The marking provisions of the IBC applicable to fire rated glazing ("Marking Provisions") were first adopted as a part of Chapter 7 of the IBC in 2004. In the last development cycle, the Fire Safety Committee recommended that the ICC Board consider submitting the marking of fire rated glazing to the Code Technology Committee (CTC) as an area of study since repeat proposals to change the Marking Provisions were being submitted on a regular basis.

The ICC Board referred the Marking Provisions to the CTC as an area of study and a Study Group (SG), Chaired Carl Wren, was formed. The SG consisted of both fire and building code officials; architects; engineers; fire rated window and door manufacturers; primary fire rated glazing manufacturers; and a fire protection engineer. It was recognized by the SG that the existing marking system, as those marks were designated in product listings, was leading to fire protection products in applications not allowed by the IBC. After numerous meetings and a full hearing before the CTC, the SG and the CTC unanimously approved proposing these changes to the IBC's Marking Provisions.

The primary objective of the CTC in proposing these changes is to make the Marking Provisions of Chapter 7 easier to understand and enforce and to minimize the possibility that the system could result in confusion between fire protection rated products in applications where fire-resistance rated products meeting ASTM E 119 are permitted. The proposal includes the following changes:

1- Adds a new Table 715.3, to define and relate the various test standards for fire rated glazing to the designations used to mark fire rated glazing. A new definition of the term "fire rated glazing" would also be included.

2- While the designations "W," "OH," "D," "DT," "DH" and "XXX" used to mark fire rated glazing will remain as they were originally adopted in 2004, the marking of fire rated glazing in fire door assemblies (D) are simplified by deleting the NH designation (not hose stream tested) and the NT designation (not temperature rise tested). It is clarified that those designations correspond to test standards, not end uses. Tables 715.4 and 715.5 show the markings required for acceptance in specified applications.

3- All text provision used to define and relate test standards to marking designations are deleted in favor of including all of the required marking provisions in Tables 715.3, 715.4 and 715.5. This is intended to provide building and fire code officials with easy access to all of the information needed when inspecting fire window and fire door installations, including required marking designations.

4- In connection with removing many of the text provisions referring to the marking of fire rated glazing and the inclusion of all pertinent marking requirements in tables 715.4 and 715.5, a number of columns are added to those Tables. These new columns specify the required designations that the building and fire code officials will need to look for when inspecting fire rated glazing in the various categories of fire resistance rated walls, fire door assemblies and fire window assemblies identified in Tables 715.4 and 715.5.

5- The size limitation provisions starting at 715.4.6.1 are re-written to eliminate the use of "exceptions" and thus clarify them - no substantive changes to these provisions are intended.

6- It was determined that Table 715.4 inadvertently omitted reference to 1 1/2 hour doors in shaft, exit enclosures and exit passageway walls and this proposal adds that reference to the Table.

7- The Marking Provisions have been written to clarify that fire protection rated glazing tested to NFPA 257 and used in transoms and sidelites in certain fire barriers and corridor walls will also have to be tested to NFPA 252 since they are a part of a door assembly. Accordingly, these glazings are marked D-H-OH-XXX.

(O'Keefe) The marking provisions of the IBC applicable to fire rated glazing ("Marking Provisions") were first adopted as a part of Chapter 7 of the IBC in 2004. In the last development cycle, the Fire Safety Committee recommended that the ICC Board consider submitting the marking of fire rated glazing to the Code Technology Committee (CTC) as an area of study since repeat proposals to change the Marking Provisions were being submitted on a regular basis, because of confusion and misuse of products being marked by individual manufacturers under the current system.

The ICC Board referred the Marking Provisions to the CTC as an area of study and a Study Group (SG), Chaired by Carl Wren, was formed. The SG consisted of both fire and building code officials; architects; engineers; fire rated window and door manufacturers; primary fire rated glazing manufacturers; and a fire protection engineer.

It was recognized by the SG that the existing marking system, as those marks were designated in product listings, was leading to the misuse of fire protection products in applications not allowed by the IBC. It was also recognized that "T" marking were being applied by some manufacturers to designate use of fire protection products in temperature rise doors that in fact did not limit temperature rise and should not be so marked. Attached as support are documents submitted to the CTC Labeling Study Group that show the confusion in listings showing end-use marks that are

not permitted by the IBC. After numerous meetings and a full hearing before the CTC, the SG and the CTC unanimously approved proposing these changes to the IBC's Marking Provisions.

The primary objective of the CTC in proposing these changes is to make the Marking Provisions of Chapter 7 easier to understand and enforce and to minimize the possibility that the system could result in confusion between fire protection rated products in applications where fire-resistance rated products meeting ASTM E 119 are required. The proposal includes the following changes:

1- Adds a new Table 715.3, to define and relate the various test standards for fire rated glazing to the designations used to mark fire rated glazing. A new definition of the term "fire rated glazing" would also be included.

2- While the designations "W," "OH," "D," "DT," "DH" and "XXX" used to mark fire rated glazing will remain as they were originally adopted in 2004, the marking of fire rated glazing in fire door assemblies (D) are simplified by deleting the NH designation (not hose stream tested) and the NT designation (not temperature rise tested). It is clarified that those designations correspond to compliance with test standards only, not that they are permitted for end uses. Tables 715.4 and 715.5 show the markings required for acceptance in specified applications.

3- All text provision used to define and relate test standards to marking designations are deleted in favor of including all of the required marking provisions in Tables 715.3, 715.4 and 715.5. This is intended to provide building and fire code officials with easy access to all of the information needed when inspecting fire window and fire door installations, including required marking designations.

4- In connection with removing many of the text provisions referring to the marking of fire rated glazing and the inclusion of all pertinent marking requirements in tables 715.4 and 715.5, a number of columns are added to those Tables. These new columns specify the required designations that the building and fire code officials will need to look for when inspecting fire rated glazing in the various categories of fire resistance rated walls, fire door assemblies and fire window assemblies identified in Tables 715.4 and 715.5.

5- The size limitation provisions starting at 715.4.6.1 are re-written to eliminate the use of "exceptions" and thus clarify them - no substantive changes to these provisions are intended.

6- It was determined that Table 715.4 inadvertently omitted reference to 1 1/2 hour doors in shaft, exit enclosures and exit passageway walls and this proposal adds that reference to the Table.

7- The Marking Provisions have been written to clarify that fire protection rated glazing tested to NFPA 257 and used in transoms and sidelites in certain fire barriers and corridor walls will also have to be tested to NFPA 252 since they are a part of a door assembly. Accordingly, these glazings are marked D-H-OH-XXX. It has also been clarified where fire rated glazing products must be tested to and marked as complying with ASTM E119 in sidelight and transom assemblies in openings requiring greater than ¾-hour protection, and for glazing sizes exceeding 100 sq. inches in doors rated 1-hour and greater.

8. Section 715.4.6.1 was revised to clarify labeling of door assembly components, and to recognize that door assemblies are permitted to have components labeled by different test agencies.

Bibliography: Examples of UL Listing Markings submitted to CTC Labeling Study Group.

Cost Impact: This code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HEILSTEDT-FS3-702

FS108–09/10

716.1 (IMC 607.1), 716.1.1 (IMC 607.1.1), 716.2.2 (IMC 607.2.2)

Proponent: Vickie Lovell representing 3M Company

Revise as follows:

716.1 (IMC 607.1) General. The provisions of this section shall govern the protection of air duct penetrations and air transfer openings in assemblies required to be protected. Protection of exhaust ducts shall comply with Chapter 5 of the International Mechanical Code.

716.1.1 (IMC 607.1.1) Ducts that penetrate fire-resistance-rated assemblies without dampers. Ducts that penetrate fire-resistance-rated wall assemblies and are not required by this section to have dampers shall be protected as required for penetrations and shall comply with the requirements of Sections 713.2.1.1 through 713.3.3. Ducts that penetrate horizontal assemblies not required to be contained within a shaft and not required by this section to have dampers shall be protected as required for penetrations and comply with the requirements of Sections 713.4 through 713.4.2.2.

716.2 (IMC 607.2) Installation. Fire dampers, smoke dampers, combination fire/smoke dampers and ceiling radiation dampers located within air distribution and smoke control systems shall be installed in accordance with the requirements of this section, the manufacturer's installation instructions and listing and the dampers' listing.

716.2.1 (IMC 607.2.1) Smoke control system. Where the installation of a fire damper will interfere with the operation of a required smoke control system in accordance with Section 909 of the International Building Code, approved alternative protection shall be utilized. Where mechanical systems including ducts and dampers utilized for normal building ventilation serve as part of the smoke control system, the expected performance of these systems in smoke control mode shall be addressed in the rational analysis required by Section 909.4.

716.2.2 (IMC 607.2.2) Hazardous exhaust ducts. Fire dampers for hazardous exhaust duct systems shall comply with the International Mechanical Code. Fire dampers, smoke dampers and combination fire/smoke dampers are prohibited in hazardous exhaust duct systems.

Reason: This section was written with better formatting to clarify where dampers are prohibited altogether. The change was based on Section 510.6.1 of the IMC. Dampers in hazardous ducts cannot "comply with the IMC" in hazardous exhaust ducts. They are not permitted.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LOVELL-FS1-716.1

FS109–09/10
716.3.1 (IMC 607.3.1)

Proponent: Bob Eugene, representing Underwriters Laboratories Inc

Revise as follows:

716.3.1 (IMC 607.3.1) Damper testing. Dampers shall be listed and labeled in accordance ~~bear the label of an approved testing agency indicating compliance~~ with the standards in this section. Fire dampers shall comply with the requirements of UL 555. Only fire dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire. Smoke dampers shall comply with the requirements of UL 555S. Combination fire/smoke dampers shall comply with the requirements of both UL 555 and UL 555S. Ceiling radiation dampers shall comply with the requirements of UL 555C.

Reason: The definition of "labeled" requires the approved agency to maintain periodic inspections of the product.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-FS6-716.3.1

FS110–09/10
716.3.2.2, 716.3.2.3

Proponent: Bob Eugene, representing Underwriters Laboratories Inc

Revise as follows:

716.3.2.2 (IMC 607.3.2.2) Smoke damper ratings. Smoke damper leakage ratings shall ~~not~~ be ~~less than~~ Class I or II. Elevated temperature ratings shall not be less than 250 F (121 C).

716.3.2.3 (IMC 607.3.2.3) Combination fire/smoke damper ratings. Combination fire/smoke dampers shall have the minimum fire protection rating specified for fire dampers in Table 716.3.2.1 for the type of penetration and shall also have a minimum ~~Class II leakage rating and a minimum elevated temperature rating of 250 F (121 C)~~.smoke damper ratings as specified in Section 716.3.2.2.

Reason: Provides consistency in the wording for the smoke damper ratings, and clarity of the two acceptable leakage rating Classes.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-FS7-716.3.2.2

FS111–09/10
716.5.3 (IMC 607.5.5)

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

716.5.3 (IMC 607.5.5) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
   1.1. ~~Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or~~ Sub-duct exhaust systems are installed in accordance with Sections 504.8 and 515 of the *International Mechanical Code*
   1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance rated assembly; or
   1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the fire damper will interfere with the operation of the smoke control system; or
   1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In ~~Group B and R occupancies~~ multi story buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke dampers are not required at penetrations of shafts where sub-duct exhaust systems are installed in accordance with Sections 504.8 and 515 of the *International Mechanical Code*.
   ~~2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.187 inch (0.4712 mm) (No. 26 gage).~~
   ~~2.2. That extend at least 22 inches (559 mm) vertically; and~~
   ~~2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.~~
3. Smoke dampers are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an approved mechanical smoke control system designed in accordance with Section 909 and where the smoke damper will interfere with the operation of the smoke control system.
5. Dampers, ~~F~~ fire dampers, ~~and~~ combination fire/smoke dampers and smoke dampers are not required in sub-duct ~~kitchen and clothes dryer~~ exhaust systems when installed in accordance with ~~the~~ Sections 504.8 and 515 of the *International Mechanical Code*.

Reason: This is an effort to update this section as it relates to sub-duct exhaust systems found in the Mechanical Code. There is no need to restate mechanical requirements in this section that are already covered in the Mechanical Code under exhaust system installation. This is intended as a steering mechanism to guide the user to the appropriate code sections. Sub-duct systems have been utilized for many years and they enjoy a good track record. These systems will work in any occupancy and there is no technical justification to limit their use to B and R occupancies. Item# 5 failed to include smoke dampers. Combination smoke/fire dampers are different than plain smoke dampers. This text will streamline this section by dispensing with unnecessary language.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-FS1-716.5.3.doc

FS112–09/10

716.5.3 (IMC 607.5.5)

Proponent: Robert Adkins representing Virginia Plumbing & Mechanical Inspectors Assn and Virginia Building and Code Officials Assn.

Revise as follows:

716.5.3 (IMC 607.5.5) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
   1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside. Dampers shall not be installed in the shaft that have the ability to interrupt the continuous airflow upward ; or
   1.2. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly; or
   1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *fire damper* will interfere with the operation of the smoke control system; or
   1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

(Exceptions not shown, remain unchanged)

Reason: The added wording will prevent a fire damper from being installed at the top of a shaft where the shaft isn't installed to the underside of the roof deck as allowed by IBC 708.12. The installation of such a fire damper, and the resulting disruption of a continuous upward airflow, would render the subduct protection useless and allow a fire to exit the rated shaft at unprotected openings. Where an exhaust duct utilizing subducts turns horizontal before penetrating the roof deck, the rated shaft must also turn horizontal and follow the exhaust duct to the roof penetration.

The new wording does allow for the combined use of a subduct penetration into the shaft from one exhaust location, along with a fire damper protected penetration into the shaft from another exhaust location if a designer chooses to combine these uses into one shaft.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Adkins-FS1-716.5.3

FS113–09/10
716.5.3 (IMC 607.5.5)

Proponent: Dave Frable, US General Services Administration, representing the US General Services Administration

Revise as follows:

716.5.3 (IMC 607.5.5) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Fire dampers* are not required at penetrations of shafts where:
   1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or
   1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly; or
   1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *fire damper* will interfere with the operation of the smoke control system; or
   1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smoke dampers* are not required at penetrations of shafts where:

2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.187-inch (0.4712 mm) (No. 26 gage);
2.2. The subducts extend at least 22 inches (559 mm) vertically; and
2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.

3. *Smoke dampers* are not required at penetrations of shafts in Group B occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 where the air in ducts continues to move and the air handling system is configured to prevent recirculation of return or exhaust air upon fire conditions.

4.~~3.~~ *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

5.~~4.~~ *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.

6.~~5.~~ *Fire dampers* and *combination fire/smoke dampers* are not required in kitchen and clothes dryer exhaust systems when installed in accordance with the *International Mechanical Code*.

Reason: The intent of this code change is to acknowledge that Group B occupancies protected by an operational fire sprinkler system where the air in ducts continues to move and the air handling system is configured to prevent recirculation of return or exhaust air upon fire conditions provides an acceptable level of safety for building occupants and therefore does not warrant the need for the installation of smoke dampers at all penetrations of shaft duct/air transfer opening penetrations. This code change proposes to remove the current requirement for smoke dampers in shaft wall penetrations, but leave fire dampers in place. This is because smoke travel through ducted ventilation shafts has not been a contributing factor to fire deaths in sprinklered Group B occupancies in recent history. Note: all high-rise office fires where smoke spread has been cited as a problem have either occurred in unsprinklered buildings, partially sprinklered buildings or buildings subject to terrorist attacks. Fire sprinklers control the burning rate (and thus limit smoke production) and maintain near ambient temperature which limits the buoyancy forces that drive smoke to the shafts where stack affect may cause smoke spread to other floors. It is also widely accepted that operating fire sprinklers will prevent room flashover and full floor fires, and will limit the size of room fires. The reliability of sprinklers should not be called into question as an NFPA report issued in 2005 indicated that automatic fire sprinklers successfully operating in reported structural fires was an exemplary 93%. This same report indicated that two-thirds of the automatic fire sprinkler system failures were because the automatic fire sprinkler systems were shut off, an unlikely scenario where jurisdictions adopt the IBC since the IBC requires the supervision of the automatic fire sprinkler system. Hence, the successful operation of an automatic fire sprinkler system designed and installed in compliance with the IBC requirements could be reasonably estimated at 98% (or better, since NFPA indicated that a number of fire incidents extinguished by sprinklers may not even be reported).

In addition to fire sprinklers, these buildings have a number of additional safeguards in place. For example, the IMC and NFPA 90A both require duct smoke detectors to shut off of air handling equipment to minimize the potential of smoke spread through ventilation ducts. Also, the 2009 edition of the IBC now requires a number of additional safety enhancements such as: two way communication at elevator landings; an increase of 50% in egress capacity for exit stairs in all buildings; increased cohesive/adhesive bond strength for sprayed fire resistive materials; exit stair path markings in all high rise buildings; fire service access elevators for buildings greater than 120 feet; and an additional stair and redundant sprinkler risers for buildings greater than 420 feet, etc.

Given the aforementioned protection coupled with the excellent track record for sprinklered B occupancies, and keeping in mind that the purpose of the IBC is to provide minimum requirements to safeguard occupants of buildings from fire and other hazards attributed to the built environment based on sound technical documentation, we strongly believe that it is unreasonable to require smoke dampers in shaft duct/air transfer opening penetrations as an additional means for slowing or stopping the spread of smoke throughout a building.

Note: Though not relevant to this code change, NFPA 90A does not require smoke dampers in shaft walls regardless of whether the building is sprinklered. Also note that some jurisdictions (e.g., Commonwealth of Virginia) are granting similar modifications to the requirement for smoke dampers in exhaust ducts because it is impractical to comply with the IBC and there is no demonstrated need.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Frable-FS1-716.5.3

FS114–09/10
716.5.4 (IMC 607.5.3)

Proponent: Tom Hedges, representing the Arizona Building Officials

Revise as follows:

716.5.4 (IMC 607.5.3) Fire partitions. Ducts and air transfer openings that penetrate *fire partitions* shall be protected with *listed fire dampers* installed in accordance with their listing.

Exceptions: In occupancies other than Group H, *fire dampers* are not required where any of the following apply:

1. Corridor walls in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and the duct is protected as a *through penetration* in accordance with Section 713.
2. Tenant partitions in *covered mall buildings* where the walls are not required by provisions elsewhere in the code to extend to the underside of the floor or roof sheathing, slab or deck above.
3. The duct system is constructed of *approved* materials in accordance with the *International Mechanical Code* and the duct penetrating the wall complies with all of the following requirements:
   3.1. The duct shall not exceed 100 square inches (0.06 m2).
   3.2. The duct shall be constructed of steel a minimum of 0.0217 inch (0.55 mm) in thickness.
   3.3. The duct shall not have openings that communicate the *corridor* with adjacent spaces or rooms.
   3.4. The duct shall be installed above a ceiling.
   3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
   3.6. A minimum 12-inch-long (305 mm) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 11/2-inch by 11/2-inch by 0.060-inch (38mmby 38mmby 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The *annular space* between the steel sleeve and the wall opening shall be filled with mineral wool batting on all sides.
4. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, and are in areas of other than Group H and are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

Reason: Currently the code is less restrictive for penetrations of a fire barrier than a fire partition. This proposal adds an additional exception for fire partitions. This proposal duplicates text of Section 716.5.2 Exception 3 as an exception 4 for fire partitions. It is logical to allow the exception for a wall type where the code places lesser restrictions on its use. This exception does not limit the size of a duct penetration as Exception 3 does currently. If this exception is acceptable for fire barriers, it should be acceptable for fire partitions.

Cost Impact: The code change proposal will not increase the cost of construction. Will lower cost.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HEDGES-FS1-716.5.4

FS115–09/10
716.6.1 (IMC 607.6.1)

Proponent: Wesley R. Davis, representing Air Conditioning Contractors of America

Revise as follows:

716.6.1 (IMC 607.6.1) Through penetrations. In occupancies other than Groups I-2 and I-3, a duct constructed of approved materials in accordance with the International Mechanical Code that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection provided that a listed fire damper is installed at the floor line or the duct is protected in accordance wth Section 713.4. For air transfer openings, see Exception 7 to Section 708.2.

Exception: A duct is permitted to penetrate three floors or less without a *fire damper* at each floor, provided such duct meets all of the following requirements:

1. The duct shall be contained and located within the cavity of a wall, where the duct passes through occupied areas, and shall be constructed of steel having a minimum wall thickness of 0.187-inches (0.4712 mm) (No. 26 gage).
2. The duct shall open into only one *dwelling or sleeping unit* and the duct system shall be continuous from the unit to the exterior of the building.
3. The duct shall not exceed 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches (0.065 m2) in any 100 square feet (9.3 m2) of floor area.

4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the *fire-resistance rating* of the construction penetrated.
5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with a *listed ceiling radiation damper* installed in accordance with Section 716.6.2.1.

Reason: This change will accurately reflect the requirement. Duct must be protected from damage from those in the occupied space, a wall provides that protection. In unoccupied spaces, such as interstitial ceiling/floor areas or attics, this requirement is unnecessary.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Davis-FS1-716.6.1

FS116–09/10
716.6.3 (IMC 607.6.3)

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council

Revise as follows:

716.6.3 (IMC 607.6.3) Non fire-resistance-rated floor assemblies. Duct systems constructed of *approved* materials in accordance
with the *International Mechanical Code* that penetrate non fire-resistance-rated floor assemblies shall be protected by any of the following methods:

1. A shaft enclosure in accordance with Section 708,or an *approved* alternative duct assembly that is a *listed* and *labelled* material, system, product or method of construction specifically evaluated for such purpose.
2. The duct connects not more than two *stories*, and the *annular space* around the penetrating duct is protected with an *approved* noncombustible material that resists the free passage of flame and the products of combustion.
3. The duct connects not more than three *stories*, and the *annular space* around the penetrating duct is protected with an *approved* noncombustible material that resists the free passage of flame and the products of combustion and a *fire damper* is installed at each floor line.

   Exception: *Fire dampers* are not required in ducts within individual residential *dwelling units*.

Reason: To introduce alternative methods for protection of ducts penetrating non fire-resistance rated assemblies. The protection of these ducts can be accomplished using *approved* alternative duct enclosures that are *listed* and *labelled* systems or product specifically evaluated for such purpose. There are alternative methods available for providing protection for duct enclosures beyond the existing shaft provisions.

Substantiation: For these applications, Section 708 requires shafts to be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* in accordance with Section 712. There are potentially cost-effective alternatives for protection of penetrations through non fire-resistance rated assemblies.

As an example, in November of 2005, ICC-ES approved the publication of AC 179, *Acceptance Criteria for Metallic HVAC Duct Enclosure Assemblies,* which can be used to evaluate products used for these applications. The purpose of the acceptance criteria is to establish requirements for fire protection enclosure systems applied to metallic HVAC ducts, as alternatives to shaft enclosures for vertical ducts with required fire-resistance-rated shafts under specified conditions, with limitations on their application. The criteria also provides an alternate to fire dampers in horizontal ducts (penetrating fire barriers, fire partitions, and or smoke barriers) and vertical ducts connecting not more than two stories. AC 179 evaluates the enclosure materials and the HVAC duct enclosure systems using the following test methods: Flame spread, smoulder resistance, a fire engulfment test based on ISO 6944 with a through-penetration fire stop, durability tests, and thermal conductivity.

Another example of a listed and labeled system which could potentially fulfill this function are systems tested in conformance with the ASTM E2336, *Standard Test Methods for Fire Resistive Grease Duct Enclosure Systems*. This standard evaluates enclosure materials and the duct enclosure systems using the following test methods: non-combustibility, full scale fire resistance, durability, internal fire, and fire-engulfment with a through-penetration fire stop. Enclosure systems which meet the ASTM E2336 criteria demonstrate the ability to resist the passage of flames and hot gases during a standardized fire resistance test and a standardized internal fire test, as well as an ability to resist transmission of heat through the duct and the enclosure material(s). The ability of a fire stop to meet the requirements of Test Method E 814 when used with the duct enclosure system is also evaluated. The test method prescribes an ASTM E119 fire exposure for both a fire engulfment and a fire resistance wall test. The fire resistance test illustrates the ability of the enclosure material to resist the effects of fire when applied in a vertical application (i.e. as a wall assembly tested in accordance with ASTM E119).

In addition, an internal fire test uses two standardized fire exposures occurring inside the protected duct itself. Both tests illustrate the enclosure material's ability to resist thermal transmission of heat to the unexposed side in a horizontal application. The first standardized fire exposure is intended to simulate long term exposure of the enclosure material to a standardized service condition. The test simulates an internal fire within the duct by maintaining a minimum 500°F (260°C) average interior temperature for at least 4 h. The second standardized fire exposure is intended to simulate a sudden rise in the exposure conditions within the duct. Within 15 min after the end of the 4-h period, increase the average

interior temperature in the duct is increased to 2000°F (1093°C). This exposure is then maintained for 30 minutes, which simulates a large fire event within the duct. The current provisions of 5.10.8.2 do not explicitly take this into account. A durability test is included for the materials, which is intended to simulate the effects of long-term exposure of typical in-service conditions on the thermal transmission qualities of the enclosure materials when subjected to a modified version of Test Method C 518. A fire-engulfment test uses a standardized fire exposure, the time temperature curve of Test Methods E 119, to simulate a fire occurring on the outside of the grease duct, and demonstrates the ability of the duct enclosure system to remain intact without a through opening. The fire-engulfment test also tests the fastening methods used to secure the enclosure material to the grease duct and the supporting system. The fire-engulfment test also provides a means to test a through-penetration fire stop to determine its compatibility with the duct enclosure system. The fire-engulfment and vertical fire resistance tests are followed by the application of a standardized hose stream test.

Work is currently underway on the development of an ASTM Consensus Standard for this application, but until such time as that process is complete, the proposed language incorporated here will provide a means of evaluating the performance of these products and systems, which are becoming more widespread in their use, while not restricting the choice of acceptable solutions available to designers.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Sarah A. Rice, CBO, representing self

Revise as follows:

SECTION 716 DUCTS AND AIR TRANSFER OPENINGS

716.1 (IMC 607.1) General. The provisions of this section shall govern the protection of duct penetrations and air transfer openings in assemblies required to be protected.

~~**716.5**~~ **716.2 (IMC 607.5) Where required.** *Fire dampers, smoke dampers* and *combination fire/smoke dampers* shall be provided at the locations prescribed in Sections 716.2.1 through 716.2.7 and 716.6. Where an assembly is required to have both *fire dampers* and *smoke dampers*, *combination fire/smoke dampers* or a *fire damper* and a *smoke damper* shall be required.

~~**716.5.1**~~ **716.2.1 (IMC 607.5.1) Fire walls.** Ducts and air transfer openings permitted in *fire walls* in accordance with Section 706.11 shall be protected with *listed fire dampers* installed in accordance with their listing.

~~**716.5.1.1**~~ **716.2.1.1 (IMC 607.5.1.1) Horizontal exits.** A *listed smoke damper* designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a *fire wall* that serves as a horizontal *exit*.

~~**716.5.2**~~ **716.2.2 (IMC 607.5.2) Fire barriers.** Ducts and air transfer openings of *fire barriers* shall be protected with *approved fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate *exit* enclosures and *exit* passageways except as permitted by Sections 1022.4 and 1023.6, respectively.

Exception: *Fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:

1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, are in areas of other than Group Hand are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

~~716.5.2.1~~ **716.2.2.1 (IMC 607.5.2.1) Horizontal exits.** A *listed smoke damper* designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a *fire barrier* that serves as a horizontal *exit*.

~~716.5.3~~ **716.2.3 (IMC 607.5.5) Shaft enclosures.** Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Fire dampers* are not required at penetrations of shafts where:
   1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or
   1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly; or
   1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *fire damper* will interfere with the operation of the smoke control system; or
   1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smoke dampers* are not required at penetrations of shafts where:
   2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.187-inch (0.4712 mm) (No. 26 gage);
   2.2. The subducts extend at least 22 inches (559 mm) vertically; and
   2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smoke dampers* are not required in kitchen and clothes dryer exhaust systems when installed in accordance with the *International Mechanical Code*.

~~716.5.4~~ **716.2.4 (IMC 607.5.3) Fire partitions.** Ducts and air transfer openings that penetrate *fire partitions* shall be protected with *listed fire dampers* installed in accordance with their listing.

Exceptions: In occupancies other than Group H, *fire dampers* are not required where any of the following apply:

1. Corridor walls in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and the duct is protected as a *through penetration* in accordance with Section 713.
2. Tenant partitions in *covered mall buildings* where the walls are not required by provisions elsewhere in the code to extend to the underside of the floor or roof sheathing, slab or deck above.
3. The duct system is constructed of *approved* materials in accordance with the *International Mechanical Code* and the duct penetrating the wall complies with all of the following requirements:
   3.1. The duct shall not exceed 100 square inches (0.06 m_2).
   3.2. The duct shall be constructed of steel a minimum of 0.0217 inch (0.55 mm) in thickness.
   3.3. The duct shall not have openings that communicate the *corridor* with adjacent spaces or rooms.
   3.4. The duct shall be installed above a ceiling.
   3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
   3.6. A minimum 12-inch-long (305 mm) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum $1_1/_2$-inch by $1_1/_2$-inch by 0.060-inch (38mmby 38mmby 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The *annular space* between the steel sleeve and the wall opening shall be filled with mineral wool batting on all sides.

~~716.5.4.1~~ **716.2.4.1 (IMC 607.5.4) Corridors.** A *listed smoke damper* designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a *corridor* enclosure required to have smoke and draft control doors in accordance with Section 715.4.3.

Exceptions:

1. *Smoke dampers* are not required where the building is equipped throughout with an *approved* smoke control system in accordance with Section 909, and *smoke dampers* are not necessary for the operation and control of the system.
2. *Smoke dampers* are not required in *corridor* penetrations where the duct is constructed of steel not less than 0.019 inch (0.48 mm) in thickness and there are no openings serving the *corridor*.

~~716.5.5~~ **716.2.5 (IMC 607.5.4) Smoke barriers.** A *listed smoke damper* designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a *smoke barrier*. *Smoke dampers* and *smoke damper* actuation methods shall comply with Section 716.3.3.2.

Exception: *Smoke dampers* are not required where the openings in ducts are limited to a single smoke compartment and the ducts are constructed of steel.

~~716.5.6~~ **716.2.6 (IMC 607.5.6) Exterior walls.** Ducts and air transfer openings in fire-resistance-rated *exterior walls* required to have protected openings in accordance with Section 705.10 shall be protected with *listed fire dampers* installed in accordance with their listing.

~~716.5.7~~ **716.2.7 (IMC 607.5.7) Smoke partitions.**A*listed smoke damper* designed to resist the passage of smoke shall be provided at each point that an air transfer opening penetrates a smoke partition. *Smoke dampers* and *smoke damper* actuation methods shall comply with Section 716.3.3.2.

Exception: Where the installation of a *smoke damper* will interfere with the operation of a required smoke control system in accordance with Section 909, *approved* alternative protection shall be utilized.

~~716.6~~ **716.3 (IMC 607.6) Horizontal assemblies.** Penetrations by ducts and air transfer openings of a floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly shall be protected by a shaft enclosure that complies with Section 708 or shall comply with Sections 716.3.1 through 716.3.3.

~~716.6.1~~ **716.3.1 (IMC 607.6.1) Through penetrations.** In occupancies other than Groups I-2 and I-3, a duct constructed of *approved* materials in accordance with the *International Mechanical Code* that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two *stories* is permitted without shaft enclosure protection, provided a *listed fire damper* is installed at the floor line or the duct is protected in accordance with Section 713.4. For air transfer openings, see Exception 7 to Section 708.2.

Exception: A duct is permitted to penetrate three floors or less without a *fire damper* at each floor, provided such duct meets all of the following requirements:

1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel having a minimum wall thickness of 0.187 inches (0.4712 mm) (No. 26 gage).
2. The duct shall open into only one *dwelling or sleeping unit* and the duct system shall be continuous from the unit to the exterior of the building.
3. The duct shall not exceed 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches (0.065 m_2) in any 100 square feet (9.3 m_2) of floor area.
4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the *fire-resistance rating* of the construction penetrated.
5. Grille openings located in a ceiling of a fire-resistance- rated floor/ceiling or roof/ceiling assembly shall be protected with a *listed ceiling radiation damper* installed in accordance with Section 716.6.2.1.

~~716.6.2~~ **716.3.2 (IMC 607.6.2) Membrane penetrations.** Ducts and air transfer openings constructed of *approved* materials in accordance with the *International Mechanical Code* that penetrate the ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with one of the following:

1. A shaft enclosure in accordance with Section 708.

2. A *listed ceiling radiation damper* installed at the ceiling line where a duct penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.
3. A *listed ceiling radiation damper* installed at the ceiling line where a diffuser with no duct attached penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.

~~716.6.2.1~~ 716.3.2.1 **(IMC 607.6.2.1) Ceiling radiation dampers.** *Ceiling radiation dampers* shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTME 119 orUL263. *Ceiling radiation dampers* shall be installed in accordance with the details *listed* in the fire-resistance-rated assembly and the manufacturer's installation instructions and the listing. *Ceiling radiation dampers* are not required where either of the following applies:

1. Tests in accordance with ASTM E 119 or UL 263 have shown that *ceiling radiation dampers* are not necessary in order to maintain the *fire-resistance rating* of the assembly.
2. Where exhaust duct penetrations are protected in accordance with Section 713.4.1.2, are located within the cavity of a wall and do not pass through another *dwelling unit* or tenant space.

~~716.6.3~~ 716.3.3 **(IMC 607.6.3) Nonfire-resistance-rated floor assemblies.** Duct systems constructed of *approved* materials in accordance with the *International Mechanical Code* that penetrate nonfire-resistance-rated floor assemblies shall be protected by any of the following methods:

1. A shaft enclosure in accordance with Section 708.
2. The duct connects not more than two *stories*, and the *annular space* around the penetrating duct is protected with an *approved* noncombustible material that resists the free passage of flame and the products of combustion.
3. The duct connects not more than three *stories*, and the *annular space* around the penetrating duct is protected with an *approved* noncombustible material that resists the free passage of flame and the products of combustion and a *fire damper* is installed at each floor line.

   Exception: *Fire dampers* are not required in ducts within individual residential *dwelling units*.

~~716.1.1~~ 716.3 **(IMC 607.1.1) Ducts that penetrate fire-resistance-rated assemblies without dampers.** Ducts that penetrate fire-resistance-rated assemblies and are not required by this section to have *dampers* shall comply with the requirements of Sections 713.2 through 713.3.3. Ducts that penetrate *horizontal assemblies* not required to be contained within a shaft and not required by this section to have *dampers* shall comply with the requirements of Sections 713.4 through 713.4.2.2.

~~716.2~~ 716.4 **(IMC 607.2) Installation.** *Fire dampers, smoke dampers, combination fire/smoke dampers* and *ceiling radiation dampers* located within air distribution and smoke control systems shall be installed in accordance with the requirements of this section, the manufacturer's installation instructions and the *dampers*' listing.

~~716.2.1~~ 716.4.1 **(IMC 607.2.1) Smoke control system.** Where the installation of a fire *damper* will interfere with the operation of a required smoke control system in accordance with Section 909, *approved* alternative protection shall be utilized. Where mechanical systems including ducts and *dampers* utilized for normal building ventilation serve as part of the smoke control system, the expected performance of these systems in smoke control mode shall be addressed in the rational analysis required by Section 909.4.

716.4.2 ~~716.2.2~~ (IMC 607.2.2) Hazardous exhaust ducts. *Fire dampers* for hazardous exhaust duct systems shall comply with the *International Mechanical Code*.

716.4.3 ~~716.1.1.1~~ (IMC 607.1.1.1) Ducts that penetrate nonfire-resistance- rated assemblies. The space around a duct penetrating a nonfire-resistance-rated floor assembly shall comply with Section 716.6.3.

Sections 716.3 – 716.4 to become Sections 716.5 – 716.6. *(Content unchanged)*

716.7 (IMC 607.7) Flexible ducts and air connectors. *(No change to text)*

Reason: This code change is one in a series of code changes intended to add clarity to the provisions of Chapter 7. Unless otherwise specifically stated, each code change can be accepted on its own merits.

This code change addresses and Section 716 (Ducts and Air Transfer Openings). This proposal is intended to accomplish several things:

Reorganization to bring the “where required” sections to the front. As a code user, the primary piece of information needed is – is a damper is even needed. If not there is no need to go any further in the section, if a damper is required, then the user will need to know the other elements that go with the devices, e.g., installation details, testing, etc. The proposed reorganization follows the format which is used for the sprinkler and fire alarm sections of the code;
Clarification regarding what types of other protection are required when a damper is not required by Section 716;
Clarification and simplification of the exceptions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-FS1L-716

FS118–09/10
717.2.1; IRC R302.11.1

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing Cellulose Insulation Manufacturers Association (CIMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

717.2.1 Fireblocking materials. Fireblocking shall consist of the following materials:

1. Two-inch (51 mm) nominal lumber.
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints.
3. One thickness of 0.719-inch (18.3 mm) wood structural panels with joints backed by 0.719-inch (18.3 mm) wood structural panels.
4. One thickness of 0.75-inch (19.1 mm) particleboard with joints backed by 0.75-inch (19 mm) particleboard.
5. One-half-inch (12.7 mm) gypsum board.
6. One-fourth-inch (6.4 mm) cement-based millboard.
7. Batts or blankets of mineral wool, mineral fiber or other approved materials installed in such a manner as to be securely retained in place.
8. Spray-applied cellulose insulation installed as tested for the specific application

PART II – IRC BUILDING/ENERGY

Revise as follows:

R302.11.1 Fireblocking materials. Except as provided in Section R302.11, Item 4, fireblocking shall consist of the following materials:

1. Two-inch (51 mm) nominal lumber.
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints.
3. One thickness of 23/32-inch (18.3 mm) wood structural panels with joints backed by 23/32-inch (18.3 mm) wood structural panels.
4. One thickness of ¾-inch (19.1 mm) particleboard with joints backed by ¾-inch (19 mm) particleboard.
5. One-half-inch (12.7 mm) gypsum board.
6. One-quarter-inch (6.4 mm) cement-based millboard.
7. Batts or blankets of mineral wool or glass fiber or other approved materials installed in such a manner as to be securely retained in place.
8. Spray-applied cellulose insulation installed as tested for the specific application.

Reason: This code change simply adds a new Item 8 to the list of fireblocking materials to recognize spray-applied cellulose insulation as a suitable fireblocking material. It qualifies the use of spray-applied cellulose insulation by indicating that it must be installed as tested for the specific application. The Cellulose Insulation Manufacturers Association (CIMA) has conducted a variety of fireblocking fire tests based on the ASTM E119 time-temperature fire curve exposure to demonstrate that spray-applied cellulose insulation will serve as an adequate fireblocking material.

It should be noted that spray-applied cellulose insulation is different than loose-fill cellulose insulation in that it is sprayed in place using a nozzle under pressure with a small quantity of water added to the insulation to activate the adhesive that, when dried, holds the cellulose insulation in place. Thus, it can be exposed in vertical applications, as well as horizontal applications. Furthermore, it will remain in place after it has dried without any need to restrain or otherwise contain or enclose it.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Thornberry-FS4-717.2.1; RB-1-R302.11.1

FS119–09/10
717.2.6

Proponent: Rick Thornberry, PE, Jesse J. Beitel, The Code Consortium, Inc., Hughes Associates, Inc., representing Trespa North America, Ltd.

Revise as follows:

717.2.6 ~~Architectural trim~~ Exterior Wall Coverings. Fireblocking shall be installed within concealed spaces of exterior wall coverings ~~finish~~ and other exterior architectural elements where permitted to be of combustible construction as specified in Section 1406 or where erected with combustible frames.~~,~~ Fireblocking shall be installed at maximum intervals of 20 feet (6096 mm)~~,~~ in either dimension so that there will be no ~~open~~ concealed space exceeding 100 square feet (9.3m^3) between fireblocking. Where wood furring strips are used, they shall be of approved wood of natural decay resistance or preservative-treated wood. If noncontinuous, such elements shall have closed ends, with at least 4 inches (102 mm) of separation between sections.

Exceptions:

1. Fireblocking of cornices is not required in single-family dwellings. Fireblocking of cornices of a two-family dwelling is required only at the line of dwelling unit separation.
2. Fireblocking shall not be required where the exterior wall covering is installed on noncombustible framing and the face of the exterior wall covering ~~finish~~ exposed to the concealed space is covered by one of the following materials:
   2.1. Aluminum having a minimum thickness of 0.019 inch (0.5 mm).
   2.2. Corrosion-resistant steel having a base of metal thickness not less than 0.016 inch (0.4 mm) at any point.
   2.3. Other approved noncombustible materials.
3. Fireblocking shall not be required where the exterior wall covering has been tested in accordance with, and complies with the acceptance criteria of, NFPA 285. The exterior wall covering shall be installed as tested in accordance with NFPA 285.

Reason: This proposed code change contains editorial revisions to clarify the text as well as a proposed new Exception 3.

The editorial clarifications are proposed to utilize consistent terminology based on the definition for "Exterior Wall Coverings" found in Section 1402.1. It also clarifies how the required fireblocking is to be installed in the concealed space between the exterior wall covering and the exterior wall face.

Exception 3 is being proposed to allow the omission of the fireblocking required by this section in those cases where the exterior wall covering has been tested in accordance with NFPA 285 Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Nonload-Bearing Wall Assemblies Containing Combustible Components and complies with the acceptance criteria therein as indicating successful performance for resisting exterior fire and flame spread along the face of and within the interior cavities of the exterior wall system. It follows that if the exterior wall covering installation meets successful performance based on the NFPA 285 exterior wall fire test, there is no need to install fireblocking within the concealed space of the exterior wall created by the installation of the exterior wall covering since it has demonstrated the ability to resist the spread of fire and flame within the concealed space. In fact, the NFPA 285 test is used to qualify combustible materials for use on exterior walls of buildings of Types I, II, III, and IV construction which are otherwise required to be of noncombustible construction. And it is specifically referenced in Section 1407 for metal composite materials (MCM) and Section 2603.5 for foam plastic insulated exterior walls.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Thornberry-Beitel-FS11-717.2.6

FS120–09/10
717.3.2

Proponent: Jeff Hugo, CBO, representing National Fire Sprinkler Association

Revise as follows:

717.3.2 Groups R-1, R-2, R-3 and R-4. Draftstopping shall be provided in floor/ceiling spaces in Group R-1 buildings, in Group R-2 buildings with three or more dwelling units, in Group R-3 buildings with two dwelling units and in Group R-4 buildings. Draftstopping shall be located above and in line with the dwelling unit and sleeping unit separations.

Exceptions:

1. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2, provided that automatic sprinklers are also installed in the combustible concealed spaces where the draftstopping is being omitted.

Reason: Section 903.3.1.2 refers to NFPA 13R, which does not require sprinklers in the concealed floor/ceiling assemblies, other combustible concealed spaces, and attics. However, the wording of this section often leads to misinterpretation by the AHJ or designer to install sprinklers in all these spaces exempted by NFPA 13R. The intent of this section is to eliminate the draftstopping above the sleeping unit or dwelling spaces in the attic space, if the attic is sprinklered, and the inserted new text further clarifies the intent of the section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HUGO-FS1-717.3.2

FS121–09/10
717.4.2

Proponent: Jeff Hugo, CBO, representing National Fire Sprinkler Association

Revise as follows:

717.4.2 Groups R-1 and R-2. Draftstopping shall be provided in attics, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more dwelling units and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, sleeping unit and dwelling unit separation walls that do not extend to the underside of the roof sheathing above.

Exceptions:

1. Where corridor walls provide a sleeping unit or dwelling unit separation, draftstopping shall only be required above one of the corridor walls.
2. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. In occupancies in Group R-2 that do not exceed four stories above grade plane, the attic space shall be subdivided by draftstops into areas not exceeding 3,000 square feet (279 m2) or above every two dwelling units, whichever is smaller.
4. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2, provided that automatic sprinklers are also installed in the combustible concealed space. ~~,~~ where the draftstopping is being omitted.

Reason: Section 903.3.1.2 refers to NFPA 13R, which does not require sprinklers in the concealed floor/ceiling assemblies, other combustible concealed spaces, and attics. However, the wording of this section often leads to misinterpretation by the AHJ or designer to install sprinklers in all these spaces exempted by NFPA 13R. The intent of this section is to eliminate the draftstopping above the sleeping unit or dwelling spaces in the attic space, if the attic is sprinklered, and the inserted new text further clarifies the intent of the section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HUGO-FS2-717.4.2

FS122–09/10
719.1

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing North American Insulation Manufacturers Association

Revise as follows:

719.1 General. Insulating materials, including facings such as vapor retarders and *vapor-permeable membranes*, similar coverings and all layers of single and multilayer reflective foil insulations, shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted.

Exceptions:

2. Foam plastic insulation shall comply with Chapter 26 and have a smoke developed index of not more than 450.

(Exceptions not shown, remain unchanged)

Reason: The exception for foamed plastics in Chapter 26 does not adequately cover smoke developed performance of foamed plastics. Current requirements for glass fiber, mineral fiber, cellulose and reflective plastic core insulation all require both flame spread and smoke development requirements either based on ASTM E84 or UL 723 or 803.1.2. Alternative methods are acceptable for use, however, their performance level needs to address the same hazards as the base requirement, plus any additional hazards that might arise as a result of a specific material.

Justification: For all other thermal and sound insulating materials within the IBC, **including non-combustible insulation materials**, the minimum performance level for materials permitted to be used includes at least some requirements for both flame spread (fire growth) and smoke production. These requirements are primarily based on either ASTM E84 testing or alternative methods such as NFPA 286, CAN/ULC-S102.2, or even UL 1715 with the inclusion of the criterion from 803.1.2. However, in the case of foamed plastics, of the four alternative test methods permitted by 2603.9, only NFPA 286 contains any limits on smoke developed for any foamed plastics by virtue of the inclusion of a reference to section 803.1.
Room corner tests such as FM 4880, UL 1040, NFPA 286 or UL 1715 do evaluate fire growth and flashover. However, with the exception of the criteria for NFPA 286 in 803.1.2, the pass/fail criteria proposed for the room corner tests in the proposed acceptance criteria do not include quantitative evaluation of smoke density. Criteria for fire and smoke performance of building materials are based as much on issues arising from smoke production from burning materials, and smoke migration within the occupied spaces. It is not reasonable to provide an exception to the basic ASTM E84 flame spread and smoked developed requirements which apply to all other types of insulations, even noncombustible insulations, for foamed plastics based on room corner tests unless the limits on smoke production are applied to all of the room corner tests.
There are numerous reported instances of the hazards associated with smoke production from building materials. One is the tragic fire at the Greenwood Health Center in Hartford, CT on Feb 26 2003. The New York Times quoted Chief Charles A. Teale of the Hartford Fire Department as stating that "Most of the 10 residents killed, ranging in ages from 27 to 76, died of smoke inhalation". The same article further goes on to quote officials as saying: "The nursing home itself suffered little damage, though, and the fire was put out in about 15 minutes. Most of the residents were then led back inside, and by midday, 84 of the 148 residents remained at the center".

It is reasonable to allow alternative methods of testing materials to determine their acceptability for use, however, their performance criteria needs to address the same hazards as the base requirement, plus any additional hazards that might arise as a result of a specific material.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CRIMI-FS8-719.1

FS123–09/10
719.7

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

719.7 Insulation and covering on pipe and tubing. Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450. This shall include insulation coverings on exposed water supply and drainpipes under accessible lavatories and sinks.

Exception: Insulation and covering on pipe and tubing installed in plenums shall comply with the *International Mechanical Code.*

Reason: There have been some statements that insulation coverings required on exposed water supply and drainpipes for ADA compliance are not really insulation products and, therefore, need to comply with the requirements for insulation in the IBC. This code proposal is simply clarification.

The ADA requires that exposed hot water and drainpipes under lavatories and sinks be insulated (sections 4.19.4 and 4.24.6). The ICC/ANSI A117.1/2003 Standard (Accessible and Usable Buildings and Facilities 606.6 Exposed Pipes and Surfaces) states that: "*Water supply and drainpipes under lavatories and sinks shall be insulated or otherwise configured to protect against contact. There shall be no sharp or abrasive surfaces under lavatories and sinks.*" This indicates that we are dealing with an exposed insulation product or material.

Cost Impact: The code change proposal will not increase the cost of construction.

202 (New); IPC 202 (New); IRC 202 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

THESE PROPOSALS ARE ON THE AGENDAS FOR THE IBC GENERAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS THREE SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THOSE COMMITTEES.

PART I – IBC GENERAL

Add new definition as follows:

SECTION 202
DEFINITIONS

INSULATION. Protective layer or covering, usually described based on its location, function or composition. Examples include acoustical insulation, cavity-wall insulation, duct insulation, foam-plastic insulation, loose-fill insulation, pipe insulation and thermal insulation.

Acoustical Insulation. Insulation material or assembly of materials used as a means for reducing the intensity of sound; also known as soundproofing.

Dust Insulation. Insulation which is in a form suitable for application to surfaces of ducts, air ducts or plenums.

Pipe Insulation. Insulation which is in a form suitable for application to cylindrical surfaces.

Thermal Insulation. Insulation material or assembly of materials used to reduce unwanted heat losses.

PART II – IPC

Add new definition as follows:

SECTION 202
DEFINITIONS

INSULATION. Protective layer or covering, usually described based on its location, function or composition. Examples include acoustical insulation, cavity-wall insulation, duct insulation, foam-plastic insulation, loose-fill insulation, pipe insulation and thermal insulation.

PART III – IRC BUILDING/ENERGY

Add new definition as follows:

SECTION R202
DEFINITIONS

INSULATION. Protective layer or covering, usually described based on its location, function or composition. Examples include acoustical insulation, cavity-wall insulation, duct insulation, foam-plastic insulation, loose-fill insulation, pipe insulation and thermal insulation.

Reason: (IBC) The concept of insulation is well understood, but it is usually considered to be associated purely with thermal insulation (heat losses). However, insulation is also used, often, for acoustical (sound) and other purposes. Moreover, insulation can be used as a layer within cavity walls, behind interior finish materials and on the outside of pipes and ducts; this is usually, but not always, done to protect from heat losses. However, this term remains undefined and there is a belief by some that the term insulation applies only to thermal insulation (often concealed).

Several IBC chapters address insulations of various types and they are not always referencing concealed thermal insulation. This includes IBC sections 603.1 and 807, which address acoustical insulation as well as thermal, and Section 719.1, which addresses pipe and duct insulation, and describes acoustical insulation materials (or sound-insulating materials). It is important for the IBC to have the appropriate definitions.

"**603.1 Allowable materials.** Combustible materials shall be permitted in buildings of Type I or Type II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:
2. Thermal and acoustical insulation, other than foam plastics, having a flame spread index of not more than 25.
Exceptions:
1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a flame spread index of not more than 100.
2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a flame spread index of not more than 200."

"**SECTION 719 - THERMAL- AND SOUND-INSULATING MATERIALS**
719.1 General. Insulating materials, including facings such as vapor retarders and *vapor-permeable membranes*, similar coverings and all layers of single and multilayer reflective foil insulations, shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted.
Exceptions:
1. Fiberboard insulation shall comply with Chapter 23.
2. Foam plastic insulation shall comply with Chapter 26.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the *International Mechanical Code*."

"**807 Insulation.** Thermal and acoustical insulation shall comply with Section 719."

Reason: (IPC) The concept of insulation is well understood, but it is usually considered to be associated purely with thermal insulation (heat losses). However, insulation is also used, often, for acoustical (sound) and other purposes. Moreover, insulation can be used as a layer within cavity walls, behind interior finish materials and on the outside of pipes and ducts; this is usually, but not always, done to protect from heat losses. However, this term remains undefined and there is a belief by some that the term insulation applies only to thermal insulation (often concealed).

Reason: (IRC) The concept of insulation is well understood, but it is usually considered to be associated purely with thermal insulation (heat losses). However, insulation is also used, often, for acoustical (sound) and other purposes. Moreover, insulation can be used as a layer within cavity walls, behind interior finish materials and on the outside of pipes and ducts; this is usually, but not always, done to protect from heat losses. However, this term remains undefined and there is a belief by some that the term insulation applies only to thermal insulation (often concealed).

FS125–09/10
Table 720.1(2)

Proponent: Sam Francis representing American Forest & Paper Association

Revise as follows:

TABLE 720.1(2)
RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS [a,o,p]

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE [b] (INCHES)			
			4 hour	3 hour	2 hour	1 hour
15. Exterior or interior walls (continued)	15-1.16[q]	2″ X 6" wood studs at 24" with double top plates, single bottom plate; interior and exterior sides covered with two layers of 5/8" Type X gypsum wallboard, 4', wide, applied horizontally with vertical joints over studs. Base layer fastened with 2-1/4" Type S drywall screws, spaced 24" on center and face layer fastened with Type S drywall screws, spaced 8" on center, wallboard joints covered with paper tape and joint compound, fastener heads covered with joint compound. Cavity to be filled with 5-1/2" mineral wool insulation.	—	—	~~7-3/4~~ 8	—
16. Exterior walls rated for fire resistance from the inside only in accordance with Section 705.5. (continued)	16-1.3[q]	2″X 6″ wood studs at 16″ centers with double top plates, single bottom plates; interior side covered with 5/8″ Type X gypsum wallboard, 4″ wide, applied vertically with all joints over framing or blocking and fastened with 2-1/4″ Type S drywall screws spaced 7″ on center. Joints to be covered with tape and joint compound. Exterior covered with 3/8″ wood structural panels (oriented strand board), applied vertically with edges over framing or blocking and fastened with 6d common nails (bright) at 12″ on center in the field and 6″ on center on panel edges. R-19 fiberglass insulation installed in stud cavity.	—	—	—	6-1/2

q. The design stress of studs shall be equal to a maximum of 100 percent of the allowable F'_c calculated in accordance with Section 2306.

(Footnotes not shown, remain unchanged)

Reason: Editorial corrections to the table

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: FRANCIS-FS5-TABLE 720.1(2)

FS126–09/10
Table 720.1(2)

Proponent: Brad Douglas, representing American Forest & Paper Association

Revise as follows:

TABLE 720.1(2)
RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS
(No changes to the table)

m. For studs with a slenderness ratio, l_e/d, greater than 33, the ~~The~~ design stress ~~of studs~~ shall be reduced to 78 percent of allowable F_c'. For studs with a slenderness ratio, l_e/d, not exceeding 33, the design stress shall be reduced to 78 percent of the adjusted stress F_c' calculated for studs ~~with the maximum not greater than 78 percent of the calculated stress with studs~~ having a slenderness ratio l_e/d of 33.

(Footnotes not shown remain unchanged)

Reason: Revisions clarify application of the footnote with regard to stud slenderness ratio and update terminology from “allowable” to “adjusted” to be consistent with terminology used in 2005 NDS.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: FRANSIS-FS6-TABLE 720.1(2)

FS127–09/10
Table 720.1(3)

Proponent: Sam Francis representing American Forest & Paper Association

Add new text as follows:

TABLE 720.1(3)
MINIMUM PROTECTION FOR FLOOR AND ROOF SYSTEMS[a,q]

FLOOR OR ROOF CONSTRUCTION	ITEM NUMBER	CEILING CONSTRUCTION	THICKNESS OF FLOOR OR ROOF SLAB (inches)				MINIMUM THICKNESS OF CEILING (inches)			
			4 hr	3 hr	2 hr	1 hr	4 hr	3 hr	2 hr	1 hr
30. Wood I-joist (minimum I-joist depth 9-1/2" with a minimum flange depth of 1-1/2" and a minimum flange cross-sectional area of 2.25 square inches; minimum web thickness of 3/8") @24" o.c. Fiberglass insulation placed between I-joists supported by the resilient channels.	30-1.1	Minimum 0.019" thick resilient channel 16" o.c. (Channels doubled at wallboard end joints), placed perpendicular to the joists and attached to each joist by 1-1/4" Type S drywall screws. Two Layers of ½" Type X gypsum wallboard applied with the long dimension perpendicular to the I-joists with end joints staggered. The base layer is fastened with 1-1/4" Type S drywall screws spaced 12" o.c. and the face layer is fastened with 1-5/8" Type S drywall screws spaced 12" o.c. Face layer end joints shall not occur on the same I-joist as base layer end joints and edge joints shall be offset 24" from base layer joints. Face layer to also be attached to base layer with 1-1/2" Type G drywall screws spaced 8" o.c. placed 6" from face layer end joints. Face layer wallboard joints to be taped and covered with joint compound.	=	=	—	Varies	—	—	—	5/8

Reason: Many code officials have come to rely upon Table 720 as the preferred source of information regarding fire resistance rated assemblies. Because of its importance, we believe that the table should offer the most common generic assemblies. Floor systems utilizing I-joists have increased from less than 10 percent in 1990 to more than 50 percent. With the increased prevalence of I-joist floor/ceiling assemblies, including this assembly in the table will make the IBC more complete and it will be more useful to code officials. It is also expected that the document will be "user friendly", particularly for designers. In an effort to fulfill this expectation, we propose this common assembly for incorporation into Table 720.1(3). It is supported by ASTM E-119 test results as shown on the attached page. The following information and test results are provided with the understanding that their inclusion does not place them within the copyright release requirements of the signature statement.

Cost Impact: This code change proposal will reduce the cost of construction by an unknown amount.

FS130–09/10
721.3.1.5 (New)

Proponent: Richard Porter and Robert Sullivan, cfiFOAM, Inc., representing self

Add new text as follows:

721.3.1.5 Airspaces and cells filled with foamed-in-place foam plastic insulation. The equivalent thickness of concrete masonry completely filled with foamed-in-place foam plastic insulation shall be the average thickness of the solid material in the unit, as contained in Table 721.3.2.

Reason: Amino-plast foamed-in-place foam plastic insulation is often marketed to extend the fire-resistance ratings of concrete masonry walls by up to 2-hrs despite the fact that product literature specifically warns not to use the product against surfaces with sustained temperatures in excess of 190ºF (87ºC).

Sections 721.2.1.2, and 721.2.1.2.2 recognize the contribution of a ≥ 1 inch (≥ 25 mm) thickness of foam plastic insulation sandwiched between two wythes of concrete to such a panel's fire-resistance rating, and that it may be calculated using Equation 7-4. For this calculation, the contribution is 5 minutes; therefore, $R_n^{0.59} = 2.5$. That being the case, the contribution of foam plastic insulation encased within the core cells of either concrete masonry or precast hollow core panel wall assemblies to the fire-resistance rating of such assemblies should be recognized by the code as, at most, only a few minutes.

When the Trenton NJ CBO discovered 3-hr fire-resistance rated UL Design No. U904 walls were built using 2-hr CMU, the proposed cure of the deficiency was injecting foamed-in-place foam plastic insulation into the walls to increase their fire-resistance rating to 3-hrs. Two foam plastic insulation manufacturers claim their foam plastic insulation can increase CMU wall fire-resistance ratings by 2-hrs. Each offers ASTM E-119 test data supporting their claim. In a report submitted to the CBO, a P.E. with extensive masonry experience, stated his professional opinion that "the foam will achieve a 3-hour or greater fire rating." However, the CBO recognized that 1) the test results upon which the P.E. staked his "professional opinion" did not represent UL Design U904, instead 2) they were reports of ASTM E-119 testing of an unlisted CMU wall assembly, and 3) the 2006 IBC does not address how to calculate the fire-resistance rating of a CMU wall assembly injected with foam plastic insulation. Thus, the CBO had no choice but to challenge the claim which, in turn, led to new ASTM E-119 testing that failed at 1 hour 58 minutes 45 seconds. The testing laboratory's engineer concluded 1) "The data indicate that the wall assembly did not meet the requirements for a 2-hour rating." and 2) "The addition of Core-Fill 500 [the trade name of the foam plastic insulation] did not improve the rating of the assembly tested." Additionally, the above expert P.E. reversed his earlier "professional opinion" to conclude separately: 1) "For the Core-Fill 500 to achieve a four-hour fire rating with an 8-inch or 12-inch CMU [wall], the CMU would have to be specially manufactured to produce results similar to what is written in their literature. By specially manufactured we mean that the face shell or percent solid was greater than 'standard' or a special aggregate was used such as 100% pumice" and 2) "Further, inspecting the cores of the demolished panel showed the Core-Fill to have disintegrated."

The claim that foam plastic insulation extends fire-resistance ratings is patently ludicrous and places life & fire safety at increased risk whenever architects and/or building & fire officials accept the claim. ICC board member Barbara Koffron is well aware of this problem. As the Fire Marshal of Phoenix, AZ she has informed other Arizona code enforcement officials by letter and personal contact that foam plastic insulation does not increase the fire-resistance rating of CMU wall assemblies.

In the interest of life and fire safety, the ICC is urged to add the proposed language to the code as a guide to architects and building & fire officials faced with similar life & fire safety dilemmas. The code should specifically acknowledge the minimal contribution made by foam plastic insulation to fire-resistance ratings. Furthermore, the ICC should seek development of an NFPA 259 linked equivalent thickness method to calculate the fire-resistance rating of concrete masonry and/or hollow precast concrete panel wall assemblies so that fire-resistance rating test reports offered in support of claims made by plastic foam insulation manufacturers are acknowledged and fully understood in their proper context. The ICC is urged to add the proposed language to the code to provide clear guidance to architects and building & fire officials faced with similar dilemmas.

FS131–09/10
Table 721.6.2(1)

Proponent: Joe Holland or Dave Bueche, Hoover Treated Wood Products, representing Hoover Treated Wood Products

Revise as follows:

TABLE 721.6.2(1)
TIME ASSIGNED TO WALLBOARD MEMBRANES[a,b,c,d]

DESCRIPTION OF FINISH	TIME[e] (minutes)
3/8-inch wood structural panel bonded with exterior glue	5
15/32-inch wood structural panel bonded with exterior glue	10
19/32-inch wood structural panel bonded with exterior glue	15
3/8-inch gypsum wallboard	10
1/2-inch gypsum wallboard	15
5/8-inch gypsum wallboard	30
1/2-inch Type X gypsum wallboard	25
5/8-inch Type X gypsum wallboard	40
Double 3/8-inch gypsum wallboard	25
1/2- + 3/8-inch gypsum wallboard	35
Double 1/2-inch gypsum wallboard	40

For SI: 1 inch = 25.4 mm.

a. These values apply only when membranes are installed on framing members which are spaced 16 inches o.c. or less

(Footnotes not shown, remain unchanged)

Reason: Correlate Note a in Table 721.6.2(1) to note a in Table 721.6.2(2). The critical spacing is not greater than16 inches. A spacing of less than 16 inches will give more support to the wallboard membrane.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Holland-Bueche-FS2-T721.6.2(1)

721.6.2.3

Proponent: Eirene Oliphant, MCP, Building Official, representing Metropolitan Kansas City Chapter of the ICC; Rick Thornberry, PE, The Code Consortium, Inc., representing California Fire Safety Advisory Council (CFSAC)

Revise as follows:

721.6.2.3 Exterior Walls. For an exterior wall with a fire separation distance greater than ~~5 feet (1524 mm)~~ 10 feet (3048 mm), the wall is assigned a rating dependant on the interior membrane and the framing as described in Tables 721.6.2(1) and 721.6.2(2). The membrane on the outside of the nonfire-exposed side of exterior walls with a fire separation distance greater than ~~5 feet (1524 mm)~~ 10 feet (3048 mm) may consist of sheathing, sheathing paper and siding as described in Table 721.6.2(3).

Reason:
(Oliphant)-This change is to provide consistent language between this section and Section 705.5. The issue is dealing with the exterior walls and the fact that the 2009 code changed Section 705.5 so the wall was rated from both sides if it had 10 feet or less fire separation distance. The 2000 to 2006 codes said that once you got past 5 feet that you only needed to rate the interior side. Code change FS16-07/08 was approved in the last round and it changed the 5 foot requirement to 10 feet in Section 705.5. Section 721.6.2.3 (dealing with calculated fire resistance for exterior walls) did not change the 5 foot dimension. The apparent conflict means that people have to decide whether you use 705.5 as the most restrictive or use 721.6.2.3 as the specific. Section 721.6.2.3 should mirror 705.5
(Thornberry)- This is a correlative code change that makes Section 721.6.2.3 consistent with Section 705.5 which was revised during the last code development cycle based on Code Change FS16-07/08. This simply changes the 5 foot separation distance to 10 feet as required for exterior walls for determining their fire-resistance ratings based on testing from both sides when the fire separation distance is not greater than 10 feet.

Cost Impact: The code change will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE AS 2 SEPARATE CODE CHANGES.

PART I – IBC FIRE SAFETY

Add new text as follows:

801.3 Fire retardant paints and coating. Fire retardant paints and coating applied to wood products shall be permitted in accordance with this chapter for interior finish when there is a change of occupancy. Paints and coatings shall comply with NFPA 703 and be maintained in accordance with the International Fire Code.

(Renumber subsequent sections)

PART II – IBC STRUCTURAL

Add new text as follows:

2303.3 Fire retardant paints and coating. Fire retardant paints and coating applied to wood products shall be permitted in accordance with Chapter 8. Paints and coatings shall comply with NFPA 703 and be maintained in accordance with the International Fire Code.

(Renumber subsequent sections)

Reason: To correlate the IBC with the IFC and IEBC. This proposal incorporates the provisions currently contained in the IFC and IEBC. Both of these documents are concerned with structures after being occupancy. The IBC does govern existing buildings when there is a change of occupancy, Chapter 34. There is concern with this class of product being used in inappropriate applications in new construction.
Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Standard NFPA 703 is currently referenced in the I-codes.

PART I – IBC FIRE SAFETY

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

PART II – IBC STRUCTURAL

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HOLLAND-BUESHE-FS1-801.1.1.3; S2-2303.3

FS134–09/10
801.9

Proponent: Bob Eugene, representing Underwriters Laboratories Inc

Add new text as follows:

801.9 Labeling and identification. Materials or its packaging required by this chapter to be tested in accordance with ASTM E84 or UL 723 shall bear the label of an approved agency showing the manufacturer's name, product listing, product identification, the flame spread index, and the smoke-developed index.

Reason: Identifying the ratings of interior finish materials can be difficult to determine in the field, especially if the packaging containing certification and ratings is not provided. The proposed requirements are intended to address this situation, and are based on the requirements included in section 2603.2. Only listing and labeling of a product can verify that the product installed at a jobsite is composed of the same material originally tested

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Standards ASTM E84 and UL 723 are currently referenced in the I-codes.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: EUGENE-FS5-801.9

FS135–09/10
803.11

Proponent: Marcelo M Hirschler (GBH International), representing American Fire Safety Council

Revise as follows:

803.11 Application of interior finish materials to fire-resistance-rated or noncombustible ~~structural~~ building elements. Where *interior finish* materials are applied on walls, ceilings or structural elements required to have a *fire-resistance rating* or to be of noncombustible construction, they shall comply with the provisions of this section.

803.11.1 Direct attachment and furred construction. Where walls and ceilings are required by any provision in this code to be of fire-resistance-rated or noncombustible construction, the *interior finish* material shall be applied directly against such construction or to furring strips not exceeding 1 ¾ inches (44 mm), applied directly against such surfaces.

803.11.1.1 ~~The~~ If the interior finish material is applied to furring strips, the intervening spaces between such furring strips shall comply with one of the following:

1. Be filled with material that is inorganic or noncombustible;
2. Be filled with material that meets the requirements of a Class A material in accordance with Section 803.1.1 or 803.1.2; or
3. Be fireblocked at a maximum of 8 feet (2438 mm) in every ~~any~~ direction in accordance with Section 717

803.11.2 Set-out construction. Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Section 803.11.1, Class A finish materials, in accordance with Section 803.1.1 or 803.1.2, shall be used.

Exceptions:

1. Where ~~except where~~ *interior finish* materials are protected on both sides by an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Where *interior finish* materials are~~, or~~ attached to noncombustible backing or furring strips installed as specified in Section 803.11.1.

803.11.2.1 Hangers and assembly members. The hangers and assembly members of such dropped ceilings that are below the ~~main ceiling line~~ horizontal fire-resistive floor or roof assemblies shall be of noncombustible materials~~, except that in Types III and V construction, *fire-retardant-treated wood* shall be permitted~~. The construction of each set-out wall and horizontal fire-resistive floor or roof assembly shall be of fire-resistance-rated construction as required elsewhere in this code.

Exception: In Types III and V construction, *fire-retardant-treated wood* shall be permitted for use as hangers and assembly members of dropped ceilings.

803.11.3 Heavy timber construction. Wall and ceiling finishes of all classes as permitted in this chapter that are installed directly against the wood decking or planking of Type IV construction or to wood furring strips applied directly to the wood decking or planking shall be fireblocked as specified in Section 803.11.1.

803.11.4 Materials. An interior wall or ceiling finish material that is not more than ¼ inch (6.4 mm) thick shall be applied directly onto the wall, ceiling or structural element without the use of furring strips and shall not be suspended away from the building element to which it is applied. ~~against a noncombustible backing.~~

Exceptions:

1. Noncombustible interior finish materials.
2. Materials that meet the requirements of Class A materials in accordance with Sections 803.1.1 or 803.1.2 where the qualifying tests were made with the material ~~suspended or~~ furred out from the noncombustible backing shall be permitted to be used with furring strips.
3. Materials that meet the requirements of Class A materials in accordance with Sections 803.1.1 or 803.1.2 where the qualifying tests were made with the material suspended away from the noncombustible backing shall be permitted to be used suspended away from the building element.

Reason: This section is very unclear and full of run-on sentences. The code proposal only clarifies the intent of the section. In particular it clarifies the issue of thin materials and of the constructions using furring strips or suspended away from the backing. The code proposal does not change the present code requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-FS7-803.11

FS136–09/10
803.12; IFC 803.8

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE AS 2 SEPARATE CODE CHANGES.

PART I – IBC FIRE SAFETY

Revise as follows:

803.12 High Density Polyethylene (HDPE) and Polypropylene (PP). Where high density polyethylene or polypropylene is used as an interior finish it shall comply with Section 803.1.2.

PART II – IFC

803.8 High Density Polyethylene (HDPE) and Polypropylene (PP). Where high density polyethylene or polypropylene is used as an interior finish it shall comply with Section 803.1.2.

Reason: Polypropylene interior finish materials need to be treated the same way as polyethylene interior finish materials, because polypropylene and polyethylene behave in a very similar fashion in fires.

In proposal FS 165 in the last cycle, James Lathrop explained the problems associated with polyethylene (HDPE), when it is used as an interior finish material, as follows (exact quote):

"HDPE is a thermoplastic that when it burns gives off considerable energy and produces a pooling flammable liquids fire. Recent full scale room-corner tests using NFPA 286 have demonstrated a significant hazard. These tests had to be terminated prior to the standard 15 minute duration due to flashover occurring, yet there was still much of the product left to burn. Extensive flammable liquid pool fires occurred during the tests. Yet this same material when tested in accordance with the tunnel test, ASTM E-84, is often given a FSI of 25 or less. However the resulting test is so intense some labs will not test HDPE partitions in their tunnel due to the damage it can do to the tunnel. This proposal will assure that when using HDPE partitions they will be formulated in such a manner to reduce the hazard that they present. Following is some of the data from one of the NFPA 286 tests: Peak HRR (excl burner) 1733 kW; Total Heat Released (excl. burner) 121 MJ; Peak Heat Flux to the floor 35.2 kW/m^2; Peak Avg Ceiling Temp 805^{o}C, 1481^{o}F."

Jim Lathrop also explained (FS 166) that HDPE was extensively used in toilet room privacy partitions.

It is worth putting the data Jim Lathrop presented into perspective by noting that pass/fail criteria are 800 kW and that those materials which perform well in the room-corner test usually exhibit heat release rates less than 400 kW, as opposed to over 1700 kW for HDPE.

The materials in Table 1 (attached) were tested in a room corner test and in the Steiner tunnel test (ASTM E 84). Most materials were tested in the NFPA room corner tests but some were tested in the much more severe ISO 9705 room corner test (where the ignition burner is at 100 kW for 10 min and then at 300 kW for a further 10 min, as opposed to 40 kW/150 kW or 40 kW/160 kW for NFPA room-corner tests). Even here, some materials perform with low peak heat release rates.

Table 1: Steiner tunnel and room corner test data

< 25	58	(ceiling only)

Experience in the past has long shown that materials with FSI values of less than 25 when tested in accordance with ASTM E 84, particularly if they are thermally thin materials or materials that melt and drip during the test (such as HDPE or polypropylene) cannot be guaranteed to be safe enough to be permitted to be used based simply on ASTM E 84 testing.

Apparently some manufacturers have figured out that they can address the letter of the code but not the spirit. A new product has now become available in the market: polypropylene toilet room privacy partitions.

Polypropylene is a material that is very similar to polyethylene. Polypropylene is also a thermoplastic polyolefin material, just like polyethylene and there is almost no difference in fire performance. Both materials melt and drip and cause flaming drips when they burn and release large amounts of heat. The consequence of this is that pool fires are formed on the floor beneath the material. Table 2 shows cone calorimeter (ASTM E 1354) data for polypropylene and polyethylene. These materials

Table 2 – Cone calorimeter test data for

Total Heat Released @ 40 kW/m^2 (in MJ/m^2)	207	221	126
Total Heat Released @ 70 kW/m^2 (in MJ/m^2)	231	228	131

*: based on cone calorimeter study of 35 materials, published in:
"Heat Release in Fires" by V. Babrauskas and S.J. Grayson – Elsevier, 1992.

The photograph above shows a 3 mm (1/8 inch) thick sheet of polypropylene exposed to fire and the resulting pool fire (Photo and quotes below from NIST Technical Note 1493, T.J. Ohlemiller and J.R. Shields, "Aspects of the Thermal Behavior of Thermoplastic Materials", 2008).

In the above work, NIST tests were conducted with thin sheets of polypropylene and revealed the problems associated with the generation of melt pool fires and the role of a pool fire in the overall fire growth process. The publication states that the results showed the following: "Thermoplastic materials yield extra complexity when they burn in the context of the products in which they are found. Under the influence of gravity, the liquid phase formed during thermal degradation flows downward. If, as is typical, this liquid is burning, then it extends the flaming zone on the solid downward onto whatever surfaces are available to catch the liquid (ultimately a horizontal floor or ground surface). This constitutes, at the least, a new form of flame spread on the object containing the thermoplastic (in addition to normal forms of flame spread over solid surfaces, which are typically fastest in the upward direction), extending the area of fuel that is burning and thereby increasing the overall heat release rate from the object. In many cases this downward flow of flaming liquid results in a pool fire under the object. If that pool fire is close enough to the object that its plume reaches the object, the result can be a self feeding pool fire that further enhances the rate of heat release from the burning system. In addition to this penchant for liquid-assisted flame spread, thermoplastic materials also tend to deform significantly as they burn. Thus large changes in the geometric shape of the burning object are common. These two aspects of thermoplastics make modeling fire growth on them, or on objects containing them, extraordinarily difficult."

With regard to the polypropylene sheet experiment described in the photograph the report states: "The pool fire is centered near the rear edge of the sample, not under the leading edge of the flames on the sheet. This is because it is being fed flaming polymer melt most rapidly from an area several centimeters behind the forward-most portion of the sample flame front where the shape of the trailing edge of the sheet curves rapidly from near vertical toward the horizontal. There is a flow separation region there that tends to dump nearly all of the melt flow accumulated from higher up on the trailing edge of the sheet. From this flow impingement area on the catch surface, the melt tends to flow radially at first. That portion of the melt that is going forward (in the direction of flame spread) under the leading edge of the flames on the base of the sheet encounters a cold catch surface that extracts heat from the melt, lowers its temperature and rapidly raises its viscosity. This nearly halts the flow in this direction, which, in fact, greatly slows the potential rate of fire spread. Because much of the "forward" flow of melt is inhibited and, because the catch surface in the opposite direction has been pre-heated by the pool fire in its march forward, there is a preferential melt flow backward, away from the direction of fire spread and toward the rear end of the pool fire. This tends to somewhat disengage the pool fire from the overall forward fire spread process. The melt flow on the catch surface appears to be driven by the small hydrostatic head that develops due to the finite thickness of the melt layer on this horizontal surface. Near the foot of the pool fire flames, the flow is also driven outward, away from the pool fire center, by the surface tension gradient that is large in this region. (One can often see a step up in melt layer thickness beneath the flame foot.) Note that the region of the pool directly beneath the flames is bubbling, indicating in-depth generation of gaseous degradation products from the polymer melt. Also note that, on the left (just to the left of the flame foot), the pool fire has burned out by locally consuming all of the melt, leaving a dry central area. Around this area, however, there is a substantial amount of melt that has not burned and is left by the fire. Evidently, this residue has cooled sufficiently (and remains sufficiently heat-sunk to the catch surface) that it will not allow flame spread onto its surface (in effect, its temperature cannot be raised to the point where it will ignite). Note that the polymer sheet itself is somewhat wavy on its rear edge (warped out of the plane defined by the cold portion of the sample sheet). This is a consequence of the heat induced softening (and, perhaps, expansion) of the sheet before it actually begins to melt and flow at an appreciable rate. This aspect of the sample behavior was not reproducible. It interacts with the location of the separation point on the rear edge of the sample and thus influences where the bulk of the melt gets deposited in relation to the leading edge of the fire on the base of the sample. This appeared to be a major source of scatter in the evolution of the heat release rate from the fire, as described further below. The above processes could conceivably produce an essentially steady-state, propagating fire after some initial transient. Interestingly, while the flame spread rate along the bottom edge of the sample sheet is nearly steady in all cases, other aspects of the fire, including the heat release rate, are not steady."

It needs to be pointed out that this is not an indictment of all polypropylene materials. It is possible to prepare polypropylene materials that exhibit excellent fire performance, including no significant flaming when tested in the ASTM E 84, Steiner tunnel. When one non fire retarded polypropylene material (1.5 mm, 0.06 inch thick) was subjected to a small open flame screening test, it ignited, dripped a flaming stream of plastic to

the floor and continued to burn on the floor until it was consumed on the specimen holder and on the floor. On the other hand, a fire retarded polypropylene material (3 mm, 1/8 inch thick) was subjected to the same small open flame screening test and caused no flaming drips. When it was then subjected to the ASTM E 84 test, it produced a flame spread index of 50 and a smoke developed index of 215, without flaming drips. Table 3 shows some cone calorimeter results on nine fire retarded polypropylene materials, which gave very adequate fire performance.

Table 3 - Cone Calorimeter Tests on Fire Retarded Polypropylene Specimens (3 mm, 1/8 inch, thick)

	Tests at 20 kW/m^2	Tests at 40 kW/m^2
Material	Pk HRR	Pk HRR
	kW/m^2	kW/m^2
FR PP 1	236	243
FR PP 2	168	206
FR PP 3	207	209
FR PP 4	195	206
FR PP 5	301	231
FR PP 6	215	193
FR PP 7	228	193
FR PP 8	207	188
FR PP 9	202	172
PP Car HVAC duct	480 (at 25 kW/m^2)	

Cost Impact: The code change proposal will increase the cost of construction. NFPA 286 is a more expensive test than is ASTM E 84. However it yields data that can be usable for fire hazard assessment while ASTM E 84 does not. Moreover, the test arrangement is more representative of how an interior finish product is used since the room is lined with the product in the NFPA 286 (room-corner) test.

PART I- IBC FIRE SAFTEY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II- IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-FS1-803.12.doc

FS137–09/10
804.4.1, Chapter 35

Proponent: Marcelo M. Hirschler, GBH International

1. Revise as follows:

804.4.1 Minimum critical radiant flux. Interior floor finish and floor covering materials in exit enclosures, exit passageways and corridors shall not be less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I- 4, M, R-1, R-2 and S. In all areas, floor covering materials shall comply with the DOC FF-1 Apill test@ (CPSC 16 CFR, Part 1630) or with ASTM D 2859.

Exception: Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, Class II materials are permitted in any area where Class I materials are required, and materials complying with DOC FF-1 Apill test@ (CPSC 16 CFR, Part 1630) or with ASTM D 2859 are permitted in any area where Class II materials are required.

2. Add new standard to Chapter 35 as follows:

ASTM D 2859-06 Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials

Reason: In this proposal only one change is being made to the IBC wording, as follows. There are two versions of the "pill test": the US federal government, through CPSC, regulates all carpets and rugs based on 16 CFR 1630 since the 1970s. However, the IBC is an international code and ASTM D 2859 is an equivalent test to 16 CFR 1630 and is included as an alternate. In fact, it is ASTM D 2859 that complies with the ICC policy on referenced standards.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM D 2589-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: HIRSCHLER-FS4-804.4.1.doc

FS138–09/10
804.4

Proponent: Marcelo M Hirschler (GBH International), representing American Fire Safety Council

Revise as follows:

804.4 Interior floor finish requirements. Interior floor covering materials shall comply with Sections 804.4.1 and 804.4.2 and interior floor finish materials shall comply with Section 804.4.2. ~~In all occupancies, interior floor finish and floor covering materials in exit enclosures, exit passageways, corridors and rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux as specified in Section 804.4.1.~~

~~**804.4.1 Minimum critical radiant flux.** Interior floor finish and floor covering materials in exit enclosures, exit passageways and corridors shall not be less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I- 4, M, R-1, R-2 and S. In all areas, floor covering materials shall comply with the DOC FF-1 Apill test@ (CPSC 16 CFR, Part 1630).~~

804.4.1 Pill test. In all occupancies, interior floor covering materials shall comply with the requirements of the DOC FF-1 Apill test@ (CPSC 16 CFR, Part 1630).

804.4.2 Minimum critical radiant flux. In all occupancies, interior floor finish and floor covering materials in exit enclosures, exit passageways, corridors and rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux. The minimum critical radiant flux shall not be less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I- 4, M, R-1, R-2 and S.

> **Exception:** Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, Class II materials are permitted in any area where Class I materials are required and materials complying with DOC FF-1 Apill test@ (CPSC 16 CFR, Part 1630)are permitted in any area where Class II materials are required.

Reason: In this proposal two changes have been made to the IBC wording:

1. The "pill test" is applied to all carpets and carpet-like floor finish materials, in view of the fact that the federal government, through CPSC, regulates all carpets and rugs based on 16 CFR 1630 since the 1970s. Note that traditional finish floors and floor coverings, such as wood flooring and resilient floor coverings, have not proved to present an unusual hazard and are known to pass the "pill test" and are exempted by the exception in 804.1.
2. In the IBC there is confusion because section 804.4 states that "interior floor finish and floor covering materials in exit enclosures, exit passageways, corridors and rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux" and then section 804.4.1 states that "interior floor finish and floor covering materials in exit enclosures, exit passageways and corridors shall not be ...". This leaves undefined what minimum critical radiant flux is required for "interior floor finish and floor covering materials in rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling". Since section 804.2 only distinguishes two classes for NFPA 253, the logical conclusion is that the words are missing and that these rooms or spaces have to meet the same requirements as the corridors from which they are not separated.

Note that the exception to 804.1 already exempts all floor finishes and floor coverings that are not comprised of fibers. Therefore this entire section applies basically only to textile floor coverings, such as carpets.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-FS11-804.4

FS139–09/10
809 (New)

Proponent: Joe McELvaney, representing himself

Add new Section as follows:

Section 809
Children's Playground Structures

809.1 Children's playground structures. Structures intended as children's playgrounds that exceed 10 feet (3048 mm) in height and 150 square feet (14 m2) in area shall comply with Sections 809.1.1 through 809.1.4.

809.1.1 Materials. Children's playground structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. Fire-retardant-treated wood complying with Section 2302.
2. Light-transmitting plastics complying with Section 2606.
3. Foam plastics (including the pipe foam used in soft-contained play equipment structures) having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975.
4. Aluminum composite material (ACM) meeting the requirements of Class A interior finish in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended for use.
5. Textiles and films complying with the flame propagation performance criteria contained in NFPA 701.
6. Plastic materials used to construct rigid components of soft-contained play equipment structures (such as tubes, windows, panels, junction boxes, pipes, slides and decks) exhibiting a peak rate of heat release not exceeding 400 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation at a thickness of 6 mm.
7. Ball pool balls, used in soft-contained play equipment structures, having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975. The minimum specimen test size shall be 36 inches by 36 inches (914mmby 914 mm) by an average of 21 inches (533 mm) deep, and the balls shall be held in a box constructed of galvanized steel poultry netting wire mesh.
8. Foam plastics shall be covered by a fabric, coating or film meeting the flame propagation performance criteria of NFPA 701.
9. The floor covering placed under the children's playground structure shall exhibit a Class I interior floor finish classification, as described in Section 804, when tested in accordance with NFPA 253.

809.1.2 Fire protection. Children's playground structures located within the compartment shall be provided with the same level of approved fire suppression and detection devices required for similar structures in the same compartment.

809.1.3 Separation. Children's playground structures shall have a minimum horizontal separation from other structures of 20 feet (6090 mm).

809.1.4 Area limits. Children's playground structures shall not exceed 300 square feet (28 m^2) in area, unless a special investigation has demonstrated adequate fire safety.

Reason: The current 2009 IBC has a section 402.12 for children's playground structures. This section currently only applies to Malls. However children's playground equipment can be found in all types of buildings and not just in malls. This new section will allow the code official to enforce these rules in any building that chooses to have children's playground equipment.

Cost Impact: The code change proposal will not increase the cost of construction.

FS140–09/10
1403.2; R703.1.1

Proponent: Theresa Weston, PhD., DuPont Building Innovations representing DuPont Building Innovations

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

1403.2 Weather protection. Exterior walls shall provide the building with a weather-resistant *exterior wall envelope*. The *exterior wall envelope* shall include flashing, as described in Section 1405.4. The *exterior wall envelope* shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a durable and continuous *water-resistive barrier* behind the exterior veneer, as described in Section 1404.2, and a means for draining water that enters the assembly to the exterior. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1405.3.

Exceptions:

(Exceptions remain unchanged)

PART II – IRC BUILDING/ENERGY

Revise as follows:

R703.1.1 Water resistance. The exterior wall envelope shall be designed and constructed in a manner that prevents the accumulation of water within the wall assembly by providing a durable and continuous water-resistant barrier behind the exterior veneer as required by Section R703.2 and a means of draining to the exterior water that enters the assembly. Protection against condensation in the exterior wall assembly shall be provided in accordance with Section R601.3 of this code.

Exceptions:

(Exceptions remain unchanged)

Reason: Durability and continuity are critical to the performance of water-resistive barriers within a wall system, therefore they should be qualities that are referenced in the code. For example, one investigation of building failures[1] reported the following causes for water breacyhing the water-resistive barrier:

-32% At flashing and penetrations
-30% Discontinuities
-14% No exterior sheathing paper
-11% Material degradation
-10% No or reverse lap
-3% Other

Enhanced durability and continuity would have accounted for the majority of the issues found in this study. The proposed usage is compatible with current code language as “durability” and “continuity” are concepts referenced throughout the code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC FIRE SAFETY

FS141–09/10
1401, 1403.2, 1405.2, 1405.17

Proponent: Joseph Lstiburek, Building Science Corporation, representing self

Revise as follows:

1401 DEFINITIONS

~~**EXTERIOR WALL ENVELOPE**~~ **WALL ENCLOSURE.** A system or assembly of *exterior wall* components, including *exterior wall* finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

1403.2 Weather protection. ~~Exterior walls shall provide the building with a weather-resistant *exterior wall envelope*. The *exterior wall envelope* shall include flashing, as described in Section 1405.4. The *exterior wall envelope*~~ The wall enclosure shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a *water-resistive barrier* behind the exterior veneer, as described in Section 1404.2, and a means for draining water that enters the assembly to the exterior. The wall enclosure shall include flashing as required in Section 1405.4. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1405.3.

Exceptions:

1. ~~A weather-resistant *exterior wall envelope* shall not be required over concrete~~ Concrete or masonry walls designed in accordance with Chapters 19 and 21, respectively.
2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1404.2 and 1405.4, shall not be required for a wall enclosure ~~an *exterior wall envelope*~~ that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E 331 under the following conditions:
   2.1. ~~*Exterior wall envelope*~~ Wall enclosure test assemblies shall include at least one opening, one control joint, one wall/eave interface and one wall sill. All tested openings and penetrations shall be representative of the intended end-use configuration.
   2.2. ~~*Exterior wall envelope*~~ Wall enclosure test assemblies shall be at least 4 feet by 8 feet (1219 mm by 2438 mm) in size.
   2.3. ~~*Exterior wall envelope*~~ Wall enclosure assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m2).
   2.4. ~~*Exterior wall envelope*~~ Wall enclosure assemblies shall be subjected to a minimum test exposure duration of 2 hours.

   The ~~*Exterior wall envelope*~~ Wall enclosure design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the *exterior wall* envelope, joints at the perimeter of openings or intersections of terminations with dissimilar materials.

3. Exterior insulation and finish systems (EIFS) complying with Section 1408.4.1.

TABLE 1405.2
MINIMUM THICKNESS OF WEATHER COVERINGS

WALL COVERING AND CLADDING TYPE	**MINIMUM THICKNESS (inches)**

(Portions of table not shown remain unchanged)

SECTION 1405
INSTALLATION OF WALL COVERINGS AND CLADDINGS

1405.2 Weather protection. *Exterior walls* shall provide weather protection for the building. The materials of the minimum nominal thickness specified in Table 1405.2 shall be acceptable as *approved* ~~weather~~ wall coverings and claddings

1405.17 Fastening. ~~Weather~~ Wall coverings ~~boarding~~ and claddings ~~wall coverings~~ shall be securely fastened with aluminum, copper, zinc, zinc-coated or other *approved* corrosion-resistant fasteners in accordance with the nailing schedule in Table 2304.9.1 or the *approved* manufacturer's installation instructions. Shingles and other ~~weather~~ wall coverings and claddings shall be attached with appropriate standard- shingle nails to furring strips securely nailed to

studs, or with *approved* mechanically bonding nails, except where sheathing is of wood not less than 1-inch (25 mm) nominal thickness or of wood structural panels as specified in Table 2308.9.3(3).

Reason: The current language of the building code is inconsistent with terms in the engineering, scientific, technical, educational, building science and "common use" communities. In fact terms and language within the code itself are inconsistently used. "Codespeak" makes it difficult to communicate appropriate requirements and concepts. The I-Codes are likely the most effective educational documents used in the construction industry. It behooves us to use the language in them correctly. If you don't call "things" by their proper names how can you expect users of the documents to execute the actions correctly. The changes proposed in this code change do not change the intent of any of the sections nor do they change any specific requirement they only fix bad terms and language and bad physics.

Cost Impact: This proposal will not raise the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LSTIBUREK-FS1-1402

FS142–09/10
1403.5 (NEW)

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing The Extruded Polystyrene Foam Association

Add new text as follows:

1403.5 Vertical and Lateral Flame Propagation. Exterior walls greater than 20 feet (6 096 mm) in height above grade plane that contain combustible exterior wall coverings shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.

Exceptions:

1. Exterior walls of Type V construction
2. Exterior walls that contain as the only combustible material, one or more of the following components:
   1. Thermal- and sound-insulating materials that meet the requirements of Section 1406.2.2.
   2. Architectural trim and embellishments.
   3. Combustible exterior wall veneers installed to heights not exceeding 40 ft. above grade plane.

(Renumber subsequent numbers)

Reason: This new section is proposed to address the potential vertical and lateral flame spread that can occur either on or within exterior wall assemblies that contain combustible materials.

Newer construction practices such as the addition of combustible weather resistant barriers allow significant amounts of combustible materials/products (other than foam plastics) to be installed on or in exterior walls. This code change proposal adds the requirement for NFPA 285 testing for exterior walls that contain these types of combustible materials. This requirement is already in place for any exterior walls that contain foam plastic insulation or use MCM exterior veneers.

Testing has shown that when a combustible weather resistive barrier was added to an exterior wall system that had successfully met the criteria for NFPA 285, that the addition of the barrier caused failure to occur in the NFPA 285 test.

Small-scale testing has shown that these types of materials can provide significant amounts of combustible fuel loading to a wall assembly and they are not currently regulated by the Code.

With the advent of newer exterior wall technologies such as “rainscreen” systems, the openings in the exterior veneer will allow flames and or heat to readily impact and ignite the barrier material. Due to the built-in standoffs of these systems, the barrier materials could then exhibit significant vertical or lateral flame propagation.

The Code proposal requires the NFPA 285 testing for exterior walls on Types I, II, III, or IV construction since these types of construction allow either none or limited combustibles in the exterior walls. The 20 ft. height limit provides a safety margin on the height of wall that can use these materials without testing. Also, while the code allows combustible exterior wall covering up to 40 ft., this proposal has as a limit 20 ft. since these materials can provide a hidden or concealed fire situation.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Standard NFPA 285 is currently referenced in the I-codes.

	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-FS1-1403.5.doc

FS143–09/10
1404.12 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

1. Add a new definition as follows:

SECTION 1402
DEFINITIONS

Polypropylene siding - a shaped material, made principally from polypropylene homopolymer, or copolymer, which in some cases may contain fillers and/or reinforcements, that is used to clad exterior walls of buildings.

2. Add new section as follows

1404.12 Polypropylene siding. Polypropylene siding shall be certified and labeled as conforming to the requirements of 1404.12.1, 1404.12.2 or 1404.12.3 by an approved quality control agency. Polypropylene siding shall be installed in accordance with the manufacturer's installation instructions.

1404.12.1 Flame Spread Index. The polypropylene siding material shall comply with the requirements of ASTM D 7254. The certification shall be accompanied by a test report stating that all portions of the test specimen ahead of the flame front remained in position during the test in accordance with ASTM E 84 or UL 723.

1404.12.2 Heat Release. The polypropylene siding material shall comply with the requirements of ASTM D 7254 and a 4 foot by 8 foot (1.22 x 2.44 m) section of the polypropylene siding material shall exhibit a peak rate of heat release not exceeding 100 kW when tested in accordance with NFPA 289 using the 20 kW ignition source at the thickness intended for use.

1404.12.3 Fire Separation Distance. The polypropylene siding shall comply with all the requirements of ASTM D 7254 and the fire separation distance between a building with polypropylene siding and the adjacent building shall be no less than 10 feet (3.05 m).

1405.18 Polypropylene siding. Polypropylene siding conforming to the requirements of this section and complying with 1404.12 shall be permitted on exterior walls of buildings of Type V construction located in areas where the basic wind speed specified in Chapter 16 does not exceed 100 miles per hour (45 m/s) and the building height is less than or equal to 40 feet (12 192 mm) in Exposure C. Where construction is located in areas where the basic wind speed exceeds 100 miles per hour (45 m/s), or building heights are in excess of 40 feet (12 192 mm), tests or calculations indicating compliance with Chapter 16 shall be submitted. Polypropylene siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1405.18.1 Application. The siding shall be applied over sheathing or materials listed in Section 2304.6. Siding shall be applied to conform with the water-resistive barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with approved manufacturer's instructions. Unless otherwise specified in the approved manufacturer's instructions, nails used to fasten the siding and accessories shall have a minimum 0.313-inch (7.9 mm) head diameter and 0.125-inch (3.18 mm) shank diameter. The nails shall be corrosion resistant and shall be long enough to penetrate the studs or nailing strip at least 0.75 inch (19 mm). Where the siding is installed horizontally, the fastener spacing shall not exceed 16 inches (406 mm) horizontally and 12 inches (305 mm) vertically. Where the siding is installed vertically, the fastener spacing shall not exceed 12 inches (305 mm) horizontally and 12 inches (305 mm) vertically.

3. Add new standards to Chapter 35 as follows:

ASTM D 7254-07	Standard specification for polypropylene (PP) siding,
NFPA 289-09	Standard Method of Fire Test for Individual Fuel Packages

Reason: Polypropylene siding is being used in construction now although the IBC does not permit it. Therefore, it is important to regulate the use of polypropylene siding in a way that it can be used safely. The new sections are similar to the existing sections on vinyl siding, except for the fire testing. Vinyl siding is known to have adequate fire performance since the siding needs to be made of rigid (unplasticized) PVC in accordance with ASTM D 3679. Polypropylene is known not to have adequate fire performance unless properly fire retarded.

A new standard specification has been issued for polypropylene siding, ASTM D 7254. The specification addresses many of the key requirements for the material. Unfortunately the fire test requirement in ASTM D 7254 is not explicit enough. ASTM D 7254 does not require that, when fire testing is conducted in the ASTM E 84 (Steiner tunnel), the test specimen must remain in place during the test and flaming drips and falling test specimens are not allowed to happen. This requirement is critical for materials that are used exposed so that the flame spread index assesses actual surface flame spread on the material surface. The standards committee responsible for the ASTM E 84 fire test (ASTM E05) decided that this issue should be addressed in the code rather than in the standard itself. Polypropylene that has not been appropriately fire retarded will release abundant amount of heat, much more than other combustible sidings permitted by the code, such as wood siding or vinyl (PVC) siding, and spread

fire through flaming drips. Such flaming drips will contribute to ignite mulch and debris found near the building and spread the fire. Table 1 shows such results.

Recent fire tests were also conducted in the Steiner tunnel, ASTM E 84, on a rigid PVC material 0.06 in. thick; it exhibited a flame spread index of 10. Under the same test conditions, a fire retarded polypropylene material 0.15 in. thick exhibited a flame spread index of 50. These are both very adequate values, in view of the fact that both the polypropylene material and the PVC material remained in place during the ASTM E 84 test and did not generate flaming drips.

Table 1: Results of Steiner Tunnel Tests (ASTM E 84)

Material	Flame Spread Index	Maximum Flame Front Advance (ft)	Time to Max. Flame Front Advance (min:s)	Flaming on Floor (Duration) (min:s)
PVC	10	4.6	7:48	None
FR Polypropylene	50	19.5	6:24	4:18

This shows that it is possible to use fire retarded polypropylene materials that give very adequate flame spread values and also very adequate heat release values, without flaming drips. Consequently, polypropylene siding should only be used when it is shown to exhibit the appropriate fire performance.

When polypropylene siding material (which does not have the appropriate fire performance) is tested in ASTM E 84 (Steiner tunnel) the test specimen will often fall ahead of the arrival of the flame giving incorrect results.

Table 2 shows new results of cone calorimeter heat release tests with polypropylene and PVC:

Table 2: Results of Cone Calorimeter (ASTM E 1354) Tests

Material	Peak Heat Release Rate	Total Heat Released	Time to Ignition	Effective Heat of Combustion	Fire Performance Index
	kW/m^2	MJ/m^2	s	MJ/kg	$s\ m^2/kW$
PVC	186.8	16.7	36	9.2	0.19
Non FR Polypropylene	768.3	47.2	23	40.3	0.03

Table 3 shows some earlier results with polypropylene, PVC and wood materials in the cone calorimeter:

Table 3 - Cone Calorimeter Data on Plastics and Douglas Fir

Material	Pk HRR (kW/m^2)	THR (MJ/m^2)	TTI (s)	EHC (MJ/kg)	FPI ($s\ m^2/kW$)
		Flux 20 kW/m^2			
PVC Rigid, Custom Inj. Mold.	40	3.0	5159	1.4	1343
PVC Rigid, Extrusion	102	2.9	3591	7.3	31.4
PP Non FR	1170	231.3	218	72.0	0.19
PP FR	236		382	23.6	1.62
PE Non FR	913	161.9	403	41.1	0.44
XLPE FR	88	87.6	750	22.4	8.08
Douglas Fir	237	46.5	254	13.1	1.10
		Flux 40 kW/m^2			
PVC Rigid, Custom Inj. Mold.	175	24.3	73	5.1	0.42
PVC Rigid, Extrusion	183	90.8	85	13.3	0.46
PP Non FR	1509	206.9	86	42.1	0.06
PP FR	243		80	23.9	0.33
PE Non FR	1408	221.0	159	46.6	0.06
XLPE FR	192	126.2	105	24.2	0.55
Douglas Fir	221	64.1	34	17.6	0.15
		Flux 70 kW/m^2			
PVC Rigid, Custom Inj. Mold.	191	93.0	45	12.7	0.24
PVC Rigid, Extrusion	190	96.5	48	10.8	0.25
PP Non FR	2421	231.1	41	43.1	0.02
PE Non FR	2735	227.5	47	42.6	0.02
XLPE FR	268	129.2	35	24.7	0.13
Douglas Fir	196	50.0	12	13.5	0.06

Table 3 shows that, when tested in the cone calorimeter, ASTM E 1354, under the same conditions, it was found that non fire retarded polypropylene exhibits a peak heat release rate of 1509 kW/m^2, while a non fire retarded PVC material exhibits a peak heat release rate of 183 kW/m^2, and a Douglas fir material exhibits a peak heat release rate of 221 kW/m^2. Such a very high heat release rate is unacceptable for a siding

material. Testing in the cone calorimeter, including the testing above, is normally conducted in the horizontal orientation with radiant heat exposing the test specimen from above, thus capturing any flaming drips and assessing their effects.

Table 4 shows that wood materials, when not fire retarded, will usually exhibit flame spread index values that are less than 200 and will correspond to Class B or Class C categories. At the same time rigid PVC (vinyl) materials will generally exhibit flame spread index values less than 25. Neither wood nor PVC materials will cause flaming drips or molten material burning on the ground.

Table 4. Steiner tunnel (ASTM E 84) Data for Wood and Vinyl Materials

Material/Product	Flame Spread Index		Material/Product	Flame Spread Index	
	Low	High		Low	High
Cellulose fiberboard ceiling tile	70	80	Ponderosa pine B	105	170
Cottonwood	115		Poplar	170	185
Cypress	145	150	Red Gum	140	155
Douglas fir	70	100	Red oak flakeboard	70	190
Douglas fir overlay	110	140	Red Oak Flooring	100	100
Douglas fir/cedar plywood	190	230	Red Pine	140	
Eastern White Pine	85		Redwood	65	70
Hemlock/cedar plywood	190		Southern yellow pine	130	195
Lauan hardwood	150	170	Vinyl faced plywood	110	130
Lodgepole Pine	95		Vinyl profile	15	20
Maple flooring	105		Vinyl Siding	10	15
Northern white pine A	190	215	Vinyl vapor barrier	10	15
Northern white pine B	120	180	Walnut	130	140
Pacific silver fir	70		West Coast Hemlock	60	70
Pacific Yellow Cedar	80		Western Red Cedar	70	
Particleboard	135	180	Western spruce	100	
Plywood paneling over gypsum	130	150	Western white pine	75	
Ponderosa pine A	170	230	Yellow birch	105	110

Figure 1 shows char from a PVC siding fire (no foam backing): the material softened, charred and burned but is still substantially intact. Figure 2 shows a vertical PP sheet melting and resulting in flaming drips on the floor.

The reason that heat release rate and floor flaming are important issues is because it has been shown that the heat radiated by siding is a major contributor to the ignition of neighboring houses, as is the spread of fire along the ground, particularly when there are loose combustibles present.

That is the reason that the third option allows polypropylene siding to be used, but with a larger separation distance, when the results of the ASTM E 84/UL 723 (Steiner tunnel) test are based on a test specimen that is not self supporting and falls to the floor of the tunnel during the test. The standard ASTM E 84 states: "1.4 Testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place." Therefore valid test results require the test specimen to stay in place ahead of the exposing flame.

Polypropylene siding should not be used in buildings other than Type V construction.

Figure 1 – remains of vinyl siding fire

Figure 2 Polypropylene siding melting and flaming on the floor.
(No figure 2 attached)

NFPA 289 was developed to test individual fuel packages and is similar in concept to UL 1975, already widely used in the code.

Cost Impact The code does not at present allow the use of polypropylene siding. In order to safely use polypropylene siding construction costs would have to increase either by using materials that would meet test requirements for adequate fire safety or by increasing fire separation distances.

Analysis: Code change proposal FS143 and FS144 address new requirements for polypropylene siding. The committee needs to make its intent clear with respect to these provisions. A review of the standard(s) proposed for inclusion in the code, ASTM D 7254-07 and NFPA 289-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1402 (New), 1404.8 (New), 1405.13 (New), Chapter 35; IRC R202, 703.13, 703.13.1, Chapter 44

Proponent: Matthew Dobson, representing Vinyl Siding Institute

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTTIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

1. Add new text as follows:

1402 DEFINITIONS

Polypropylene Siding. A shaped material made principally from polypropylene that is used to clad exterior walls covering.

2. Add new text as follows:

1404.8 Polypropylene Siding. Polypropylene siding shall conform to the requirements of ASTM D7254.

(Renumber subsequent sections)

3. Add new text as follows:

1405.13 Polypropylene Siding. Polypropylene siding conforming to the requirements of this section and complying with ASTM D7254 shall be permitted on exterior walls of buildings located in areas where the wind speed specified in Chapter 16 does not exceed 100 miles per hours (45m/s) and the building height is less than or equal to 40 feet (12 192 mm) in Exposure C. Where construction is located in areas where the basic wind speed exceed 100 mile per hour (45 m/s), or building heights are in excess of 40 feet (12 192 mm), tests or calculations indicating compliance with Chapter 16 shall be submitted. Polypropylene siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1405.13.1 Application. The siding shall be applied over sheathing or materials listed in Section 2304.6. Siding shall be applied to conform with the weather-resistive barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with approved manufacturer's instructions.

(Renumber subsequent sections)

4. Add new text to Chapter 35 standards as follows:

ASTM D7254 – 07 Standard Specification for Polypropylene (PP) Siding…1402, 1404.8, 1405.13

PART II – IRC BUILDING/ENERGY

1. Add new text as follows:

R202 DEFINITIONS

Polypropylene Siding. A shaped material made principally from polypropylene that is used to clad exterior walls covering.

2. Add new text as follows:

TABLE R703.4
WEATHER–RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL	NOMINAL THICKNESS[a] (inches)	JOINT TREATMENT	Water Resistive Barrier Required	Wood or wood structural panel sheathing	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to studs	Number or spacing of fasteners
(NEW) Polypropylene Siding[X]	Varies	Lap	Yes	0.120 nail (shank) with a .313 head[y,z]	Not allowed[aa,bb]	Not allowed[aa,bb]	Not allowed[aa,bb]	Not allowed	As specified by the manufacturer instructions or test report

(Portions of table and footnotes not shown remain unchanged)

aa. Where the sheathing is applied directly over wood structural panels or other approved backing capable of independently resisting the design wind pressure, the polypropylene siding shall be installed in accordance with the manufacturer's installation instructions.

bb. Where the polypropylene siding manufacturer's product specifications provide an approved design wind pressure rating for installation over fiberboard, gypsum or foam plastic sheathing, use of this design wind pressure rating shall be permitted and the siding shall be installed in accordance with the manufacture's installation instructions.

3. Add new text as follows:

R703.13 Polypropylene Siding. Polypropylene siding shall comply with requirements of ASTM D 7254.

R703.13.1 Installation. Polypropylene siding shall be installed in accordance with the manufacturer's installation instructions.

4. Add new text to Chapter 44 standards as follows:

ASTM D7254 – 07 Standard Specification for Polypropylene (PP) Siding…Table R703.4, R703.13

Reason: The purpose of this change is to assist code officials with the recognition of polypropylene (PP) siding. This product has reached a level of maturity including the establishment of an acceptance criterion through ES and an ASTM product standard. By providing this recognition in the code, building officials will be able to quickly reference the product and installation provisions.

Currently there is confusion in the market place between vinyl siding and PP siding. In many instances the PP siding is thought to be vinyl siding, this new language will help the code official to understand the requirements of the product established by ES and ASTM and what to enforce relative to its installation.

D7254 – 07 Standard Specification for Polypropylene (PP) Siding

The ASTM standard provides all necessary manufacturing tests and specifications to ensure the product meets the intent of the code from safety and welfare to wind performance. Included with this proposal are copies of the acceptance criteria and the ASTM standard D7254.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposal FS143 and FS144 address new requirements for polypropylene siding. The committee needs to make its intent clear with respect to these provisions. A review of the standard(s) proposed for inclusion in the code, ASTM D7254-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DOBSON-FS1-1404.8; RB2-202 PART II

FS145–09/10

1402 (New), 1404.13 (New), Table 1405.2, 1405.10.2 (New)

Proponent: Olene Bigelow, representing International Masonry Institute

1. Add new text as follows:

1402 DEFINITIONS

COMPOSITE NATURAL STONE. A veneer consisting of natural stone laminated to, or combined with, other like units to form a larger unit, or to dissimilar materials to form a cladding to be anchored or adhered to an approved substrate.

2. Add new text as follows:

1404.13 Porcelain Tile. Porcelain tile shall conform to the requirements of ANSI 137.1.3 for ceramic tile having an absorption of 0.5% or less according to ANSI 137.4.1 – Class Table and ANSI 137.1.6.1 Allowable Properties by Tile Type – Table 10.

3. Revise as follows:

TABLE 1405.2
MINIMUM THICKNESS OF WEATHER COVERINGS

Covering Type	Minimum Thickness (Inches)
Porcelain Tile	0.25
Composite Natural Stone	0.50

(Portions of table not shown remain unchanged)

4. Add new text as follows:

1405.10.2 Exterior adhered masonry veneers - porcelain tile and composite natural stone. Adhered units shall not exceed 5/8" thickness and a maximum of 24" in any face dimension nor more than 3 square feet in total face area and shall not weigh more than 9 pounds per square foot. Porcelain tile and composite natural stone shall be adhered to an approved backing system.

Reason: There is currently no definition for composite natural stone in the IBC. This proposal would add that definition. Currently, there is no definition for porcelain tile in the IBC. As one of myriad types of ceramic tile, its unique characteristics and extremely low absorption rate requires it be dealt with differently from other materials, especially when applied as an exterior adhered veneer. These materials are relatively new in exterior applications and fall outside the scope of TMS 402/ACI 530/ASCE 6. With no specific code requirements found in IBC, installations of these materials are being found inadequate and some significant failures have occurred. See attached photographs. When these units and/or their adhesion system fail, for whatever ultimate reason, public safety is put at risk.

Here, only a few units have fallen, so far. No mechanical attachment.

Another project: Upon stripping the façade, it appears an attempt was made to “anchor” the units, but it was clearly unsuccessful

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Standards ANSI A137 are currently referenced in the I-codes.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BIGELOW-FS1, FS2, FS3, FS4

FS146–09/10

Table 1405.2

Proponent: John Woestman, The Kellen Company, representing the Masonry Veneer Manufacturers Association (MVMA)

Revise as follows:

TABLE 1405.2
MINIMUM THICKNESS OF WEATHER COVERING

OVERING TYPE	MINIMUM THICKNESS (inches)
Precast stone facing	0.625[e]
Stone (cast artificial, anchored)	1.5

e. Includes scratch coat, setting bed, and precast stone.

(Portions of table and footnotes not shown, remain unchanged)

Reason: Table 1405.2 contains several items which have been interpreted as applying to adhered masonry veneer. The proposed revisions to Table 1405.2 attempt to clarify the IBC with a footnote to the table for the precast stone facing. The revisions also clarify that cast artificial stone, with a minimum thickness of 1.5 inches, is an anchored veneer, not an adhered veneer.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: WOESTMAN-FS2-Table 1405.2

FS147–09/10
Table 1405.3; IRC Table R601.3.1

Proponent: Edward L. Keith, PE, APA, The Engineered Wood Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

TABLE 1405.3.1
CLASS III VAPOR RETARDERS

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:[a]
Marine 4	~~Vented cladding over OSB~~ ~~Vented cladding over plywood~~ Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with *R*-value ≥ .5 over 2x4 wall Insulated sheathing with *R*-value ≥ 3.75 over 2x6 wall
5	~~Vented cladding over OSB~~ ~~Vented cladding over plywood~~ Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with *R*-value ≥ 5 over 2x4 wall Insulated sheathing with *R*-value ≥ 7.5 over 2x6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with *R*-value ≥ 7.5 over 2x4 wall Insulated sheathing with *R*-value ≥ 11.25 over 2x6 wall
7 and 8	Insulated sheathing with *R*-value ≥ 10 over 2x4 wall Insulated sheathing with *R*-value ≥ 15 over 2x6 wall

For SI: 1 pound per cubic foot = 16 kg/m^3.

a. Spray foam with a minimum density of 2 lb/ft3 applied to the interior cavity side of ~~OSB, plywood~~ wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the insulating sheathing requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

PART II – IRC BUILDING/ENERGY

Revise as follows:

TABLE R601.3.1
CLASS III VAPOR RETARDERS

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:[a]
Marine 4	~~Vented cladding over OSB~~ ~~Vented cladding over plywood~~ Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with *R*-value ≧ 2.5 over 2x4 wall Insulated sheathing with *R*-value ≧ 3.75 over 2x6 wall
5	~~Vented cladding over OSB~~ ~~Vented cladding over plywood~~ Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with *R*-value ≧ 5 over 2x4 wall Insulated sheathing with *R*-value ≧ 7.5 over 2x6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with *R*-value ≧ 7.5 over 2x4 wall Insulated sheathing with *R*-value ≧ 11.25 over 2x6 wall
7 and 8	Insulated sheathing with *R*-value ≧ 10 over 2x4 wall Insulated sheathing with *R*-value ≧ 15 over 2x6 wall

For SI: 1 pound per cubic foot = 16.02 kg/m3.

a. Spray foam with a minimum density of 2 lb/ft3 applied to the interior cavity side of ~~OSB, plywood~~ wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the insulating sheathing requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

Reason:
PART I- The proposed change is made to foster consistency in the code. The IBC and other codes only differentiate between plywood and OSB when there is a difference in performance. In all other cases, in this and the other codes, the generic term "wood structural panel" is used. As there is no difference in performance between plywood, OSB, or composite panels where the use of a Class III vapor retarder is concerned, the term "wood structural panel" is appropriate.

Note that the use of a vapor retarder for wood structural panel products is in line with our long-standing recommendations.

PART II- The proposed change is made to foster consistency in the code. The IRC and other codes only differentiate between plywood and OSB when there is a difference in performance. In all other cases, in this and the other codes, the generic term "wood structural panel" is used. As there is no difference in performance between plywood, OSB, or composite panels where the use of a Class III vapor retarder is concerned, the term "wood structural panel" is appropriate.

Note that the use of a vapor retarder for wood structural panel products is in line with our long-standing recommendations.

Cost Impact: The code change proposal will not increase the cost of construction.

FS148–09/10
1405.6.2

Proponent: Charles Clark, representing Brick Industry Association-Masonry Alliance for Codes and Standards (MACS)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTUAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise as follows:

1405.6 Anchored masonry veneer. Anchored masonry veneer shall comply with the provisions of Sections 1405.6, 1405.7, 1405.8 and 1405.9 and Sections 6.1 and 6.2 of TMS 402/ACI 530/ASCE 5.

1405.6.1 Tolerances. Anchored masonry veneers in accordance with Chapter 14 are not required to meet the tolerances in Article 3.3 F1 of TMS 602/ACI 530.1/ASCE 6.

1405.6.2 Seismic requirements. Anchored masonry veneer located in Seismic Design Category C, D, E or F shall conform to the requirements of Section 6.2.2.10 of TMS 402/ACI 530/ASCE 5. ~~Anchored masonry veneer located in Seismic Design Category D shall also conform to the requirements of Section 6.2.2.10.3.3 of TMS 402/ACI 530/ASCE 5.~~

Reason: This proposed code change addresses anchored masonry veneer constructed on a building located in Seismic Design Category D and removes the requirement to include wire joint reinforcement in the veneer and mechanically attach the reinforcement to the veneer anchors. This proposed change is based on shaking-table testing conducted in January and March 2009 on full-scale structures (one wood-stud frame and one reinforced masonry structure) at The University of California San Diego complemented by prior shaking-table testing and quasi-static testing of wall segments, all with clay masonry veneer. The testing conclusively demonstrated that incorporating wire reinforcement in anchored veneer does not improve the performance or behavior of the anchored masonry veneer during or after the maximum considered earthquake for a structure located in Seismic Design Category D (Bibliography References 1 & 2 below).

The testing was conducted separately on two full-scale specimens: a 20 ft x 20 ft prototypical wood-stud frame structure with anchored brick veneer and a 20 ft x 20 ft prototypical concrete masonry structure with anchored brick veneer. For each specimen, two of the four veneer elevations included joint reinforcement with the remaining two veneer elevations constructed without joint reinforcement. Both specimens were each subjected separately to a seismic load imposed by the Maximum Considered Earthquake (2% probability of exceedance in 50 years) for Seismic Design Category D. In each specimen, no differences in performance or behavior were observed in the veneers with and without joint reinforcement.

Not requiring reinforcement in the veneer will likely decrease the possibility of corrosion occurring in the veneer. By not requiring reinforcement, the extent of metal accessories present in the veneer is substantially lowered thus reducing the probability of corrosion.

As way of background, the Masonry Alliance for Codes and Standards has previously submitted this change as FS179-07/08 based on previous out-of-plane shaking-table testing conducted on wall segments (Bibliography Reference 5 below) as well as analysis (Bibliography References 3 & 4 below) that supported the change. The full-scale entire structure testing program mentioned above was not yet complete. Aware of this program, the IBC Structural Committee disapproved the change citing their preference to "wait until that testing is complete and those results are made available before approving the proposal." That testing has now been completed and has indicated that the requirement to include joint reinforcement in anchored masonry veneer located in Seismic Design Category D is not necessary.

	Assembly:	ASF	AMF	DF

ICCFILENAME: CLARK-FS1-1405.6.2

FS149–09/10
1405.7

Proponent: Gary J. Ehrlich, PE, representing National Association of Home Builders

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER OF THIS COMMITTEE.

Revise as follows:

1405.7 Stone veneer. Stone veneer units not exceeding 10 inches (254 mm) in thickness shall be anchored directly to masonry, concrete or to stud construction by one of the following methods:

1. *(No change to current text)*
2. With wood stud backing, a 2-inch by 2-inch (51 by 51 mm) 0.0625-inch (1.59 mm) corrosion-resistant wire mesh with two layers of water-resistive barrier in accordance with Section 1404.2 shall be applied directly to wood studs spaced a maximum of 16 inches (406 mm) o.c. On studs, the mesh shall be attached with 2-inch-long (51 mm) corrosion-resistant steel wire furring nails at 4 inches (102 mm) o.c. providing a minimum 1.125-inch (29 mm) penetration into each stud and with 8d common nails at 8 inches (203 mm) o.c. into top and bottom plates or with equivalent wire ties. There shall be not less than a 0.1055-inch (2.68 mm) corrosion-resistant wire, or approved equal, looped through the mesh for every 2 square feet (0.2 m2) of stone veneer. This tie shall be a loop having legs not less than 15 inches (381 mm) in length, so bent that it will lie in the stone veneer mortar joint. The last 2 inches (51 mm) of each wire leg shall have a right-angle bend. One-inch (25 mm) minimum thickness of cement grout shall be placed between the backing and the stone veneer.
3. With cold-formed steel stud backing, a 2-inch by 2-inch (51 by 51 mm) 0.0625-inch (1.59 mm) corrosion-resistant wire mesh with two layers of water-resistive barrier in accordance with Section 1404.2 shall be applied directly to steel studs spaced a maximum of 16 inches (406 mm) o.c. The mesh shall be attached with 2-inch-long (51 mm) corrosion-resistant #8 self-drilling, tapping screws at 4 inches (102 mm) o.c. providing a minimum 0.5-inch (12.7 mm) penetration into each stud, and at 8 inches (203 mm) o.c. into top and bottom tracks or with equivalent wire ties. There shall be not less than a 0.1055-inch (2.68 mm) corrosion-resistant wire, or approved equal, looped through the mesh for every 2 square feet (0.2 m2) of stone veneer. This tie shall be a loop having legs not less than 15 inches (381 mm) in length, so bent that it will lie in the stone veneer mortar joint. The last 2 inches (51 mm) of each wire leg shall have a right-angle bend. One-inch (25 mm) minimum thickness of cement grout shall be placed between the backing and the stone veneer. The cold-formed steel framing members shall have a minimum uncoated thickness of 0,043 inches (1.09 mm).

Reason: The purpose of this proposal is to provide guidance for stone veneer anchored to cold-formed steel stud backing. The current language only addresses wood studs, leaving attachment to cold-formed steel stud backing as an alternate means and methods. The language mirrors the wood stud language, with appropriate revisions based on ICC-ES stone veneer reports and BIA Technical Note 28B on Brick Veneer/Steel Stud Walls.

Cost Impact: The code change proposal will not increase the cost of construction.

1405.10.2 (New), 1405.10.2.1 (New), 1405.10.2.2 (New), 1405.10.2.3 (New); IRC R703.12.1 (New)

Proponent: John Woestman, The Kellen Company, Representing the Masonry Veneer Manufacturers Association (MVMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Add new text as follows:

1405.10 Adhered masonry veneer. Adhered masonry veneer shall comply with the applicable requirements in Section 1405.10.1 and Sections 6.1 and 6.3 of TMS 402/ACI 530/ASCE 5.

1405.10.1 Interior adhered masonry veneers. Interior adhered masonry veneers shall have a maximum weight of 20 psf (0.958 kg/m2) and shall be installed in accordance with Section 1405.10. Where the interior adhered masonry veneer is supported by wood construction, the supporting members shall be designed to limit deflection to 1/600 of the span of the supporting members.

1405.10.2 Exterior adhered masonry veneer. Exterior adhered masonry veneer shall be in accordance with section 1405.10

1405.10.2.1 Water-resistive barriers. Water-resistive barriers shall be installed as required in Section 1404.2 and, where applied over wood-based sheathing, shall include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of Grade D paper.

> **Exception:** Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of 60-minute Grade D paper and is separated from the adhered masonry veneer by an intervening, substantially nonwater-absorbing layer or drainage space.

1405.10.2.2 Flashing at foundation. A corrosion-resistant screed or flashing of a minimum 0.019-inch (0.48 mm) or 26 gage galvanized or plastic with a minimum vertical attachment flange of 3 ½ inches (89 mm) shall be installed a minimum of 1 inch (25 mm) below the foundation plate line on exterior stud walls in accordance with Section 1405.4 to direct moisture to the exterior. The water-resistive barrier shall lap over the exterior of the attachment flange of the screed or flashing.

1405.10.2.3 Installation. Adhered masonry veneer shall be installed in accordance with the manufacturer's instructions..

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R703.12 Adhered masonry veneer installation. Adhered masonry veneer shall be installed in accordance with the manufacturer's instructions.

R703.12.1 Flashing at foundation. A corrosion-resistant screed or flashing of a minimum 0.019-inch (0.48 mm) or 26 gage galvanized or plastic with a minimum vertical attachment flange of 3 ½ inches (89 mm) shall be installed a minimum of 1 inch (25 mm) below the foundation plate line on exterior stud walls in accordance with Section R703.8 to direct moisture to the exterior. The water-resistive barrier, as required by Table R703.4 Footnote w, shall lap over the exterior of the attachment flange of the screed or flashing.

Reason:

PART I-The added section for exterior adhered masonry veneer compliments the existing section for interior adhered masonry veneer.

The proposed language for water-resistive barriers is modeled after similar requirements for stucco (section 2510.6).

The proposed language for flashing at the foundation is similar to the weep screed requirements for stucco and compliments the performance requirements of section 1405.4 Flashing (*Flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect it to the exterior* . . . . . .) while at the same time allowing for alternates to the stucco-specific weep screed.

Adhered masonry veneer manufacturers require their products to be installed per their instructions and the building code should support this requirement with enforceable language.

PART II- The proposed language for flashing at the foundation is similar to the weep screed requirements for stucco and compliments the flashing performance requirements of section R703.8 Flashing (*Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components . . . .) while at the same time allowing for effective alternates to the stucco-specific weep screed.

Cost Impact: The code change proposal will not increase the cost of construction

PART I – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing: Committee: AS AM D

FS151–09/10

1405.10.2 (New), 1405.2.1 (New); IRC R703.12.1 (New)

Proponent: John Woestman, The Kellen Company, Representing the Masonry Veneer Manufacturers Association (MVMA)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTTIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Add new text as follows:

1405.10 Adhered masonry veneer. Adhered masonry veneer shall comply with the applicable requirements in Section 1405.10.1 and Sections 6.1 and 6.3 of TMS 402/ACI 530/ASCE 5.

1405.10.1 Interior adhered masonry veneers. Interior adhered masonry veneers shall have a maximum weight of 20 psf (0.958 kg/m2) and shall be installed in accordance with Section 1405.10. Where the interior adhered masonry veneer is supported by wood construction, the supporting members shall be designed to limit deflection to 1/600 of the span of the supporting members.

1405.10.2 Exterior adhered masonry veneer. Exterior adhered masonry veneer shall be in accordance with section 1405.10

1405.10.2.1 Clearances. Adhered masonry veneer shall be installed a minimum of 4 inches (102 mm) above the earth or 2 inches (51 mm) above paved areas or ½ inch (12 mm) above exterior walking surfaces supported by the same foundation which supports the exterior wall.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R703.12 Adhered masonry veneer installation. Adhered masonry veneer shall be installed in accordance with the manufacturer's instructions.

R703.12.1 Clearances. Adhered masonry veneer shall be installed a minimum of 4 inches (102 mm) above the earth or 2 inches (51 mm) above paved areas or ½ inch (12 mm) above exterior walking surfaces supported by the same foundation which supports the exterior wall.

Reason:

PART I: The added section for exterior adhered masonry veneer compliments the existing section for interior adhered masonry veneer.

The clearance requirements are consistent with stucco applications and go one step further by specifying a minimum of ½" clearance to exterior walking surfaces which are supported by the same foundation that supports the wall to which the exterior veneer is adhered. The proposed requirement that both the wall and the walking surface be supported by the same foundation, along with existing IBC flashing performance requirements of section 1405.4 for exterior wall intersections with porches, decks, balconies, and similar architectural features, limits this ½" clearance to building elements stable to each other and required to be flashed to manage water. This ½" clearance requirement allows for architectural and aesthetic improvements in the installation of adhered masonry veneer.

PART II: The clearance requirements proposed are consistent with stucco applications and go one step further by specifying a minimum of ½" clearance to exterior walking surfaces which are supported by the same foundation that supports the wall to which the exterior veneer is adhered. The proposed requirement that both the wall and the walking surface be supported by the same foundation, along with existing IRC flashing performance requirements of section R703.8 for exterior wall intersections with porches, decks, or stairs, limits this ½" clearance to building elements stable to each other and required to be flashed to manage water. This ½" clearance requirement allows for architectural and aesthetic improvements in the installation of adhered masonry veneer.

FS152–09/10
1405.13.2

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

Revise as follows:

IBC 1405.13.2 Window sills. In Occupancy Groups R-2 and R-3, one- and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1829 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 24 inches (610 mm) above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 24 inches (610 mm) shall be fixed or have openings through which a 4-inch (102 mm) diameter sphere cannot pass through.

Exception: Openings that are more than 75 feet above grade that are provided with window ~~guards~~ fall prevention devices that comply with ASTM F 2006 ~~or F 2090.~~

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Child Window Safety". The scope of the activity is noted as:

Study the incidence and mechanisms of falls from open windows by children and to investigate the necessity and suitability of potential safeguards and/or revisions to the current codes.

In a related change, both the IBC and IRC are proposed to be updated to allow the use of window opening control devices to abate the hazard of child falls through windows. These devices can be used for buildings of any height and are regulated by updated standard ASTM F2090 – 2008.

The scope of ASTM F 2006 – 00 (2005) entitled "Standard Safety Specification for Window Fall Prevention Devices for Non-Emergency Escape (Egress) and Rescue (Ingress) Windows" is noted in Section 1.2 of the standard which states; "This safety specification applies only to window fall prevention devices that are to be used on windows that are not intended for escape (egress) and rescue (ingress)." Further, Section 1.3 states that: " This safety specification applies only to devices intended to be applied to windows installed at heights of more than 75 above ground level in multiple family dwelling buildings. This safety specification is not intended to apply to windows below 75 feet because all windows below 75 feet that are operable could be used as a possible secondary means of escape."

Cost Impact: This code change proposal will slightly increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HEILSTEDT-FS2-1405.13.2

FS153–09/10
1405.13.2, 1405.13.2.1, Chapter 35

Proponent: Julie Ruth, PE, J Ruth Code Consulting, representing the American Architectural Manufacturers Association Window Opening Control Device Task Group

1. Revise as follows:

1405.13.2 Window sills. In Occupancy Groups R-2 and R-3, one- and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1829 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 24 inches (610 mm) above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 24 inches (610 mm) shall be fixed or have openings through which a 4-inch (102 mm) diameter sphere cannot pass.

Exceptions:

1. Openings that are provided with window guards that comply with ASTM F 2006 or F 2090.
2. Windows that are provided with window opening control devices that comply with Section 1405.13.2.1.

1405.13.2.1 Window opening control devices. When required elsewhere in this code, window opening control devices shall comply with the provisions of AAMA 909.

2. Revise Chapter 35 as follows:

AAMA
AAMA 909 Voluntary Specification for Window Opening Control Devices….. 1405.13.2.1

Reason: The 2009 IRC permits an exception to the current minimum sill height requirement of Section R612.3 for windows that are provided with window opening limiting devices. For consistency with the IRC, the IBC should permit the same. The criteria for these devices within the IRC, however, is inadequate. The 2008 edition of ASTM F2090 attempts to provide greater guidance, but the members of the AAMA Window Opening Control Device task group, which was created specifically to respond to this new requirement in the International Codes, have found inconsistencies and confusion within ASTM F2090-08 as well. Therefore, the members of the AAMA WOCD TG have committed of the development and completion of an AAMA standard in time for the 2012 International Residential Code in late 2010.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, AAMA-909, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ruth-FS2-1405.13.2

FS154–09/10
1013.1 (New), 1405.13.2

Proponent: Daniel E. Nichols, PE, New York State Div. of Code Enforcement and Administration

1. Add new text as follows:

1013.1 General. Guards and operable windows shall comply with this section. Guards shall comply with the provisions of Sections 1013.2 through 1013.7. Operable windows with sills located more than 72 inches above finished grade or other surface below shall comply with Section 1013.8.

(Renumber subsequent sections)

2. Relocate Section 1405.13.2 to new Section 1013.8 as follows:

~~**1405.13.2**~~ **1013.8 Window Sills**. In Occupancy Groups R-2 and R-3, one – and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 24 inches above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 24 inches shall be fixed or have openings through which a 4-inch diameter sphere cannot pass.

Exception: Openings that are provided with window guards that comply with ASTM F2006 or F2090.

Reason: The reason for Section 1405.13.2 is essentially a protection from fall requirement. That is the same reason that 1013 exists. Having this section located in Chapter 14 results in it being frequently overlooked by designers and building officials alike. Section 1013.1 is modified to scope the section to include fall protection requirements from windows.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICHOLS-FS1-1405.13.2

FS155–09/10
1406.2.1; IRC R302.1.2 (New)

Proponent: Michael Love, representing Metropolitan Washington DC Fire Marshal's Committee

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC Fire Safety

Revise as follows:

1406.2.1 Ignition resistance. Combustible exterior wall coverings shall be tested in accordance with NFPA 268.

Exceptions:

1. Wood or wood-based products.
2. Other combustible materials covered with an exterior covering other than vinyl sidings listed in Table 1405.2.
3. Aluminum having a minimum thickness of 0.019 inch (0.48mm).
4. Exterior wall coverings on exterior walls of Type V construction.

1406.2.1.1 Fire separation 5 feet or less. Where installed on exterior walls having a fire separation distance of 5 feet (1524 mm) or less <u>to buildings, structures or decks</u>, combustible exterior wall coverings shall not exhibit sustained flaming as defined in NFPA 268.

<u>Exceptions:</u>

1. <u>Decks constructed of fire retardant treated wood</u>
2. <u>Exterior balconies and decks protected by automatic sprinklers as provided for in Section 903.3.1.2.1</u>

1406.2.1.2 Fire separation greater than 5 feet. For fire separation distances greater than 5 feet (1524 mm) <u>to buildings, structures or decks</u>, an assembly shall be permitted that has been exposed to a reduced level of incident radiant heat flux in accordance with the NFPA 268 test method without exhibiting sustained flaming. The minimum fire separation distance required for the assembly shall be determined from Table1406.2.1.2 based on the maximum tolerable level of incident radiant heat flux that does not cause sustained flaming of the assembly.

<u>Exceptions:</u>

1. <u>Decks constructed of fire retardant treated wood</u>
2. <u>Exterior balconies and decks protected by automatic sprinklers as provided for in Section 903.3.1.2.1</u>

PART II – IRC Building/Energy

Add new text as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1.

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. Walls of *dwellings* and *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).

5. Foundation vents installed in compliance with this code are permitted.

R302.1.2. Combustible Exterior Walls and Combustible Decks . Combustible exterior wall coverings and sheathing that are ignitable below 12.5 KW/m^2 and exhibit sustained flaming shall not be used where installed on exterior walls having a fire separation distance of 5 feet (1524 mm) to combustible decks or balconies.

Exception: Decks constructed of fire retardant treated wood

Reason:
Part I- A technical change is needed to Section 1406 relating to the lack of fire resistance of the exterior surface of exterior combustible walls when directly exposed to combustible decks. It is likely that code development did not consider the need to require fire resistance for the exterior wall from these structures but there is a growing concern for the number of fires that start on and under combustible decks which when ignited burn fiercely.

This code change proposal is not intended to address all fires that could present an exposure to combustible exterior walls. It focuses on the higher risk and increased likelihood for a fire involving a combustible deck that is directly attached or within five feet of the combustible exterior wall. Since decks would have a limited exposure to a building any additional expenditure for more fire resistant materials is reduced. Ultimately a sheathing of gypsum even in thin layers increases the resistance.

1406.2.1.1 and 1406.2.1.1 both add the same language to include proximity to buildings, structures or decks and allows an exception for decks constructed of fire retardant wood.

This code change proposal is not intended to address all fires that could present an exposure to combustible exterior walls. It focuses on the higher risk and increased likelihood for a fire involving a combustible deck that is directly attached to or within five feet of the combustible exterior wall. Since decks would have a limited exposure to a building any additional expenditure for more fire resistant materials is reduced. Ultimately a sheathing of gypsum even in thin layers increases the resistance.

These fires are rarely extinguished before it has spread into the void of the exterior combustible wall or up the exterior surface of the walls and into the attic. While the most frequent facing surface of the exterior wall is vinyl siding this is listed in specs as non-combustible. There is experience that indicates no effective resistance to fire though as the siding readily melts away to allow fire access to the substrate sheathing which most often is a combustible material such as Oriented Strand Board (OSB), low density fiber board and Rigid Foam Insulation. These common materials are combustible but OSB resists direct flame longer then rigid foam insulation. Tests conducted by the National Institute for Standards and Technology showed that when a plume of heated gases and flame impinges on a combustible exterior wall it will ignite the combustible exterior wall that is within five feet. This scenario may actually be less dramatic then a well advanced fire involving an attached deck which could preheat the combustible wall and directly expose it to a vertical flame. This exposure and create a more intense flame spread vertically on the wall. Some materials used as a substrate to the exterior siding will resist fire more then others; some materials readily spread fire vertically directly to the roof along the exterior surface; into a non-fire resistant soffit then into the attic, or destroys the integrity of the substrate material and the enters the wall void.

Decks have become more like exterior rooms with furniture, outdoor kitchens and primarily the presence of people. Barbecue grills, lighting and the inappropriate disposal of smoking materials are all hazards that have been the causes of fires that first ignite decks then spread easily to and into the structure of a home or similar building. Once ignited decks burn violently with direct flame and radiant heat exposure to combustible exterior walls. The fact that the fuel in a deck is open on all sides which enhances oxidization for complete combustion and ample direct flame as well as preheating from radiant heat make them a perfect primary fire source to feed fires that most often spread to and involve the roof and attic of homes. The direct flaming attack on these walls cause nearly immediate destruction of combustible and easily degraded sidings to allow immediate access and exposure to the interior structure. Due to the unique flow of the heat and gases from the deck fires into the structure these fires most often result in near total loss of structure. In the Washington D.C Metro area these fires have resulted in many fires one incident which killed a firefighter and another fire incident that severely burned multiple firefighters.

Part II- Add a new section to IRC Chapter 3 as R302.1.2 to increase fire resistance of combustible exterior walls when directly exposed to combustible decks. It is likely that the code development process did not consider the need to require fire resistance for the exterior wall from decks but there is a growing concern for the number of fires that start on and under combustible decks which when ignited burn fiercely. IRC considers exposure buildings in regard to fire spread but does not include the hazard of combustible deck fires. While IRC has some limited passive fire resistance of residential construction through use of fire blocking and compartmentation it does not recognize the hazard of a deck involved in fire to the structure of the main building through the exterior facing of the wall.

This code change proposal is not intended to address all fires that could present an exposure to combustible exterior walls. It focuses on the higher risk and increased likelihood for a fire involving a combustible deck that is directly attached to or within five feet of the combustible exterior wall. Since decks would have a limited exposure to a building any additional expenditure for more fire resistant materials is reduced. Ultimately a sheathing of gypsum even in thin layers increases the resistance.

These fires are rarely extinguished before it has spread into the void of the exterior combustible wall or up the exterior surface of the walls and into the attic. While the most frequent facing surface of the exterior wall is vinyl siding this is listed in specs as non-combustible. There is experience that indicates no effective resistance to fire though as the siding readily melts away to allow fire access to the substrate sheathing which most often is a combustible material such as Oriented Strand Board (OSB), low density fiber board and Rigid Foam Insulation. These common materials are combustible but OSB resists direct flame longer then rigid foam insulation. Tests conducted by the National Institute for Standards and Technology showed that when a plume of heated gases and flame impinges on a combustible exterior wall it will ignite the combustible exterior wall that is within five feet. This scenario may actually be less dramatic then a well advanced fire involving an attached deck which could preheat the combustible wall and directly expose it to a vertical flame. This exposure and create a more intense flame spread vertically on the wall. Some materials used as a substrate to the exterior siding will resist fire more then others; some materials readily spread fire vertically directly to the roof along the exterior surface; into a non-fire resistant soffit then into the attic, or destroys the integrity of the substrate material and the enters the wall void.

Decks have become more like exterior rooms with furniture, outdoor kitchens and primarily the presence of people. Barbecue grills, lighting and the inappropriate disposal of smoking materials are all hazards that have been the causes of fires that first ignite decks then spread easily to and into the structure of a home or similar building. Once ignited decks burn violently with direct flame and radiant heat exposure to combustible exterior walls. The fact that the fuel in a deck is open on all sides which enhances oxidization for complete combustion and ample direct flame as well as preheating from radiant heat make them a perfect primary fire source to feed fires that most often spread to and involve the roof and attic of homes. The direct flaming attack on these walls cause nearly immediate destruction of combustible and easily degraded sidings to allow immediate access and exposure to the interior structure. Due to the unique flow of the heat and gases from the deck fires into the structure these fires most often result in near total loss of structure. In the Washington D.C Metro area these fires have resulted in many fires one incident which killed a firefighter and another fire incident that severely burned multiple firefighters.

Cost Impact: Part I & II- Product information indicates that a product such as a gypsum-based exterior sheathing is comparable to other sheathing and is more resistant to fire.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARI8NG ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Add new text as follows:

1404.12 Foam plastic sheathing. Foam plastic sheathing shall comply with requirements for foam plastic insulation in Section 2603. When used as a water-resistive barrier, the foam plastic sheathing material and installation shall be approved in accordance with Section 1404.2.

2. Revise as follows:

1405.2 Weather protection. *Exterior walls* shall provide weather protection for the building. The materials of the minimum nominal thickness specified in Table 1405.2 shall be acceptable as *approved* weather coverings. Foam plastic sheathing used in exterior wall covering assemblies with approved exterior weather coverings shall comply with Section 1405.18.

3. Add new text as follows:

1405.18 Foam plastic sheathing. Foam plastic sheathing used in exterior wall covering assemblies shall comply with this section, Section 2603, Chapter 13, and the foam sheathing manufacturer's approved installation instructions.

1405.18.1 Minimum thickness. The thickness of foam plastic sheathing shall comply with Table 1405.18.1.

Exception: Where foam plastic sheathing is applied directly over or behind wall sheathing or other solid substrate capable of separately resisting the required wind pressure, the limitations of Table 1405.18.1 shall not apply.

TABLE 1405.18.1
REQUIREMENTS FOR FOAM PLASTIC SHEATHING
IN EXTERIOR WALL COVERING ASSEMBLIES[1,2]

	¾"	95	NP	NP	NP
	1"	125	85	105	NP
	≥1-1/2"	130	120	130	100

For SI: 1 inch = 25.4 mm, 1 mile per hour = 1.609 km/h

NP = not permitted

1. Tabulated maximum wind speed values are based on a mean roof height of 30-feet (9.1 m). Multiply maximum wind speed by 0.95 for a mean roof height of 45 feet (13.7 m) or 0.9 for a mean roof height of 60 feet (18.3 m). For greater mean roof heights, an approved design shall be required.
2. Foam plastic sheathing panels shall be permitted to be oriented parallel or perpendicular to framing members.
3. Foam plastic sheathing shall meet or exceed the following material standards: Expanded Polystyrene (EPS) – ASTM C578 (Type II, min.1.35 lb/ft^3 density), Polyisocyanurate – ASTM C1289 (Type 1, min.), and extruded polystyrene (XPS) – ASTM C578 (Type X, min. 1.30 lb/ft^3 density). Where a "faced" product is indicated, a facer shall be provided on both faces of the foam plastic sheathing. Where facing is not indicated in the table, faced and unfaced foam plastic sheathing shall be permitted. For all foam plastic sheathing products, approved manufacturer data shall be permitted in lieu of the table requirements.
4. Multiply tabulated maximum wind speed by 0.85 for wind exposure C or by 0.78 for wind exposure D.
5. Interior finish shall be minimum 1/2-inch (12.7 mm) thick gypsum wall board or an approved product with equivalent or greater out-of-plane bending strength and stiffness.

1405.18.2 Siding attachment over foam sheathing. Siding shall be attached over foam sheathing in accordance with Section 1405.18.2.1, Section 1405.18.2.2, or an approved design. In no case shall the siding material be used in a manner that exceeds its application limits.

Exception: Where the siding manufacturer has provided approved installation instructions for application over foam sheathing, those requirements shall apply.

1405.18.2.1 Direct siding attachment. Approved weather coverings installed directly over foam sheathing without separation by an air space shall comply with Table 1405.18.2.1 in regard to nail diameter, penetration, and nail spacing for the applicable foam sheathing thickness and wind speed condition. The siding fastener and siding installation shall otherwise comply with Chapter 14.

Exceptions:

1. For adhered masonry veneer, refer to Section 1405.10
2. For vinyl siding, refer to Section 1405.14.
3. For exterior insulation and finish systems, refer to Section 1408.

TABLE 1405.18.2.1
FASTENING REQUIREMENTS FOR DIRECT SIDING ATTACHMENT OVER FOAM PLASTIC SHEATHING[1,2]

Minimum Nail Diameter[3] (inches)	Nail Spacing along Stud[4] (inches)	Maximum Foam Sheathing Thickness[5] (inches)	16"oc WALL FRAMING Maximum Wind Speed (mph)			24"oc WALL FRAMING Maximum Wind Speed (mph)		
			Exposure B	Exposure C	Exposure D	Exposure B	Exposure C	Exposure D
0.113	6	2	140	120	110	120	100	90
	8	2	130	110	100	100	85	DR
	12	1	100	85	DR	85	DR	DR
0.120	6	3	140	120	110	120	100	90
	8	2	130	110	100	110	90	85
	12	1.5	110	90	85	90	DR	DR
0.135	6	3	140	120	110	130	110	100
	8	3	140	120	110	110	90	85
	12	2	110	90	85	90	DR	DR

For SI: 1 inch = 25.4 mm; 1 mph = 1.609 km/h
DR = design required

1. Maximum wind speed values are based on a minimum 1-1/4 inch (31.8 mm) penetration of a smooth shank nail fastener into wood framing of Spruce-Pine-Fir or any wood species with a specific gravity of 0.42 or greater in accordance with AFPA/NDS.
2. Tabulated maximum wind speed values are based on a mean roof height of 30-feet (9.1 m). Multiply maximum wind speed by 0.95 for a mean roof height of 45 feet (13.7 m) or 0.9 for a mean roof height of 60 feet (18.3 m). For greater mean roof heights, an approved design shall be required.
3. Nail fasteners shall comply with ASTM F1667, except nail length shall be permitted to exceed ASTM F1667 standard lengths to provide a minimum 1-1/4 inch (31.8 mm) penetration into wood framing. Specified nails in accordance with Chapter 1405 or the siding manufacturer's approved installation instructions shall meet all other requirements in ASTM F1667 or be otherwise approved for the intended application.
4. 'Nail spacing along stud' refers to spacing of siding fasteners in the vertical direction. A minimum of one fastener shall be applied at each intersection of an individual siding member with a wall stud.
5. Maximum foam sheathing thickness values are based on a maximum 24-inch (0.6 m) stud spacing, a maximum siding dead load of 11 psf (0.53 kPa), and S_{DS} per Section 1613.5.4 not exceeding 0.83g. Siding dead load shall not exceed 8 psf (0.39 kPa) for and S_{DS} of 1.17g, 6 psf (0.29 kPa) for S_{DS} of 1.5g, or 3.0 psf (0.14 kPa) for S_{DS} of 3.0 g.

1405.18.2.2 Offset siding attachment. When an airspace separates the siding from direct contact with the foam plastic sheathing, the approved weather coverings shall be attached in accordance with Chapter 14 to minimum 1x3 wood furring strips placed over the foam sheathing. Furring shall be attached through the foam sheathing to wall framing in accordance with Table 1405.18.2.2. When placed horizontally, wood furring strips shall be preservative treated wood in accordance with Section 2303.1.8 or naturally durable wood and fasteners shall be corrosion resistant in accordance with Section 2304.9.5.

Exception: Furring strips shall not be required over foam plastic sheathing behind anchored stone and masonry veneer installed in accordance with Section 1405.6. Veneer ties shall be installed on the surface of the foam plastic sheathing with fasteners of sufficient length to pass through the thickness of foam plastic sheathing and penetrate framing to provide required pull-out resistance determined in accordance with Chapter 16.

TABLE 1405.18.2.2
FASTENING REQUIREMENTS FOR WOOD FURRING OVER FOAM PLASTIC SHEATHING[1,2,3]

Fastener Type	Minimum Penetration into Wall Framing (inches)	Fastener Spacing in Furring[4] (inches)	Maximum Thickness of Foam Sheathing[5] (inches)	16"oc FURRING Maximum Wind Speed (mph)			24"oc FURRING Maximum Wind Speed (mph)		
				Exposure B	Exposure C	Exposure D	Exposure B	Exposure C	Exposure D

#8 wood screw	1	12	3	140	120	110	140	120	110
		16	2	140	120	110	140	120	110
¼" lag screw[6]	1-1/2	24	3	140	120	110	140	120	110

For SI: 1" = 25.4 mm; 1 mph = 1.609 km/h
DR = design required

1. Furring strips shall be spaced a maximum of 24"oc in a vertical or horizontal orientation. Table values are based on minimum ¾-inch (19.1 mm) thick furring strip and wood studs of Spruce-Pine-Fir or any softwood species with a specific gravity of 0.42 or greater per AFPA/NDS.
2. Tabulated maximum wind speed values are based on a mean roof height of 30-feet (9.1 m). Multiply maximum wind speed by 0.95 for a mean roof height of 45 feet (13.7 m) or 0.9 for a mean roof height of 60 feet (18.3 m). For greater mean roof heights, an approved design shall be required.
3. Where minimum required siding fastener penetration exceeds ¾ inch (19.1 mm), a minimum 2x furring strip shall be used unless approved deformed shank siding nails or siding screws are used to provide equivalent withdrawal strength.
4. In a vertical orientation, furring strips shall be located over wall studs and attached with the required fastener spacing. In a horizontal orientation, furring strips shall be fastened at each stud intersection with a number of fasteners equivalent to the required fastener spacing. In no case shall fasteners be spaced more than 24 inches (0.6 m) apart.
5. Maximum foam sheathing thickness values are based on a maximum 24-inch (0.6 m) stud spacing, a maximum siding dead load of 11 psf (0.53 kPa), and S_{DS} per Section 1613.5.4 not exceeding 0.83g. Siding dead load shall not exceed 8 psf (0.39 kPa) for and S_{DS} of 1.17g, 6 psf (0.29 kPa) for S_{DS} of 1.5g, or 3.0 psf (0.14 kPa) for S_{DS} of 3.0 g.
6. Lag screws shall be installed with a standard cut washer and shall be pre-drilled in accordance with AF&PA NDS-05. Approved self-drilling screws of equal or greater shear and withdrawal strength shall be permitted without pre-drilling.

4. Revise as follows:

1405.14.1 Application. The siding shall be applied over sheathing or materials listed in Section 2304.6 or foam plastic sheathing in accordance with Sections 1405.14.2 and 1405.18. Siding shall be applied to conform with the water-resistive barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with approved manufacturer's instructions. Unless otherwise specified in the approved manufacturer's instructions, nails used to fasten the siding and accessories shall have a minimum 0.313-inch (7.9 mm) head diameter and 1/8-inch (3.18 mm) shank diameter. The nails shall be corrosion resistant and shall be long enough to penetrate the studs or nailing strip at least 3/4 inch (19 mm). Where the siding is installed horizontally, the fastener spacing shall not exceed 16 inches (406 mm) horizontally and 12 inches (305 mm) vertically. Where the siding is installed vertically, the fastener spacing shall not exceed 12 inches (305 mm) horizontally and 12 inches (305 mm) vertically.

5. Add new text as follows:

1405.14.2 Foam Plastic Sheathing. Vinyl siding used with foam plastic sheathing shall be installed in accordance with 1405.14.2.1, 1405.14.2.2., and 1405.14.2.3.

Exception: Where the foam plastic sheathing is applied directly over wood structural panels, fiberboard, gypsum sheathing, or other approved backing capable of independently resisting the design wind pressure, the vinyl siding shall be installed in accordance with 1405.14.1.

1405.14.2.1 Basic Wind Speed Not Exceeding 90 mph and Exposure Category B. Where the basic wind speed does not exceed 90 mph, the Exposure Category is B and gypsum wall board or equivalent is installed on the side of the wall opposite the foam plastic sheathing, the minimum siding fastener penetration into wood framing shall be 1-1/4 inches (32 mm) using minimum 0.120-inch diameter nail (shank) with a minimum 0.313-inch diameter head, and fastened 16 inches on center. The foam plastic sheathing shall comply with Section 1405.18.1 and shall not exceed a maximum thickness of 1.5 inches (38 mm) for a 0.120-inch diameter nail or 2.0 inches (51 mm) for a 0.135-inch diameter nail. Vinyl siding shall be permitted to be installed on furring strips in accordance with Section 1405.18.2.2 and the siding manufacturer's installation instructions when foam plastic sheathing thickness complies with Section 1405.18.1.

1405.14.2.2 Basic Wind Speed Exceeding 90mph or Exposure Categories C and D. Where the basic wind speed exceeds 90 mph or the Exposure Category is C or D, or all conditions of 1405.14.2.1 are not met, the adjusted design pressure rating for the assembly shall meet or exceed the wind loads required by Chapter 16. The design wind pressure rating of the vinyl siding for installation over solid sheathing as provided in the vinyl siding manufacturer's product specifications shall be adjusted for the following wall assembly conditions:

1. For wall assemblies with foam plastic sheathing on the exterior side and minimum ½-inch (12.7 mm) thick gypsum wall board or equivalent on the interior side of the wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.39.
2. For wall assemblies with foam plastic sheathing on the exterior side and no gypsum wall board or equivalent on the interior side of wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.27.

   Exception: The above adjustments shall not apply when vinyl siding is attached to wood furring strips installed over the foam plastic sheathing in accordance with Section 1405.18.2.2 and such installation is in accordance with the vinyl siding manufacturer's installation instructions.

1405.14.2.3 Manufacturer Specification. Where the vinyl siding manufacturer's product specifications provide an approved design wind pressure rating for installation over foam plastic sheathing, use of this design wind pressure rating shall be permitted and the siding shall be installed in accordance with the manufacturer's installation instructions.

6. Revise as follows:

2304.6 Wall sheathing. Except as provided for in Section 1405 for weatherboarding or where stucco construction that complies with Section 2510 is installed, enclosed buildings shall be sheathed with one of the materials of the nominal thickness specified in Table 2304.6, foam sheathing in accordance with Section 1405.18, or any other approved material of equivalent strength and durability.

PART II – IRC BUILDING/ENERGY

1. Add new text as follows:

R703.3 Foam plastic sheathing. Foam plastic sheathing used in exterior wall covering assemblies shall comply with this section, Section R316, Chapter 11 and the manufacturer's installation instructions.

R703.3.1 Minimum thickness. The thickness of foam plastic sheathing shall comply with Table R703.3.1.

Exception: Where foam plastic sheathing is applied directly over or behind wall sheathing or other solid substrate capable of separately resisting the required wind pressure, the limitations of Table R703.3.1 shall not apply.

TABLE R703.3.1
REQUIREMENTS FOR FOAM PLASTIC SHEATHING
IN EXTERIOR WALL COVERING ASSEMBLIES[1,2]

Foam Plastic Sheathing Material[3]	Foam Sheathing Thickness (in)[3]	Maximum Wind Speed (mph) – Exposure B[4]			
		Walls with Interior Finish[5]		Walls without Interior Finish

	¾"	95	NP	NP	NP
	1"	125	85	105	NP
	≥1-1/2"	130	120	130	100

For SI: 1 inch = 25.4 mm, 1 mile per hour = 1.609 km/h

NP = not permitted

1. Tabulated maximum wind speed values are based on a mean roof height of 30-feet (9.1 m). Multiply maximum wind speed by 0.95 for a mean roof height of 45 feet (13.7 m).

2. Foam plastic sheathing panels shall be permitted to be oriented parallel or perpendicular to framing members.
3. Foam plastic sheathing shall meet or exceed the following material standards: Expanded Polystyrene (EPS) – ASTM C578 (Type II, min.1.35 lb/ft^3 density), Polyisocyanurate – ASTM C1289 (Type 1, min.), and extruded polystyrene (XPS) – ASTM C578 (Type X, min. 1.30 lb/ft^3 density). Where a "faced" product is indicated, a facer shall be provided on both faces of the foam plastic sheathing. Where facing is not indicated in the table, faced and unfaced foam plastic sheathing shall be permitted. For all foam plastic sheathing products, approved manufacturer data shall be permitted in lieu of the table requirements.
4. Multiply tabulated maximum wind speed by 0.85 for wind exposure C or by 0.78 for wind exposure D.
5. Interior finish shall be minimum 1/2-inch (12.7 mm) thick gypsum wall board or an approved product with equivalent or greater out-of-plane bending strength and stiffness.

R703.3.2 Siding attachment over foam sheathing. Siding shall be attached over foam sheathing in accordance with Section R703.3.2.1, Section R703.3.2.2, or an approved design. In no case shall the siding material be used in a manner that exceeds its application limits.

Exception: Where the siding manufacturer has provided installation instructions for application over foam sheathing, those requirements shall apply.

R703.3.2.1 Direct siding attachment. Siding installed directly over foam sheathing without separation by an air space shall comply with Table R703.3.2.1 in regard to nail diameter, penetration, and nail spacing for the applicable foam sheathing thickness and wind speed condition. The siding fastener and siding installation shall otherwise comply with Section R703.4 and Table R703.4.

Exceptions:

1. For vinyl siding, refer to Section R703.11.2.
2. For exterior insulation and finish systems, refer to Section R703.9.
3. For adhered veneer, refer to Section R703.12.

TABLE R703.3.2.1
FASTENING REQUIREMENTS FOR DIRECT SIDING ATTACHMENT OVER FOAM PLASTIC SHEATHING[1,2]

Minimum Nail Diameter[3] (inches)	Nail Spacing along Stud[4] (inches)	Maximum Foam Sheathing Thickness[5] (inches)	16"oc WALL FRAMING Maximum Wind Speed (mph)			24"oc WALL FRAMING Maximum Wind Speed (mph)

	8	3	140	120	110	110	90	85
	12	2	110	90	85	90	DR	DR

For SI: 1 inch = 25.4 mm; 1 mph = 1.609 km/h
DR = design required

1. Maximum wind speed values are based on a minimum 1-1/4 inch (31.8 mm) penetration of a smooth shank nail fastener into wood framing of Spruce-Pine-Fir or any wood species with a specific gravity of 0.42 or greater in accordance with AFPA/NDS.
2. Tabulated maximum wind speed values are based on a mean roof height of 30-feet (9.1 m). Multiply maximum wind speed by 0.95 for a mean roof height of 45 feet (13.7 m).
3. Nail fasteners shall comply with ASTM F1667, except nail length shall be permitted to exceed ASTM F1667 standard lengths to provide a minimum 1-1/4 inch (31.8 mm) penetration into wood framing. Specified nails in accordance with Section R703.4 or the siding manufacturer's installation instructions shall meet all other requirements in ASTM F1667 or be otherwise approved for the intended application.
4. 'Nail spacing along stud' refers to spacing of siding fasteners in the vertical direction. A minimum of one fastener shall be applied at each intersection of an individual siding member with a wall stud.
5. Maximum foam sheathing thickness values are based on a maximum 24-inch (0.6 m) stud spacing and a maximum siding dead load of 11 psf (0.53 kPa) based on 7/8-inch (22 mm) thick Portland cement plaster, For Seismic Design Category D2, the maximum siding dead load shall be 8 psf.

R703.3.2.2 Offset siding attachment. When an airspace separates the siding from direct contact with the foam plastic sheathing, the siding shall be attached in accordance with Section R703.4 and Table R703.4 to minimum 1x3 wood furring strips placed over the foam sheathing. Furring shall be attached through the foam sheathing to wall framing in accordance with Table R703.3.2.2. When placed horizontally, wood furring strips shall be preservative treated wood or naturally durable wood and fasteners shall be corrosion resistant in accordance with Section R317.

Exception: Furring strips shall not be required over foam plastic sheathing located behind anchored stone and masonry veneer installed in accordance with Section R703.7. Veneer ties shall be installed in accordance with Section R703.7.4.1.

TABLE R703.3.2.2
FASTENING REQUIREMENTS FOR WOOD FURRING OVER FOAM PLASTIC SHEATHING[1,2,3]

Fastener Type	Minimum Penetration into Wall Framing (inches)	Fastener Spacing in Furring[4] (inches)	Maximum Thickness of Foam Sheathing[5] (inches)	16"oc FURRING Maximum Wind Speed (mph)			24"oc FURRING Maximum Wind Speed (mph)

¼" lag screw[6]	1-1/2	24	3	140	120	110	140	120	110

For SI: 1" = 25.4 mm; 1 mph = 1.609 km/h
DR = design required

1. Furring strips shall be spaced a maximum of 24"oc in a vertical or horizontal orientation. Table values are based on minimum ¾-inch (19.1 mm) thick furring strip and wood studs of Spruce-Pine-Fir or any wood species with a specific gravity of 0.42 or greater per AFPA/NDS.
2. Tabulated maximum wind speed values are based on a mean roof height of 30-feet (9.1 m). Multiply maximum wind speed by 0.95 for a mean roof height of 45 feet (13.7 m).
3. Where minimum required siding fastener penetration exceeds ¾ inch (19.1 mm), a minimum 2x furring strip shall be used unless approved deformed shank siding nails or siding screws are used to provide equivalent withdrawal strength.
4. In a vertical orientation, furring strips shall be located over wall studs and attached with the required fastener spacing. In a horizontal orientation, furring strips shall be fastened at each stud intersection with a number of fasteners equivalent to the required fastener spacing. In no case shall fasteners be spaced more than 24 inches (0.6 m) apart.
5. Maximum foam sheathing thickness values are based on a maximum 24-inch (0.6 m) stud spacing and a maximum siding dead load of 11 psf (0.53 kPa) based on 7/8-inch (22 mm) thick Portland cement plaster. For Seismic Design Category D2, the maximum siding dead load shall be 8 psf.
6. Lag screws shall be installed with a standard cut washer and shall be pre-drilled in accordance with AF&PA NDS-05. Approved self-drilling screws of equal or greater shear and withdrawal strength shall be permitted without pre-drilling.

(Renumber subsequent sections)

2. Revise as follows:

R703.4 Attachments. Unless specified otherwise, all wall coverings shall be securely fastened in accordance with Table R703.4 or with other *approved* aluminum, stainless steel, zinc-coated or other *approved* corrosion-resistive fasteners. Additional requirements in accordance with Section R703.3.2 shall apply when siding is installed over foam sheathing. Where the basic wind speed per Figure R301.2(4) is 110 miles per hour (49 m/s) or higher, the attachment of wall coverings shall be designed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3).

TABLE R703.4
WEATHER–RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL		NOMINAL THICKNESS[a] (inches)	JOINT TREATMENT	WATER RESISTIVE BARRIER REQUIRED	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS[b,c,d]

For SI: 1 inch = 25.4 mm.

a. Based on stud spacing of 16 inches on center where studs are spaced 24 inches, siding shall be applied to sheathing approved for that spacing.

b. Nail is a general description and shall be T-head, modified round head, or round head with smooth or deformed shanks.

c. Staples shall have a minimum crown width of 7/16-inch outside diameter and be manufactured of minimum 16 gage wire.

d. Nails or staples shall be aluminum, galvanized, or rust-preventative coated and shall be driven into the studs where for fiberboard, or gypsum, or foam plastic sheathing backing is used

e. Aluminum nails shall be used to attach aluminum siding.
f. Aluminum (0.019 inch) shall be unbacked only when the maximum panel width is 10 inches and the maximum flat area is 8 inches. The tolerance for aluminum siding shall be +0.002 inch of the nominal dimension.
g. All attachments shall be coated with a corrosion-resistant coating.
h. Shall be of approved type.
i. Three-eighths-inch plywood shall not be applied directly to studs spaced more than 16 inches on center when long dimension is parallel to studs. Plywood 1/2-inch or thinner shall not be applied directly to studs spaced more than 24 inches on center. The stud spacing shall not exceed the panel span rating provided by the manufacturer unless the panels are installed with the face grain perpendicular to the studs or over sheathing approved for that stud spacing.
j. Wood board sidings applied vertically shall be nailed to horizontal nailing strips or blocking set 24 inches on center. Nails shall penetrate 1 1/2 inches into studs, studs and wood sheathing combined or blocking. For application over foam sheathing, refer to Section R703.3.2.2. combined or blocking.
k. Hardboard siding shall comply with CPA/ANSI A135.6.
l. Vinyl siding shall comply with ASTM D 3679.
m. Minimum shank diameter of 0.092 inch, minimum head diameter of 0.225 inch, and nail length must accommodate sheathing and penetrate framing 1 1/2 inches. For application over foam sheathing, minimum shank diameter and penetration into framing shall comply with Section R703.3.2.
n. When used to resist shear forces, the spacing must be 4 inches at panel edges and 8 inches on interior supports.
o. Minimum shank diameter of 0.099 inch, minimum head diameter of 0.240 inch, and nail length must accommodate sheathing and penetrate framing 1 1/2 inches. For application over foam sheathing, minimum shank diameter and penetration into framing shall comply with Section R703.3.2.
p. Vertical end joints shall occur at studs and shall be covered with a joint cover or shall be caulked.
q. See Section R703.10.1.
r. Fasteners shall comply with the nominal dimensions in ASTM F 1667. For application over foam sheathing, refer to Section R703.3.2
s. See Section R703.10.2.
t. Face nailing: one 6dcommonnail through the overlapping planks at each stud. Concealed nailing: one 11 gage 11/2 inch long galv. roofing nail through the top edge of each plank at each stud.
u. See Section R703.2 exceptions.
v. Minimum nail length must accommodate sheathing and penetrate framing 11/2 inches. For application over foam sheathing, refer to Section R703.3.2
w. Adhered masonry veneer shall comply with the requirements of Section R703.6.3 and shall comply with the requirements in Sections 6.1 and 6.3 of ACI 530/ASCE 5/TMS-402.
x. Vertical joints, if staggered shall be permitted to be away from studs if applied over wood structural panel sheathing.
y. Minimum fastener length must accommodate sheathing and penetrate framing .75 inches or in accordance with the manufacturer's installation instructions. For application over foam sheathing, fastener penetration into framing shall comply with Section R703.3.2.
z. Where approved by the manufacturer's instructions or test report siding shall be permitted to be installed with fasteners penetrating not less than .75 inches throughwood orwood structural sheathing with or without penetration into the framing.
aa. Refer to Section R703.3 for additional requirements.
bb. For siding application over foam sheathing, fastener spacing shall comply with the more stringent requirement of this table or Section R703.3.2.

R703.5.1 Application. Wood shakes or shingles shall be applied either single-course or double-course over nominal 1/2-inch (13 mm) wood-based sheathing or to furring strips over nominal 1/2-inch (13 mm) nonwood sheathing.

Exception: Wood shakes or shingles over foam plastic sheathing, shall be applied to wood furring strips in accordance with Section R703.3.2.2.

A permeable water-resistive barrier shall be provided in accordance with Section R703.2 over all sheathing, with horizontal overlaps in the membrane of not less than 2 inches (51mm) and vertical overlaps of not less than 6 inches (152 mm). Where furring strips are used, they shall be 1 inch by 3 inches or 1 inch by 4 inches (25mmby 76 mm or 25mm by 102 mm), and shall be fastened horizontally to the studs with 7d or 8d box nails. For application over foam plastic sheathing, furring strips shall be fastened in accordance with Section R703.3.2.2. and Furring strips shall be spaced a distance on center equal to the actual weather exposure of the shakes or shingles, not to exceed the maximum exposure specified in Table R703.5.2. The spacing between adjacent shingles to allow for expansion shall not exceed 1/4 inch (6 mm), and between adjacent shakes, it shall not exceed 1/2 inch (13 mm). The offset spacing between joints in adjacent courses shall be a minimum of 11/2 inches (38 mm).

R703.6.1 Lath. All lath and lath attachments shall be of corrosion-resistant materials. Expanded metal or woven wire lath shall be attached with 1 1/2-inch-long (38 mm), 11 gage nails having a 7/16-inch (11.1 mm) head, or 7/8-inch-long (22.2 mm), 16 gage staples, spaced at no more than 6 inches (152 mm), or as otherwise *approved*. For application of maximum 7/8-inch-thick Portland cement plaster over foam plastic sheathing, nail length and shank diameter shall comply with Section R703.3.2.

R703.7.4.1 Size and spacing. Veneer ties, if strand wire, shall not be less in thickness than No. 9 U.S. gage [(0.148 in.) (4 mm)] wire and shall have a hook embedded in the mortar joint, or if sheet metal, shall be not less than No. 22 U.S. gage by [(0.0299 in.)(0.76 mm)] 7/8 inch (22 mm) corrugated. Each tie shall be spaced not more than 24 inches (610 mm) on center horizontally and vertically and shall support not more than 2.67 square feet (0.25 m2) of wall area. For application over foam plastic sheathing, corrugated metal ties shall be fastened through the foam plastic sheathing using a 10d common nail with a minimum penetration of 1 1/2 inches (38 mm) into wood framing for a maximum wind condition of 90 miles per hour (40 m/s) in wind exposure B. For a basic wind speed not exceeding

110 miles per hour (49 m/s) in any wind exposure and in Seismic Design Categories C, D_0, D_1, and D_2, a #8 wood screw with a minimum 1 inch (25.4 mm) penetration into wood wall framing shall be used in each tie. Alternatively, an approved fastener with equivalent withdrawal strength shall be permitted.

Exception: In Seismic Design Category D_0, D_1 or D_2 or townhouses in Seismic Design Category C or in wind areas of more than 30 pounds per square foot pressure (1.44 kPa), each tie shall support not more than 2 square feet (0.2 m2) of wall area.

R703.11.2 Foam plastic sheathing. Vinyl siding used with foam plastic sheathing shall be installed in accordance with Section R703.11.2.1, R703.11.2.2, or R703.11.2.3.

Exception: Where the foam plastic sheathing is applied directly over wood structural panels, fiberboard, gypsum sheathing or other *approved* backing capable of independently resisting the design wind pressure, the vinyl siding shall be installed in accordance with Section R703.11.1.

R703.11.2.1 Basic wind speed not exceeding 90 miles per hour and Exposure Category B. Where the basic wind speed does not exceed 90 miles per hour (40 m/s), the Exposure Category is B and gypsum wall board or equivalent is installed on the side of the wall opposite the foam plastic sheathing, the minimum siding fastener penetration into wood framing shall be 11/4 inches (32 mm) using minimum 0.120-inch diameter nail (shank) with a minimum 0.313-inch diameter head, 16 inches on center. The foam plastic sheathing minimum thickness shall comply with Section R703.3.1 and shall not exceed a maximum thickness of 1.5 inches (38mm) for a 0.120-inch diameter nail or 2.0 inches (51 mm) for a 0.135-inch diameter nail. shall be 1/2-inch-thick (12.7 mm) (nominal) extruded polystyrene per ASTM C578, 1/2-inch-thick (12.7 mm) (nominal) polyisocyanurate per ASTM C1289, or 1-inch-thick (25 mm)(nominal) expanded polystyrene per ASTM C578. Vinyl siding shall be permitted to be installed on furring strips in accordance with Section 1405.18.2.2 using the siding manufacturer's installation instructions when foam plastic sheathing thickness complies with Section1405.18.1.

R703.11.2.2 Basic wind speed exceeding 90 miles per hour or Exposure Categories C and D. Where the basic wind speed exceeds 90 miles per hour (40 m/s) or the Exposure Category is C or D, or all conditions of Section R703.11.2.1 are not met, the adjusted design pressure rating for the assembly shall meet or exceed the loads listed in Tables R301.2(2) adjusted for height and exposure using Section R301.2(3). The design wind pressure rating of the vinyl siding for installation over solid sheathing as provided in the vinyl siding manufacturer's product specifications shall be adjusted for the following wall assembly conditions:

1. For wall assemblies with foam plastic sheathing on the exterior side and minimum ½-inch-thick gypsum wall board or equivalent on the interior side of the wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.39.
2. For wall assemblies with foam plastic sheathing on the exterior side and no gypsum wall board or equivalent on the interior side of wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.27.

   Exception: The above adjustments shall not apply when vinyl siding is attached to wood furring strips installed over the foam plastic sheathing in accordance with Section R703.3.2.2 and such installation is in accordance with the vinyl siding manufacturer's installation instructions.

R703.11.2.3 Manufacturer specification. Where the vinyl siding manufacturer's product specifications provide an *approved* design wind pressure rating for installation over foam plastic sheathing, use of this design wind pressure rating shall be permitted and the siding shall be installed in accordance with the manufacturer's installation instructions.

Reason:

Part I-As with a related IRC proposal, this proposal is a comprehensive clarification and upgrading of requirements for foam plastic sheathing and siding installation over foam plastic sheathing. It primarily addresses adequate foam sheathing thickness and siding attachment over foam sheathing to resist a range of design wind load conditions, beyond which design is required or installation in accordance with manufacturer instructions specific to application of siding over foam sheathing. It also provides siding connections through foam sheathing that provide adequate support to resist the dead load of siding installed over foam sheathing and limits the siding weight, particularly in higher seismic conditions (beyond which design is required or approved installation guidelines). As a whole, these provisions are necessary to ensure appropriate use of foam sheathing and siding materials together on exterior wall assemblies in a way that best compliments existing exterior wall covering provisions in Chapter 14. A detailed explanation of the test data and analysis justifying the proposed requirements can be found at www.foamsheathing.org.

In support of proposed new Section 1405.18.1, the wind pressure resistance of foam sheathing used in this proposal is based on certified full-scale (4'x8' panel) testing conducted at the NAHB Research Center, Inc. Samples included specimens from various manufacturers representing the industry at large. The design wind speed data (without rounding or capping values) is shown in the table below for informational purposes. The values in the proposed table have been rounded to the nearest 5 mph increment and capped at 130 mph (Exposure B) which corresponds to a maximum wind speed of 110 mph in exposure C or 100 mph Exposure D. This proposal is needed to avoid potential exclusion of foam sheathing products due to the incompleteness of current code requirements which can negatively affect other concerns such as energy conservation code

requirements and green building interests. Most importantly, these requirements will ensure that foam sheathing is used appropriately to prevent building envelope damage, particularly in higher wind conditions and with thinner material used on more widely spaced studs (e.g., 24"oc center on gable roof ends which typically have no interior finish). These requirements also agree reasonably well with the generally successful use of foam sheathing on typical wall assemblies (e.g., 16"oc framing or 24"oc framing with interior finish) on many buildings in lower wind regions of the U.S.

TABLE R703.3.1- Part A (Actual design values based on test data – not rounded or capped as in the proposal)
MAXIMUM WIND SPEED (mph – 3 SECOND GUST) PERMITTED
FOR FOAM PLASTIC SHEATHING
WITH DIRECTLY ATTACHED SIDING PER SECTION R703.3.2.1

Foam Sheathing Material[3]	Foam Sheathing Nominal Thickness (in)	Maximum Wind Speed (mph) – Exposure B[4]			
		Walls with Interior Finish[5]		Walls without Interior Finish	
		16"oc framing	24"oc framing	16"oc framing	24"oc framing
EPS	¾" (unfaced)	110	73	92	61
	1" (unfaced)	147	98	123	82
	1-1/2" (unfaced)	222	148	186	124
Polyiso-cyanurate	½" (faced)	136	91	114	76
	¾" (faced)	177	118	148	99
	1" (faced)	193	129	162	108
	1-1/2" (faced)	207	138	173	116

	¾" (unfaced)	109	73	91	61
	1" (unfaced)	145	97	121	81
	1-1/2" (unfaced)	208	139	174	116

Design value based on the minimum tested uniform pressure capacity for each sheathing type and thickness category divided by a safety factor of 1.5 and ASCE 7-05 positive pressure design loads for wall corner zone and a 10 sq ft wind effective area (negative pressure is resisted by the foam sheathing and siding assembly). Because the 1.5 safety factor is applied to a minimum test value (not the average), these requirements are more stringent than safety margins required for other building envelop components such as doors and windows which are also important to envelope integrity. This "minimum test value" basis also serves to better control safety margins with regard to variability in material properties or performance.

TABLE R703.3.1 – Part B (Actual design values based on test data – not rounded or capped as in the proposal)
MAXIMUM WIND SPEED (mph – 3 SECOND GUST) PERMITTED
FOR FOAM PLASTIC SHEATHING
WITH FURRED SIDING PER SECTION R703.3.2.2[1]

Foam Plastic Sheathing Material[2]	Foam Sheathing Nominal Thickness (in)[2]	Maximum Wind Speed (mph) – Exposure B[3,4]			
		Walls with Interior Finish[5]		Walls without Interior Finish

	¾" (faced)	153	102	128	85
	1" (faced)	167	112	140	93
	≥1-1/2" (faced)	179	120	150	100
XPS	½" (faced)	108	72	91	61
	¾"	94	63	79	53
	1"	126	84	105	70
	≥1-1/2"	180	120	151	101

Design value based on the minimum tested uniform pressure capacity for each sheathing type and thickness category divided by a safety factor of 1.5 and ASCE 7-05 negative pressure design loads for wall corner zone and a 10 sq ft wind effective area. Because the siding is spaced away from foam sheathing in this wall covering assembly condition, it does not contribute to foam sheathing resistance. Thus, the foam sheathing must independently resist the negative wind pressure load. The furring strips provide adequate bearing at connection to secure the foam sheathing as well as the siding material.

In support of proposed new Section 1405.18.2, the generalized connection requirements for siding over foam sheathing are based on an analysis using the AF&PA NDS-2005 connection design provisions in consideration of withdrawal to resist wind pressure and shear strength to resist siding dead load. To account for the "gap" in the connection caused by the presence of foam sheathing, the provisions of AF&PA TR12 were used to downgrade connection strength based on the thickness of foam sheathing (i.e., width of gap in the connection). The design shear strength was based on calculated ultimate capacity divided by a safety factor of 2 while conservatively ignoring any benefit of the foam material filling the gap in the siding or furring connection to wall framing. Wind loads were based on application of the full ASCE 7-05 components and cladding wind pressure applied to the exterior wall covering while conservatively ignoring any distribution of wind pressure to other wall layers. In addition, the wind pressures were based on the most stringent wall corner zone condition and an effective wind area of 10 sq ft.

Addition of new Section 1405.14.2 provides special requirements and limitations for use of foam plastic sheathing with vinyl siding. The proposed changes are consistent approved changes now included in the 2009 IRC. These changes are needed to ensure appropriate use of vinyl siding wind pressure ratings when foam sheathing is used, thus preventing inadequate performance.

Limited changes to other parts of the code are made in coordination with the above improvements.

Part II- As with a related IBC proposal, this proposal is a comprehensive clarification and upgrading of requirements for foam sheathing and siding installation over foam sheathing. It primarily addresses adequate foam sheathing thickness and siding attachment over foam sheathing to resist design wind loads within the scope of the IRC (e.g., up to 110 mph, Exposure D). It also provides siding connections through foam sheathing that provide adequate support to resist the dead load of siding installed over foam sheathing. As a whole, these provisions are necessary to ensure appropriate use of foam sheathing and siding materials together on exterior wall assemblies in a way that best compliments existing exterior wall covering provisions in Section R703 of the code. A detailed explanation of the test data and analysis justifying the proposed requirements can be found at www.foamsheathing.org.

In support of proposed new Section R703.3.1, the wind pressure resistance of foam sheathing used in this proposal is based on certified full-scale (4'x8' panel) testing conducted at the NAHB Research Center, Inc. Samples included specimens from various manufacturers representing the industry at large. The design wind speed data (without rounding or capping values) is shown in the table below for informational purposes. The

values in the proposed table have been rounded to the nearest 5 mph increment and capped at 130 mph (Exposure B) as this corresponds to a maximum wind speed of 110 mph in exposure C, which is essentially the scope limit of the IRC. This proposal is needed to avoid potential exclusion of foam sheathing products due to the incompleteness of current code requirements which can negatively affect other concerns such as energy conservation code requirements and green building interests. Most importantly, these requirements will ensure that foam sheathing is used appropriately to prevent building envelope damage, particularly in higher wind conditions and with thinner material used on more widely spaced studs (e.g., 24"oc center on gable roof ends which typically have no interior finish). These requirements also agree reasonably well with the generally successful use of foam sheathing on typical wall assemblies (e.g., 16"oc framing or 24"oc framing with interior finish) on many homes in lower wind regions of the U.S.

Because the siding is spaced away from foam sheathing in this wall covering assembly condition, it does not contribute to foam sheathing resistance. Thus, the foam sheathing must independently resist the negative wind pressure load. The furring strips provide adequate bearing at connection to secure the foam sheathing as well as the siding material.

In support of proposed new Section R703.3.2, the generalized connection requirements for siding over foam sheathing are based on an analysis using the AF&PA NDS-2005 connection design provisions in consideration of withdrawal to resist wind pressure and shear strength to resist siding dead load. To account for the "gap" in the connection caused by the presence of foam sheathing, the provisions of AF&PA TR12 were used to downgrade connection strength based on the thickness of foam sheathing (i.e., width of gap in the connection). The design shear strength was based on calculated ultimate capacity divided by a safety factor of 2 while conservatively ignoring any benefit of the foam material filling the gap in the siding or furring connection to wall framing. Wind loads were based on application of the full ASCE 7-05 components and cladding wind pressure applied to the exterior wall covering while conservatively ignoring any distribution of wind pressure to other wall layers. In addition, the wind pressures were based on the most stringent wall corner zone condition and an effective wind area of 10 sqft.

Changes to other parts of Section R703, including changes to Table R703.4 and various siding attachment requirements, are made in coordination with the above improvements.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: ASTM standards within this proposed are currently referenced in the I-codes.

FS157–09/10
1406.2, 1406.3, 1406.4, TABLE 1406.2.1.2

Proponent: Rick Thornberry, PE, Jesse J. Beitel, The Code Consortium, Inc., Hughes Associates, Inc., representing Alcan Composites USA, Inc., Trespa North America, Ltd.

Revise as follows:

SECTION 1406
COMBUSTIBLE MATERIALS ON THE EXTERIOR SIDE OF EXTERIOR WALLS

1406.1 General. Section 1406 shall apply to exterior wall coverings; balconies and similar protections: and bay and oriel windows constructed of combustible materials.
1406.2 Combustible exterior wall coverings. Combustible exterior wall coverings shall comply with this section.

Exception: Plastics complying with Chapter 26.

1406.2.2<u>1</u> Type I, II, III and IV construction. On buildings of Type I, II, III and IV construction, exterior wall coverings shall be permitted to be constructed of ~~wood in accordance with Section 1405.5, or other equivalent~~ combustible material<u>s</u>, complying with the following limitations:

1. Combustible exterior wall coverings shall not exceed 10 percent of an exterior wall surface area where the fire separation distance is 5 feet (1524 mm) or less.
2. Combustible <u>exterior wall coverings</u> ~~architectural trim~~ shall be limited to 40 feet (12 192mm) in height above grade <u>plane</u>.
3. Combustible exterior wall coverings constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation shall not be limited in wall surface area where the fire separation distance is 5 feet (1524 mm) or less and shall be permitted up to 60 feet (18 288 mm) in height above grade <u>plane</u> regardless of the fire separation distance.
4. <u>Wood veneers shall comply with Section 1405.5.</u>

1406.2.1<u>.1</u> Ignition resistance. <u>Where permitted by Section 1406.2.1,</u> combustible exterior wall coverings shall be tested in accordance with NFPA 268.

Exceptions:

1. Wood or wood-based products.
2. Other combustible materials covered with an exterior covering other than vinyl sidings listed in Table 1405.2.
3. Aluminum having a minimum thickness of 0.019 inch (0.48 mm).
4. ~~Exterior wall coverings on exterior walls of Type V construction.~~

1406.2.1.1<u>.1</u> Fire separation 5 feet or less. Where installed on exterior walls having a fire separation distance of 5 feet (1524 mm) or less, combustible exterior wall coverings shall not exhibit sustained flaming as defined in NFPA 268.

1406.2.1.<u>1.</u>1.2 Fire separation greater than 5 feet. For fire separation distances greater than 5 feet (1524 mm), any <u>exterior wall covering</u> ~~assembly~~ shall be permitted that has been exposed to a reduced level of incident radiant heat flux in accordance with the NFPA 268 test method without exhibiting sustained flaming. The minimum fire separation distance required for the <u>exterior wall covering</u> ~~assembly~~ shall be determined from Table 1406.2.1.<u>1</u>.2 based on the

maximum tolerable level of incident radiant heat flux that does not cause sustained flaming of the exterior wall covering ~~assembly~~.

Table 1406.2.1.1.2
MINIMUM FIRE SEPARATION FOR COMBUSTIBLE EXTERIOR WALL COVERINGS ~~VENEERS~~
(Potions of Table not shown, remain unchanged)

1406.2.~~3~~2 Location. ~~Where~~ Combustible exterior wall coverings ~~is~~ located along the top of exterior walls~~, such trim~~ shall be completely backed up by the exterior wall and shall not extend over or above the top of the exterior walls~~.~~

1406.2.~~4~~ 3 Fireblocking. Where the combustible exterior wall covering is furred out from the exterior wall and forms a solid surface, the distance between the back of the covering and the wall shall not exceed 1 5/8 inches (41 mm). ~~Where required by Section 717,~~ The concealed space thereby created shall be fireblocked in accordance with Section 717.

1406.3 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated ~~in accordance with~~ where required by Table 601 for floor construction or shall be of Type IV construction in accordance with Section 602.4. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Type I and II construction, three stories or less above grade plane, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood is permitted for pickets and rails or similar guardrail devices that are limited to 42 inches (1067 mm) in height.
3. Balconies, and similar projections on buildings of Types III, IV and V construction shall be permitted to be of Type V construction~~,~~ and shall not be required to have a fire-resistance rating where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.

1406.4 Bay ~~windows~~ and oriel windows. Bay and oriel windows shall conform to the type of construction required for the building to which they are attached.

Exception: Fire-retardant-treated wood shall be permitted on buildings three stories or less above grade plane of Type I, II, III or ~~and~~ IV construction.

Reason: This code change is editorial. It accomplishes a number of things as indicated in the following.

1. It slightly reorganizes the section so that the provisions that permit combustible exterior wall coverings to be installed on exterior walls of buildings of Types I, II, III, and IV construction (current Section 1406.2.2) comes before the section that requires those combustible exterior wall coverings to be tested in accordance with NFPA 268 (current Section 1406.2.1).
2. It clarifies that current Section 1406.2.1 (redesignated as Section 1406.2.1.1 by this code change) applies where combustible exterior wall coverings are permitted by current Section 1406.2.2 (redesignated as Section 1406.2.1 by this code change). The purpose for doing this is so that the users of the code are not misled into thinking that if a combustible exterior wall covering complies with this section, it can be used wherever noncombustible exterior wall coverings are required. In other words, the code has to first permit the use of combustible exterior wall coverings and when that is satisfied, then the combustible exterior wall coverings are required to comply with this section.
3. Current Section 1406.2.1.2 (redesignated as Section 1406.2.1.1.2 by this code change) is editorially revised to utilize the defined term "Exterior Wall Covering" in lieu of "assembly" since the test method is intended to apply to the exterior wall covering.
4. The title to current Table 1406.2.1.2 (redisignated as Table 1406.2.1.1.2 by this code change) is editorially revised to delete the reference to "Veneers" and substitute the term "Exterior Wall Coverings" which, as noted above, is a defined term applicable to this particular section.
5. The charging sentence in current Section 1406.2.2 (redesigated as Section 1406.2.1 by this code change) has been revised to delete the reference to Section 1405.5 and relocate it as a new Item 4 in the list of limitations for the allowable use of combustible materials. We believe this makes more sense to have the requirements for the use of wood veneers on exterior walls of buildings of Type I, II, III, and IV construction referenced in the list of limitations rather than in the charging sentence. The charging sentence should be more general by just referring to combustible materials which are the subject of this section.
6. In current Section 1406.2.2 (redesignated as Section 1406.2.1 by this code change) Item 2 has been clarified to indicate that it applies to all "exterior wall coverings" and not just "architectural trim." It should be noted in the definition for "exterior wall coverings" that architectural trim is included. However, architectural trim is not defined by itself. So it follows that if architectural trim is allowed up to 40 feet in height above grade plane, then any type of combustible exterior wall covering should be so limited as well.
7. The rest of the changes are editorial clarifications without making any technical changes.

In summary, we believe the revisions proposed to this code change will help to clarify the application and interpretation of this section and make it easier to use, as well as to enforce.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Thornberry-FS5-1406

FS158–09/10
1406.2.1.2

Proponent: Don Davies representing Utah Chapter of ICC

Delete without substitution:

~~**1406.2.1.2 Fire separation greater than 5 feet.** For fire separation distances greater than 5 feet (1524 mm), an assembly shall be permitted that has been exposed to a reduced level of incident radiant heat flux in accordance with the NFPA 268 test method without exhibiting sustained flaming. The minimum fire separation distance required for the assembly shall be determined from Table 1406.2.1.2 based on the maximum tolerable level of incident radiant heat flux that does not cause sustained flaming of the assembly.~~

~~TABLE 1406.2.1.2~~
~~MINIMUM FIRE SEPARATION FOR COMBUSTIBLE VENEERS~~

~~FIRE SEPARATION DISTANCE (feet)~~	~~TOLERABLE LEVEL INCIDENT RADIANT HEAT ENERGY(kW/m2)~~	~~FIRE SEPARATION DISTANCE (feet)~~	~~TOLERABLE LEVEL INCIDENT RADIANT HEAT ENERGY(kW/m2)~~
~~5~~	~~12.5~~	~~16~~	~~5.9~~
~~6~~	~~11.8~~	~~17~~	~~5.5~~
~~7~~	~~11.0~~	~~18~~	~~5.2~~
~~8~~	~~10.3~~	~~19~~	~~4.9~~
~~9~~	~~9.6~~	~~20~~	~~4.6~~
~~10~~	~~8.9~~	~~21~~	~~4.4~~
~~11~~	~~8.3~~	~~22~~	~~4.1~~
~~12~~	~~7.7~~	~~23~~	~~3.9~~
~~13~~	~~7.2~~	~~24~~	~~3.7~~
~~14~~	~~6.7~~	~~25~~	~~3.5~~
~~15~~	~~6.3~~		

Reason: Now that I.B.C. Section 705.5 has been changed in the 2009 I.B.C. increasing the fire separation distance from 5 feet to 10 where the fire-resistance of the exterior walls is required on both sides of the wall there is no longer a compelling reason to address radiant heat flux in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Davies-FS1-1406.2.1.2

FS159–09/10
1406.2.4

Proponent: Rick Thornberry, PE, Jesse J. Beitel, The Code Consortium, Inc., Hughes Associates, Inc., representing Trespa North America, Ltd.

Revise as follows:

1406.2.4 Fireblocking. Where the combustible exterior wall covering is furred <u>out</u> from the <u>exterior</u> wall and forms a solid surface, the distance between the back of the <u>exterior wall</u> covering and the <u>exterior</u> wall shall not exceed 1 5/8 inches (41 mm). Where required by Section 717, the <u>concealed</u> space thereby created shall be fireblocked.

> **<u>Exception:</u>** <u>The distance between the back of the exterior wall covering and the exterior wall shall be permitted to exceed 1 5/8 inches (41 mm) where the concealed space is not required to be fireblocked by Section 717.</u>

Reason: Some editorial clarifications are made to Section 1406.2.4 to make the section more enforceable and subject to less interpretation. Also a new Exception is added to allow for the distance between the back of the exterior wall covering and the exterior wall to exceed the 1-5/8 inches limit where the concealed space so created is not required to be fireblocked by Section 717. In our opinion, it follows that if the concealed space does not require fireblocking, there is no need to be concerned about the maximum set off of the exterior wall covering from the face of the exterior wall.

The applicable Exception in Section 717.2.6 is Exception 2 which allows the fireblocking to be omitted when the face of the combustible exterior wall covering exposed to the concealed space is covered by the noncombustible materials listed in that Exception. Furthermore, we have proposed a separate code change which will further modify Section 717.2.6 to add a new Exception 3 that will allow the omission of fireblocking in these concealed spaces when the exterior wall covering has been tested in accordance with NFPA 285 Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Nonload-Bearing Wall Assemblies Containing Combustible Components and has successfully met the acceptance criteria therein. In both those cases there will be little opportunity for a fire in the concealed space to spread via the materials in the concealed space because of their noncombustible coverings or because they successfully passed NFPA 285 to show limited fire and flame spread over the face of, as well as within the interior of, the exterior wall system.

Cost Impact: The code change will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

1. Revise as follows:

1407.10.2 Thermal barriers. MCM shall be separated from the interior of a building by an approved thermal barrier consisting of ½ -inch (12.7 mm) gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275. ~~equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (121°C) after 15 minutes of fire exposure in accordance with the standard time-temperature curve of ASTME 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for not less than 15 minutes based on a test conducted in accordance withUL1715.~~

2603.4 Thermal barrier. Except as provided for in Sections 2603.4.1 and 2603.9, foam plastic shall be separated from the interior of a building by an approved thermal barrier of ½-inch (12.7 mm) gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275. ~~equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (120°C) after 15 minutes of fire exposure, complying with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on FM 4880, UL 1040, NFPA 286 or UL 1715.~~ Combustible concealed spaces shall comply with Section 717.

2. Add new standard to Chapter 35 as follows:

NFPA 275–09	Standard Method of Fire Tests for the Evaluation of Thermal Barriers Used Over Foam Plastic Insulation

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R316.4 Thermal barrier. Unless otherwise allowed in Section R316.5 or Section R316.6, foam plastic shall be separated from the interior of a building by an *approved* thermal barrier of minimum ½ inch (12.7 mm) gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275. ~~an *approved* finish material equivalent to a thermal barrier material that will limit the average temperature rise of the unexposed surface to no more than 250°F (139°C)~~

~~after 15 minutes of fire exposure complying with the ASTM E 119 or UL 263 standard time temperature curve. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on NFPA 286 with the acceptance criteria of Section R302.9.4, FM 4880, UL 1040 or UL 1715.~~

2. Add new standard to Chapter 35 as follows:

NFPA 275–09 Standard Method of Fire Tests for the Evaluation of Thermal Barriers Used Over Foam Plastic Insulation

Reason: The thermal barrier requirement has been in the Codes since the addition of the foam plastics Sections/Chapters in the late 1970's. The Code requirements for a material to be a thermal barrier are vague and imprecise. Over time confusion has occurred relating to the specific test(s) to use and the interpretation of the existing Code language.

The new NFPA 275 "Standard Method of Fire Tests for the Evaluation of Thermal barriers Used Over Foam Plastic Insulation" was developed to specifically address the testing of materials to qualify as a thermal barrier. The test method provides specific sample construction, fire exposures and acceptance criteria to qualify a material to be a 15-minute thermal barrier. The test method address both the capability of the material to retard heat transfer via a fire-resistance test and to remain in place via a full-scale fire test.

Cost Impact: The code change proposal will not increase the cost of construction.
Analysis: Code change proposal FS160 and FS161 address thermal barrier requirements. The committee needs to make its intent clear with respect to these provisions. A review of the standard(s) proposed for inclusion in the code, NFPA 275-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IBC FIRE SAFETY

Proponent: Marcelo M Hirschler (GBH International), representing American Fire Safety Council

1. Revise as follows:

1407.10.2 Thermal barriers. MCM shall be separated from the interior of a building by an approved thermal barrier consisting of $^1/_2$-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material ~~that will limit the average temperature rise of the unexposed surface to not more than 250°F (121°C) after 15 minutes of fire exposure in accordance with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for not less than 15 minutes based on a test conducted in accordance with UL 1715~~.The thermal barrier material shall comply with Section 1407.10.2.1 or 1407.10.2.2.

1407.10.2.1 Temperature transmission and integrity. The thermal barrier material shall comply with the requirements of the temperature transmission fire test and of the integrity fire test in NFPA 275, Standard Method of Fire Tests for the Evaluation of Thermal Barriers Used Over Foam Plastic Insulation.

1407.10.2.2 Temperature transmission and conditions of acceptance. The thermal barrier material shall comply with the temperature transmission test in NFPA 275 and with the conditions of acceptance of UL 1715 when tested in conjunction with the MCM, at the maximum thickness intended for use, for a period of 15 minutes.

2. Revise as follows:

2603.4 Thermal barrier. Except as provided for in Sections ~~2603.4.1~~ 2603.4.3 and 2603.9, foam plastic shall be separated from the interior of a building by an approved thermal barrier of 0.5-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material ~~that will limit the average temperature rise of the unexposed surface to not more than 250°F (120°C) after 15 minutes of fire exposure, complying with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based~~

~~on FM 4880, UL 1040, NFPA 286 or UL 1715~~. The thermal barrier material shall comply with 2603.4.1 or 2603.4.2. Combustible concealed spaces shall comply with Section 717.

2603.4.1 Temperature transmission and integrity. The thermal barrier material shall comply with the requirements of the temperature transmission fire test and of the integrity fire test in NFPA 275, Standard Method of Fire Tests for the Evaluation of Thermal Barriers Used Over Foam Plastic Insulation.

2603.4.2 Temperature transmission and conditions of acceptance. The thermal barrier material shall comply with the temperature transmission test in NFPA 275 and with the conditions of acceptance of FM 4880, UL 1040 or UL 1715 when tested in conjunction with the foam plastic insulation for a period of 15 minutes.

~~2603.4.1~~ 2603.4.3 Thermal barrier not required. *(No change to text)*

(Renumber subsequent sections)

2. Add new standard to Chapter 35

NFPA 275-08	Standard Method of Fire Tests for the Evaluation of Thermal Barriers Used Over Foam Plastic Insulation, 2009 Edition

Reason: NFPA 275 was specifically developed to clarify the test for thermal barrier materials to be used over foam plastic insulation. It contains two tests.

The temperature transmission fire test in NFPA 275 uses the ASTM E 119 (or UL 263) time-temperature fire curve to expose the thermal barrier specimen and it requires the following: "4.8.1 During the 15-minute test period, the average measured temperature rise above the average temperature at the start of the fire test for the thermocouples described in Section 4.3 shall not exceed 250°F (139°C), and the measured temperature rise of any such single thermocouple shall not exceed 325°F (181°C)." Therefore, the temperature transmission fire test in NFPA 275 corresponds to what the code requires now.

The integrity fire test in NFPA 275 requires that the thermal barrier material, together with the foam plastic insulation, be tested to NFPA 286 (which is a 15 minute test) and that the pass/fail criteria are identical to those used for NFPA 286 elsewhere in the code (for example Chapter 8). NFPA 275 explains that when thermal barriers are to be used over MCM, the test specimen must contain the MCM at the maximum thickness intended for use.

The code recognizes at present that thermal barrier materials tested, in conjunction with MCM, to UL 1715 and complying with the conditions of acceptance of this test is acceptable. It should continue to do so. NFPA 275 also states that the integrity fire test can be conducted in accordance with UL 1715 if its pass/fail criteria are used.

With regard to MCM, the code, in section 1407.10.2 recognizes at present that thermal barrier materials tested, in conjunction with MCM, to UL 1715 and complying with the conditions of acceptance of this test, are acceptable. It should continue to do so. NFPA 275 also states that the integrity fire test can be conducted in accordance with UL 1715 if the pass/fail criteria of UL 1715 are used.

With regard to foam plastics, the code recognizes, in section 2603.4, that thermal barrier materials tested, in conjunction with foam plastic insulation, to FM 4880, UL 1040 and UL 1715 and complying with the conditions of acceptance of these tests are equally acceptable. It should also continue to do so. NFPA 275 also states that the integrity fire test can be conducted in accordance with the UL 1715, UL 1040 and FM 4880 alternate test methods, if the pass/fail criteria of those test methods are used.

Note that there is an error in unit conversion in the code since the actual equivalent in degrees centigrade of a temperature rise of 250 ºF is 139 ºC. The equivalent of 250 ºF actual temperature is 121 ºC. This becomes a moot point since the relevant information will now be contained within NFPA 275.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposal FS160 and FS161 address thermal barrier requirements. The committee needs to make its intent clear with respect to these provisions. Standards FM 4480, UL 1040 and UL 1715 are currently referenced in the I-codes. A review of the standard(s) proposed for inclusion in the code, NFPA 275-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-FS8-2603.4

FS162–09/10
1407.10.3

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

1407.10.3 Thermal barrier not required. The thermal barrier specified for MCM in Section 1407.10.2 is not required where:

1. The MCM system is specifically approved based on tests conducted in accordance with NFPA 286 (with the acceptance criteria of Section 803.1.2.1), UL 1040 or UL 1715. Such testing shall be performed with the MCM in the maximum thickness intended for use. The MCM system shall include seams, joints and other typical details used in the installation and shall be tested in the manner intended for use.
2. The MCM is used as elements of balconies and similar projections, architectural trim or embellishments.

Reason: The code recognizes that NFPA 286 is an acceptable test for assessing the fire performance of materials that cannot be properly tested in accordance with ASTM E 84. In fact, NFPA 286 is a more modern test than UL 1715 or UL 1040.

There are three key differences between UL 1715 and NFPA 286: (a) the ignition source is a wood crib in UL 1715 and a gas burner in NFPA 286; (b) NFPA 286 lines the material fully on all three walls and the ceiling of the room while in UL 1715 wall lining is only partial and (c) the pass fail criteria or UL 1715 are qualitative ("During the test, the test specimen shall not project flame through the doorway opening at any time, and flames shall not extend to the extremities of the specimen. The char pattern shall show a decreasing char layer as measured from the fire source to the extremities."), while those for NFPA 286 are contained in the code (in 803.1.2.1) and include heat release, flame spread and smoke (as shown below).

This clearly indicates that a material that complies with the pass fail criteria in the IBC for NFPA 286 will pass the criteria for UL 1715 and therefore NFPA 286 should be allowed as an alternate test. In fact, acceptability for NFPA 286 as an alternate test to UL 1715 is already in the code in 2603.4 and in 2603.9.

This code proposal does not make any changes to the acceptability of materials tested to UL 1715 or to UL 1040.

IBC 803.1.2.1 Acceptance criteria for NFPA 286. During the 40 kW exposure, the interior finish shall comply with Item 1. During the 160 kW exposure, the interior finish shall comply with Item 2. During the entire test, the interior finish shall comply with Items 3 and 4.

1. During the 40kW exposure, flames shall not spread to the ceiling.
2. During the 160 kW exposure, the interior finish shall comply with the following:
2.1. Flame shall not spread to the outer extremity of the sample on any wall or ceiling.
2.2. Flashover, as defined in NFPA 286, shall not occur.
3. The peak rate of heat release throughout the NFPA 286 test shall not exceed 800 kW.
4. The total smoke released throughout the NFPA 286 test shall not exceed 1,000 m^2.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Standard NFPA 286 is currently referenced in the I-codes.

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing Alcan Composites USA, Inc.

1. Revise as follows:

1407.11 Alternate conditions. MCM and MCM systems shall not be required to comply with Sections 1407.10.1 through 1407.10.4 provided such systems comply with Section 1407.11.1, ~~or~~ 1407.11.2, 1407.11.3 or 1407.11.4.

2. Add new text as follows:

1407.11.3 Installations up to 75 feet in height (Option 1). MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1407.11.3.1 through 1407.11.3.5.

Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall be exempt from the height limitation.

1407.11.3.1 Prohibited occupancies. MCM shall not be permitted on buildings classified as Group A-1, A-2, H, I-2 or I-3 occupancies.

1407.11.3.2 Non-fire-resistance-rated exterior walls. MCM shall not be permitted on exterior walls required to have a fire-resistance-rating by other provisions of this code.

1407.11.3.3 Specifications. MCM shall be required to comply with all of the following:

1. MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929.

2. MCM shall have a smoke-developed index of not more than 450 when tested in the maximum thickness intended for use in accordance with ASMT E 84 or UL 723 or a maximum average smoke density rating not greater than 75 when tested in the maximum thickness intended for use in accordance with ASTM D 2843.
3. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D 635:

   Class CC1: Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.

   Class CC2: Materials that have a burning rate of 2 ½ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.

1407.11.3.4 Area limitation and separation. The maximum area of a single MCM panel and the minimum vertical and horizontal separation requirements for MCM panels shall be as provided for in Table 1407.11.3.4. The maximum percentage of exterior wall area of any story covered with MCM panels shall not exceed that indicated in Table 1407.11.3.4 or the percentage of unprotected openings permitted by Section 705.8, whichever is smaller.

Exception: In buildings provided with flame barriers complying with Section 705.8.5 and extending 30 inches (760 mm) beyond the exterior wall in the plane of the floor, a vertical separation shall not be required at the floor other than that provided by the vertical thickness of the flame barrier.

1407.11.3.5 Automatic sprinkler system increases. Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the maximum percentage area of exterior wall of any story covered with MCM panels and the maximum square footage of a single area of MCM panels in Table 1407.11.3.4 shall be increased 100 percent. The area of MCM panels shall not exceed 50 percent of the exterior wall area of any story or the area permitted by Section 704.8 for unprotected openings, whichever is smaller.

TABLE 1407.11.3.4
AREA LIMITATION AND SEPARATION REQUIREMENTS FOR MCM PANELS

FIRE SEPARATION DISTANCE (feet)	COMBUSTIBILITY CLASS OF MCM	MAXIMUM PERCENTAGE AREA OF EXTERIOR WALL COVERED WITH MCM PANELS	MAXIMUM SINGLE AREA OF MCM PANELS (square feet)	MINIMUM SEPARATION OF MCM PANELS (feet)	
				Vertical	Horizontal
Less than 6	---	Not Permitted	Not Permitted	---	---
6 or more but less than 11	CC1	10	50	8	4
	CC2	Not Permitted	Not Permitted	---	---
11 or more but less than or equal to 30	CC1	25	90	6	4
	CC2	15	70	8	4
More than 30	CC1	50	Not Permitted	3[a]	0
	CC2	50	100	6[a]	3

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m^2.
a. For reductions in the minimum vertical separation, see Section 1407.11.3.4.

1407.11.4 Installations up to 75 feet in height (Option 2). MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1407.11.4.1 through 1407.11.4.4.

Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall be exempt from the height limitation.

1407.11.4.1 Minimum fire separation distance. MCM shall not be installed on any wall with a fire separation distance less than 30 feet (9 144 mm).

Exception: Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the fire separation distance shall be permitted to be reduced to not less than 20 feet (6 096 mm).

1407.11.4.2 Specifications. MCM shall be required to comply with all of the following:

1. MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929.
2. MCM shall have a smoke-developed index of not more than 450 when tested in the maximum thicknesses intended for use in accordance with ASMT E 84 or UL 723 or a maximum average smoke density rating not greater than 75 when tested in the maximum thicknesses intended for use in accordance with ASTM D 2843.
3. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D 635:

   Class CC1: Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.

   Class CC2: Materials that have a burning rate of 2 ½ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.

1407.11.4.3 Area and size limitations. The aggregate area of MCM panels shall not exceed 25 percent of the area of any exterior wall face of the story on which it is installed. The area of a single MCM panel installed above the first story above grade plane shall not exceed 16 square feet (1.5 m^2) and the vertical dimension of a single MCM panel shall not exceed 4 feet (1219 mm).

Exception: Where the building is equipped throughout with an automatic sprinkler system is provided throughout in accordance with Section 903.3.1.1, the maximum aggregate area of MCM panels shall be increased to 50 percent of the exterior wall face of the story on which it is installed and there shall not be a limit on the maximum dimension or area of a single MCM panel.

1407.11.4.4 Vertical separations. Flame barriers complying with Section 705.8 and extending 30 inches (762 mm) beyond the exterior wall or a vertical separation of not less than 4 feet (1219 mm) in height shall be provided to separate MCM panels located on the exterior walls at one story intervals.

Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Reason: This code change proposal is a follow up to Code Change FS184-06/07 which we had also submitted on behalf of Alcan Composites USA, Inc. for a previous code development cycle. However, that code change simply provided a direct reference to the light-transmitting plastic Sections (Sections 2607 and 2608) in Chapter 26 with a statement that the MCM panels should be substituted for the light-transmitting plastic wall panels or glazing in those sections. The Comamittee at that time recommended disapproval of the code change because they basically thought it would create confusion by referring to Chapter 26 without more clear guidance on how the MCM panels would replace the light-transmitting plastic wall panels or glazing. But the Committee did indicate that the concept was fine although they thought it would be preferable to bring the provisions from Chapter 26 into Chapter 14 instead of referring to Chapter 26. So that is what this code change proposal has done to respond to the Committee's concerns at that time.

This code change proposal provides for additional alternate conditions under which MCM and MCM systems can be installed on buildings greater than 50 feet in height. Two conditions are allowed which are based on the allowable use of light-transmitting plastics in the exterior walls of buildings in accordance with Section 2607 Light-transmitting Plastic Wall Panels and Section 2608 Light-transmitting Plastic Glazing. These two sections have been in the International Building Code (IBC) since its inception and were basically contained in all three of the legacy model building codes for many years prior to the development of the IBC. Thus, they have a long history of successful fire performance under the previous legacy codes, as well as under the IBC.

It is our belief that if exposed light-transmitting plastics can be used on the exterior walls of buildings under the provisions indicated in those sections, it is reasonable to expect that MCMs which contain a solid plastic core covered by a metal skin, such as aluminum or steel, should perform as well or better. It should be noted that the MCM meet all the requirements necessary to be an approved plastic which is also the requirement for light-transmitting plastics. And the MCM must meet an even more stringent burning limitation than light-transmitting plastics since MCMs are required to be tested in accordance with ASTM E84 or UL 723 to demonstrate a flame spread index not greater than 75 and a smoke-developed index not greater than 450.

Furthermore, it should be noted that the legacy evaluation services evaluated several manufacturers' MCMs based on meeting the criteria for approved light-transmitting plastics and their applications for both wall panels and glazing under the conditions previously allowed for those plastics by the legacy model codes. Those evaluation reports were based on the same concept that the MCMs would perform under fire conditions as well or better than the light-transmitting plastics allowed to be used in the exterior applications indicated above.

Alcan Composites USA, Inc. has a history of over 25 years of experience manufacturing and installing MCMs to meet those code requirements for light-transmitting plastics. To our knowledge, there has not been a fire involving the installation of their products that has resulted in unacceptable performance when installed in accordance with the code. Therefore, we respectfully request the Committee approve this code change proposal to allow for additional applications of MCMs on buildings greater than 50 feet in height.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Thornberry-FS6-1407.11

FS164–09/10
1409 (New)

Proponent: Rick Thornberry, PE, Jesse J. Beitel, The Code Consortium, Inc., Hughes Associates, Inc., representing Trespa North America, Ltd.

1. Add new text as follows:

SECTION 1409
HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATES (HPL)

1409.1 General. The provisions of this section shall govern the materials, construction and quality of High-Pressure Decorative Exterior-Grade Compact Laminates (HPL) for use as exterior wall coverings in addition to other applicable requirements of Chapters 14 and 16.

1409.2 Exterior wall finish. HPL used as exterior wall covering or as elements of balconies and similar projections and bay and oriel windows to provide cladding or weather resistance shall comply with Sections 1409.4 and 1409.14.

1409.3 Architectural trim and embellishments. HPL used as architectural trim or embellishments shall comply with Sections 1409.7 through 1409.14.

1409.4 Structural design. HPL systems shall be designed and constructed to resist wind loads as required by Chapter 16 for components and cladding.

1409.5 Approval. Results of approved tests or an engineering analysis shall be submitted to the building official to verify compliance with the requirements of Chapter 16 for wind loads.

1409.6 Weather resistance. HPL systems shall comply with Section 1403 and shall be designed and constructed to resist wind and rain in accordance with this section and the manufacturer's installation instructions.

1409.7 Durability. HPL systems shall be constructed of approved materials that maintain the performance characteristics required in Section 1409 for the duration of use.

1409.8 Fire-resistance rating. Where HPL systems are used on exterior walls required to have a fire-resistance rating in accordance with Section 705, evidence shall be submitted to the building official that the required fire-resistance rating is maintained.

> **Exception:** HPL systems not containing foam plastic insulation, which are installed on the outer surface of a fire-resistance-rated exterior wall in a manner such that the attachments do not penetrate through the entire exterior wall assembly, shall not be required to comply with this section.

1409.9 Surface-burning characteristics. Unless otherwise specified, HPL shall have a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in the minimum and maximum thicknesses intended for use in accordance with ASTM E 84 or UL 723.

1409.10 Type I, II, III, and IV construction. Where installed on buildings of Type I, II, III and IV construction, HPL systems shall comply with Sections 1409.10.1 through 1409.10.4, or Section 1409.11.

1409.10.1 Surface-burning characteristics. HPL shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested in the minimum and maximum thicknesses intended for use in accordance with ASTM E 84 or UL 723.

1409.10.2 Thermal barriers. HPL shall be separated from the interior of a building by an approved thermal barrier consisting of ½-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (121°C) after 15 minutes of fire exposure in accordance with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for not less than 15 minutes based on a test conducted in accordance with UL 1715.

1409.10.3 Thermal barrier not required. The thermal barrier specified for HPL in Section 1409.10.2 is not required where:

1. The HPL system is specifically approved based on tests conducted in accordance with UL 1040 or UL 1715. Such testing shall be performed with the HPL in the minimum and maximum thicknesses intended for use. The HPL system shall include seams, joints and other typical details used in the installation and shall be tested in the manner intended for use.
2. The HPL is used as elements of balconies and similar projections, architectural trim or embellishments.

1409.10.4 Full-scale tests. The HPL system shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use.

1409.11 Alternate conditions. HPL and HPL systems shall not be required to comply with Sections 1409.10.1 through 1409.10.4 provided such systems comply with Section 1409.11.1 or 1409.11.2.

1409.11.1 Installations up to 40 feet in height. HPL shall not be installed more than 40 feet (12 190 mm) in height above grade plane where installed in accordance with Sections 1409.11.1.1 and 1409.11.1.2.

1409.11.1.1 Fire separation distance of 5 feet or less. Where the fire separation distance is 5 feet (1524 mm) or less, the area of HPL shall not exceed 10 percent of the exterior wall surface.

1409.11.1.2 Fire separation distance greater than 5 feet. Where the fire separation distance is greater than 5 feet (1524 mm), there shall be no limit on the area of exterior wall surface coverage using HPL.

1409.11.2 Installations up to 50 feet in height. HPL shall not be installed more than 50 feet (15 240 mm) in height above grade plane where installed in accordance with Sections 1409.11.2.1 and 1409.11.2.2.

1409.11.2.1 Self-ignition temperature. HPL shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929.

1409.11.2.2 Limitations. Sections of HPL shall not exceed 300 square feet (27.9 m^2) in area and shall be separated by a minimum 4 feet (1219 mm) vertically.

1409.12 Type V construction. HPL shall be permitted to be installed on buildings of Type V construction.

1409.13 Foam plastic insulation. HPL systems containing foam plastic insulation shall also comply with the requirements of Section 2603.

1409.14 Labeling. HPL shall be labeled in accordance with Section 1703.5.

2. Add new definitions as follows:

1402.1 General.

HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATE (HPL). Panels consisting of layers of cellulose fibrous material impregnated with thermosetting resins and bonded together by a high pressure process to form a homogeneous non-porous core suitable for exterior use.

HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATE (HPL) SYSTEM. An exterior wall covering fabricated using HPL in a specific assembly including joints, seams, attachments, substrate, framing and other details as appropriate to a particular design.

Reason: This code change proposes to add an entirely new Section 1409 titled “High-Pressure Decorative Exterior-Grade Laminates (HPL)” which specifies requirements for the installation of high-pressure decorative exterior-grade compact laminates (HPL) when used as exterior wall coverings. This proposed new section parallels Section 1407 on Metal Composite Materials (MCM) which pioneered the code provisions for combustible composite materials used as exterior wall coverings on buildings of all types of construction including Types I, II, III, and IV construction where the walls are required to be noncombustible. MCM complying with Section 1409 have an excellent fire performance record in the field. We believe the basic requirements contained in that section would also be appropriate for regulating HPL to provide the same excellent level of fire safety performance. Trespa North America, Ltd. has conducted tests of its high-pressure decorative exterior-grade compact laminates in accordance with of the provisions of this proposed new section. These tests have demonstrated that Trespa’s exterior wall coverings meet, and even exceed, those requirements including the full-scale fire testing conducted in accordance with NFPA 285.

This code change also contains new definitions for “High-Pressure Decorative Exterior-Grade Compact Laminate (HPL)” and “High-Pressure Decorative Exterior-Grade Compact Laminate (HPL) System” consistent with the definitions for “MCM” and “MCM System.” They are based on the International Standard EN 438.

These systems have been used successfully throughout Europe for the last 35 years with even less fire safety regulations than those proposed in this code change. They are now finding their way into the United States and have gained wide acceptance from the architectural community as being desirable exterior wall claddings for buildings under many different applications including high-rise buildings. These high-pressure decorative exterior-grade compact laminates have been developed in accordance with the International Standard EN 438-2005 High-Pressure Decorative Laminates Part 6 Classification and Specification for Exterior-Grade Compact Laminates of Thickness 2 mm and Greater which specifies the classification, quality, performance and testing of high-pressure decorative exterior-grade compact laminates and Part 7 Compact Laminate and HPL Composite Panels for Internal and External Wall and Ceiling Finishes.

It should also be noted that Trespa North America, Ltd. is not the only manufacturer of these laminates. In fact, Trespa is a member of the International Committee of the Decorative Laminate Industry (ICDLI) which has been in existence for more than 40 years. Currently, there are 14 international members of the ICDLI and of those, 8 manufacture high-pressure decorative exterior-grade compact laminates. So this is certainly not a proprietary code change proposal. More information on the ICDLI can be found by going to their website at www.icdli.com. Of most interest would be the ICDLI Product Data Sheet for High-Pressure Laminates (HPL) dated August, 2008.

Trespa North America, Ltd. testing experience to date, as well as field experience with HPL installations, has shown that its high-pressure decorative exterior-grade compact laminates and systems perform as well as, and even better than, some of the MCM panels and systems currently allowed and regulated by Section 1407. Therefore, we believe it is appropriate to include this new Section 1409 on high-pressure decorative exterior-grade compact laminates (HPL) in the International Building Code at this time.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Thornberry-Beitel-FS10-1409

FS165–09/10
2603.3

Proponent: Mike Ennis, representing Single Ply Roofing Industry (SPRI, Inc.)

Revise as follows:

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame-spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame-spread and smoke-developed indexes.

Exceptions:

1. Smoke-developed index for interior *trim* as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The approved *automatic sprinkler system* shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is part of a Class A, B or C roof covering assembly provided the assembly with the foam plastic insulation satisfactorily passes FM 4450 or UL 1256. The flame spread index and the smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame-spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section 2603.9 using the thickness and density intended for use.
5. Flame-spread and smoke-developed indexes for foam plastic interior signs in *covered mall buildings* provided the signs comply with Section 402.15.

Reason: The exceptions for this section appear to relate to both flame spread and smoke-developed indexes. Testing used to provide Fire Classifications A, B and C evaluate the potential for flame spread when the roof assembly is exposed to a topside fire source. UL 1256 and FM 4450 evaluate fire spread potential when the roof assembly is exposed to a fire source from below. By conducting these tests the flame spread of the roofing assembly containing the foam plastic insulation has already been evaluated. There is no need to have additional flame spread requirements for the foam plastic insulation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENNIS-FS1-2603_3

FS166–09/10
2603.4.1.5, 2603.6

Proponent: Tony Crimi, AC Consulting Solutions Inc., representing North American Insulation Manufacturers Association

Revise as follows:

2603.4.1.5 Roofing. Foam plastic insulation under a roof assembly or roof covering having a smoke-developed index of not more than 450, and ~~that is~~ installed in accordance with the code and the manufacturer's instructions shall be separated from the interior of the building by wood structural panel sheathing not less than 0.47 inch (11.9 mm) in thickness bonded with exterior glue, with edges supported by blocking, tongue-and-groove joints or other approved type of edge support, or an equivalent material. A thermal barrier is not required for foam plastic insulation that is a part of a Class A,B or C roof-covering assembly, provided the assembly with the foam plastic insulation satisfactorily passes FM 4450 or UL 1256.

2603.6 Roofing. Foam plastic insulation meeting the requirements of Sections 2603.2, 2603.3 and 2603.4 and having a smoke-developed index of not more than 450, shall be permitted as part of a roof-covering assembly, provided the assembly with the foam plastic insulation is a Class A, B or C roofing assembly where tested in accordance with ASTM E 108 or UL 790.

Reason: Fires in roofing materials can occur during installation or maintenance of roofing, during the normal course of operations, or during maintenance and installation of building equipment. While ASTM E108 and UL 790 are a means of evaluating fire spread, they do not measure smoke production.

Although roofing materials are installed on the exterior of a building, the smoke from burning roof insulations can be a hazard to both firefighters and the environment. Combustible smoke and off-gassing from combustible insulating materials pose a serious risk to building occupants and firefighters. Excessive quantities of smoke emanating from burning roofing materials also prevent effective firefighting operations, potentially delay response times or the effectiveness of fire fighting operations. There are also documented cases of fires starting in roofing materials causing sprinklers inside the building to activate and cause additional property damage.

Even when a fire is contained within the building, sufficient heat can be generated through a metal roof deck to cause smoldering combustion and smoke release. While a smoke developed index of 450 is consistent with some interior applications, it still represents a limit which most foam plastic insulations can conform with.

Several foam plastic insulation products have direct-to-steel-deck approvals from both FM and UL. FM approval for Class 1 roof systems based on passing FM 4450 and UL 1256. Both of these tests are specifically referenced in the IBC. The International Building Code (IBC) already waives the requirements for a thermal barrier for foam plastic roof insulation used in roof deck construction that complies with FM 4450 or UL 1256. Some minimum smoke developed rating should be maintained.

Cost Impact: This proposal should not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRIMI FS9 AND FS10

FS167–09/10
2603.4.1.5, 2603.4.1.5.1, 2603.4.1.5.2

Proponent: Mike Ennis, Single Ply Roofing Industry (SPRI), representing the Single Ply Roofing Industry (SPRI)

Revise as follows:

2603.4.1.5 Roofing. Foam plastic insulation under a roof assembly or roof covering shall comply with Sections 2603.4.1.5.1 and 2603.4.1.5.2 as applicable.

2603.4.1.5.1 Wood roof decks. A thermal barrier is not required for foam plastic insulation that is part of a Class A, B or C roof-covering assembly, provided the assembly ~~under a roof assembly or roof covering that~~ is installed in accordance with the code and the manufacturer's instructions and is ~~shall be~~ separated from the interior of the building by wood structural panel sheathing not less than 0.47 inch (11.9 mm) in thickness bonded with exterior glue, with edges supported by blocking, tongue-and-groove joints or other approved type of edge support, or an equivalent material.

2603.4.1.5.2 Any roof deck. A thermal barrier is not required for foam plastic insulation that is part of a Class A, B or C roof-covering assembly, provided the assembly with the foam plastic insulation satisfactorily passes FM 4450 or UL 1256.

Reason: The proposed wording is offered to clarify when the two exceptions for a thermal barrier in Section 2603.4.1.5 are applicable. The first sentence in the current version 2603.4.1.5 is only applicable when a wood roof deck is used. The second sentence is applicable for any type of roof deck. The proposed wording provides clarification without changing the intent.

Cost Impact: The code change proposal will not increase the cost of construction

2603.4.1.6; IRC R316.5.3, R316.5.4

Proponent: Jesse J. Beitel, Hughes Associates, Inc. representing The Extruded Polystyrene Foam Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTTIVE HEARING ORDERS FOR THESE COMMITTEES.
PART I – IBC FIRE SAFETY

Revise as follows:

2603.4.1.6 Attics and crawl spaces. Within an attic or crawl space where entry is made only for service of utilities, and where there is no direct air circulation between the attic or crawl space and the interior of the building, foam plastic insulation shall be protected against ignition by 1 $^1/_2$-inch-thick (38 mm) mineral fiber insulation; $^1/_4$-inch-thick (6.4 mm) wood structural panel, particleboard or hardboard; $^3/_8$-inch (9.5 mm) gypsum wallboard, corrosion-resistant steel having a base metal thickness of 0.016 inch (0.4 mm) or other approved material installed in such a manner that the foam plastic insulation is not exposed. The protective covering shall be consistent with the requirements for the type of construction.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R316.5.3 Attics. The thermal barrier specified in Section R316.4 is not required where all of the following apply:

1. *Attic* access is required by Section R807.1.
2. The space is entered only for purposes of repairs or maintenance.
3. There is no direct air circulation between the attic space and the interior of the building.
~~3~~ 4. The foam plastic insulation is protected against ignition using one of the following ignition barrier materials:
   - ~~3.1~~ 4.1. $1^1/_2$-inch-thick (38 mm) mineral fiber insulation;
   - ~~3.2~~ 4.2. $^1/_4$-inch-thick (6.4 mm) wood structural panels;
   - ~~3.3~~ 4.3. $^3/_8$-inch (9.5 mm) particleboard;
   - ~~3.4~~ 4.4. $^1/_4$-inch (6.4 mm) hardboard;
   - ~~3.5~~ 4.5. $^3/_8$-inch (9.5 mm) gypsum board; or
   - ~~3.6~~ 4.6. Corrosion-resistant steel having a base metal thickness of 0.016 inch (0.406 mm).

The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

R316.5.4 Crawl spaces. The thermal barrier specified in Section R316.4 is not required where all of the following apply:

1. Crawlspace access is required by Section R408.4
2. Entry is made only for purposes of repairs or maintenance.
3. There is no direct air circulation between the crawl space and the interior of the building.
~~3~~ 4. The foam plastic insulation is protected against ignition using one of the following ignition barrier materials:
   - ~~3.1~~ 4.1. $1^1/_2$-inch-thick (38 mm) mineral fiber insulation;
   - ~~3.2~~ 4.2. $^1/_4$-inch-thick (6.4 mm) wood structural panels;
   - ~~3.3~~ 4.3. $^3/_8$-inch (9.5 mm) particleboard;
   - ~~3.4~~ 4.4. $^1/_4$-inch (6.4 mm) hardboard;

~~3.5~~ 4.5. $^3/_8$-inch (9.5 mm) gypsum board; or
~~3.6~~ 4.6. Corrosion-resistant steel having a base metal thickness of 0.016 inch (0.406 mm).

The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

Reason: This Section of the Code was developed in the mid 1970's, to recognize that there was limited potential fire exposure to foam plastics in these areas of a building. Thus, the foam is allowed to be protected by an ignition barrier instead of the usual thermal barrier. Also, at that time, attics and crawl spaces were vented to the outside and since there was no direct communication between attics or crawl spaces and the interior of the buildings, the movement of smoke was not a potential issue.

In today's buildings, there may be direct communication between crawl spaces and possibly attics and the interior of the building. Thus, if the foam plastic becomes involved in a fire, smoke can migrate into the building sooner than if the foam plastic was covered by a thermal barrier.

This Code proposal addresses this issue such that if the foam plastic is covered by an ignition barrier, there can be no direct air circulation to the interior of the building. As with all foam plastics, if the foam is protected by a thermal barrier, then it can be used anywhere in the building per Section 2603.4. This proposal provides an increase in life safety for the occupants of the building.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC FIRE SAFETY

FS169–09/10
2603.4.1.6; IRC R316.5.3, R316.5.4

Proponent: Ted Grant, Atlas Roofing Corporation, representing Atlas Roofing Corporation

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITEES.

PART I – IBC FIRE SAFETY

Revise as follows:

2603.4.1.6 Attics and crawl spaces. Within an *attic* or crawl space where entry is made only for service of utilities, foam plastic insulation shall be protected against ignition by 1½-inch-thick (38 mm) mineral fiber insulation; ¼-inch-thick (6.4 mm) wood structural panel, particleboard or hardboard; $^3/_8$-inch (9.5 mm) gypsum wallboard, corrosion-resistant steel having a base metal thickness of 0.016 inch (0.4 mm)<u>; inorganic coated glass mat having a thickness not less than 0.016 inch (0.406 mm) and ash test results greater than 85 wt/wt%,</u> or other approved material installed in such a manner that the foam plastic insulation is not exposed. The protective covering shall be consistent with the requirements for the type of construction.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R316.5.3 Attics. The thermal barrier specified in Section R316.4 is not required where all of the following apply:
1. *Attic* access is required by Section R807.1.
2. The space is entered only for purposes of repairs or maintenance.
3. The foam plastic insulation is protected against ignition using one of the following ignition barrier materials:
   3.1. 1½-inch-thick (38 mm) mineral fiber insulation;
   3.2. ¼-inch-thick (6.4 mm) wood structural panels;
   3.3. $^3/_8$-inch (9.5 mm) particleboard;
   3.4. ¼-inch (6.4 mm) hardboard;

3.5. $^3/_8$-inch (9.5 mm) gypsum board; ~~or~~
3.6. Corrosion-resistant steel having a base metal thickness of 0.016 inch (0.406 mm); or
3.7. Inorganic coated glass mat having a thickness not less than 0.016 inch (0.406 mm) and ash test result greater than 85 wt/wt%.

The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

R316.5.4 Crawl spaces. The thermal barrier specified in Section R316.4 is not required where all of the following apply:

1. Crawlspace access is required by Section R408.4
2. Entry is made only for purposes of repairs or maintenance.
3. The foam plastic insulation is protected against ignition using one of the following ignition barrier materials:
   3.1. 1½-inch-thick (38 mm) mineral fiber insulation;
   3.2. ¼-inch-thick (6.4 mm) wood structural panels;
   3.3. $^3/_8$-inch (9.5 mm) particleboard;
   3.4. ¼-inch (6.4 mm) hardboard;
   3.5. $^3/_8$-inch (9.5 mm) gypsum board; ~~or~~
   3.6. Corrosion-resistant steel having a base metal thickness of 0.016 inch (0.406 mm); or
   3.7. Inorganic coated glass mat having a thickness not less than 0.016 inch (0.406 mm) and ash test results greater than 85 wt/wt%.

The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

Reason: Inorganic coated glass mats are referred to as slip sheets in the commercial roofing industry, and are used as ignition barriers to prevent the roof insulation from catching fire in the event of hot embers or other fire exposure. The inorganic coated glass mats are composed of drywall-like compounds over glass mat, and are approved by Underwriters Laboratories and Factory Mutual in many roofing constructions as replacements for ½" gypsum cover boards. They are available in rolls and can thus be easily installed inside crawl spaces or attics with complete coverage over the insulation as well as the roof or floor joists. Allowing this ignition barrier to be used in attics and crawl spaces will provide another option to end users where sheet products may not be feasible and 1-1/2" mineral fiber insulation may not be desirable.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRANT-FS1-2306.4.1.6

FS170–09/10
2603.4

Proponent: Jeff Inks, representing the Window and Door Manufacturers Association (WDMA)

Revise as follows:

2603.4.1.7 Doors not required to have a fire protection rating. Where pivoted or side-hinged doors are permitted without a fire protection rating, foam plastic insulation, having a flame spread index of 75 or less and a smoke-developed index of not more than 450, shall be permitted as a core material ~~where the door facing is of metal having a minimum thickness of 0.032-inch (0.8 mm) aluminum or steel having a base metal thickness of not less than 0.016 inch (0.4 mm) at any point.~~ provided the door is faced with aluminum, steel, fiberglass, wood or other approved material.

2603.4.1.8 Exterior doors in buildings of Group R-2 or R-3. In occupancies classified as Group R-2 or R-3, foam-filled exterior entrance doors to individual *dwelling units* that do not require a fire-resistance rating shall be faced with aluminum, steel, fiberglass, wood or other approved materials.

Reason: The language above is unchanged since at least the 2000 IBC. However, insulated side-hinged doors with facing materials other than aluminum or steel have become widely accepted in the market and without demonstrated issues. In addition, the specified minimum thickness text proposed to be deleted is not needed because durability requirements of doors results in facing material significantly thicker than the specified thickness.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WOESTMAN-FS1-2603.4.1.7

FS171–09/10
2603.4.1.14; IRC R316.5.13

Proponent: Jesse J. Beitel, Hughes Associates, Inc. representing The Extruded Polystyrene Foam Association

THIS IS A 2 PART PROPOSAL. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Add new text as follows:

2603.4.1.14 Floors. The thermal barrier specified in Section 2603.4 is not required to be installed on the walking surface of a structural floor system that contains foam plastic insulation when the foam plastic is covered by a minimum nominal ½-inch (12.7 mm) thick wood structural panel or equivalent. The thermal barrier specified in Section 2603.4 is required on the underside of the structural floor system that contains foam plastic insulation when the underside of the structural floor system is exposed to the interior of the building.

Exception: Foam plastic used as part of an interior floor finish.

(Renumber subsequent section)

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R316.5.13 Floors. The thermal barrier specified in Section R316.4 is not required to be installed on the walking surface of a structural floor system that contains foam plastic insulation when the foam plastic is covered by a minimum nominal ½-inch (12.7 mm) thick wood structural panel or equivalent. The thermal barrier specified in Section R316.4 is required on the underside of the structural floor system that contains foam plastic insulation when the underside of the structural floor system is exposed to the interior of the building.

Reason: In today's construction new types of products are being used which incorporate foam plastic insulation for energy reasons. One example is SIPS panels where the foam plastic is laminated between two structural wood facings. This type of panel can be used as a wall, floor or roof.

Foam plastic is required to be protected by a thermal barrier which typically is ½ inch gypsum wallboard. In the case of flooring, gypsum wallboard or other common thermal barrier materials cannot be used on the walking surfaces due to their friability to load, etc.

This Code proposal addresses this problem. The proposed requirement for the ½ inch thick plywood or equivalent will provide sufficient protection to the foam plastic insulation. While ½-inch plywood is not by itself a thermal barrier, in the case of a floor, it will provide sufficient protection since in the event of an interior fire, the floor is typically the last building element to be significantly exposed by the fire.

If the floor is used in multistory construction, then the underside of the floor system (ceiling of the room below) must be covered by the required thermal barrier.

An exception is added to the IBC to address items such as carpet padding, etc. that have not and do not need to be covered by a thermal barrier.

Cost Impact: This code change will not increase the cost of construction.

PART I – IBC FIRE SAFETY:

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/COMMITTEE:

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-FS8-2603.4.13; RB4-R316.5.13 PART II

FS172–09/10
2603.5.3, 2603.5.5, 2603.5.5.1 (New)

Proponent: Gene Boecker, Code Consultants, Inc, representing Code Consultants, Inc.

1. Delete without substitution:

~~**2603.5.3 Potential heat.** The potential heat of foam plastic insulation in any portion of the wall or panel shall not exceed the potential heat expressed in Btu per square feet (mJ/m2) of the foam plastic insulation contained in the wall assembly tested in accordance with Section 2603.5.5. The potential heat of the foam plastic insulation shall be determined by tests conducted in accordance with NFPA 259 and the results shall be expressed in Btu per square feet (mJ/m2).~~

~~**Exception:** One-story buildings complying with Section 2603.4.1.4.~~

(Renumber subsequent sections)

2. Revise as follows:

2603.5.5 Test standard<u>s</u>. The wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. <u>The potential heat of the foam plastic insulation shall be determined by tests conducted in accordance with NFPA 259 and the results shall be expressed in Btu per square feet (mJ/m2).</u>

Exception: One-story buildings complying with Section 2603.4.1.4.

3. Add new text as follow:

<u>**2603.5.5.1 Alternate Material.** An alternate foam plastic insulation is permitted to be used provided that the potential heat of the alternate material does not exceed the potential heat of the foam plastic insulation contained in the wall assembly tested in accordance with Section 2603.5.5.</u>

Reason: The proposed revisions are not technical and are intended for clarity only. All foam plastic insulation is currently required to be tested in accordance with NFPA 259. However, the existing text is confusing to the user as to how the results from the NFPA 259 test are related to the results of NFPA 285 test required by Section 2603.5.5. The new Section 2603.5.5.3.1 clarifies that a substitute material can be used provided that the potential heat of the substitute foam plastic is less than the potential heat of the foam plastic that was used in the NFPA 285 test.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Standard NFPA 259 is currently referenced in the I-codes.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOECKER-FS2-2603.5.3

FS173–09/10
2603.5.6

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing Dow Chemical Company

Revise as follows:

2603.5.6 Label required. The edge or face of each piece<u>, package or container</u> of foam plastic insulation shall bear the label of an approved agency. The label shall contain the manufacturer's or distributor's identification, model number, serial number or definitive information describing the product or materials' performance characteristics and approved agency's identification.

Reason: When this Section was written, the typical foam plastic insulation materials used for exterior walls were delivered to the jobsite in sheets or panels. Thus, they were marked as required by the existing Code Section. Currently, different types of foam plastic insulations are being used in these applications. These foam plastics such as spray polyurethane foam are delivered to the job site in drums which contain the components of the foam plastic insulation and typically, materials from two drums are mixed as they are sprayed and the resultant foam plastic insulation is applied to the wall surfaces. The component (drums or packaging) bears a label with the information required in the Section.

This Code proposal provides recognition for these types of foam plastics and their packaging method (drums versus boards) and requires labeling per this section of the Code.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-FS4-2603.5.6.doc

FS174–09/10
2603.7, 2603.8 (New)

Proponent: Marcelo M. Hirschler (GBH International) (representing American Fire Safety Council)

Revise as follows:

2603.7 Interior Finish in plenums. ~~Foam plastic insulation shall not be used as interior wall or ceiling finish in plenums except as permitted in Section 2604 or when protected by a thermal barrier in accordance with Section 2603.4.~~ Foam plastic insulation used as interior wall or ceiling finish in plenums shall comply with one or more of the following:

1. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.
2. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 when tested in accordance with NFPA 286.
3. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

2603.8 Interior trim in plenums. Foam plastic insulation used as interior trim in plenums shall comply with the requirements of Section 2603.7.

(Renumber subsequent sections)

Reason: This code proposal revises the requirements for use of foam plastic insulation as interior wall and ceiling finish or as interior trim in plenums. The IBC and IMC requirements for materials in plenums has always been that they be noncombustible or exhibit a flame spread index of 25 or less and a smoke developed index of 50 when tested to ASTM E 84. As presently written there is some confusion because the foam plastic insulation could be approved based on tests using any of the standards from 2603.9 (and only NFPA 286 has pass/fail criteria for smoke) and there is the additional potential for conflict between that section and the remainder of 2603. Moreover, as written interior trim could be used in plenums based on section 2604.2, which is unacceptable. This proposal requires that exposed foam plastic insulation (i.e. foam plastic left unprotected), whether used as interior finish or as interior trim, shall exhibit a flame spread index of 25 or less and a smoke developed index of 50 and meet the requirements of the full scale room-corner fire test (NFPA 286) with requirements for flame spread, heat release, no flashover and smoke release. Additionally, two alternatives are provided to protect foam plastics and thus allow them even when they have a higher flame spread index and smoke developed index, namely a thermal barrier and a corrosion-resistant steel barrier. This is also consistent with the requirements of NFPA 90A, which has the same requirements for foam plastic insulation used as interior finish in plenums.
A parallel proposal was submitted to the IBC, for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposal FS174 and FS175 address foam plastic interior finish requirements. The committee needs to make its intent clear with respect to these provisions. Standards ASTM E84, UL 723 and NFPA 286 are currently referenced in the I-codes.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-FS14-2603.7

FS175–09/10
2603.7

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing self

Delete and substitute as follows:

~~**2603.7 Plenums.** Foam plastic insulation shall not be used as interior wall or ceiling finish in plenums except as permitted in Section 2604 or when protected by a thermal barrier in accordance with Section 2603.4.~~
2603.7 Plenums. Foam plastic insulation used as wall or ceiling finish in plenums shall comply with one or more of the following:

1. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.
2. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall be tested in accordance with and meet the criteria of Section 803.1.2.
3. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

Reason: This code proposal revises the requirements for use of foam plastics in plenums. The intent of the IBC and the IMC has been to require that all materials used in plenums shall be noncombustible or exhibit a flame spread index of 25 or less and a smoke-developed index of 50. The same criteria should also be applied to foam plastics used as wall or ceiling finish in plenums. This proposal requires that if the foam plastic is left unprotected then it shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 and meet the requirements of a full-scale fire test (NFPA 286). Additionally, several alternatives are provided to protect foam plastics and thus allow them to have a greater flame spread index and smoke-developed index.

Cost Impact: The code change proposal will increase the cost of construction

Analysis: Code change proposal FS174 and FS175 address foam plastic interior finish requirements. The committee needs to make its intent clear with respect to these provisions.

2603.8; IRC R316.7, R318.4, R403.3.4, R404.1.2.3.6.1

Proponent: Todd Bergstrom, Ph.D., AFM Corporation, representing AFM Corporation

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE SAFETY COMMITTEE.

PART I – IBC FIRE SAFETY

Revise as follows:

2603.8 Protection against termites. In areas where the probability of termite infestation is very heavy or moderate to heavy in accordance with Figure 2603.8, extruded and expanded polystyrene, polyisocyanurate and other foam plastics shall not be installed on the exterior face or under interior or exterior foundation walls or slab foundations located below grade. The clearance between foam plastics installed above grade and exposed earth shall be at least 6 inches (152 mm).

Exceptions:

1. Buildings where the structural members of walls, floors, ceilings and roofs are entirely of noncombustible materials or preservative-treated wood.

2. An approved method of protecting the foam plastic and structure from subterranean termite damage is provided.
3. On the interior side of basement walls.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R316.7 Termite damage. The use of foam plastics in areas of "very heavy" or "moderate to heavy" termite infestation probability shall be in accordance with Section R318.4.

R318.4 Foam plastic protection. In areas where the probability of termite infestation is "very heavy" or "moderate to heavy" as indicated in Figure R301.2(6), extruded and expanded polystyrene, polyisocyanurate and other foam plastics shall not be installed on the exterior face or under interior or exterior foundation walls or slab foundations located below grade. The clearance between foam plastics installed above grade and exposed earth shall be at least 6 inches (152 mm).

Exceptions:

1. Buildings where the structural members of walls, floors, ceilings and roofs are entirely of noncombustible materials or pressure-preservative-treated wood.
2. When in addition to the requirements of Section R318.1, an approved method of protecting the foam plastic and structure from subterranean termite damage is used.
3. On the interior side of basement walls.

R403.3.4 Termite damage. The use of foam plastic in areas of "very heavy" or "moderate to heavy" termite infestation probability shall be in accordance with Section R318.4.

R404.1.2.3.6.1 Stay-in-place forms. Stay-in place concrete forms shall comply with this section.

1. Surface burning characteristics. The flame-spread index and smoke-developed index of forming material, other than foam plastic, left exposed on the interior shall comply with Section R302. The surface burning characteristics of foam plastic used in insulating concrete forms shall comply with Section R316.3.
2. Interior covering. Stay-in-place forms constructed of rigid foam plastic shall be protected on the interior of the building as required by Section R316. Where gypsum board is used to protect the foam plastic, it shall be installed with a mechanical fastening system. Use of adhesives in addition to mechanical fasteners is permitted.
3. Exterior wall covering. Stay-in-place forms constructed of rigid foam plastics shall be protected from sunlight and physical damage by the application of an approved exterior wall covering complying with this code. Exterior surfaces of other stay-in-place forming systems shall be protected in accordance with this code.
4. Termite hazards. In areas where hazard of termite damage is "very heavy" or "moderate to heavy" in accordance with Figure R301.2(6), foam plastic insulation shall be permitted below grade on foundation walls in accordance with one of the following conditions:
   4.1. Where in addition to the requirements in Section R318.1, an approved method of protecting the foam plastic and structure from subterranean termite damage is provided.
   4.2. The structural members of walls, floors, ceilings and roofs are entirely of noncombustible materials or pressure-preservative-treated wood.
   4.3. On the interior side of basement walls.

Reason:
Part I-Damage to foam plastic insulations installed below grade (and subsequently building structures) in termite regions of moderate to heavy probability (see Figure 2603.8) is an area of the IBS that provides the possibility for significant potential for damage. The use of alternative methods as provided by the Exception to 2603.8 are real solutions that help minimize the risk to structures and this should be extended to the moderate to heavy probability regions to protect the long term integrity of building structures.
Part II- Damage to foam plastic insulations installed below grade (and subsequently building structures) in termite regions of moderate to heavy probability [see Figure R301.2(6)] is an area of the IRC that leaves open the possibility for significant potential for damage to structures. The use of alternative methods as provided by the Exception to R318.4 are real solutions that help minimize the risk to structures and this should be extended to the moderate to heavy probability regions to protect the long term integrity of building structures

Cost Impact: The code change proposal will not increase the cost of construction.

2603.8

Proponent: Steve Heller, representing the Insulating Concrete Form Association

Revise as follows:

2603.8 Protection against Termites. In areas where the probability of termite infestation is very heavy in accordance with Figure 2603.8, extruded and expanded polystyrene, polyisocyanurate and other foam plastics shall not be installed on the exterior face or under interior or exterior foundation walls or slab foundations located below grade. The clearance between foam plastics installed above grade and exposed earth shall be at least 6 inches (152 mm).

Exceptions:

1. Buildings where the structural members of walls~~,~~ and floors~~, ceiling and roofs~~ are entirely of noncombustible materials or pressure-preservative-treated wood; or the exterior wall envelope is entirely monolithic concrete walls, including flat-wall and waffle grid ICFs, with continuous concrete from the footings to the roofline.
2. An approved method of protecting the foam plastic and structure from subterranean termite damage is provided.
3. On the interior side of basement walls.

Reason: This proposal acknowledges the protection of concrete construction from structural damage due to termites.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HELLER-FS1-2603.8

FS178–09/10
2603.9

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing North American Insulation Manufacturers Association

Revise as follows:

2603.9 Special approval. Foam plastic shall not be required to comply with the requirements of Sections 2603.4 through 2603.7 where specifically approved based on large-scale tests such as, but not limited to, NFPA 286 (with the acceptance criteria of Section 803.2), FM 4880, UL 1040 or UL 1715. Such testing shall be related to the actual end-use configuration and be performed on the finished manufactured foam plastic assembly in the maximum thickness intended for use. Foam plastics that are used as interior finish on the basis of special tests shall also conform to the flame spread and smoke developed requirements of Chapter 8. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

Reason: At a minimum, the provision for special approvals for foamed plastics, which waives other requirements of Chapters 8 and 26 for foamed plastics needs to provide a comparable level of performance and safety to the existing provisions.

Justification: In the 2007 Supplement, additional language was introduced to 2603.9 to retain the flame spread requirements for interior finish materials, despite the fact that additional fire testing was required in 2603.9. With the exception of the performance criterion in 803.1.2 related to NFPA 286, the smoke developed requirements on foamed plastics arising from Chapters 7 & 8 are being waived, despite the fact that testing in accordance with FM 4880, UL 1040 and UL 1715 does not contain any smoke development criterion.

By requiring testing to be related to the actual end-use configuration and be performed on the finished manufactured foam plastic assembly in the maximum thickness intended for use, the Code does not clearly include or exclude smoke development requirements. For all other thermal and sound insulating materials within the IBC, including non-combustible insulation materials, the minimum performance level for materials permitted to be used includes at least some requirements for both flame spread (fire growth) and smoke production. These requirements are primarily based on either ASTM E84 testing or alternative methods such as NFPA 286, CAN/ULC-S102.2, or even UL 1715 with the inclusion of the criterion from 803.1.2. However, in the case of foamed plastics, of the four alternative test methods permitted by 2603.9, only NFPA 286 contains any limits on smoke developed for any foamed plastics by virtue of the inclusion of a reference to section 803.1. The additional language proposed here covers this omission by using a widely accepted testing methodology of ASTM E84 and UL 723.

Further, by virtue of the language contained in article 2603.7 and Section 2604, foamed plastics are permitted to be installed in plenums without any limitations on the smoke development, and without requiring protection with a thermal barrier. Section 2603.9 permits foamed plastic insulation to be used as interior wall or ceiling finish in plenums even without the installation of a thermal barrier.

Cost Impact: This proposal will not increase the cost of construction.

FS179–09/10

2603.9.1 (New)

Proponent: Jesse J. Beitel, Hughes Associates, Inc. representing The Extruded Polystyrene Foam Association

Add new text as follows:

2603.9 Special approval. Foam plastic shall not be required to comply with the requirements of Sections 2603.4 through 2603.7 where specifically approved based on large-scale tests such as, but not limited to, NFPA 286 (with the acceptance criteria of Section 803.2), FM 4880, UL 1040 or UL 1715. Such testing shall be related to the actual end-use configuration and be performed on the finished manufactured foam plastic assembly in the maximum thickness intended for use. Foam plastics that are used as interior finish on the basis of special tests shall also conform to the flame spread requirements of Chapter 8. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

2603.9.1 Exterior walls. Testing based on Section 2603.9 shall not be used to eliminate any component of the construction of an exterior wall assembly when that component was included in the construction that has met the requirements of Section 2603.5.5.

Reason: Section 2603.5.5 of the IBC requires that when foam plastic insulation is used in or on an exterior wall, the NFPA 285 must be conducted on the wall assembly. In this test, typically one layer of gypsum wallboard is used to cover the interior surface of the wall assembly. See Figure 1.

Sections 2603.4 and 2603.5.2 of the IBC require that the foam plastic be separated from the interior of the building by a thermal barrier, typically gypsum wallboard. Section 2603.9 allows that when a foam plastic is successfully tested in a full-scale test such as NFPA 286, UL 1715, etc. then the thermal barrier can be eliminated.

A question has arisen in that if the gypsum wallboard is used to pass the NFPA 285 test, then can it be eliminated if the assembly also passes for example, an NFPA 286 test?

The NFPA 285 is a test in which the interior wall surface is exposed to the equivalent of an ASTM E 119 fire exposure for 30 minutes. This test evaluates vertical and lateral flame propagation away from the compartment of fire origin and the performance of the wall support system (i.e., steel studs, etc.) plays a significant role in the wall's performance.

The tests specified in Section 2603.9 evaluate the flame spread of a foam plastic when exposed to a fire of limited size and typically for on 15 minutes. These methods evaluate the flame spread potential of the foam plastic.

The NFPA 285 test evaluates different performance parameters than the Section 2603.9 test. Also, the exposure to the interior of the wall in the NFPA 285 is significantly more severe.

Thus, if the gypsum wallboard used in the successful performance of the NFPA 285 test is eliminated based on tests in Section 2603.9, then the support system for the wall may not perform since it is now unprotected, and the results of the NFPA 285 test may no longer be valid. In fact, the wall system without the gypsum wallboard could now fail the NFPA 285 test.

This Code change will clarify the intent of the Code with respect to this question by requiring that the specific assembly successfully tested in NFPA 285 be the assembly used for these applications in the field. Thus if a foam plastic assembly successfully passes a full-scale test such as NFPA 286, UL 1715, etc. to remove the thermal barrier, the same assembly (without the thermal barrier) must also pass the NFPA 285 to be used in commercial walls.

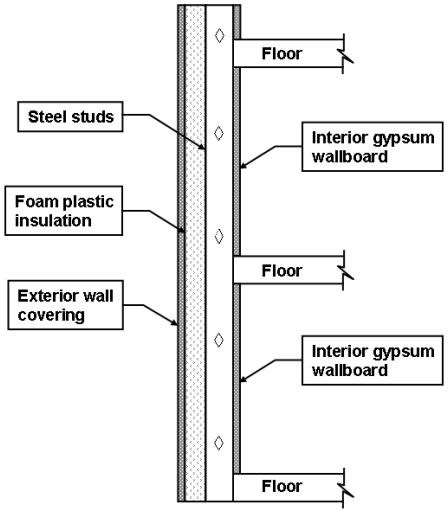

FIGURE 1

Cost Impact: The code change proposal will not increase the cost of construction

	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-FS10-2603.9

FS180–09/10
2606.5, 2609.1.1 (New), 2610.1.1 (New)

Proponent: J. Nigel Ellis, representing Ellis Fall Safety Solutions, LLC

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE HEARING ORDER FOR THIS COMMITTEE.

1. Revise as follows:

2606.5 Structural requirements. Light-transmitting plastic materials in their assembly shall be of adequate strength and durability to withstand the loads indicated in Chapter 16. Technical data shall be submitted to establish stresses, maximum unsupported spans and such other information for the various thicknesses and forms used as deemed necessary by the *building official*. Every skylight shall be guarded by a standard skylight screen or a fixed standard railing on all exposed sides. Skylight screens shall be of such construction and mounting that they are capable of withstanding a load of at least 200 lbs applied perpendicularly at any one area on the screen. They shall also be of such construction and mounting that under ordinary loads or impacts, they will not deflect downward sufficiently to break the glass below them. The construction shall be of grillwork with openings not more than 4 inches long or of slatwork with openings not more than 2 inches wide with length unrestricted.

2. Add new text as follows:

2609.1 General. Light-transmitting plastic roof panels shall comply with this section and Section 2606. Light-transmitting plastic roof panels shall not be installed in Groups H, I-2 and I-3. In all other groups, light-transmitting plastic roof panels shall comply with any one of the following conditions:

1. The building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
2. The roof construction is not required to have a fire-resistance rating by Table 601.
3. The roof panels meet the requirements for roof coverings in accordance with Chapter 15.

2609.1.1 Guarding. Light-transmitting roof panels and assemblies shall be guarded as required by Section 2606.5.

3. Add new text as follows:

2610.1 Light-transmitting plastic glazing of skylight assemblies. Skylight assemblies glazed with light-transmitting plastic shall conform to the provisions of this section and Section 2606. Unit skylights glazed with light-transmitting plastic shall also comply with Section 2405.5.

Exception: Skylights in which the light-transmitting plastic conforms to the required roof-covering class in accordance with Section 1505.

2610.1.1 Guarding. Unit skylight assemblies shall be guarded as required by Section 2606.5.

Reason: The proposed wording is verbatim Federal OSHA standard from 1971 and needs to be reflected in the building code because Chapter 16 loading is inadequate for human falls onto skylights and skylight manufacturers are not the only users of the skylights they produce. In other words some building owners may not be employers who maintain the roof skylights and therefore need the protection from the manufacturers in each installation going forward with the inclusion or design integration of a necessary hazard control.

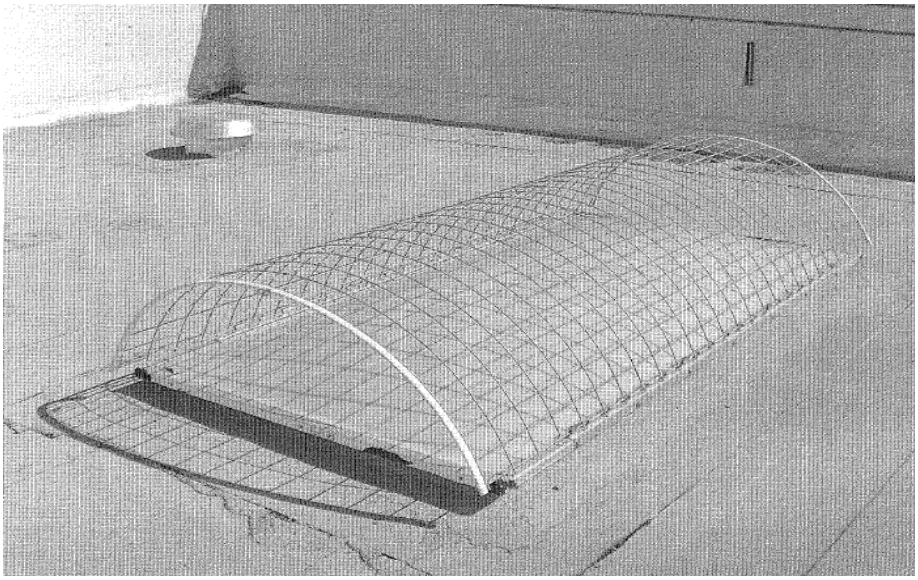
Fatalities from falls through skylights which category for inclusion includes light-transmitting panels and smoke vents are documented by the Bureau of Labor Statistics which in 2006 accounted for 36 deaths in non-government buildings in the USA www.bls.gov. Skylights have their own fatal fall category as opposed to roof or floor openings that also have their own listing. The Federal requirement for General Industry is 29CFR1910.23(a)(4) and (e)(8) which became mandatory in 1971 for employers.

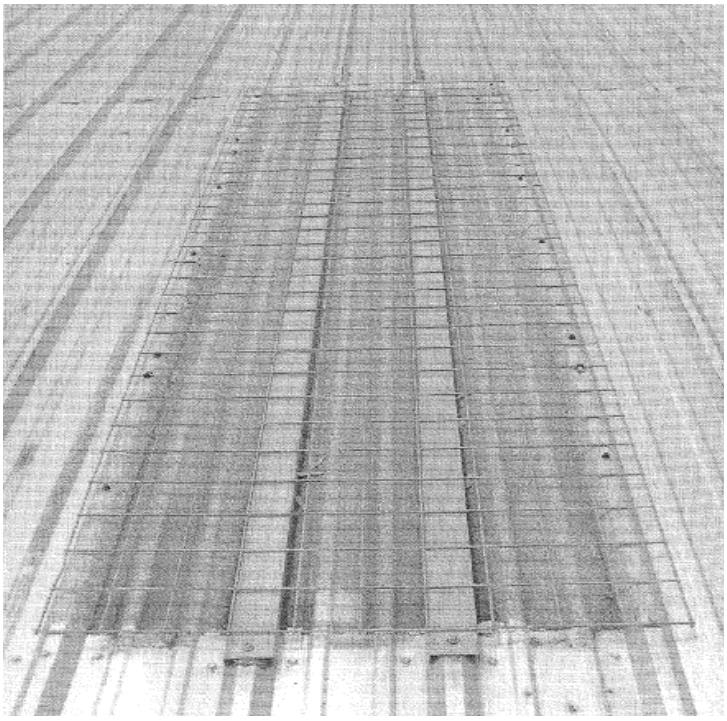
There are also similar requirements in the 1926.500-503 Construction regulations that equate skylights with open holes and require the use of adequate covers. The ANSI A1264.1 and A10.18 are similarly worded but all are aimed ineffectively at employers with exposed employees but not exposed independent contractors who visit dozens of building roofs each month without a feasible protection method e.g. HVAC, Laborers, roofers, Window Cleaners etc.).

However after 38 years not even 1% of skylights have the required screen protection. Ref Plasteco President Key Sandow. Skylight manufacturers do not mark their skylights clearly in the same way that auto glazers do, so that manufacturers may never know their skylight ever failed to support a falling worker. Instead, the blame falls on the injured person for not knowing to stay away from or be careful around skylights. My experience is that workers do not know the degree of danger stepping close to skylights until it is too late nor do their employers.

Plastic skylights may survive impacts from falling or tripping by the trades (of which there may be 25 or more) when new but almost all suffer from uv light degradation over the years. An alternative that also takes care of controlling intruders is under-skylight grills especially for opening smoke vents and similar skylights and corrosive conditions and sometimes both to reduce fall distances to 4 ft or less per OSHA General Industry requirements. Skylights are maintained today by sealing leaks with silicone, fiberglass or equivalent and appear in “good” condition on maintenance company reports to the building owner if they do not presently leak despite the fact that they have cracks after a few years in the sun and are patched regularly. There is no common lifetime for plastic skylights that may now be 50+ years old and users do not currently replace a skylight unless a leak cannot be stemmed.

The request is to include the federal requirement in the IBC Building Code and carry the responsibility to architects, engineers and building owners and managers to protect the work trades that maintain the roof systems in those buildings by including adequate protection in specifications. No building owner expects that a skylight will have a disastrously weak strength that a worker can step onto and through as the years progress eventually almost as easily as pushing a finger through. The OSHA interpretation by John Miles in 1984 does not anticipate the degradation that occurs with almost all synthetic-related skylights nor the dynamic force of a slip, trip and/or fall by a passing worker. Use of personal fall arrest is a last resort but no system is legal without a 5,000 lbs anchorage point which is simply unavailable on a roof unless designed by a structural engineer and regularly recertified (OSHA 1926.500-503 and ANSI Z359-2007 The Fall Protection Code) and building owners do not contract or pay for 5000 lbs anchors in their roofs or confirm roof strengths with any contractors at this time (ref: 1926.501(a)(2) adequate surface strength requirements). Examples of skylight screens follow:





Cost Impact: Approx. $300 including a 4'x8' skylight screen and installation

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ELLIS-FS1-2606.5

FS181–09/10
2610.2

Proponent: Ennis, representing the Single Ply Roofing Industry (SPRI))

Revise as follows:

2610.2 Mounting. The light-transmitting plastic shall be mounted above the plane of the roof on a curb constructed in accordance with the requirements for the type of construction classification, but at least 4 inches (102 mm) above the plane of the roof. ~~Edges of the light-transmitting plastic skylights or domes shall be protected by metal or other approved noncombustible material, or the~~ <u>The</u> light transmitting plastic dome or skylight shall be shown to be able to resist ignition where exposed at the edge to a flame from a Class B brand as described in ASTM E 108 or UL 790.

Exceptions:

1. Curbs shall not be required for skylights used on roofs having a minimum slope of three units vertical in 12 units horizontal (25-percent slope) in occupancies in Group R-3 and on buildings with a nonclassified roof covering.
2. ~~The metal or noncombustible edge material is not required where nonclassified roof coverings are permitted.~~

Reason: The flames of the Class B brand can extend above the noncombustible edge and contact the dome, allowing for the possibility of catching fire and test failure. ASTM E108 tests have been conducted on products with non-combustible edge material in which the flame extended beyond the noncombustible edge material and contacted the dome. This could result in ignition of the dome depending upon the type of material used for the dome. Testing per ASTM E108 or UL790 with a Class B brand should be the accepted requirement.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENNIS-F3-2610.2 AND ENNIS-F5-2610.2

FS182–09/10
2610.2

Proponent: Mike Ennis, representing Single Ply Roofing Industry (SPRI, Inc.)

Revise as follows:

2610.2 Mounting. The light-transmitting plastic shall be mounted above the plane of the roof on a curb constructed in accordance with the requirements for the type of construction classification, but at least 4 inches (102 mm) above the plane of the roof. Edges of the light-transmitting plastic skylights or domes shall be protected by metal or other approved noncombustible material, or the light transmitting plastic dome or skylight shall be shown to be able to resist ignition where exposed at the edge to a flame from a Class B brand as described in ASTM E 108 or UL 790. The Class B brand test shall be conducted on a skylight that is elevated to a height specified by the manufacturer, but not less than 4 inches (102 mm)

Exceptions:

(Exception remain unchanged)

Reason: The skylights should be tested at the minimum curb height specified for installation by the manufacturer, but not less than the 4-inch minimum required by the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENNIS-FS4-2610_2b

FS183–09/10
2610.3

Proponent: Julie Ruth, PE, JRuth Code Consulting, representing American Architectural Manufacturers Association

Revise as follows:

2610.3 Slope. Flat or corrugated light-transmitting plastic skylights shall slope at least four units vertical in 12 units horizontal (4:12). Dome-shaped skylights shall rise above the mounting flange a minimum distance equal to 10 percent of the maximum ~~span~~ width of the dome but not less than 3 inches (76 mm).

Exception: Skylights that pass the Class B Burning Brand Test specified in ASTM E 108 or UL 790.

Reason: The aspect ratios (length/width) of early generation plastic dome skylights tended to be 1:1 or 1.5:1, and seldom exceeded 2:1. Therefore, basing the dome rise required on the maximum span of the skylight, with a minimum of 3 inches, and the slope this imposed on the shorter span, was not considered to be excessive.

With more recent advances, however, it is now possible for the length of dome shaped skylights to be much greater than the width, with aspect ratios (length/width) of 4 or more not being uncommon. For these products, basing the rise required on the maximum span is excessive and referring to the maximum width, while retaining the minimum of 3 inches, is more appropriate.

Cost Impact: Could reduce cost for domed skylights, will not increase cost.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RUTH-FS1-2610.3

FS184–09/10
2602, 2612.3.1 (New)

Proponent: Jesse J. Beitel, Hughes Associates, Inc. representing American Composites Manufacturers Association

1. Revise as follows:

2602 DEFINITIONS

FIBER REINFORCED POLYMER. Polymeric composite material consisting of reinforcement fibers impregnated with a fiber-binding polymer which is then molded and hardened. Fiber reinforced polymers are permitted to contain cores laminated between fiber reinforced polymer facings.

FIBERGLASS REINFORCED POLYMER. Polymeric composite material consisting of glass reinforcement fibers impregnated with a fiber-binding polymer which is then molded and hardened. Fiberglass reinforced polymers are permitted to contain cores laminated between fiberglass reinforced facings.

2. Add new text as follows:

2612.3 Interior Finish. Fiber reinforced polymer or fiberglass reinforced polymer used as *interior finish* shall comply with Chapter 8.

2612.3.1 Foam plastic cores. Fiber reinforced polymer or fiberglass reinforced polymer used as interior finish and which contain foam plastic cores shall comply with Chapter 8 and Chapter 26.

Reason: Some fiber reinforced polymers or fiberglass reinforced polymers may be constructed as sandwich panels. These panels would have fiber reinforced polymer or fiberglass reinforced polymer on both sides of a core material. The core material provides additional support to the fiber reinforced polymer or fiberglass reinforced polymer system. Typical core materials can be but are not limited to balsa wood, plywood or even foam plastic materials. The change in the definitions for fiber reinforced polymer or fiberglass reinforced polymer address these types of materials.

When foam plastic is used as a core material and the resultant fiber reinforced polymer or fiberglass reinforced polymer is used as interior finish, the resultant fiber reinforced polymer or fiberglass reinforced polymer must comply with both the requirements of Chapter 8 and Chapter 26.

Since foam plastic is regulated by Chapter 26, it is appropriate that fiber reinforced polymers or fiberglass reinforced polymers which contain foam plastic cores also be regulated by Chapter 26.

Cost Impact: This code change will increase the cost of construction

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: BEITEL-FS6-2602

FS185–09/10

2602, 2612.1, 2612.2, 2612.3, 2612.4, 2612.5, 2612.6

Proponent: Maureen Traxler, City of Seattle, representing City of Seattle Dept of Planning & Development

1. Revise as follows:

SECTION 2602
DEFINITIONS

FIBER REINFORCED POLYMER. A polymeric composite material consisting of reinforcement fibers , such as glass, impregnated with a fiber-binding polymer which is then molded and hardened.

~~**FIBERGLASS REINFORCED POLYMER.** A polymeric composite material consisting of glass reinforcement fibers impregnated with a fiber-binding polymer which is then molded and hardened.~~

SECTION 2612
FIBER REINFORCED POLYMER ~~AND FIBERGLASS REINFORCED POLYMER~~

2612.1 General. The provisions of this section shall govern the requirements and uses of fiber reinforced polymer ~~or fiberglass reinforced polymer~~ in and on buildings and structures.

2612.2 Labeling and identification. Packages and containers of fiber reinforced polymer ~~or fiberglass reinforced polymer~~ and their components delivered to the job site shall bear the *label* of an *approved agency* showing the manufacturer's name, product listing, product identification and information sufficient to determine that the end use will comply with the code requirements.

2612.3 Interior finishes. Fiber reinforced polymer ~~or fiberglass reinforced polymer~~ used as *interior finishes, decorative materials* or *trim* shall comply with Chapter 8.

~~**2612.4 Decorative materials and trim.** Fiber reinforced polymer or fiberglass reinforced polymer used as *decorative materials* or *trim* shall comply with Section 806.~~

(Renumber subsequent sections)

2612.5 Light-transmitting materials. Fiber reinforced polymer ~~or fiberglass reinforced polymer~~ used as light-transmitting materials shall comply with Sections 2606 through 2611 as required for the specific application.

2612.6 Exterior use. Fiber reinforced polymer ~~or fiberglass reinforced polymer~~ shall be permitted to be installed on the *exterior walls* of buildings of ~~any type of~~ Types IV and V construction when such polymers meet the requirements of Section 2603.5. ~~and is fireblocked~~ Fireblocking shall be installed in accordance with Section 717. ~~The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613, respectively.~~

Exceptions:

1. Compliance with Section 2603.5 is not required when ~~When~~ all of the following conditions are met:
   1.1. When the area of the fiber reinforced polymer ~~or the fiberglass reinforced polymer~~ does not exceed 20 percent of the respective wall area, the fiber reinforced polymer ~~or the fiberglass~~ ~~reinforced polymer~~ shall have a flame spread index of 25 or less. ~~or w~~When the area of the fiber reinforced polymer ~~or the fiberglass reinforced polymer~~ does not exceed 10 percent of the respective wall area, the fiber reinforced polymer ~~or the fiberglass reinforced polymer~~ shall have a flame spread index of 75 or less. The flame spread index requirements do not apply to ~~shall not be required for~~ coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber reinforced polymer ~~or the fiberglass reinforced polymer~~.
   1.2. Fireblocking complying with Section 717.2.6 shall be installed.
   1.3. The fiber reinforced polymer ~~or the fiberglass reinforced polymer~~ shall be installed directly to a noncombustible substrate or be separated from the *exterior wall* by one of the following materials: corrosion-resistant steel having a minimum base metal thickness of 0.016 inch (0.41 mm) at any point, aluminum having a minimum thickness of 0.019 inch (0.5 mm) or other approved noncombustible material.
   ~~1.4. The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613, respectively.~~
2. Compliance with Section 2603.5 is not required when the fiber reinforced polymer is ~~When~~ installed on buildings that are 40 feet (12 190 mm) or less above grade when all of the following conditions are met:
   2.1. ~~t~~The fiber reinforced polymer ~~or the fiberglass reinforced polymer~~ shall meet the requirements of Section 1406.2. ~~and shall comply with all of the following conditions:~~
   ~~2.1~~ 2.2. Where the fire separation distance is 5 feet (1524 mm) or less, the area of the fiber reinforced polymer ~~or the fiberglass reinforced polymer~~ shall not exceed 10 percent of the wall area. Where the fire separation distance is greater than 5 feet (1524 mm), there shall be no limit on the area of the *exterior wall* coverage using fiber reinforced polymer ~~or the fiberglass reinforced polymer~~.
   ~~2.2~~2.3. The fiber reinforced polymer ~~or the fiberglass reinforced polymer~~ shall have a flame spread index of 200 or less. The flame spread index requirements do not apply to ~~shall not be required for~~ coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber reinforced polymer ~~or the fiberglass reinforced polymer~~.
   ~~2.3~~2.4. Fireblocking complying with Section 717.2.6 shall be installed.
   ~~2.4 The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613, respectively~~

Reason: "Fiberglass reinforced polymer" is a type of "fiber reinforced polymer", so the definitions can be combined. The provisions regulating fiber reinforced polymers are found in Section 2612, which includes identical regulations for polymers reinforced with glass as with other types of fibers. The two terms always appear together.

Section 2612.4 is unnecessary because Section 2612.3 already requires compliance with Chapter 8. The title of Chapter 8 is "Interior Finishes" and encompasses decorative materials and trim as well as "interior finish".

A substantive change is proposed that limits the use of this provision to combustible construction. Fireblocking is a crucial element of safe use of this material, and the only fireblocking provisions available are suitable only for combustible construction types. Section 717.2 clearly limits the scope of Section 717's fireblocking provisions to combustible buildings. Referencing that section creates the inference that the fireblocking requirements only apply when the fiber reinforced polymers are used on buildings of combustible construction. Unless fireblocking requirements appropriate to noncombustible buildings are provided, use of this material should be limited to combustible buildings.

The last sentence of the paragraph is not needed because the provisions of Chapter 16 apply regardless.

The changes to the exceptions are editorial. Charging language is added to both of them to specify that they are exceptions from the requirements of Section 2603.5. Other changes to the exceptions are consistent with changes proposed for the rest of Section 2612.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: Code change proposal FS185, FS186 and FS187 address Exception #1 to Section 2612.6. The committee needs to make its intent clear with respect to these provisions.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Traxler-FS3-2602

FS186–09/10
2612.6

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing American Composites Manufacturers Association

Revise as follows:

2612.6 Exterior use. Fiber reinforced polymer or fiberglass reinforced polymer shall be permitted to be installed on the exterior walls of buildings of any type of construction when such polymers meet the requirements of Sections 2603.5 and is fire-blocked in accordance with Section 717. The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613 respectively.

Exceptions:

1. When all of the following conditions are met:
   - 1.1. The fiber reinforced polymer or the fiberglass reinforced polymer shall not exceed an aggregate total of 20% of the area of the specific wall to which it is attached, and no single architectural element shall exceed 10% of the area of the specific wall to which it is attached, and no contiguous set of architectural elements shall exceed 10% of the area of the specific wall to which they are attached. ~~When the area of the fiber reinforced polymer or the fiberglass reinforced polymer does not exceed 20% of the respective wall area, the fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame-spread index of 25 or less or when the area of the fiber reinforced polymer or the fiberglass reinforced polymer does not exceed 10% of the respective wall area, the fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame-spread index of 75 or less. The flame-spread index requirement shall not be required for coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber reinforced polymer or the fiberglass reinforced polymer~~
   - 1.2. The fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame-spread index of 25 or less. The flame-spread index requirement shall not be required for coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber reinforced polymer or the fiberglass reinforced polymer.
   - 1.3. Fireblocking complying with Section 717.2.6 shall be installed.
   - 1.4. The fiber reinforced polymer or the fiberglass reinforced polymer shall be installed directly to a noncombustible substrate or be separated from the exterior wall by one of the following materials: corrosion-resistant steel having a minimum base metal thickness of 0.016 inch (0.41 mm) at any point, Aluminum having a minimum thickness of 0.019 inch (0.5 mm) or other approved noncombustible material.
   - 1.5. The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613 respectively.

(Exception 2 remains unchanged)

Reason: This proposal addresses “large amounts of fuel loading” in any given area on the exterior wall. In essence, while a total of 20% of the wall surface can have the fiber reinforced polymer installed on it this modification will require that the fiber reinforced polymer be limited to discrete areas of not more than 10% of the area of the wall. This 10% limitation applies not only to a single architectural element but it also applies to a group of elements such that if they are touching, the grouping cannot exceed 10%. By this modification, the area of the fiber reinforced polymer elements must be less than 10% of the wall area, be noncontiguous and thus separation of the elements is provided. This modification addresses the issue whereby the 20% aggregate total would be in a single area.

Also, the industry has removed the Section whereby materials with a Class B flame spread are allowed and only materials with a Class A flame spread can be used on the exterior of a wall in this Exception. By this modification, the industry continues to improve the fire performance of these materials.

This Code proposal is based on a proposed comment made during the last Code cycle. At that time some issues with wording were identified and we feel that this has been corrected.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposal FS185, FS186 and FS187 address Exception #1 to Section 2612.6. The committee needs to make its intent clear with respect to these provisions.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FS187–09/10
2612.6

Proponent: Douglas H. Evans, P.E., FSFPE, Clark County, NV, representing the Department of Development Services – Building Division

Revise as follows:

2612.6 Exterior use. Fiber reinforced polymer or fiberglass reinforced polymer shall be permitted to be installed on the exterior walls of buildings of any type of construction when such polymers meet the requirements of Sections 2603.5 and is fireblocked in accordance with Section 717. The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613 respectively.

Exceptions~~:~~:

~~1. When all of the following conditions are met:~~
- ~~1.1. When the area of the fiber reinforced polymer or the fiberglass reinforced polymer does not exceed 20 percent of the respective wall area, the fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame spread index of 25 or less or when the area of the fiber reinforced polymer or the fiberglass reinforced polymer does not exceed 10 percent of the respective wall area, the fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame spread index of 75 or less.The flame spread index requirement shall not be required for coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber reinforced polymer or the fiberglass reinforced polymer~~
- ~~1.2. Fireblocking complying with Section 717.2.6 shall be installed.~~
- ~~1.3. The fiber reinforced polymer or the fiberglass reinforced polymer shall be installed directly to a noncombustible substrate or be separated from the exterior wall by one of the following materials: corrosion-resistant steel having a minimum base metal thickness of 0.016 inch (0.41 mm) at any point, Aluminum having a minimum thickness of 0.019 inch (0.5 mm) or other approved noncombustible material.~~
- ~~1.4. The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613 respectively.~~

~~2~~1. When installed on buildings that are 40 feet (12 190 mm) or less above grade, the fiber reinforced polymer or the fiberglass reinforced polymer shall meet the requirements of Section 1406.2 and shall comply with all of the following conditions:
- ~~2~~1.1. Where the fire separation distance is 5 feet (1524 mm) or less, the area of the fiber reinforced polymer or the fiberglass reinforced polymer shall not exceed 10 percent of the wall area. Where the fire separation distance is greater than 5 feet (1524 mm), there shall be no limit on the area of the exterior wall coverage using fiber reinforced polymer or the fiberglass reinforced polymer.
- ~~2~~1.2. The fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame spread index of 200 or less. The flame spread index requirement shall not be required for coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber reinforced polymer or the fiberglass reinforced polymer.
- ~~2~~1.3. Fireblocking complying with Section 717.2.6 shall be installed.
- ~~2~~1.4. The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613 respectively.

Reason: Section 2612.1 through the base requirements/allowances of 2612.6 and Exception 2 of 2612.6 appear to provide a level of protection consistent with other established allowances (e.g. EIFS under Section 2603.5). However, **the first exception** to Section 2612.6 **allows an unacceptable increase in the amount of combustible materials on exterior facades of any height and any type of construction**.

Exception 1 allows up to 20 percent of the respective wall area of any type of construction to be covered with these materials when they have a flame spread index of 25 or less (or up to 10 percent with a flame spread index not exceeding 75). Twenty percent (and even 10 percent) of the

respective wall area can constitute **one extremely large continuous fuel package that can allow fire on an exterior façade to propagate unchecked**.

The test used to determine flame spread (ASTM E 84) is not an appropriate test to ensure plastics provide the level of protection intended by code for the proposed applications. The ignition source used for ASTM E 84 is substantially less than the exposure required for EIFS under Section 2603.5 (which is intended to simulate a fully involved room fire projecting out of a window onto the exterior façade). It has been demonstrated a number of times that **polymers only formulated to pass the E 84 test will typically not pass more rigorous tests**.

In addition, some polymers create flaming droplets and pool fires on the floor of the E 84 furnace. Installing such materials over locations where exits discharge would not be prudent.

As written, **Exception 1 applies to exterior facades of high-rise buildings that may be out of reach of fire department hose lines**. A façade fire out of reach of standard fire-fighting operations creates a hazard to occupants of the building, the building itself and the emergency responders trying to keep it from propagating. This does not reflect the intent of code.

In addition, Section 2612 does not provide guidance to restrict the thickness of these materials. The photo included with the initial proposed code change shows a cornice projecting from an exterior wall at least 5 feet. Although the "area" of polymer to exterior wall may not exceed the 10 or 20 percent limitation, the extent of projection (depth) can create a substantial combustible load on an exterior façade any height above grade and also needs to be limited. Eliminating Exception 1 requires that these materials pass the same test as EIFS, or be limited to buildings not exceeding 40 feet high.

The Report of Public Hearings indicates the one of the reasons the committee supported approval was that "the products are currently widely in use." The floor discussion indicated that these products have been installed outside of the limitations of the code for years. Just because an application has been installed "illegally" is not a reason to revise the code. These non-compliant installations in no way indicate that these materials provide the level of protection intended by code.

In summary, the amount of combustible materials allowed by Exception 1 on exterior facades of any height and any type of construction creates a potentially unsafe condition to building occupants, increases the risk to property and places unreasonable demands on firefighting personnel.

Cost Impact: This code change proposal will increase the cost of construction beyond what Section 2612 would otherwise allow.

Analysis: Code change proposal FS185, FS186 and FS187 address Exception #1 to Section 2612.6. The committee needs to make its intent clear with respect to these provisions.

	Assembly:	ASF	AMF	DF

ICCFILENAME: EVANS-FS2-Section 2612

FS188–09/10

2613.3, 2613.3.1, 2613.3.2, Chapter 35

Proponent: Marcelo Hirschler (GBH International) on behalf of American Fire safety Council

1. Revise as follows:

2613.3 Surface-burning characteristics. Reflective plastic core insulation shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested in accordance with ASTM E 84 or UL 723. The reflective plastic core insulation shall be tested at the maximum thickness intended for use . Test specimen preparation and mounting shall be in accordance with ASTM E 2599. ~~and shall be tested using one of the mounting methods in Section 2613.3.1 or 2613.3.2.~~

~~**2613.3.1 Mounting of test specimen.** The test specimen shall be mounted on 2-inch-high (51 mm) metal frames so as to create an air space between the unexposed face of the reflective plastic core insulation and the lid of the test apparatus.~~

~~**2613.3.2 Specific testing.** A set of specimen preparation and mounting procedures shall be used which are specific to the testing of reflective plastic core insulation.~~

2. Add new standard to Chapter 35 as follows:

ASTM E 2599-09	Standard Practice for Specimen Preparation and Mounting of Reflective Insulation Materials and Radiant Barrier Materials for Building Applications to Assess Surface Burning Characteristics

Reason: ASTM E 2599 was specifically developed as the test specimen preparation and mounting method for reflective insulation materials when using ASTM E 84 or UL 723, Steiner tunnel test. The sections proposed to be deleted were written in anticipation that the standard practice would be issued and describe both a mounting method that is specific for reflective plastic core insulation and that uses a test specimen mounted on two inch metal frames to create an air space.

Note that this code proposal does not affect testing in accordance with the room corner test or the other requirements for the reflective insulation materials.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM E2599-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FS189–09/10
2601.1, 2602.1, 2612.1, 2612 (New), Chapter 35

Proponent: Sam Francis, representing American Forest & Paper Association

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PLEASE SEE THE AGENDA FOR THIS COMMITTEE.

1. Revise as follows:

SECTION 2601
GENERAL

2601.1 Scope. These provisions shall govern the materials, design, application, construction and installation of foam plastic, foam plastic insulation, plastic veneer, interior plastic finish and trim, and light-transmitting plastics, and composite plastics. See Chapter 14 for requirements for exterior wall finish and trim and Chapters 6, 10 and 16 for structural requirements.

SECTION 2602
DEFINITIONS

2. Add new text as follows:

2602.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

COMPOSITE, WOOD- PLASTIC. A composite material made primarily from wood or cellulose-based materials in combination with a smaller fraction of plastic(s) by weight.

3. Add new text as follows:

SECTION 2612
WOOD-PLASTIC COMPOSITES USED AS STRUCTURAL MATERIALS

2612.1 General. Wood-plastic composite materials used in any exterior structural application, including deck boards, stair treads, handrails and guardrail systems shall bear a label indicating compliance with the provisions of ASTM D 7032,

2612.1.1 Structural applications. Wood-plastic composite materials used for structural purposes shall comply with the provisions of this code or with Section 2612.2. The label required in Section 2612.1 shall indicate the type and magnatude of the load determined in ASTM D 7031 or ASTM D 7032.

2612.1.2 Flame Spread Index. Wood-plastic composite materials required elsewhere in this code to have a Flame Spread Index, shall have those properties determined in accordance with Chapter 8. Otherwise, wood-plastic composite materials shall meet the requirements of ASTM D 7032.

Exception: materials determined to be noncombustible in accordance with Section 703.4.2.

2612.2 Prescriptive Design Considerations. Wood-plastic composite material shall be permitted to be installed in accordance with the following requirements.

2612.2.1 Span rating. Wood-plastic composite materials used as structural components of a floor or stair system shall have a span rating determined in accordance with ASTM D 7032 with a deflection limit of L/360.

2612.2.2 Guard construction and attachment. Guard construction and attachment shall be in accordance with ICC ES Acceptance Criteria AC174 or by engineering analysis.

2612.2.3 Termite and Decay resistance. Wood-plastic composite materials shall be termite and decay resistant as determined in accordance with Section 4.8 of ASTM D 7032. The sampling requirements for ASTM D 2017 shall be modified to require six specimens for each of the two fungi tested.

2612.2.4 Differential movement of components. Wood-plastic composite materials used as structural elements shall have approved fastening to allow for differential movement of the structural members to which it is fastened.

(Renumber subsequent sections)

4. Add new standard to Chapter 35 as follows:

ASTM
D7031-04 Standard Guide for Evaluating Mechanical and Physical Properties of Wood- Plastic Composite Products, ASTM International.

ASTM
D7032-04 Standard Specification for Establishing Performance Ratings for Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails), ASTM International.

ICC ES Acceptance Criteria For Deck Board Span Ratings And Guardrail Systems (Guards And Handrails) AC 174

Reason: In the last cycle of the code, proposals were made to introduce language for materials which that industry calls wood/plastic composite material. The proposal was to include it in Chapter 23 –Wood. This is clearly inappropriate because the base material is plastic. Chapter 26 – Plastic is the more reasonable place for these requirements to reside. Moreover, Section 1406 *Combustible Materials On The Exterior Side of Exterior Walls*, specifically notes plastic-based materials as a separate category and has an exception for Plastics complying with Chapter 26. Since Section 1406.3 (Balconies and similar projections) describes the precise uses for these composites, it makes sense to consider them in the same manner as other products with similar base materials (plastic resin) and place them in Chapter 26.

In the past, it was argued that because the composite materials contain wood, they ought to reside in that chapter. This is flawed. The Standard referenced for this material has no minimum amount of non-plastic material so that it can be exclusively plastic under the standard. In fact, additives, which may be fillers, are not compelled to be 'wood'. Hence, the resin base is the material which is the basis for the mechanical and fire properties of this material. It should therefore logically be included with other materials also of the same type.

In the development of the standard, certain requirements from ICC ES Acceptance Criteria were reduced. This proposal also seeks to maintain the criteria by which the products have been successfully judged and brought into the building code arena in the past. Maintaining those levels of performance seem to be necessary to ensure that the material is evaluated consistently with other products.

Finally the basic issues of fire performance, mechanical properties, and interface with other building materials are included in this proposal to facilitate correlation with the rest of the code.

Cost Impact: Unable to determine any cost impact.

Staff Analysis: Acceptance criteria are developed for use solely by ICC-ES for purposes of issuing ICC-ES evaluation reports. They are available to the public as a courtesy to ICC-ES report applicants and to testing laboratories and inspection agencies that provide services to applicants. Acceptance criteria are not for use outside of the ICC-ES system. ICC-ES Acceptance Criteria are not intended to be code-referenced documents and they do not meet the ICC criteria for referenced standards as contained in ICC Council Policy CP-28. A review of the standard(s) proposed for inclusion in the code, ASTM D7031-04 and ASTM D7032-04, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRANCIS-FS7-2601.1

FS190–09/10
2606.12, 2612 (New)

Proponent: David M. Baker, representing PDM Solar, Inc.

Delete and substitute as follows:

~~**2606.12 Solar collectors.** Light-transmitting plastic covers on solar collectors having noncombustible sides and bottoms shall be permitted on buildings not over three stories in height or 9,000 square feet (836.1 m^2) in total floor area, provided the light-transmitting plastic cover does not exceed 33.33 percent of the roof area for CC1 materials or 25 percent of the roof area for CC2 materials.~~

~~**Exception:** Light-transmitting plastic covers having a thickness of 0.010 inch (0.3 mm) or less or shall be permitted to be of any plastic material provided the area of the solar collectors does not exceed 33.33 percent of the roof area.~~

SECTION 2612
LIGHT-TRANSMITTING PLASTIC COVERS ON SOLAR COLLECTORS

2612.1 General. Light-transmitting plastic covers on solar collectors having noncombustible sides and bottoms shall comply with this section and Section 2606. Light-transmitting plastic solar collector covers shall not be installed in Groups H, I-2 and I-3. In all other groups, light-transmitting plastic solar collector covers shall comply with any one of the following conditions:

1. The building is not over three stories in height or 9,000 square feet (836.1 m^2) in total floor area.
2. The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. The roof construction is not required to have a fire-resistance rating by Table 601.

2612.2 Location. Where exterior wall openings are required to be protected by Section 704.8, a plastic solar collector cover shall not be installed within 6 feet (1829 mm) of such exterior wall.

2612.3 Area limitations. Plastic solar collector covers shall be limited in area and the aggregate area of plastic solar collector covers shall be limited as a percentage of the roof area in accordance with Table 2612.3.

Exceptions:

1. The area limitations of Table 2612.3 shall be permitted to be increased by 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

2. Light-transmitting plastic covers having a thickness of 0.010 inch (0.3 mm) or less or shall be permitted to be of any plastic material provided the area of the solar collectors does not exceed 33.33 percent of the roof area.

TABLE 2612.3
AREA LIMITATIONS FOR LIGHT-TRANSMITTING PLASTIC COVERS ON SOLAR COLLECTORS

CLASS OF PLASTIC	MAXIMUM AREA OF INDIVIDUAL PLASTIC SOLAR COLLECTOR COVERS (square feet)	MAXIMUM AGGREGATE AREA OF PLASTIC COVERS (percent of roof area)
CC1	150	33.33
CC2	30	25

For SI: 1 square foot = 0.0929 m^2

Reason: The code as currently written is overly restrictive in regards to the use of plastic covers on solar collectors on large buildings. As is shown in further detail in this justification, the identical material is currently permitted for use on buildings of the same size as that proposed in applications which pose more of a risk to the building than in the solar collector cover application.

As a result of the current focus on energy costs and emissions of greenhouse gases, renewable energy in general and solar energy in particular is being considered for new building construction. A significant amount of research in currently being conducted in order to develop new cost effective solar energy applications which have the potential to be widely adopted and provide a part of the solution to our energy and environmental problems. For example, PDM Solar, Inc. is developing a solar powered vapor compression air conditioning system, using a patent pending solar powered vapor compression technology. This technology uses solar heated hot water between 180 F and 200 F to provide the steam to operate the concentrator or energy conversion unit.

The use of light-transmitting plastic covers provides significant benefits over the use of glass for our applications. The plastic has dual walls, which lowers the convection and radiation losses, allowing the collectors to produce the desired water temperature with a higher efficiency. The higher efficiency enables the production of more hot water from a given area, providing more air conditioning. The plastic covers are also substantially lighter than glass, lowering the added roof load. The plastic covers are also available at a lower cost than glass. The lower cost combined with higher efficiency provides a more economical system with a faster payback, which is necessary to ultimately make solar air conditioning competitive with air conditioning provided from fossil fuels.

Although ICC staff was unable to discover the original motivation for 2606.12, we believe that the prohibition of the use of light-transmitting plastic solar collector covers on buildings over 3 stories or 9000 square feet is a result of safety concerns for occupants and firefighters. However, use of the same product is already permitted by the code on the roofs of the same size buildings with the same area limitations as included in the proposed change. As detailed below, we believe that use of the product for solar collector covers poses no more, and often less, risk to both occupants and fire fighters than the uses for which the product is currently permitted. At the suggestion of ICC staff, we are seeking a change in ICC 2606.12 during the 2009/2010 ICC code development cycle.

The light-transmitting plastic that we are requesting to use is a 2-layer 10-mm (3/8") structured polycarbonate sheet. Each layer is approximately 0.020" thick. We are planning to purchase the polycarbonate from Gallina USA, but equivalent product is made by several companies, including MacroLux , PolyGal, and General Electric. The proposed product has been tested by the ICC Evaluation Service and others and is a class CC1 product. The product is considered self-extinguishing. It will burn when exposed to a flame, but will self extinguish when the flame is removed (per ASTM D 635). The product has a spontaneous ignition temperature of 896 F per ASTM D-1929, 246 F higher than required by the code (2606.4). It has a flame spread of 25 and a smoke-developed classification of 135 when tested per ASTM E84-01, which compares favorably to the maximum 450 smoke developed index allowed in the code. The product has been found to have a linear burn rate of 0.0 mm/min when tested to ASTM D 635-98.

Two sections of the code permit the use of the proposed product on the roof of buildings larger than 9000 square feet. Section 2609 of the code permits the use of light-transmitting plastic roof panels and section 2610 permits the use of light-transmitting plastic for skylight glazing. We believe that the proposed use of light-transmitting plastic poses no more, and generally less, risk to occupants and firefighters than either of these permitted uses.

In section 2609, the product is permitted to be used in all groups except H, I-2, and I-3. Section 2609 permits the CC1 class plastic to cover 60% of the floor space, if the building is equipped with an automatic sprinkler system in accordance with Section 903.3.1.1.

In section 2610, the product is permitted to be used without restriction by group. Section 2610 permits the CC1 class plastic to cover 66.6% of floor area, if the building is equipped with an automatic sprinkler system in accordance with Section 903.3.1.1.

We believe that use of the product for solar collector covers poses no more, and generally less, risk to both occupants and fire fighters than for either of these two permitted uses.

Both of the permitted uses allow for the product to be used in place of, or replace part of, the roof assembly. The proposed use does not replace the roof assembly, which remains intact to provide the fire safety for which it was designed.

Use of the product on the roof of the building has the potential to increase the risk to occupants and firefighters in the following areas: 1) an increase in the amount of combustible material available to support a fire, 2) an increase in the amount of smoke and byproducts which would develop during a fire, 3) shortening the time until a fire penetrates the roof assembly, and 4) increasing the potential to provide a ignition source.

In the first three areas, the proposed use would pose either the same risk as the currently permitted uses or, in many cases, substantially less.

In the case of a fire that originates within the building, the proposed use should have substantially less effect on the occupants than either of the currently permitted uses. Unlike the currently permitted uses, the proposed use does not affect the fire safety capabilities of the existing roof assembly and the product is not directly in contact with the interior of the building. As a result, the proposed use of the product would have a minimal affect on the amount of combustible material available and the smoke generated when compared to either of the currently permitted uses. Unlike the permitted uses, the proposed use would have no affect on shortening the time until the fire penetrates the roof.

In the case of a fire that originated from an external source, such as a lightning strike or a fire in another structure, the amount of combustible material available and smoke generated externally, affecting the firefighters, would be no more than under the currently permitted uses. Because the proposed use of the product does not pierce the roof, the effect on the occupants of the combustible material available, the smoke generated, and the time for a fire to penetrate the roof should be less than under the currently permitted uses.

In either the case of an internally generated or an externally generated fire, the use of the product in the proposed application should have no more (and often substantially less) affect on the safety of the occupants and firefighters than other currently permitted uses in the areas of combustible material, smoke developed, and effectiveness of the roof assembly.

The final area of potential concern would be the potential for use of the light-transmitting plastic as a solar collector material to act as an ignition source. The self ignition temperature of the proposed light-transmitting plastic has been tested at 896 F. The maximum solar collector stagnation temperature for our flat panel non concentrating solar collectors is less than 450 F, which provides a safety margin of 400 F. In addition, both the walls and bottom of the solar collectors are constructed of non-combustible material (aluminum), providing an additional level of protection between the plastic cover and the roof assembly.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE

GENERAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

G1–09/10
202, 419.1

Proponent: Maureen Traxler representing Washington Association of Building Officials Technical Code Development Committee

1. Add new definition as follows:

SECTION 202
DEFINITIONS

LIVE/WORK UNIT. A *dwelling unit* or *sleeping unit* in which a significant portion of the space includes a nonresidential use that is operated by the tenant. See Section 419.

2. Revise as follows:

419.1 General. A live/work unit ~~is a dwelling unit or sleeping unit in which a significant portion of the space includes a nonresidential use that is operated by the tenant and~~ shall comply with Sections 419.1 through 419.8.

Exception: Dwelling or sleeping units that include an office that is less than 10 percent of the area of the dwelling unit ~~shall not be classified as a live/work unit~~ are permitted to be classified as dwelling units with accessory occupancies in accordance with Section 508.2.

Reason: The term live/work unit is found in several sections of the IBC, including Sections 310, 419, 508 and 1103, so the definition should be located in Chapter 2. This proposed definition of live/work unit is currently contained within 419, but not identified as a definition.

Section 419 is revised to relocate the definition of "live/work unit" to Chapter 2. The exception to Section 419.1 is revised to more clearly coordinate with the accessory occupancy provisions of Section 508.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAXLER-G1-202

G2–09/10
202, Appendix I; IRC R202, Appendix H

Proponent: Daniel J. Walker, P.E., Thomas Associates, Inc., representing the National Sunroom Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

1. Add new text as follows:

SECTION 202
DEFINITIONS

PATIO COVER. A one story structure with open or glazed walls which is used for recreational and outdoor living purposes associated with a dwelling unit.

2. Revise text as follows:

APPENDIX I
PATIO COVERS

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION I101
GENERAL

I101.1 General. Patio covers shall be permitted to be detached from or attached to *dwelling units*. Patio covers shall be used only for recreational, outdoor living purposes and not as carports, garages, storage rooms or habitable rooms. ~~Openings shall be permitted to be enclosed with insect screening, approved translucent or transparent plastic not more that 0.125 inch (3.2 mm) in thickness, glass conforming to the provisions of Chapter 24 or any combination of the foregoing.~~

SECTION I102
HEIGHT ~~DEFINITIONS~~

I102.1 ~~PATIO COVERS.~~ Height. Patio covers are limited to one story structures not exceeding 12 feet (3657 mm) in height. ~~Enclosure walls shall be permitted to be of any configuration, provided the open or glazed area of the longer wall and one additional wall is equal to at least 65 percent of the area below a minimum of 6 feet 8 inches (2032 mm) of each wall, measured from the~~ floor.

SECTION I103
EXTERIOR WALLS AND OPENINGS

I103.1 Enclosure walls. Enclosure walls shall be permitted to be of any configuration, provided the open or glazed area of the longer wall and one additional wall is equal to at least 65 percent of the area below a minimum of 6 feet 8 inches (2032 mm) of each wall, measured from the floor. Openings shall be permitted to be enclosed with insect screening, approved translucent or transparent plastic not more that 0.125 inch (3.2 mm) in thickness, glass conforming to the provisions of Chapter 24 or any combination of the foregoing.

~~I103.1~~ I1032. Light, ventilation and emergency egress. Exterior openings of the dwelling unit required for light and ventilation shall be permitted to open into a patio structure. However, the patio structure shall be unenclosed if such openings are serving as emergency egress or rescue openings from sleeping rooms. Where such exterior openings serve as an exit from the dwelling unit, the patio structure, unless unenclosed, shall be provided with exits conforming to the provision of Chapter 10.

SECTION I104
STRUCTURAL PROVISIONS

I104.1 Design loads. Patio covers shall be designed and constructed to sustain, within the stress limits of this code, all dead loads plus a minimum vertical live load of 10 pounds per square foot (0.48 kN/m^2) except that snow loads shall be used where such snow loads exceed this minimum. Such patio covers shall be designed to resist the minimum wind and seismic loads set forth in this code.

I104.2 Footings. In areas with a frost depth of zero, a patio cover shall be permitted to be supported on a concrete slab on grade without footings, provided the slab conforms to the provisions of Chapter 19 of this code, is not less than $3^1/_2$ inches (89 mm) thick and further provided that the columns do not support loads in excess of 750 pounds (3.36 kN) per column.

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

SECTION R202
DEFINITIONS

PATIO COVER. A one story structure with open or glazed walls which is used for recreational and outdoor living purposes associated with a dwelling unit.

2. Revise text as follows:

APPENDIX H
PATIO COVERS

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION AH101
GENERAL

AH101.1 Scope. Patio covers shall conform to the requirements of ~~this appendix chapter~~ Sections AH101 through AH106.

AH101.2 Permitted uses. Patio covers shall be permitted to be detached from or attached to *dwelling units*. Patio covers shall be used only for recreational, outdoor living purposes and not as carports, garages, storage rooms or habitable rooms.

SECTION AH102
~~DEFINITION~~ HEIGHT

~~**Patio covers.**~~ **AH102.1 Height.** Patio covers are limited to one-story structures not exceeding 12 feet (3657 mm) in height. ~~Enclosure walls shall be permitted to be of any configuration, provided the open or glazed area of the longer wall and one additional wall is equal to at least 65 percent of the area below a minimum of 6 feet 8 inches (2032 mm) of each wall, measured from the floor. Openings shall be permitted to be enclosed with (1) insect screening, (2) *approved* translucent or transparent plastic not more than 0.125 inch (3.2 mm) in thickness, (3) glass conforming to the provisions of Section R308, or (4) any combination of the foregoing.~~

~~SECTION AH103~~
~~PERMITTED USES~~

~~**AH103.1 General.** Patio covers shall be permitted to be detached from or attached to *dwelling units*. Patio covers shall be used only for recreational, outdoor living purposes and not as carports, garages, storage rooms or habitable rooms.~~

~~SECTION AH104~~
~~DESIGN LOADS~~

~~**AH104.1 General.** Patio covers shall be designed and constructed to sustain, within the stress limits of this code, all dead loads plus a minimum vertical live load of 10 pounds per square foot (0.48 kN/m^2) except that snow loads shall be used where such snow loads exceed this minimum. Such covers shall be designed to resist the minimum wind loads set forth in Table R301.2(1).~~

SECTION AH104
EXTERIOR WALLS AND OPENINGS

AH 104.1 Enclosure walls. Enclosure walls shall be permitted to be of any configuration, provided the open or glazed area of the longer wall and one additional wall is equal to at least 65 percent of the area below a minimum of 6 feet 8 inches (2032 mm) of each wall, measured from the floor. Openings shall be permitted to be enclosed with the following:

1. Insect screening,
2. Approved translucent or transparent plastic not more than 0.125 inch (3.2 mm) in thickness,
3. Glass conforming to the provisions of Section R308, or
4. Any combination of the foregoing.

~~SECTION AH105~~
~~LIGHT AND VENTILATION/EMERGENCY EGRESS~~

~~**AH105.1 General.**~~ **AH104.2 Light, ventilation and emergency egress.** Exterior openings required for light and ventilation shall be permitted to open into a patio structure conforming to Section AH101, provided that the patio structure shall be unenclosed if such openings are serving as emergency egress or rescue openings from sleeping rooms. Where such exterior openings serve as an exit from the *dwelling unit*, the patio structure, unless unenclosed, shall be provided with exits conforming to the provisions of Section R310 of this code.

SECTION AH105
STRUCTURAL PROVISIONS

~~**AH104.1 General.**~~ **AH 105.1 Design loads.** Patio covers shall be designed and constructed to sustain, within the stress limits of this code, all dead loads plus a minimum vertical live load of 10 pounds per square foot (0.48 kN/m^2) except that snow loads shall be used where such snow loads exceed this minimum. Such covers shall be designed to resist the minimum wind loads set forth in Table R301.2(1).

~~**SECTION AH106**~~
~~**FOOTINGS**~~

~~**AH106.1 General.**~~ **AH 105.2 Footings.** In areas with a frostline depth of zero as specified in Table R301.2(1), a patio cover shall be permitted to be supported on a slab on *grade* without footings, provided the slab conforms to the provisions of Section R506 of this code, is not less than 3.5 inches (89 mm) thick and the columns do not support live and dead loads in excess of 750 pounds (3.34 kN) per column.

(Renumber subsequent sections)

Reason: This language has long been included in Appendix I of the code. Although the term is defined in the Patio Cover Appendix, this appendix is not a mandatorily adopted part of the code.

Because the term patio cover is used in the main body of the code, the definition needs to be placed in Chapter 2. However because the existing definition contains many regulatory provisions, a new definition needs to be created, leaving the regulatory provisions in Appendix I of IBC and Appendix H of IRC. This provides an opportunity to restructure the provisions of the appendix to put related items together. The section by section changes are as follows:

- 202 – Definition. This is simply the essence that this is a one story structure of open construction that is associated with a dwelling unit which is limited in use.
- I101.1 General – The general provision is reduced to the general limitations on the location of the structure and its use. The details on bug screens are moved to I103
- I102.1 Height. This was the definition, but the all that is left from the definition is the height limitation. The wall and opening limits are moved to I103.
- I103 Exterior Walls and Openings. 103.1 is the new location of the opening limits formerly in the definition and the screening limits moved out of the General Section. 103.2 is the existing 103 section, but with the minor clarification that the exterior openings are those of the dwelling unit, not the patio cover.
- I104. Structural provisions are unchanged.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WALKER-G1-202-PATIO COVER.doc

G3–09/10
202

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

Revise as follows:

SECTION 202
DEFINITIONS

SECONDARY MEMBERS. The following structural members shall be considered secondary members and not part of the primary structural frame:

1. Structural members not having direct connections to the columns;
2. Members of the floor construction <u>and roof construction</u> not having direct connections to the columns; and
3. Bracing members other than those that are part of the primary structural frame.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:

> Review the recommendations issued by NIST in its report entitled "Final Report on the Collapse of the World Trade Center Towers", issued September 2005, for applicability to the building environment as regulated by the I-Codes. To evaluate the necessity of developing code changes in response to the NIST report.

The text for "primary structural frame" and "secondary members" was originally developed for placement in Section 704 on Fire-resistance Ratings of Structural Members (Section 714 in the 2006 IBC). At the most recent final action hearings, however, this text was relocated to Section 202 essentially without revision. In the 2009 IBC, bracing members are defined as members of the primary structural frame where they are essential to the stability of the primary structural frame under gravity loading regardless of whether they are designed to resist gravity loads. All other bracing members are defined as secondary members.

This proposal corrects the oversight that roof construction should be treated the same a floor construction within the context of secondary members.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HEILSTEDT-G7-202.doc

G4–09/10
202

Proponent: John England, MCO, England Enterprises Inc., representing the Cities of Beaufort and Hardeeville, SC

Revise definition as follows:

SECTION 202
DEFINITIONS

TOWNHOUSE. ~~A single-family *dwelling unit* constructed in a group of three or more attached units in which each unit extends from the foundation to roof and with open space on at least two sides~~. Single family Group R-3 dwelling unit with zero lot lines which are connected to other dwelling units where three or more exist. The units extend from the foundation to the roof and are open on two or more sides. When three or more townhouses are on the same property they are considered Group R-2 Apartments

Reason: To clarify the confusion of which code(s) applies Town houses build under the IRC are considered separate properties and are really houses with zero lot lines. They will have 2 hr fire walls build between them. They will be sprinkled with NFPA 13D requirements. Accessibility will not become an issue.

Townhouses which are on the same property and are rented are considered Group R-2 (Apartments) and need to be regulated by the IBC when it comes to fire partitions, NFPA 13R sprinklers and accessibility.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Changing the definition of townhouse may affect the scoping of the *International Building Code* and *International Residential Code.*

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-G8-202-TOWNHOUSE.doc

G5–09/10
202; IRC R202

Proponent: Theresa Weston, PhD., DuPont Building Innovations

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

Revise definition as follows:

SECTION 202
DEFINITIONS

VAPOR-PERMEABLE MEMBRANE. A material or covering having a permeance rating of ~~5~~ 10 perms (~~52.9~~ 5.7 x 10^{-10} kg/Pa●s●m^2) or greater, when tested in accordance with the desiccant method using Procedure A of ASTM E 96. A vapor-permeable material permits the passage of moisture vapor.

PART II – IRC BUILDING/ENERGY

Revise definition as follows:

SECTION R202
DEFINITIONS

VAPOR PERMEABLE MEMBRANE. A material or covering having a permeance rating of ~~5~~ 10 perms (~~2.9~~ 5.7 x 10^{-10} kg/Pa●s●m^2) or greater, when tested in accordance with the desiccant method using Procedure A of ASTME 96. A vapor permeable material permits the passage of moisture vapor.

Reason: (IBC) This change is to correct an apparent contradiction between definitions within the code. Currently, a *Class III Vapor Retarder* is defined as having a permeance between 1 and 10 perms, while a *Vapor-Permeable Membrane* is defined having vapor permeance greater than 5 perms. The permeance region of 5 to 10 perms is therefore both vapor permeable and vapor retarding. I propose resolving this contradiction by raising the vapor permeable minimum permeance to 10 perms. Additionally, currently the metric conversion number is incorrect and a correct metric conversion is provided in this change.

(IRC) This change is to correct an apparent contradiction between definitions within the code. Currently, a *Class III Vapor Retarder* is defined as having a permeance between 1 and 10 perms, while a *Vapor-Permeable Membrane* is defined having vapor permeance greater than 5 perms. The permeance region of 5 to 10 perms is therefore both vapor permeable and vapor retarding. I propose resolving this contradiction by raising the vapor permeable minimum permeance to 10 perms.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: WESTON-G1-202.doc

G6–09/10
202, 304.1 (IFC 202)

Proponent: Ali M. Fattah, City of San Diego, San Diego Area Chapter ICC Code Committee

1. Add new definition as follows:

DEFINITIONS
SECTION 202

FIRE STATION. A building or a portion of a building used by fire and rescue personnel to store equipment and apparatus, for on site living quarters and for administrative and training spaces exclusively dedicated for use by fire station personnel.

2. Revise as follows:

304.1 (IFC 202) Business Group B. Business Group B occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:

Airport traffic control towers
Ambulatory health care facilities
Animal hospitals, kennels and pounds
Banks
Barber and beauty shops
Car wash
Civic administration
Clinic—outpatient
Dry cleaning and laundries: pick-up and delivery stations and self-service
Educational occupancies for students above the 12th grade

Electronic data processing
Fire Stations
Laboratories: testing and research
Motor vehicle showrooms
Post offices
Print shops
Professional services (architects, attorneys, dentists, physicians, engineers, etc.)
Radio and television stations
Telephone exchanges
Training and skill development not within a school or academic program

Reason: This proposed change is to update the 2009 IBC due to recently adopted and published changes to Section 508 in the prior code change cycle. The code change also adds clarity since most designers and building officials we contacted consider the fire station to be a use that falls into one occupancy category. Just like a dwelling can have a garage and a storage area a fire station has an apparatus room, office and training space as well as living quarters for personnel to be comfortably accommodated while on standby awaiting deployment to a call. Currently Fire Stations are not classified and as a result the code forces an un-separated mixed occupancy building design that includes Group R-3 congregate residence, Group S-2 parking, Group B business (office/training) and therefore the 2009 IBC requires the following additional fire protection due to the R-3 occupancy classification: a one-hour occupancy separation between the living quarters and the rest of the fire station as well as a fire suppression system throughout the building. NFPA 13-D is the sprinkler design and installation standard for residential occupancies such as R-3 but would not be appropriate for a fire station which would be most likely protected with a NFPA 13-R or full NFPA 13 system.

Many fire stations have been protected voluntarily with a fire sprinkler system, and in some cases are located in jurisdictions where all buildings require sprinkler protection and therefore so are fire stations. The one hour occupancy separation required in Section 508.2.4 Exception 3, does not allow R-3 occupancies to be non-separated uses. The occupancy separation will be onerous since in many fire stations living quarters can occupy one half of the floor area and can be immediately adjacent to or above the apparatus room and office spaces.

The primary use for a fire station is not for living but for storage of apparatus and to stage fire and rescue personnel prior to deployment. Fire fighters are able bodied and on duty when at the fire station. The 1997 UBC in Section 304.1 item 12 classifies a fire station as a Group B occupancy, as did the 2000 IBC when first published. The 2000 IBC was changed in code Change G20-01 submitted by William Koffel without substantiation, the argument was that a fire station is mixed occupancy and that non-separated use option is available. The 2009 CBC has now changed to require separations for R-3 occupancies despite the non-separated use option. Additionally there were concerns that fire stations in some communities can contain community rooms. The 2009 IBC includes requirements for live-work, however it was not the intent of the proponents of live-work-units to include fire stations which can be considered a place of work where employees live. The only alternative without approval of this code change is to consider the fire station a mixed use occupancy building. By adding the fire station definition, the code change makes clear that when located as a part of a building or as a standalone unit only the fire station operation shall be classified as a Group B occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FATTAH-G1-304.1.doc

G7–09/10
202

Proponent: Phillip A. Brown, American Fire Sprinkler Association

Add new definition as follows:

SECTION 202
DEFINITIONS

LIMITED-COMBUSTIBLE MATERIAL. A building construction material that in the form it is used has a potential heat release value not exceeding 3,500 Btu per pound.

Reason: A definition needs to be added to define Limited-Combustible Material. The IBC and IFC do not provide a definition of limited combustible construction. But both the IBC and IFC send you to Section 903.3 for the requirements of providing fire sprinklers protection. And as explained in Section 903.3.1 of the 2006 IBC Code and Commentary automatic sprinkler systems are to be installed to comply with the code and NFPA 13, 13R or 13D. NFPA 13:8.15.1.2.1 and 8.15.1.2.10 sets the criteria that will allow for the omission of sprinkler protection, as such explained in the IBC Commentary, the IBC will also allow this. If the IBC or IFC did not want to allow this it would have addressed it as it does in Section 903.3.1.2.1 which requires the sprinklering of balconies and decks where the building is of Type V construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The term 'limited-combustible material' is not presently used in the IBC. A proposal by Ohler for Section 3302 does include the use of this term.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-G1-202 (NEW).doc

G8–09/10
202, 3103.1

Proponent: Patrick Vandergriff, Vandergriff Code Consulting Services

1. Add new definition as follows:

SECTION 202
DEFINITIONS

MODULAR BUILDING. Prefabricated structures that are manufactured off site and constructed in accordance with the adopted code at the time of construction. Modular buildings are delivered to the customer in one or more complete modular sections for either temporary or permanent installation.

2. Revise as follows:

3103.1 General. The provisions of this section shall apply to structures erected for a period of less than ~~180 days~~ 24 months for modular buildings and similar structures. Tents and other membrane structures erected for a period of less than 180 days shall comply with the *International Fire Code*. Those erected for a longer period of time shall comply with applicable sections of this code.

Reason: Sec. 3103.1. This change provides for time period for temporary structures that is more in keeping with the issue of buildings used as temporary offices and temporary use buildings during construction projects and for other purposes where the old 180 days is simply not going to cover it. It keeps the building official from having to repeatedly review and re-issue permission over and over on such uses which have become common within the industry. It also provides a vehicle for separating modular or other code constructed structures from the Tent and membrane structures.

Definition: There is currently no definition within the code for a modular structure. This language provides a definition and establishes a basis for current proposed language and future development of requirements relative to modular construction building.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: This is one of several changes by this proponent which would add modular buildings into existing text, or adds specific text addressing modular buildings.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: VANDERGRIFF-G3-202.doc

G9–09/10
202

Proponent: Tony Crimi, A.C., Consulting Solutions Inc., representing North American Insulation Manufacturers Association

Add new definition as follows:

SECTION 202
DEFINITIONS

NONCOMBUSTIBLE MATERIAL. A material that will not ignite or burn when subjected to specified fire or heat conditions. Materials that meet the acceptance criteria of ASTM E 136 are considered noncombustible materials.

Reason: There is a need for a definition of "noncombustible material" in the IBC. Several of the I-Codes have varying definitions of the term "non-combustible material", each based upon the way in which the concept of "non-combustible" is used within that Code. Throughout the ICC code system, the concept of "noncombustible material" is based on the idea that the material should not ignite or burn when subjected to fire or heat The IBC, which uses the term extensively, does not contain a specific definition.

The concept of "noncombustible materials" and "noncombustibility" in terms of types of construction is widely used throughout the International Codes. While the IRC, IMC, and IWUIC all contain definitions of the term, they are all different from each other.

In contrast, the IBC, IFC, IEBC and IFGC do not contain a separate definition, even though they use the terminology "non-combustible materials". There is a need for a consistent definition of "noncombustible material" in all ICC codes that use the term.

In common usage, the term "noncombustible" is used to denote materials which do not ignite or are not capable of sustaining combustion. The common Dictionary definitions for "noncombustible" are typically as follows:

Noncombustible, adj – not capable of igniting and burning (Webster's Third New International Dictionary of the English Language, Unabridged, 2007)

In contrast to the common usage, the traditional use of the terminology and concept of "noncombustible materials" in the Codes has been based on acceptable performance when tested in accordance with ASTM E136, Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C. Materials passing the test are permitted limited flaming and other indications of combustion. However, these have traditional been acceptable. Understandably, ASTM E136 does not replicate the full spectrum of actual building fire exposure conditions. However, this test method does provide an assessment indicating those materials which do not act to aid combustion or add appreciable heat to an ambient fire.

While each of the model I-Codes which reference the term "noncombustible" do have unique additional attributes, we are in agreement with the original proponent, that these are best addressed outside of the definition. For example, section 703.4 of the IBC does provide additional requirements and acceptance criteria which are specific to its own intent and contained in Sections 602.2, 602.3, and 602.4. However, this section only describes "Noncombustibility Tests", rather than providing a definition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRIMI-G2-202.doc

G10–09/10
303.1 (IFC [B] 202)

Proponent: Ron Hoover, City of Marion, Alburnett Fire, representing self

Revise as follows:

303.1 (IFC [B] 202) Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

Exceptions:

1. A building or tenant space used for assembly purposes with an *occupant load* of less than 50 persons shall be classified as a Group B occupancy.
2. A room or space used for assembly purposes with an *occupant load* of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
3. A room or space used for assembly purposes that is less than 750 square feet (70m^2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
4. ~~Assembly areas~~ A room or space used for assembly purposes that ~~are~~ is ~~accessory to~~ associated with a Group E ~~occupancies~~ occupancy ~~are not considered separate~~ shall be classified as a Group E ~~occupancies~~ occupancy ~~except when applying the assembly occupancy requirements of Chapter 11~~.
5. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

(Portions of text not shown remain unchanged)

Reason: In previous Code cycles, the wording of this exception was extracted from the general requirement of Section 303 and moved to Section 508, then moved back to 303.1 as an exception. In doing so, the text was changed slightly and the logic of English language was lost, resulting in an exception that is not consistent in format with other exceptions to 303.1 and is not logical in literal meaning. The proposed change will recapture the original intent of this exception in concise language that is consistent with the remainder of this section. Change of wording from 'accessory to' to 'associated with' will clarify that these areas are not separate accessory occupancies subject to the provisions of Section 508.2 and individually classified, but are part of the primary occupancy to which they are associated, and classified accordingly. This exception is an exception only to the occupancy classification and not an exception to the requirements found elsewhere in the Code. By referencing only Chapter 11 in this exception, the code user is left to think that they don't have to comply with other assembly provisions of Chapter 10 or other Code sections. It is not necessary to state here that these areas must comply with the Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The phrase "accessory to Group E occupancies" also occurs in Sections 1010.2, 1014.3, 1028.1, 1028.2, 1028.3 and 1028.9. If this proposal is approved, staff will editorially revise the other sections.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOOVER-G1-303.1

G11–09/10
303.1 (IFC [B] 202)

Proponent: Ron Hoover, City of Marion, Alburnett Fire, representing self

Revise as follows:

303.1 (IFC [B] 202) Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for the purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

Exceptions:

1. A building or tenant space used for assembly purposes with an *occupant load* of less than 50 persons shall be classified as a Group B occupancy.
2. A room or space used for assembly purposes with an *occupant load* of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
3. A room or space used for assembly purposes that is less than 750 square feet (70m_2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
4. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.
5. ~~Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.~~

Assembly occupancies shall include the following:

A-3 Assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A including, but not limited to:

Amusement arcades
Art galleries
Bowling alleys
Community halls
Courtrooms
Dance halls (not including food or drink consumption)
Exhibition halls
Funeral parlors
Gymnasiums (without spectator seating)
Indoor swimming pools (without spectator seating)
Indoor tennis courts (without spectator seating)
Lecture halls
Libraries
Museums
Places of religious worship
Pool and billiard parlors
<u>Religious education rooms</u>
Waiting areas in transportation terminals

(Portions of text not shown remain unchanged)

Reason: In previous Code cycles, the wording of this exception was extracted from the general requirement of Section 303 and moved to Section 508, then moved back to 303.1 as an exception for the 2009 Edition. In doing so, the text was changed slightly and the logic of English language was lost, resulting in an exception that is not consistent in format with other exceptions to 303.1 and is not logical in literal meaning. The threshold of occupant load less than 100 in the current Code language would put in doubt the proper classification of similar uses with an occupant load greater than 100 and is not needed. The Current Code language is more clarification that the uses described are indeed assembly rather than an exception to assembly classification, it is appropriate to delete the exception and insert “religious educational rooms” in the list of A-3 uses. Religious auditoriums would be included in the current list as “Lecture halls”.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOOVER-G2-303.1

G12–09/10
303.1 (IFC [B] 202)

Proponent: Ron Hoover, City of Marion, Alburnett Fire, representing self

Revise as follows:

303.1 (IFC [B] 202) Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for the purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

Exceptions:

1. A building or tenant space used for assembly purposes with an *occupant load* of less than 50 persons shall be classified as a Group B occupancy.
2. A room or space used for assembly purposes with an *occupant load* of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
3. A room or space used for assembly purposes that is less than 750 square feet (70m_2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
4. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.
5. ~~Accessory~~ A room or space used for religious education ~~educational rooms and~~ or as a religious auditorium ~~auditoriums with occupant loads of less than 100 are not considered separate occupancies~~ and associated with a Group A-3 occupancy place of religious worship shall be classified as a Group A-3 occupancy.

(Portions of text not shown remain unchanged)

Reason: In previous Code cycles, the wording of this exception was extracted from the general requirement of Section 303 and moved to Section 508, then moved back to 303.1 as an exception for the 2009 Edition. In doing so, the text was changed slightly and the logic of English language was lost, resulting in an exception that is not consistent in format with other exceptions to 303.1 and is not logical in literal meaning. The proposed change will recapture the original intent of this exception in concise language that is consistent with the remainder of this section. The threshold of occupant load less than 100 was removed in the proposed language because an occupant load of greater than 100 would also be classified as an assembly Group A-3. The current Code language would put in doubt the proper classification of similar uses with an occupant load greater than 100. Change of wording from 'accessory to' to 'associated with' will clarify that these areas are not separate accessory occupancies subject to the provisions of Section 508.2 and individually classified, but are part of the primary occupancy to which they are associated, and classified accordingly.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HOOVER-G3-303.1.doc

G14–09/10
303.1 (IFC [B] 202)

Proponent: Stephen Thomas, Colorado Code Consulting, LLC representing the Colorado Chapter ICC

Revise as follows:

303.1 (IFC [B] 202) Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

A-2 Assembly uses intended for food and/or drink consumption including, but not limited to:

Banquet halls
Casinos
Night clubs
Restaurants
Taverns and bars

(Portions not shown are unchanged.)

Reason: Casinos are being constructed across the country. These occupancies are sometimes very large. The current code does not specify the occupancy classifications for casinos. Therefore, different classifications are given by building departments and there is inconsistency between jurisdictions. Some jurisdictions classify casinos as Group A-2 and other classify them as Group A-3. This proposal designates casinos as A-2 occupancies. This is the occupancy that is used by the Southern Nevada area including the Las Vegas and Clark County. The A-2 occupancy classification is also appropriate because the casinos have similar hazard characteristics of the other uses in this category. There are distracting lights, sounds, decorations and in some cases alcohol being served. The occupants can become disoriented and confused in an emergency condition and have difficulty finding the exits. Therefore, it seems reasonable to place casinos in the Group A-2 Occupancy Classification.

Cost Impact: The code change will not increase the cost of construction.

Proponent: Paul K. Heilstedt, PE, Chair, representing ICC Code Technology Committee (CTC)

1. Revise as follows:

304.1 (IFC [B] 202) Business Group B. Business Group B occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:

Ambulatory ~~health~~ care facilities
Clinic – outpatient

(Portions of list not shown remain unchanged)

~~304.1.1~~ 304.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

(Relocate definition for Ambulatory Health Care Facilities from Section 202, and revise)

AMBULATORY ~~HEALTH~~ CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than 24-hour basis to individuals who are rendered incapable of self-preservation by the services provided.

CLINIC-OUTPATIENT. Buildings or portions thereof used to provide medical care on less than a 24-hour basis to individuals who are not rendered incapable of self-preservation by the services provided.

SECTION 422
AMBULATORY ~~HEALTH~~ CARE FACIILITIES

422.1 General. Occupancies classified as ~~Group B~~ ambulatory ~~health~~ care facilities shall comply with the provisions of Sections 422.1 through ~~422.6~~ 422.7 and other applicable provisions of this code.

422.2 Separation. Ambulatory care facilities where the potential for four or more care recipients are to be incapable of self preservation at any time, whether rendered incapable by staff or staff accepted responsibility for a care recipient already incapable, shall be separated from adjacent spaces, corridors or tenants with a fire partition installed in accordance with Section 708.

~~422.2~~ 422.3 Smoke ~~barriers~~ compartments. ~~Smoke barriers shall be provided to subdivide every~~ Where the aggregate area of one or more ambulatory ~~health~~ care facilities ~~greater than~~ exceeds 10,000 square feet on one story, the story shall be provided with a smoke barrier to subdivide the story into not less than ~~into a minimum of~~ two smoke compartments ~~per story~~. The area of any one such smoke compartment shall not exceed 22,500 square feet (2092 m^2). The travel distance from any point in a smoke compartment to a smoke barrier door shall not exceed 200 feet (60 960 mm). The smoke barrier shall be installed in accordance with Section 710 with the exception that smoke barriers shall be continuous from outside wall to an outside wall, a floor to a floor, or from a smoke barrier to a smoke barrier or a combination thereof.

~~422.3~~ **422.4 Refuge area.** At least 30 net square feet (2.8 m^2) per nonambulatory ~~patient~~ care recipient shall be provided within the aggregate area of corridors, ~~patient~~ care recipient rooms, treatment rooms, lounge or dining areas and other low-hazard areas ~~on each side of each smoke barrier~~ within each smoke compartment. Each occupant of an ambulatory care facility shall be provided with access to a refuge area~~s~~ without passing through or utilizing adjacent tenant spaces.

~~422.4~~ **422.5 Independent egress.** A means of egress shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of egress originated.

~~422.5~~ **422.6 Automatic sprinkler systems.** Automatic sprinklers systems shall be provided for ambulatory care facilities in accordance with Section 903.2.2.

~~422.6~~ **422.7 Fire alarm systems**. A fire alarm system shall be provided for ambulatory care facilities in accordance with Section 907.2.2.1.

710.5 Openings. Openings in a *smoke barrier* shall be protected in accordance with Section 715.

Exceptions:

1. In Group I-2 and ambulatory care facilities, where doors are installed across *corridors*, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested. The doors shall be close fitting within operational tolerances, and shall not have undercuts in excess of 3/4-inch, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and shall be automatic closing by smoke detection in accordance with Section 715.4.8.3. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Group I-2 and ambulatory care facilities, horizontal sliding doors installed in accordance with Section 1008.1.4.3 and protected in accordance with Section 715.

[F] 903.2.2 (IFC 903.2.2) ~~Group B~~ ambulatory ~~health~~ care facilities. An automatic sprinkler system shall be installed throughout all fire areas containing an ~~Group B~~ ambulatory ~~health~~ care facility ~~occupancy~~, when either of the following conditions exist at any given time:

1. Four or more care recipients are incapable of self preservation, whether rendered incapable by staff or staff have accepted responsibility for care recipients already incapable.
2. One or more care recipients that are incapable of self preservation are located at other than the level of exit discharge.

In buildings where care is provided on levels other than the level of exit discharge, an automatic sprinkler system shall be installed on the entire floor where care is provided as well as all floors below, and all floors between the level of care and the closest level of exit discharge.

[F] 903.3.2 (IFC 903.3.2) Quick-response and residential sprinklers. Where automatic sprinkler systems are required by this code, quick-response or residential automatic sprinklers shall be installed in the following areas in accordance with Section 903.3.1 and their listings:

1. Throughout all spaces within a smoke compartment containing ~~patient~~ sleeping units in Group I-2 in accordance with this code.
2. Throughout all spaces within a smoke compartment containing treatment rooms in ambulatory care facilities.
3. ~~2.~~ Dwelling units, and sleeping units in Group R and I-1 occupancies.
4. ~~3.~~ Light-hazard occupancies as defined in NFPA 13.

[F] 907.2.2 (IFC 973.2.2) Group B. A manual fire alarm system shall be installed in Group B occupancies where one of the following conditions exists:

1. The combined Group B *occupant load* of all floors is 500 or more.
2. The Group B *occupant load* is more than 100 persons above or below the lowest *level of exit discharge*.
3. The ~~Group B~~ *fire area* contains a ~~Group B~~ ambulatory ~~health~~ care facility.

Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

[F] 907.2.2.1 (IFC 907.2.2.1) ~~Group B~~ ambulatory ~~health~~ care facilities. Fire areas containing ~~Group B~~ ambulatory ~~health~~ care facilities shall be provided with an electronically supervised automatic smoke detection system installed within the ambulatory ~~health~~ care facility and in public use areas outside of tenant spaces, including public *corridors* and elevator lobbies.

Exception: Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, provided the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

Reason: Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as: Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Ambulatory Care Facilities, Section 422 and related sections

This public comment represents the collaborative efforts to address the more specifically concerns regarding these uses over the past several cycles.

Change modifying the existing language includes:

- Remove an unneeded reference to "Health" as the definition clearly expresses that these types of facilities are related to some form or care. Also relocate the definition to Section 304.2 to align with the formatting of other Groups that provide definitions for special occupancies within that specifically related section.
- Remove an unneeded reference to "Group B" whenever the term Ambulatory Health Care Facility is used.
- Added Section 422.2 to require fire partition separation from adjacent spaces in facilities with greater than 4 care recipients. The intent is to subdivide the floor to allow for a reasonable level of safety for care recipients who made need assistance to evacuate, or to allow for the option of protecting in place for a limited period of time.
- Modified the continuity requirements of a smoke barrier to deal with intersection or connection to adjacent tenants, and maintain the integrity and safety.
- Several of these changes are mindful of existing buildings to allow for renovations without going into other tenant spaces.
- Added 22,500 square foot limit to a smoke compartment, similar to Group I-2s.
- For multiple tenant spaces, language is added to the area of refuge requirements to clarify that the area of refuge must be accessed without going through adjacent tenant spaces.

Correlative changes to Sections 710, 903 and 907 are bringing consistency of terminology and provision cross references.

Cost Impact: The code change proposal will increase the cost of construction.

305.1, 305.2 (New), 305.2 (IFC [B] 202); 308.5, 308.5.1, 308.5.2 (IFC [B] 202), 310.2; [F] 903.2.6 (IFC 903.2.6); 1015.1, Table 1015.1, 1015.7 (New), 1021.2, Table 1021.2 (IFC [B] 1015.1, Table 1015.1, 1015.7 (New), 1021.2, Table 1021.2); 1103.2.12; [P] Table 2902.1, [P] 2903.1, [P] 2903.2 (IPC Table 403.1, 403.1, 403.2)

Proponent: Paul K. Heilstedt, PE, Chair, representing ICC Code Technology Committee (CTC)

1. Revise as follows:

SECTION 305
EDUCATIONAL GROUP E

305.1 (IFC [B] 202) Educational Group E. Educational Group E occupancy includes, among others, the use of a building or structure, or a portion thereof, by six or more persons at any one time for educational purposes through the 12th grade.

Exception: Religious educational rooms and religious auditoriums, which are accessory to *places of religious worship* in accordance with Section 303.1 and have *occupant loads* of less than 100, shall be classified as a Group A-3 occupancies.

305.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

(Relocate definition for Personal Care Service from Section 310.2, and revise)

PERSONAL CARE SERVICE. The care of ~~residents~~ occupant's who do not require ~~chronic or convalescent~~ medical ~~or nursing~~ care. Personal care involves responsibility for the safety of the ~~residents~~ occupants while inside the building.

~~**305.2**~~ **305.3 (IFC [B] 202) Group E, Day care facilities.** The use of a building or structure, or portion thereof, for educational, supervision or *personal care services* or more than five children older than 2 1/2 years of age, shall be classified as a Group E occupancy.

A facility such as the above within a dwelling unit and having five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.

SECTION 308
INSTITUTIONAL GROUP I

308.5 (IFC [B] 202) Group I-4, day care facilities. This group shall include buildings and structures occupied by persons of any age who receive custodial care for less than 24 hours by individuals other than parents or guardians, relatives by blood, marriage or adoption, and in a place other than the home of the person cared for. ~~A facility such as the above five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2. Places of worship during religious functions are not included.~~ This group shall include, but not be limited to, the following:

Adult day care
Child day care

~~**308.5.1 (IFC [B] 202) Adult care facility.** A facility that provides accommodations for less than 24 hours for more than five unrelated adults and provides supervision and custodial care shall be classified as Group I-4.~~
~~**Exception:** A facility where occupants are capable of responding to an emergency situation without physical assistance from the staff shall be classified as Group R-3.~~

~~**308.5.2 (IFC [B] 202) Child care facility.** A facility that provides supervision and custodial care on less than a 24-hour basis for more than five children 2 1/2 years of age or less shall be classified as Group I-4.~~

Exceptions:

1. A child day care facility that provides custodial care for more than five but no more than 100 children 2-1/2 years or less of age, when the rooms where such children are cared for are located on the level of exit discharge and each of these child care rooms has an exit door directly to the exterior, shall be classified as Group E.
2. Rooms and spaces within places of worship providing such care during religious functions shall be classified as part of the primary occupancy.

A facility such as the above within a dwelling unit and having five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.

[F] 903.2.6 (IFC 903.2.6) Group I. An *automatic sprinkler system* shall be provided throughout buildings with a Group I *fire area*.

Exceptions:

1. An *automatic sprinkler system* installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities.
2. An *automatic sprinkler system* is not required where day care facilities are at the *level of exit discharge* and where every room where care is provided has at least one exterior *exit* door.
3. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic sprinkler system in accordance with 903.3.1.1 shall be installed on the entire floor where care is provided as well as all floors below, and all floors between the level of care and the closest level of exit discharge.

1015.1 (IFC [B] 1015.1) Exits or exit access doorways from spaces. Two *exits* or *exit access doorways* from any space shall be provided where one of the following conditions exists:

Exception: Group I-2 occupancies shall comply with Section 1014.2.2 through 1014.2.7.

1. The *occupant load* of the space exceeds one of the values in Table 1015.1.

   Exception: In Group R-2 and R-3 occupancies, one *means of egress* is permitted within and from individual dwelling units with a maximum *occupant load* of 20 where the dwelling unit is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

2. The *common path of egress travel* exceeds one of the limitations of Section 1014.3.
3. Where required by Section 1015.3, 1015.4, 1015.5, 1015.6 ~~or~~ 1015.6.1, or 1015.7.

Where a building contains mixed occupancies, each individual occupancy shall comply with the applicable requirements for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1.

TABLE 1015.1 (IFC [B] TABLE 1015.1)
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY

OCCUPANCY	MAXIMUM OCCUPANT LOAD
A, B, E[a], F, M, U	49
H-1, H-2, H-3	3
H-4, H-5, I-1, I-3, I-4, R	10
S	29

~~a. Day care maximum occupant load is 10.~~

2. Add new text as follows:

1015.7 (IFC [B] 1015.7) Day care means of egress. Day care facilities, rooms or spaces where care is provided for more than 10 children that are 2-1/2 years of age or less, shall have access to not less than two exits or exit access doorways.

3. Revise as follows:

1021.2 (IFC [B] 1021.2) Single exits. Only one *exit* shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single *exit* in buildings otherwise required to have more than one *exit* if the areas served by the single *exit* do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single *exits* provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single *exit* shall not be located more than one *story* below *grade plane*.

TABLE 1021.2 (IFC [B] TABLE 1021.2)
STORIES WITH ONE EXIT

STORY	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE
First story or basement	A, B[d], E[e], F[d], M, U, S[d]	49 occupants and 75 feet travel distance
	H-2, H-3	3 occupants and 25 feet travel distance
	H-4, H-5, I, R	10 occupants and 75 feet travel distance
	S[a]	29 occupants and 100 feet travel distance
Second story	B[b], F, M, S[a]	29 occupants and 75 feet travel distance
	R-2	4 dwelling units and 50 feet travel distance
Third story	R-2[c]	4 dwelling units and 50 feet travel distance

For SI: 1 foot = 304.8 mm.

a. For the required number of exits for parking structures, see Section 1021.1.2.
b. For the required number of exits for air traffic control towers, see Section 412.3.
c. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1029.
d. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
~~e. Day care occupancies shall have a maximum occupant load of 10.~~

1103.2.12 Day care facilities. Where a day care facility ~~(Groups A-3, E, I-4 and R-3)~~ is part of a dwelling unit, only the portion of the structure utilized for the day care facility is required to be accessible.

[P] TABLE 2902.1 (IPC TABLE 403.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]
(See Sections 2902.2 and 2902.3)

No.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2 OF THE INTERNATIONAL PLUMBING CODE)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAINS [e, f] (SEE SECTION 410.1 OF THE INTERNATIONAL PLUMBING CODE)	OTHER
				MALE	FEMALE	MALE	FEMALE			
5	Institutional	I-4	Adult day care and child <u>day</u> care	1 per 15		1 per 15		1	1 per 100	1 service sink

(Portions of table not shown remain unchanged)

[P] 2903.1 (IPC 403.1) Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in ~~day care and~~ child <u>day</u> care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

[P] 2903.2 (IPC 403.2) Urinal partitions. Each urinal utilized by the public or employees shall occupy a separate area with walls or partitions to provide privacy. The walls or partitions shall begin at a height not more than 12 inches (305 mm) from and extend not less than 60 inches (1524 mm) above the finished floor surface. The walls or partitions shall extend from the wall surface at each side of the urinal a minimum of 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished back wall surface, whichever is greater.

Exceptions:

1. Urinal partitions shall not be required in a single occupant or unisex toilet room with a lockable door.
2. Toilet rooms located in ~~day care and~~ child day care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as: Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Day Care Facilities, Section 305.3 and related sections

This public comment represents the collaborative efforts of the CTC Study Group on Care to clarify the scope and intent of the code as it applies to the subject of when care is provided and what are the appropriate elements of the building code to address the risks associated with Day Care. Changes to modify the existing language include:

- Changing the provisions for religious educational facilities to become an exception.
- Adding a definition section for the educational group and moving the definition of personal care services from 310.2 to 305.2, clarifying the day care as a day care facility, and adding the correlation to classify that a Group E, day care facility with five or fewer is allowed in an R-3 or may be constructed per the IRC.
- Adding clarifications to the I-4 Group to include both adult and child day care services, and adding an exception for such services within a place of worship, and clarifying that day care facility with five or fewer is allowed in an R-3 or may be constructed per the IRC.
- Correlating the requirements for fire suppression in Chapter 9 with the provisions for day care.
- Clarifying the requirement for means of egress from day care where more than 10 children receive care.
- Removing the occupancy group designations from the scoping criteria in Chapter 11 as being unnecessary, C
- Clarifying that the plumbing table is applicable for day care, and that the exclusion for partitions is meant to apply to child day care, not all day care.

Issues concerning the multitude of occupancies, conflicting criteria and/or confusion between the occupancies identified as "Day Care vs. Child or Adult Day Care" were the initial impetus for the study of care. The overlap and inconsistencies for all types of care were eventually included once the true scope of the issues was recognized.

Cost Impact: The code change proposal will not increase the cost of construction.

305.3 (New) [IFC [B] 202 (New)]

Proponent: James R. Mason, III, Home School Legal Defense Association (HSLDA)

Add new text as follows:

305.3 (IFC [B] 202) Home education. The use of a portion of a dwelling unit for a home school or private school for children who normally reside in the dwelling unit shall be classified the same occupancy as the dwelling unit.

Reason: Home School Legal Defense Association is a national organization that exists to protect the right of parents to teach their children at home. With over 85,000 member families across the United States, we are the largest homeschooling association in the world. Recently we have run into some difficulty with officials who believe that residences where children both reside and are home educated should be classified as school buildings. For families with six or more children, this would mean that their home must comply with all school fire and safety codes—an extremely burdensome requirement, and not at all in line with the intent of building and fire codes. This is no small problem; the Department of Education recently estimated that over 1.5 million children are taught by their parents in their own home.[1]

Most recently, this issue arose in Ohio, a state where families have the option of teaching their own children by filing either as a homeschool or as a religious private school. The Ohio Department of Education has taken the position that families with more than six children who file as a private school must also ensure that their homes comply with the building and safety requirements of Educational Group E; even though these are "private schools" only on paper and actually consist of parents educating only their own children in their own residences. On April 20, 2009, a Hearing Officer agreed with the Department, stating that Educational Group E "applies, ***inter alia***, if a structure or part thereof is used for educational purposes by six or more persons. This provision does not provide an exception for structures which also serve other purposes (such as homes), nor does it distinguish between 'persons' who are family members and those who are not." (Report and Recommendation of Hearing Officer, April 17, 2009, Attachment A) On June 12, 2009, the Ohio Department of Education adopted the Hearing Officer's decision.

To prevent this problem, we are proposing a clarification, not an alteration. Teaching one's own children in one's own home does not transform the residence into a school building, as is clear from a detailed reading of the building and residential codes. However, such a conclusion is never explicitly stated within the ICC codes, leading some education officials to erroneously conclude that parents who teach six or more of their own children in their residence automatically convert the residence to a school building, subject to all school building requirements.

Other organizations associated with safety codes have already recognized the need for a clarification. The NFPA codes read: "In cases where instruction is incidental to some other occupancy, the section of this *Code* governing such other occupancy shall apply." (101 Life Safety Code, 6.1.33; 14.1.4.3; & 15.1.4.3, Attachment B). The North Dakota Supreme Court has applied the NFPA clarification to homeschoolers. (*Birst v. Stansted,* 493 N. W. 2d 690 (1992), Attachment C) In California, where the same issue came up tangentially in 2008, the Fire Marshall had already clarified the ICC codes with the following caveat to Educational Group E: "Exception: A residence used as a home school for the children who normally reside at the residence. Such residences shall remain classified as Group R-2, or Group R-3." (California Fire Code, Attachment D)

Since the way homeschooling is defined varies by state, with some states labeling them "homeschools" while other states require parents to file as home-based private schools, the clarification for homeschooling needs to be broad enough to account for variation between state statutes. This proposed wording accounts for the variety between states. Such a clarification in the IBC would pre-empt the confusion brought on by erroneous readings of the codes and avoid the costly litigation that can result from such readings.

306.2 (IFC [B] 202)

Proponent: Stephen Thomas, Colorado Code Consulting, LLC representing the Colorado Chapter

Revise as follows:

306.2 (IFC [B] 202) Factory Industrial F-1 Moderate-hazard Occupancy. Factory industrial uses which are not classified as Factory Industrial F-2 Low Hazard shall be classified as F-1 Moderate Hazard and shall include, but not be limited to, the following:

Aircraft (manufacturing, not to include repair)
Appliances
Athletic equipment
Automobiles and other motor vehicles
Bakeries
Beverages: over 16-percent alcohol content
Bicycles
Boats
Brooms or brushes
Business machines
Cameras and photo equipment
Canvas or similar fabric
Carpets and rugs (includes cleaning)
Clothing
<u>Commercial kitchens containing commercial cooking appliances</u>
Construction and agricultural machinery

Disinfectants
Dry cleaning and dyeing
Electric generation plants
Electronics
Engines (including rebuilding)
Food processing
Furniture
Hemp products
Jute products
Laundries
Leather products
Machinery
Metals
Millwork (sash and door)
Motion pictures and television filming (without spectators)
Musical instruments
Optical goods
Paper mills or products
Photographic film
Plastic products
Printing or publishing
Recreational vehicles
Refuse incineration
Shoes
Soaps and detergents
Textiles
Tobacco
Trailers
Upholstering
Wood; distillation
Woodworking (cabinet)

Reason: Commercial kitchens are not currently classified in the IBC. However, Table 508.4 has footnote d which states that a separation between a commercial kitchen and the seating areas that they serve is not required. That would indicate that the kitchen is a separate occupancy. The designation has been included within a Group F-1 Occupancy because it is similar to a Bakery and Food Processing facility. Essentially, meals are being assembled in a kitchen to be served in the dining area. It is the same general process that occurs in a food processing plant. This category would also clarify the occupancy classification for a catering kitchen that is not attached to a dining area. Many people try to classify a kitchen as a Group B Occupancy because this occupancy has been a catch all occupancy in the past. That classification is reserved for personal service uses and office. A kitchen does not fit into this type of occupancy. The additional language regarding the commercial cooking appliance is to clarify that a break room that has a microwave and sink is not a commercial kitchen. If a commercial cooking appliance is not installed, the use would not be classified as a Group F Occupancy, but a part of the main occupancy. The International Mechanical Code defines the term Commercial Cooking Appliance.

Cost Impact: The code change proposal will not increase the cost of construction.

Soaps
Sugar
Tires, bulk storage of
Tobacco, cigars, cigarettes and snuff
Upholstery and mattresses
Wax candles

[F] ~~903.2.9.1~~ 903.2.4.2 (IFC ~~903.2.9.1~~ 903.2.4.2) Repair garages. An automatic sprinkler system shall be provided throughout all buildings used as repair garages in accordance with Section 406, as shown:

1. Buildings having two or more stories above grade plane, including basements, with a fire area containing a repair garage exceeding 10,000 square feet (929 m^2).
2. Buildings no more than one story above grade plane, with a fire area containing a repair garage exceeding 12,000 square feet (1115 m^2).
3. Buildings with repair garages servicing vehicles parked in the basement.
4. A Group S-1 fire area used for the repair of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m^2).

Reason: Propose changing the occupancy classification for motor vehicle repair from Group S-1 to F-1.

Group S occupancies are described as “Storage Group S occupancy includes, among others, the use of a building or structure, or a portion thereof, for storage that is not classified as hazardous occupancy”; and Group F-1 occupancies are described as “Factory Industrial Group F occupancy includes, among others, the use of a building or structure, or a portion thereof, for assembling, disassembling, fabrication, finishing, manufacturing, packaging, repair or processing operations that are not classified as a Group H hazardous or Group S storage occupancy.

The requirements for automotive repair garages are consistent with the activities of Group F use; assembling, disassembling, and repairing. Group S occupancy is described as storage use, therefore, automotive repair garages should be placed within the Group F rather than Group S occupancy classification.

Group S-1 Type VB building has an allowable area of 9,000 square feet, whereas the Group F-1 Type 5B has an allowable area of 8,500 square feet. This difference in allowable area will have a negligible effect the size and construction type of these structures, particularly when considering the increases permitted by sprinkling the building throughout.

Table 503 permits Group F-1 of Type IA and IB construction to be unlimited area, but limits Group S-1 Type IB to 48,000 sq.ft. However, Groups S-1 and F-1 may be still unlimited under any type of construction where meeting Section 507.3 and this may even be further mitigated using Section 507.5 to reduce one of the required yards.

Section 414 addresses issues related to quantities of hazardous materials stored within the occupancy other than what is within the vehicle, which is regulated by the IFC. Storage of hazardous material would require control rooms where exceeding Tables 307.1 (1) & (2).

Repair garages are not buildings that store vehicles, but rather, repair facilities.

Codes covering other requirements are under Section 406.6 (IBC), ventilation Section 403.3 (IMC), spray painting Chapter 15 (IFC), hot work Chapter 26 (IFC), repair garages Chapter 22 (IFC), and Section 1004.7.2 (IPC).

The Interior Finish Classification requirement in Table 803.9 for a non-sprinkled corridor requires Class B for Group S occupancy and a Class C for Group F occupancy. The change of classification would benefit to proposed new classification of this occupancy by reduce code requirements and somewhat reduce constructions costs a bit in this area. This also holds true with regard to minimum radiant flux criteria of flooring under Section 804.4.1 where the Group F occupancy, unlike the Group S occupancy, is not required to meet minimum requirement of Class II in exits and exit access components.

Large Group F occupancies would require an alarm system per Section 907.2.4, but with sprinklers this becomes a mote point by the exception.

Table 1004.1.1 provides a specific square foot gross (200) for egress design for fabrication and manufacturing, where the Group S-1 did not. As a Group S-1 many designers many be using the storage criterion listed in Table 1004.1 of 300. Others may even utilize 100 for industrial area. By changing automotive repair garages to the Group F-1 classification we can now have a more specific guide line to determine occupant load which is more realistic to the repair shop use.

Section 1015 and Table 1015.1 may save some costs for additional exits and exit discharges due to higher allowed occupant loads allowed within F compared to Group S occupancies. However, when one compares building size permitted between Groups S-1 and F-1 occupancy using 300 square feet per occupant for Group S-1 and 200 square feet per occupant for F-1 the difference in building square footage permitted is only 12.6% area increase before two exits are required for Group F-1 occupancies. The travel distance is the same for both occupancies.

To summarize: automotive repair should be classified as a Group F-1 occupancy in order to be more consistent with the described use. The impact this change has on other code requirements is minimal and the change helps clarify some of the code requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

Revise as follows:

308.1 (IFC [B] 202) Institutional Group I. Institutional Group I occupancy includes, among others, the use of a building or structure, or a portion thereof, in which ~~people are cared for or live in a supervised environment, having physical limitations because of health or age are harbored for medical treatment or other care or treatment, or in which people are detained for penal or correctional purposes or in which the liberty of the occupants is restricted~~ care or supervision is provided to individuals who, are or are not capable of self preservation without physical assistance or in which people are detained for penal or correctional purposes or in which the liberty of the occupants is restricted. Institutional occupancies shall be classified as Group I-1, I-2, I-3 or I-4.

308.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

(Relocate revised definitions from Section 308.3.1, and revise)

24 HOUR CARE. The actual time that a person is an occupant within a facility for the purpose of receiving care. It shall not include a facility that is open for 24 hours and is capable of providing care to someone visiting the facility during any segment of the 24 hours.

CUSTODIAL CARE. Assistance with day-to-day living tasks; such as assistance with cooking, taking medication, bathing, using toilet facilities and other tasks of daily living, usually on a long-term basis. Custodial care include occupants who evacuate at a slower rate and/or who have mental and psychiatric complications.

DETOXIFICATION FACILITIES. Facilities that ~~serve patients who are~~ provided treatment for substance abuse ~~on a 24-hour basis and~~ serving care recipients who are incapable of self-preservation or who are harmful to themselves or others.

~~CHILD~~ FOSTER CARE FACILITIES. Facilities that provide care ~~on a 24-hour basis~~ to more than five children, $2^1/_2$ years of age or less,

HOSPITALS AND ~~MENTAL~~ PSYCHIATRIC HOSPITALS. Facilities ~~buildings or portion thereof used on a 24 hour basis~~ that provides care or treatment for the medical, psychiatric, obstetrical, or surgical treatment of inpatients ~~who~~ care recipients that are incapable of self-preservation.

INCAPABLE OF SELF PRESERVATION. Persons because of age; physical limitations; mental limitations; chemical dependency; or medical treatment cannot respond as an individual to an emergency situation.

MEDICAL CARE. Care involving medical or surgical procedures, nursing or for psychiatric purposes.

NURSING HOMES. ~~Nursing homes are long-term care~~ Facilities that provide long-term care ~~on a 24-hour basis~~, including both intermediate care facilities and skilled nursing facilities, ~~serving more than five persons and~~ where any of the persons are incapable of self-preservation.

~~308.2~~ 308.3 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or portions thereof ~~housing~~ for more than 16 persons who reside on a 24 hour basis ~~who because of age, mental disability or other reasons, live~~ in a supervised ~~residential~~ environment ~~that provides *personal care services*~~ and receive custodial care. The occupants are capable of ~~responding to an emergency situation without physical assistance from staff~~ self preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Initial stage Alzheimer's facilities
Residential board and custodial care facilities
Social rehabilitation facilities

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2. A facility such as above, housing at least six and not more than 16 persons, shall be classified as Group R-4.

~~308.3~~ 308.4 (IFC [B] 202) Group I-2. This occupancy shall include buildings and structures used for medical~~, surgical, psychiatric, nursing or custodial~~ care on a 24 hour basis for more than five persons who are not capable of self-preservation. This group shall include, but not be limited to, the following:

Foster ~~Child~~ care facilities
Detoxification facilities
Hospitals
Nursing homes
~~Mental~~ Psychiatric hospitals

A facility such as the above with five or fewer residents shall be classified as Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2.

~~**308.3.1 Definitions.** The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.~~

(Relocate revised definitions to Section 308.2)

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the International Residential Code in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing sleeping units where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (not transient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer individuals are permitted to comply with the requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, or I, including:

Buildings that do not contain more than two dwelling units.
~~Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.~~
~~Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.~~
Care facilities as that provide accommodations for five or fewer persons
Congregate living facilities with 16 or fewer individuals**.**

~~Adult care and child~~ Care facilities for 5 or fewer individuals receiving care that are within a single-family ~~home~~ dwellings are permitted to comply with the International Residential Code.

R-4. This occupancy shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24 hour basis in a supervised residential environment and receive custodial care. The occupants are capable of self preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Initial stage Alzheimer's facilities
Residential board and custodial care facilities
Social rehabilitation facilities

~~Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.~~

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code ~~or shall comply with the *International Residential Code* provided the building is protected by an *automatic sprinkler system* installed in accordance with Section 903.2.8.~~

310.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

BOARDING HOUSE. A building arranged or used for lodging for compensation, with or without meals, and not occupied as a single-family unit.

CONGREGATE LIVING FACILITIES. A building or part thereof that contains sleeping units where residents share bathroom and/or kitchen facilities.

DORMITORY. A space in a building where group sleeping accommodations are provided in one room, or in a series of closely associated rooms, for persons not members of the same family group, under joint occupancy and single management, as in college dormitories or fraternity houses.

GROUP HOME. A facility for social rehabilitation, substance abuse or mental health problems that contain a group housing arrangement that provides custodial care but does not provide acute care.

~~**RESIDENTIAL CARE/ASSISTED LIVING FACILITIES.** A building or part thereof housing persons on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment which provides personal care services. The occupants are capable of responding to an emergency situation without physical assistance from staff. This classification shall include, but not be limited to, the following: residential board and care facilities, assisted living facilities, halfway houses, group homes, congregate care facilities, social rehabilitation facilities, alcohol and drug abuse centers and convalescent facilities.~~

TRANSIENT. Occupancy of a *dwelling unit* or *sleeping unit* for not more than 30 days.

[F] 903.2.6 (IFC 903.2.6) Group I. An *automatic sprinkler system* shall be provided throughout buildings with a Group I *fire area*.

Exception: An *automatic sprinkler system* installed in accordance with Section 903.3.1.2 ~~or 903.3.1.3~~ shall be ~~allowed~~ permitted in Group I-1 facilities.

[F] 903.2.8 (IFC 903.2.8) Group R. An automatic sprinkler system installed in accordance with Section 903.3 shall be provided throughout all buildings with a Group R *fire area*.

An *automatic sprinkler system* installed in accordance with 903.3.1.3 shall be permitted in congregate residences with 16 or fewer residents. An automatic sprinkler system installed in accordance with 903.3.1.3 shall be permitted in care facilities with 5 or fewer individuals a single family dwelling.

[F] 903.3.1.3 (IFC 903.3.1.3) NFPA 13D sprinkler systems. *Automatic sprinkler systems* installed in one and two-family *dwellings*, Group R-3 and R-4 congregate residences and *townhouses* shall be permitted to be installed throughout in accordance with NFPA 13D.

[F] 903.3.2 (IFC 903.3.2) Quick-response and residential sprinklers. Where automatic sprinkler systems are required by this code, quick-response or residential automatic sprinklers shall be installed in the following areas in accordance with Section 903.3.1 and their listings:

1. Throughout all spaces within a smoke compartment containing ~~patient~~ care recipient sleeping units in Group I-2 in accordance with this code.
2. Dwelling units, and sleeping units in Group R and I-1 occupancies.
3. Light-hazard occupancies as defined in NFPA 13.

[F] 907.2.6 (IFC 907.2.6) Group I. A manual fire alarm system that activates the occupant notification system shall be installed in Group I occupancies. An automatic smoke detection system that activates the occupant notification system shall be provided in accordance with Sections 907.2.6.1, 907.2.6.2 and 907.2.6.3.3.

Exceptions:

1. Manual fire alarm boxes in ~~resident or~~ ~~patient~~ sleeping units of Group I-1 and I-2 occupancies shall not be required at *exits* if located at all ~~nurses'~~ care providers' control stations or other constantly attended staff locations, provided such stations are visible and continuously accessible and that travel distances required in Section 907.4.2 are not exceeded.
2. Occupant notification systems are not required to be activated where private mode signaling installed in accordance with NFPA 72 is *approved* by the fire code official.

[F] 907.2.6.2 (IFC 907.2.6.2) Group I-2. An automatic smoke detection system shall be installed in *corridors* in nursing homes, long term care facilities ~~(both intermediate care and skilled nursing facilities)~~, detoxification facilities and spaces permitted to be open to the *corridors* by Section 407.2. The system shall be activated in accordance with Section 907.5. Hospitals shall be equipped with smoke detection as required in Section 407.

Exceptions:

1. *Corridor* smoke detection is not required in smoke compartments that contain ~~patient~~ sleeping units where such units are provided with smoke detectors that comply with UL 268. Such detectors shall provide a visual display on the *corridor* side of each ~~patient~~ *sleeping unit* and shall provide an audible and visual alarm at the care provider ~~nursing~~ station attending each unit.
2. *Corridor* smoke detection is not required in smoke compartments that contain ~~patient~~ *sleeping units* where ~~patient~~ *sleeping unit* doors are equipped with automatic door-closing devices with integral smoke detectors on the unit sides installed in accordance with their listing, provided that the integral detectors perform the required alerting function.

1021.2 (IFC [B] 1021.2) Single exits. Only one *exit* shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single *exit* in buildings otherwise required to have more than one *exit* if the areas served by the single *exit* do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single *exits* provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single *exit* shall not be located more than one *story* below *grade plane*.

TABLE 1021.2 (IFC [B] TABLE 1021.2)
STORIES WITH ONE EXIT

STORY	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE
First story or basement	A, B[d], E[e], F[d], M, U, S[d]	49 occupants and 75 feet travel distance
	H-2, H-3	3 occupants and 25 feet travel distance
	H-4, H-5, I, ~~R~~ R-1, R-2, R-4	10 occupants and 75 feet travel distance
	S[a]	29 occupants and 100 feet travel distance
Second story	B[b], F, M, S[a]	29 occupants and 75 feet travel distance
	R-2	4 dwelling units and 50 feet travel distance
Third story	R-2[c]	4 dwelling units and 50 feet travel distance

For SI: 1 foot = 304.8 mm.

a. For the required number of exits for parking structures, see Section 1021.1.2.
b. For the required number of exits for air traffic control towers, see Section 412.3.
c. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1029.
d. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
e. Day care occupancies shall have a maximum occupant load of 10.

1107.5.3 Group I-2 hospitals. Accessible units and Type B units shall be provided in General-purpose hospitals, psychiatric facilities, and detoxification facilities ~~and residential care/assisted living facilities~~ of Group I-2 occupancies in accordance with Sections 1107.5.3.1 and 1107.5.3.2.

(Portions of table not shown remain unchanged)

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as:

> Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Group I-1, I-2, R-4; Section 308 and related correlations

Change modifying the existing language includes:

- A modification is proposed to the general charging language of Group I to more clearly express the various types of occupancy conditions found within Group I.
- Consolidate the definitions from Section 308.3.1 and 308.1 to create a definition Section 308.2 for all of Group I, consistent with current format within the code. Some of the definitions have been modified to add clarity; others are new to remove confusion of meaning and intent.
- Modified the general language of specific use occupancies within Group I and R to reflect the new definitions proposed and be more current with industry and licensing descriptions, but not the provisions.
- Modifications or additions have been made to the example listings of uses and correlate the terminology for a consistency of application. The threshold of more than 5 persons was added to the first paragraph of Group I-2 and the last sentence was added after the example listing to allow for families to care for person without becoming an I-2 use. This also correlates how the occupancies with less than 5 persons are handled in the other care facilities.
- The definition of Child Care Facilities has been to Foster Care Facilities and the provision of 24 hours was removed as it is redundant to the general language of an I-2 use. Foster Care for more than 5, children 2 ½ years of age or less is still an I-2 use. Facilities providing care to 6 to 16 children greater than 2 ½ years of age, is an R-4 and facilities for greater than 16 children it will be an I-1. Additionally, this will eliminate the confusion between day care and 24 hour care facilities.
- In Section 903.2.6 it is proposed to delete the option for the NFPA13D sprinkler system for Group I-1 because a NFPA 13D system is not permitted based on the threshold for Group I-1 being greater than 16 occupants. The sprinkler requirements for Group R is generic and currently not clear for facilities such as small congregate residences. As a small assisted living facility, the NFPA 13D sprinkler system is appropriate permitted in Group R-4 (see the revisions to Section 903.2.8) as well as other congregate residences with 16 or fewer occupants. Indicating the used in Section 903.1.3 clarifies that congregate residences with 16 or fewer occupants, while not single family dwellings, are permitted to use NFPA 13D systems. This is consistent with NFPA13D requirements. This was permitted specifically for Group R-4 in the 2000 IBC. This would also be consistent with Fair Housing Act court cases based on non-discrimination for group homes.
- Changes proposed beyond Chapter 3 are correlative in nature to reflect the new definitions or provisions previously allowed under chapter 3 provisions but not correlated for ease of use.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Daniel Purgiel, LRS Architects Inc.

1. Revise as follows:

308.2 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or parts thereof housing more than ~~16~~ five persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. The occupants require physical assistance with evacuation in responding to an emergency situation. ~~The occupants are capable of responding to an emergency situation without physical assistance from staff.~~ This group shall include, but not be limited to, the following:

Alcohol and drug centers
Alzheimer's facilities
Assisted living facilities
~~Congregate care facilities~~
Convalescent facilities
Group homes
~~Halfway houses~~
Residential board and care facilities
~~Social rehabilitation facilities~~

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2. A facility such as above, housing at least six and not more than 16 persons, ~~shall be classified as Group R-4.~~ shall meet the requirements for construction as defined for Group R-3, except as otherwise provided in this code or shall comply with the *International Residential Code*, provided the building complies with Section 903.2.6. A facility such as above, where occupants are capable of responding to an emergency situation without physical assistance, shall be classified as Group R-4.

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (not transient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as R-1, R-2, R-4 or I including:

Buildings do not contain more than two dwelling units.
Adult facilities that that provide accommodations for five or fewer persons of any age for less than 24 hours.
Child care facilities that that provide accommodations for five or fewer persons of any age for less than 24 hours.
Congregate living facilities with 16 or fewer persons.
Adult and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*.

R-4 ~~Residential occupancies shall include buildings, arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.~~ Residential occupancies located in buildings or portions thereof housing more than five persons, excluding staff, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. The occupants are capable of responding to an emergency situation without physical assistance. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Residential board and care facilities
Social rehabilitation facilities

Group R-4 occupancies housing 16 or fewer persons, shall meet the requirements for construction as defined for Group R-3 except as otherwise provided for in this code, or shall comply with the *International Residential Code* provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.7.

310.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

RESIDENTIAL CARE/ASSISTED LIVING FACILITIES. A building or part thereof housing persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment which provides personal care services. ~~The occupants are capable of responding to an emergency situation without physical assistance from staff.~~ The occupants are not bedridden, except during temporary sickness. Occupancy classification is based on the ability of occupants to respond to an emergency situation with or without physical assistance. ~~This classification~~ Residential care/ assisted living facilities shall include, but not be limited to, the following: residential board and care facilities, assisted living facilities, halfway houses, group homes, congregate care facilities, social rehabilitation facilities, alcohol and drug abuse centers and convalescent facilities.

(Definitions not shown remain unchanged)

SECTION 420
GROUPS I-I~~, R-1, R-2, R-3~~ and R

420.1 General. Occupancies in Groups I-1~~, R-1, R-2 R-3~~ and R shall comply with the provisions of this section and other applicable provisions of this code.

420.2 Separation walls. Walls separating dwelling units in the same building, walls separating sleeping units in the same building and walls separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as fire partitions in accordance with Section 709.

Exception: Walls separating dwelling units and sleeping units within Groups I-1 and R-4 occupancies, housing 16 or fewer persons are not required to be constructed as fire partitions.

420.3 Horizontal separation. Floor assemblies separating dwelling units in the same buildings, floor assemblies separating sleeping units in the same building and floor assemblies separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as horizontal assemblies in accordance with Section 712.

2. Add new text as follows:

420.4 Groups I-1 smoke barriers. Group I-1 occupancies housing more than 16 residents shall be provided with smoke barriers in accordance with Section 710. Smoke barriers shall subdivide every story used by residents for sleeping or treatment into at least two smoke compartments. Each smoke compartment shall have a maximum of 16 sleeping rooms, or 10,500 square feet (976 m^2), whichever is less, and the travel distance from any point in a smoke compartment to a smoke barrier door shall not exceed 150 feet (60 960 mm).

420.4.1 Refuge area. At least 6 net square feet (0.56 m^2) of refuge area per resident shall be provided within the aggregate area of corridors, treatment rooms, or other low hazard common space rooms on each side of each smoke barrier.

420.4.2 Independent egress. A means of egress shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of egress originated.

420.4.3 Horizontal assemblies. Horizontal assemblies supporting smoke barriers required by this section shall be designated to resist the movement of smoke and shall comply with Section 712.9.

420.5 Group I-1 corridors. Group I-1 occupancies shall have an exit access door from dwelling units or sleeping rooms leading directly to a corridor. Corridors in Group I-1 shall be continuous to the exits and separated from other areas in accordance with Section 1018, except areas conforming to Section 420.5.1

Exception: Sleeping rooms and dwelling units with exit doors opening directly to the exterior at ground level shall not be required to have an exit access door leading directly to a corridor.

420.5.1 Group I-1 multipurpose areas. Multipurpose areas directly adjacent to sleeping rooms that are not part of a dwelling unit shall be permitted to be open to the corridor where the following criteria are met:

1. The area shall be under continuous 24 hour supervision by the facility staff;
2. The area is not used as an exit access for more than 16 sleeping rooms;
3. Travel distance within the smoke compartment, where the sleeping rooms and multipurpose areas are located, shall not exceed 75 feet (30 480 mm);
4. The area shall have direct access to an exit or shall exit into a fire-resistance rated corridor in accordance with Section 1018;
5. The area is arranged so as not to obstruct any access to the required exits;
6. The area is equipped with an automatic fire detection system installed in accordance with Section 907.2;
7. The walls and ceilings of the area outside the sleeping rooms are constructed as required for corridors;
8. The area shall be separated from incidental accessory occupancies in accordance with Section 508.2.5; and
9. Doors from the sleeping rooms opening into the area shall not have a required protection rating and shall not be required to be equipped with self-closing or automatic closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted.

3. Revised text as follows:

TABLE 503
ALLOWABLE HEIGHT AND BUILDING AREAS
Height limitations shown as stories and feet above grade plane.
Area limitations as determined by the definition of "Area, building," per floor

		TYPE OF CONSTRUCTION								
		TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
		A	B	A	B	A	B	HT	A	B
GROUP	HEIGHT (feet) HEIGHT (s)	UL	160	65	55	65	55	65	50	40
I-1[e]	S	UL	~~9~~ 6	~~4~~ 2	~~3~~ 1	~~4~~ 1	~~3~~ 1	~~4~~ 1	~~3~~ 1	~~2~~ NP
	A	UL	55,000	19,000	10,000	16,500	10,000	18,000	10,500	~~4,500~~ NP
R-4	S	UL	~~11~~ 9	4	~~4~~ 3	4	~~4~~ 3	4	3	2
	A	UL	~~UL~~ 55,000	~~24,000~~ 19,000	~~16,000~~ 10,000	~~24,000~~ 16,500	~~16,000~~ 10,000	~~20,500~~ 18,000	~~12,000~~ 10,500	~~7,000~~ 4,500

(Portions of table and footnotes not shown remain unchanged)

504.2 Automatic sprinkler system increase. Where a building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, the value specified in Table 503 for maximum *building height* is increased by 20 feet (6096 mm) and the maximum number of *stories* is increased by one. These increases are permitted in addition to the *building area* increase in accordance with Sections 506.2 and 506.3. For Group R buildings equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.2, the value specified in Table 503 for maximum *building height* is increased by 20 feet (6096 mm) and the maximum number of *stories* is increased by one, but shall not exceed 60 feet (18 288 mm)or four *stories*, respectively.

Exceptions:

1. Buildings or portions of buildings, classified as a Group I-1 occupancy, specifically designated or licensed by a state to house residents with Alzheimer's disease in Types IIB, III, IV, or V construction.
2. ~~1.~~ Buildings or portions of buildings, classified as a Group I-2 occupancy of Type IIB, II, IV or V construction.
3. ~~2.~~ Buildings or portions of buildings, classified as a Group H-1, H-2, H-3 or H-5 occupancy.
4. ~~3.~~ Fire resistance rating substitution in accordance with Table 601, Note d.

508.2.4 Separation of occupancies. No separation is required between accessory occupancies and the main occupancy.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Incidental accessory occupancies required to be separated or protected by Section 508.2.5.

3. Group ~~I-1,~~ R-1, R-2 and R-3 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.
4. Groups I-1 and R-4 occupancies with more than 16 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.

508.3.3 Separation. No separation is required between nonseparated occupancies.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Group ~~I-1,~~ R-1, R-2 and R-3 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.
3. Groups I-1 and R-4 occupancies with more than 16 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.

Table 706.4

F-1, H-3[b], H-5, M, S-1	3
H-1, H-2	4[b]
F-2, S-2, R-3, ~~R-4~~	2

(Footnotes not shown, remain unchanged)

710.5 Openings. Openings in a smoke barrier shall be protected in accordance with Section 715.

Exceptions:

1. In Groups I-1 and I-2, where such doors are installed across corridors, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested. The doors shall be close fitting within operational tolerances, and shall not have undercuts in excess of ¾- inch, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and shall be automatic-closing by smoke detection in accordance with Section 715.4.8.3. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Groups I-1 and I-2, horizontal sliding doors installed in accordance with Section 1008.1.4.3 and protected in accordance with Section 715.

[F] 903.2.6 (IBC [F] 903.2.6) Group I. An automatic sprinkler system shall be provided throughout buildings with Group I fire area.

Exception: An automatic sprinkler system installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities, housing 16 or fewer persons.

[F] 907.2.6.1 (IBC 907.2.6.1) Group I-1. An automatic ˙ smoke detection system shall be installed in *corridors,* waiting areas open to *corridors* and *habitable spaces* other than *sleeping units* and kitchens. The system shall be activated in accordance with Section 907.5.

Exceptions:

~~1. Smoke detection in habitable spaces is not required where the facility is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.~~
~~2~~. 1. Smoke detection is not required for exterior balconies.

[F] 907.5.2.3.3 (IBC 907.5.2.3.3) Groups I-1, ~~and~~ R-1, and R-4. Groups I-1, ~~and~~ R-1, and R-4 dwelling units or sleeping units in accordance with Table 907.5.2.3.3 shall be provided with a visible alarm notification appliance, activated by both the in-room smoke alarm and the building fire alarm system.

Exception: Visible alarm notification appliances are not required in Groups I-1 and R-4 occupancies, housing 16 or fewer persons.

1006.1 Illumination required. The means of egress, including the exit discharge, shall be illuminated at all times the building space served by the means of egress is occupied.

Exceptions:

1. Occupancies in Group U.
2. Aisle accessways in Group A.
3. Dwelling units and sleeping units in Groups R-1, R-2, ~~and~~ R-3 and R-4.
4. Dwelling units and sleeping units of Group I occupancies.

1107.6.4 Group R-4. Accessible Units and Type B units shall be provided in Group R-4 occupancies shall be provided in accordance with Sections 1107.6.4.1 and 1107.6.4.2.

1107.6.4.1 Accessible units. At least 4 percent but not less than one of the dwelling or sleeping units shall be an Accessible unit.

1107.6.4.2 Type B units. In structures with four or more dwelling or sleeping units or sleeping units intended to be occupied as a residence, every dwelling and sleeping unit intended to be occupied as a residence shall be a Type B unit.

Exception: The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

Reason: IBC PERSONAL CARE OCCUPANCY REVISIONS: SUMMARY OVERVIEW OF THE ISSUE

This proposal revises Group I-1 to allow not capable of self preservation residents in facilities that provide personal care services. This reflects the actual conditions that currently occur across the country as is now indicated in a referenced national study. This proposal keeps all not capable of self preservation occupants in the Group I occupancy. The study also shows that there are capable of self preservation personal care uses. This proposal moves the current capable Groups I-1 and R-4 uses exclusively to the R-4. This makes Group R for overnight residential and personal care uses that are capable of self preservation. The smaller 6-16 resident personal care uses (current R-4), and their five current "exceptions" due to size, are now proposed to be made by "exceptions" in the new proposed I-1 and R-4, instead of by a separate occupancy classification.

This following Summary Overview provides background information required to understand why these revisions are proposed. More detailed background information is provided in attachment G- Additional Detailed Substantiation and the other referenced attachments in *(parenthesis and italics).*

Issue: The IBC Groups I-1 and R-4 are the occupancy designations for personal care. The resident profile requirement in Section 308.2 states that the "occupants are capable of responding to an emergency situation without physical assistance from staff."

The IBC statement above about the types of residents in personal care assisted living, is a central point of reference in the findings of a 130 page national analysis conducted by the State of Hawaii in 2007. The analysis is entitled "Assisted Living Analysis of All State Regulations Relative to Building Codes and Life Safety Codes," hereafter referred to as the study or analysis. Attachments A, B, and D are from the Hawaii analysis. This national review of assisted living resident types and related protection features was conducted to give recommendations to Hawaii on how it should regulate its assisted living. The findings included in the study are also used here to help substantiate the reasons for the proposed changes to the IBC.

The Hawaii Study Is The Only Known In Depth National Review of Assisted Living Relative to These Subjects.

- The analysis indicates that assisted living facilities and Alzheimer's facilities have the largest populations in personal care service occupancies. There are approximately 35,000 assisted living facilities in the United States. They are licensed by state governments under similar assisted living licenses in all 50 states, each with their own unique licensure regulations.
- The study shows that the current resident profile requirements in the IBC I-1 and R-4 occupancies are exclusively applicable in just 4 states, relative to assisted living. *(See Attachment A-All State Summary Table.)*
- The study finds that 51 of the 89 total assisted living categories in all 50 states have residents that require physical assistance with evacuation. The IBC does not currently allow non capable types of residents in its I-1 or R-4 personal care assisted living occupancies, and personal care is not listed in the I-2 occupancy.
- The study recommends that the IBC personal care occupancies should be revised to include personal care service assisted living with its actual resident types, while adding more I-2 protection requirements.
- It recommends that personal care assisted living not incorporate numerous other I-2 requirements and exceptions for reasons stated later in this summary.
- The recommendations in the study also allow for personal care occupancies having capable of self preservation residents as is currently found in the I-1 and R-4 occupancies, closely matching the current R-2 requirements.
- The IBC revisions proposed here follow concepts from the Hawaii recommendations and three other states that have created statewide amendments to the IBC, for the same reasons found in the Hawaii study.

Both Federal and Individual State Licensing Requirements Override Current IBC Personal Care Criteria and Requirements

The study shows that approximately 36 states allow Federal Medicaid waivers to allow Medicaid reimbursement to residents in their state's assisted living facilities, bringing other Federal requirements to personal care assisted living. *(See Attachment A-All State Summary Table).* Most of these states and other individual state licensing regulations then add other life safety protection requirements not currently covered in the IBC personal care I-1 and R-4 occupancies. (*See Attachment G-Additional Detailed Substantiation-Protection Feature Sampling of Recent Projects).* The Federal Centers for Medicare and Medicaid Services (CMS) enforce these requirements in many states, similar to what occurs in nursing facilities. This majority of states across the country, under additional enforcement of life safety, allow residents who need evacuation assistance, now further limit wood frame stories, and require full coverage commercial sprinklers and smoke barriers. *(See Attachment C-IBC Revision Summary Table.)*

The current lack of coordination with a majority of state licensing regulations life safety requirements, Federal CMS regulations, and the lack of classification of actual conditions in assisted living in the IBC, cause inconsistent application of the IBC across the country. Assisted living with residents of the same capabilities, and the same number of residents and stories, may be wood frame, have residential sprinklers with no smoke barriers in one city; and be required to be steel frame, have full coverage commercial sprinklers, and have smoke barriers in a nearby city. *(See Attachment G-Additional Detailed Substantiation.)*

Proposal Includes a Broad Spectrum National Approach

Finally, this proposal takes a broad spectrum national approach to personal care service uses, while not emphasizing preferences of one or a few states**.** It deals with the issue that each state has numerous types of these personal care uses and that each state regulates them differently. This proposal realigns the personal care occupancies to match the actual conditions and variations of occupant capabilities across the country. It will help eliminate the current inconsistent application of the IBC and make the code more consistent with other Federal and state enforced regulations. Once incorporated, the proposed revisions in the IBC will cover the full spectrum of the different types of personal care uses. *(See Attachment B-Elder Care Resident Profile Guide and C-IBC Revision Summary Table.)*

SUMMARY OF CONCEPTS & PROPOSED REVISIONS

A. Proposed Not Capable of Self Preservation Personal Care Requiring Similar Protection Found in Nursing

Most actual personal care assisted living have residents that may not be capable of self evacuation. This revision concept makes the Group I occupancy for those who are not capable of responding to emergencies on their own, and makes the R occupancy for those who are capable of responding on their own. The revision allows the non capable personal care resident type in the I-1. It then revises the I-1 to have similar protection features found in I-2 nursing. This is versus the current I-1 closely matching the current the R-2 resident capability and protection features. The remaining personal care uses that have residents that are capable of evacuation are proposed to be moved to the R-4 occupancy. *(See Attachment C-IBC Revision Summary Table, E-Current IBC Occupancy Requirements Comparison Table, and F- Proposed IBC Occupancy Requirements Comparison Table.)*

These revisions:

- Allow residents that may need assistance with evacuation in the I-1 occupancy. (Matching current CMS and a majority of state assisted living regulations.)
- Keep the current IBC "personal care" definition the same: Personal care is care of residents that do not require chronic nursing care etc.
- Adds the three main applicable protection features from I-2 into the I-1: Further story limitations on wood framing, full sprinklerization (NFPA 13 versus the current NFPA 13R), and smoke barriers providing compartmentalization. (Matching current CMS and a majority of state regulation concepts.)
- Changes the I-1 from housing more than 16 to housing over five persons, and then includes “exceptions” for 6 to 16 occupant facilities, instead of making a separate occupancy classification for them.
- Includes specially designated Alzheimer’s facilities in I-1 while providing exceptions for corridors and story limitations in the proposed Chapters 4 and 5 for Alzheimer’s facilities. (Aligning with current CMS concepts, matching 47 states that allow Alzheimer’s facilities under assisted living licenses, and matching a majority of state licensing regulations.)

B. **Proposed Not Capable of Self Preservation Personal Care Requiring More Stringent Protection than Nursing**

The State of Hawaii review of all 50 states assisted living regulations showed that personal care assisted living is different from I-2 nursing care. *(See Attachment A-All State Summary Table and G-Additional Detailed Substantiation)*

- It showed that all states limit assisted living care to not include nursing care beyond intermittent care which is also consistent with the current IBC personal care definition. All states regulate nursing as another higher level of care not allowed in assisted living.
- All states do not allow bedridden residents in personal care assisted living, except due to short term sickness. Residents who are bedridden beyond temporary sickness, or require beyond intermittent nursing care from temporary sickness, are required to be discharged to a nursing facility in all states assisted living regulations.
- Assisted living residents are required to participate in fire drills and eventually disperse to a point of safety in case of an emergency in the fire code, in state assisted living regulations, and by most CMS enforced regulations. Nursing facilities are "protect in place," meaning residents are instructed to stay in their rooms and wait for rescue as needed.
- Assisted living has generally less required staff to resident ratios than nursing due to assisted living residents generally being more capable of evacuation than nursing residents.

These four criteria differentiate personal care services in assisted living from nursing care, substantiating why it is and should continue to be classified as a different occupancy. These differences then require personal care service occupancies to have some different protection features that the I-2 nursing occupancy does not require. *(See Attachment G-Additional Detailed Substantiation)*

These proposed IBC revisions:

- Make corridors in I-1 and R-4 more stringent than in I-2 nursing. The current requirement for protected rated corridors in I-1 and R-4 is maintained in most cases. This is more stringent than the unprotected corridor openings and spaces open to corridors allowed in I-2 nursing in the IBC Chapter 4. Having protected corridors in personal care service assisted living is appropriate because they are not "protect in place" and they have lower staff to resident ratios.
- Make smoke barriers in I-1 more stringent than in I-2 nursing. The proposal requires the smoke barrier "compartments" to be smaller in size versus what is allowed in nursing. This effectively reduces travel distance and travel time to reach a point of safety, taking into account slower residents than the general public and less staff than found in nursing.

C. Proposed Capable of Self Preservation Personal Care Requiring Similar Protection Found in Residential Occupancies

The proposed IBC revisions moves current personal care service uses with occupants capable of exiting on their own without physical assistance, to Group R-4. This makes Group R for overnight uses for those that are considered generally capable of self preservation except for short term sickness. This proposal accomplishes the following:

- Makes R-4 as fully capable personal care: It moves the current I-1 and R-4 personal care uses that have all residents that can evacuate on their own to the R-4 occupancy. It changes the current R-4 from housing 6 to 16 to housing over five persons. It then includes “exceptions” for 6 to 16 occupant facilities in other sections, instead of making a whole occupancy classification for them. There are only five exceptions for differentiating the current I-1 from the R-4, so combining the two resident counts into one-occupancy is appropriate.
- The detailed analysis of the current I-1, R-2 and R-4 shows essentially the same protection features between these occupancies*. (See the Attachment E Current IBC Occupancy Requirements Comparison Table)* The only differences currently between I-1 and R-2 are minor

Chapter 5 and 9 differences. There are also currently no differences between the R-2 and R-4 allowable areas and stories. So moving personal care uses that have residents capable of self evacuation such as boarding homes, halfway houses, social rehab, and some assisted living to the general Group R and specifically Group R-4 is appropriate.

D. Proposal Offers Conceptual Differentiation Between Two Letter Group Occupancies

This proposal creates a true conceptual difference between the Group I and R occupancies. It also eliminates the splitting of personal care uses between the Group I (I-1) and Group R (R-4) occupancies, based solely on the number of occupants. That current condition of changing an occupancy letter group (I and R) solely for the number of residents, only occurs in these two occupancies in the code. This proposal changes this previous "number only" split, and now provides a definitive user capability difference between Groups I and R. It makes the general Group I for persons most likely depending on others to exit a building. It creates a capability level order in Group I from limited capability to fully detained occupants:

- Group I-1 is revised for non bedridden conscious persons needing limited assistance in exiting a building.
- Group I-2 is maintained as a "protect in place" occupancy and for persons who may require full assistance to exit a building, including bedridden and unconscious patients.
- Group I-3 is maintained for persons under restraint or security.
- Group I-4 is maintained as more of an exception to typical 24 hour Group I, but who's occupants still most likely require assistance with evacuation.
- The proposal then keeps the R for overnight sleeping occupancies for persons generally capable of self preservation. It keeps transient and non transient differences in R, while now also including only capable of self preservation personal care uses.

E. **Other Proposed Assisted Living Substantiations**

The proposed IBC revisions maintain assisted living as I-1 and R-4. It keeps other non-related nursing protection features and exceptions out of these personal care service occupancies. The revisions also more closely match CMS and a majority of states existing additional building protection requirements, while having little or no cost effect.

This proposal accomplishes the following:

- **Keep sole I-2 requirements in I-2:** It keeps exclusive I-2 requirements that are not applicable to personal care, only in I-2 and not in I-1 or R-4 personal care. They include a shorter 200' general allowable travel distance in the I-2 in Chapter 10, which is offset by the proposed smaller smoke compartment area in the I-1. There are numerous egress width differences required in the I-2 occupancy i.e. 8' corridor, 44" door, .3 egress width, that are all related to bed movement of bedridden occupants in I-2. Bedridden residents are not allowed in personal care assisted living, so those requirements are not applicable to personal care and thus are not proposed here. There is also a structural redundancy requirement for I-2 because it is a protect in place occupancy, which is also not applicable to assisted living personal care. *(See Attachment G-Additional Detailed Substantiation)*
- **These proposed personal care revised resident type and associated requirements closely match approximately 40 states current state regulations and CMS regulations.** Also note that last three editions of the CMS enforced life safety regulations for personal care, used in over half the states, have removed the timing of the resident formulas used in older editions that resulted in over complexity of determining capability of residents. This removal of timing is now just referenced as a guide but is not a determinate of its occupancy classification system anymore. The lack of timing of residents and other proposed changes in the IBC for personal care assisted living are consistent with the requirements already in existence in approximately 29 states through current CMS and other state licensing requirements: allowing assistance with evacuation in a non I-2 type occupancy, NFPA 13 sprinklers, further wood framing story limitations, and smoke barriers. The proposed revisions are also similar with 11 other states current licensing requirements for a total of about 40 states that already include the concepts proposed here. This continuity of requirements create national consistency similar to what already occurs between CMS life safety regulations in nursing and the IBC I-2 requirements. *(See Attachment C-IBC Revision Summary Table and G-Additional Detailed Substantiation)*
- **Proposal allows occupancy classification options for the variations of personal care around the country:** The proposal allows assisted living in the 46 or so states that exclusively have assistance with evacuation or both assistance and no assistance categories, to use all the new appropriately categorized occupancies of I-1 and R-4, versus the current lack of applicable occupancy classifications. This then effectively eliminates the discussions that must now occur as to what IBC occupancy is to be used between the building official, fire marshal, state licensing department, and applicant, when not capable residents are proposed as often occurs.
  - The proposal allows the 4 or so states that do not allow assistance with evacuation in personal care assisted living, to keep their regulations essentially the same, and now be classified as a Group R-4 occupancy.
  - The 5 or so states assisted licensing regulations that currently require essentially I-2 assisted living exclusively, can continue doing that through their licensing regulations (as currently occurs) or update them to the proposed new IBC format and/ or current similar CMS regulations. It also allows the 10 or so states to have multiple assisted living classifications in the revised IBC due to requiring older CMS regulations or other licensing regulations.
  - This seemingly complex issue of personal care occupancy classification is now made simpler for the building code plans reviewer compared to the lack of clarity that often now occurs. These classifications are revised and based on only whether the residents are capable or not capable of evacuation: The permit applicant must still confirm the state licensing agency resident type category and comply with their regulations (usually the Department of Human Services or Department of Health).
  - The applicant will initially propose an assumed classification of I-1 or R-4. The submitted set of plans to the building department should also indicate the state license agency category, to confirm in writing that the occupancy classification is correct relative to resident counts and capabilities as defined by the state regulations. The applicant should state on the permit application drawings whether the resident type proposed are capable or not capable of self preservation. The Building Official then makes the final determination of the occupancy classification based on the applicant's statement, and/or state licensing information provided to the building official. The applicant can also be requested by the building department to quote state licensing requirements of the state licensing regulation definitions on the drawings as now often occurs. This can be accomplished because numerous states write in their regulations whether the residents are capable or not capable of self preservation. If not shown in state licensing definitions, other parts of state licensing criteria indicate capability of residents including but not limited to: the types of facilities allowed, admissions and discharge criteria, or referenced CMS enforced life safety code and their resident capability classifications. This can help prove to the Building Official whether the I-1 or R-4 is the appropriate classification.
- **Keeps personal care out of I-2.** There are advocates for moving personal care to the I-2 occupancy. This is misdirected due to the numerous reasons indicated in the above overview including: assisted living having less than the nursing level of care residents, having less staff to resident ratios, not being protect in place, and nursing having numerous non applicable exceptions and additional protection requirements due to being a protect in place occupancy.

- The major difference though is having less staff to resident ratios in assisted living. Higher staff ratios allows nursing and hospitals to be protect in place and exempt corridor protections, while also adding additional structural redundancy requirements.
- These I-2 advocates also do not recognize that moving non capable personal care to I-2 would cause a non justified increase in construction costs with no relative increased occupant protection: A majority of assisted living facilities are constructed of protected wood frame and many are over one story. Wood frame costs are generally in the $100 to $130 per square foot range for these facilities. Steel frame costs up to 5 stories, are generally in the $130 to $160 per square foot range for the limited number of these facilities built this way. Changing these personal care facilities to I-2 would cause a majority of facilities to be steel frame (I-2 limits wood frame to 1 story) for little if any protection increases in comparison to the other protection features included in this proposal. This potential construction cost increase of 20% would be an undue burden on the industry. Keeping them in the new proposed I-1 (2 story wood) and R-4 (4 story wood) will have little if any affect on construction costs, especially in the majority of states under current CMS and state regulations with similar story and protection requirements matching this proposal.

- **Other options for including both capable and non capable personal care, with their different requirements, cause as many or more revised sections to the IBC, but create or do not solve other issues.** Keeping personal care in the I-1 and R-4, while delineating capability differences between these two occupancies is the most appropriate occupancy designation solution for dealing with personal care. The following are summaries of numerous options for revising personal care. All the revision options below assume including both capable and non capable personal care while adding new requirements to non capable uses, similar to what is in this proposal. The following summary concludes that this proposal option in this submittal is the best overall long term solution to match actual conditions across the country.
  - This proposal option:
    - (+) Makes conceptual I and R use differences with I as not capable and R as capable.
    - (+) Ads new requirements in the revised I-1.
    - (+) Removes the number only split of the current I-1 and R-4.
    - (+) Best long term conceptual revision.
    - (+/-) 22 sections revised.
  - Option for making I-1 and R-4 not capable personal care, keeping current number split, and adding capable personal care to R-2:
    - (+) Leaves current I-1 and R-4 mostly in tact with just revising resident type, while adding new requirements.
    - (-) Adds capable personal care list to R-2 and mixes the use with R-2.
    - (-) Leaves the number only split of the current I-1 and R-4.
    - (+) Requires 10-15 revised sections.
  - Option for keeping the current capable I-1 and R-4, and adding not capable personal care to I-2:
    - (+) Leaves current I-1 and R-4 in tact.
    - (-) Adds not capable personal care list to I-2 and adds various exceptions for non bed, not protect in place, and lower staff ratio personal care requirements and exceptions to I-2.
    - (-) Limits not capable personal care to one story wood, increasing construction costs.
    - (-) Leaves the number only split of the current I-1 and R-4.
    - (+/-)Requires 15-20 revised sections.
  - Option for adding a new not capable personal care occupancy designation number in either I or R (R-5?):
    - (-) Creates a new occupancy
    - (-) Requires 40+ revised sections plus major IFC revisions.

ITEMIZED IBC SECTION REASONS

Section 308.2 is revised to allow residents in Group I-1 that require assistance with evacuation. Residential care/assisted living facilities and other personal care uses that are allowed by individual state licensing regulations to have these types of residents remain in this revised Group I-1.

The previous reference of "assistance from staff" is removed, since assistance can be from staff as was previously mentioned in this section, or from other residents, or from first responders, such as fire department personal. The proposed reference of just "assistance" assumes that assistance with evacuation can be from anyone. Assistance from anyone then places a resident in this category.

The term "not capable of self preservation" is not included as part of the personal care occupancy descriptions since the term is not currently defined in the IBC. The term is currently used in the I-2 and is generally accepted as meaning that an occupant is not capable of self preservation when they are incapable of responding to an emergency situation on their own to exit a building without physical assistance. The current I-1 Section 308.2 clarifies what the implied definition of capable of self preservation is by stating that occupants are capable of responding to an emergency situation on their own without physical assistance. This approach of stating the implied definition versus using the term itself is maintained in the proposed I-1 and R-4 occupancy resident type descriptions to clarify the intent without referencing a definition. The statements in the current I-1 and both the proposed I-1 and R-4, then definitively delineate resident capability classification.

Alzheimer's facilities are also specifically itemized since the Hawaii study showed that 47 states allow these facilities under assisted living licenses. *(See Attachment A-All State Summary Table).* Current CMS regulations also allow these facilities in their non nursing health care regulations. Alzheimer's facilities have additional requirements in the proposed Chapter 5 story limitation revisions. There is also a corridor protection exception to allow the current common "neighborhood" designs for Alzheimer's facilities in the proposed Chapter 4. See those section's "Reasons" for substantiation.

Some other types of uses are removed from the current I-1 list because none of those uses are considered to have occupants that are not capable of self preservation.

Group I-1 is also changed from housing more than 16 to housing over five persons, matching the current I-2 resident count. The "exceptions" for 6 to 16 occupant facilities are listed in other revised sections under I-1, instead of making a separate occupancy classification. The facilities that have residents capable of self evacuation are moved from the current I-1 category to the R-4 category since there are currently only minor differences between the I-1, R-2, and R-4 occupancies. The categories moved to the R-4 include the complete list of uses from the current I-1, since some or all of these types of facilities have residents that are capable of self preservation. They include: Alcohol and drug centers, congregate care facilities, convalescent facilities, group homes, halfway houses, social rehabilitation facilities, and the limited types of assisted living and residential care facilities that require full capability. Clarification of the differences between the I-1 and I-2 is that I-1 facilities only provide "personal care service" as appropriately defined in the current IBC. Personal care services (I-1, R-4) do not provide "chronic convalescent, health, medical or surgical care." The Group I-2 occupancy is the appropriate facility to provide those types of services. *(See Attachment C-IBC Revision Summary Table)*

The last paragraph of this section continues cross-referencing other related occupancies, which now include adding cross-referencing R-3, and referring capable personal care to the R-4 occupancy. Exceptions for complying with construction requirements for R-3 are maintained for facilities with 6-16 residents, including requiring added compliance with Section 903.2.6 (sprinklers), written in the same format as the current R-4 last paragraph description.

Section 310.1 Group R-4 is revised to include personal care facilities, all of which have residents that do not require physical assistance with evacuation, similar to the current I-1. The whole section is re-written to match the current I-1 description. These types of facilities that have residents that are capable of self evacuation are moved from the current I-1 category to the R-4 category since there are currently only minor differences between the I-1, R-2, and R-4 occupancies. The categories moved to the R-4 include the complete list of uses from the current I-1, since some or all of these types of personal care service facilities have residents that are capable of self preservation. They include: Alcohol and drug centers, congregate care facilities, convalescent facilities, group homes, halfway houses, social rehabilitation facilities, and the limited types of assisted living and residential care facilities that require full capability by certain individual state licensing regulations. *(See Attachment A-All State Summary Table)*. *(See Attachment C-IBC Revision Summary Table)*

The number of residents is revised from the current 6-16 to more than five residents. The "exceptions" for 6 to 16 occupant facilities are listed in other revised sections under R-4, instead of making a separate occupancy classification. The last paragraph of this section continues cross-referencing other related occupancies, which now include adding cross-referencing R-3.

Section 310.2 The "Residential Care/Assisted Living" definition is revised to delete the previous resident capability limitation. The revised definition states that occupancy classification is based on the ability of occupants to respond to an emergency situation with or without assistance. The limitation on not allowing assistance with evacuation is now only written into the R-4 occupancy description. The Group I-1 occupancies are revised to allow assistance with evacuation. The definition further adds text that the occupants are non bedridden persons, except during temporary common sicknesses that occur in the general public. This is added to clarify the limitation of personal care versus I-2 nursing care. It is consistent with the current "personal care" definition and current assisted living regulations across the country. See the Summary Overview substantiating the concept reasons for the change. Other aspects of the current definitions remain unchanged, since they reflect current common distinctions in the personal care service industry.

Section 420.1 Group R-4 is added since it is now proposed to be similar to the current I-1 in terms of resident types. The new R-4 requirements mostly parallel the current I-1 requirements.

Section 420.2 The exceptions for 6 to 16 occupant facilities are listed here matching current requirements, instead of making a separate occupancy classification.

Section 420.4 Smoke barriers are added as a requirement in Group I-1 occupancies with over 16 residents. They are added to I-1 due to the abilities of the new proposed resident type allowed and to match already existing CMS and state licensing regulations in a majority of states.

The section utilizes similar language and format from the current I-2 Section 407 for smoke barriers. This proposed section provides smoke barrier size and travel distance requirements that are more restrictive than the Group I-2 requirements. These limits, compared to I-2 smoke compartment size, are proposed because of the probability of less staff in personal care occupancies to assist in evacuation when compared to nursing. Smaller smoke compartments and shorter travel distance assumes less time to reach a point of safety from the compartment of origination. The proposed revisions limit the size of smoke compartments to 16 sleeping rooms, or 10,500 square feet, whichever is less, versus the 22,500 square feet allowed in I-2. The proposed limit is taken from the basic Group I-1 exceptions for over 16 occupant criteria throughout the code, or 10,500 square feet, the basic allowable area allowed in the I-1 occupancy. There are four states that have statewide amendments to the IBC for personal care implementing the overall concepts in this proposal. The State of Oregon and Hawaii statewide building code amendments reduce smoke compartment size in their non capable personal care occupancies to the approximately the size proposed here. Oregon has over a twenty year history of amendments for personal care occupancies with residents who are not capable of self preservation, including reduced smoke compartment size.

The use of the term "sleeping room" is included so not to mix the more limiting Chapter 10 occupant load calculations into this requirement. The concept is that actual sleeping rooms will be counted. The travel distance will additionally control the size. The reduction from the I-2 travel distance of 200' is reduced in the I-1 by 25 percent to 150'. This reduction is also based on the probability of less staff to assist residents in personal care during evacuation.
(See Attachment C-IBC Revision Summary Table)

Section 420.4.1 The added refuge area requirement utilizes wording matching the current I-2 Section 407.4.1.

Section 420.4.2 The added Independent egress requirement utilizes wording matching the current I-2 Section 407.4.2.

Section 420.4.3 The added Horizontal assembly requirement utilizes wording matching the current I-2 Section 407.4.3.

Section 420.5 is added to confirm that corridors are required in I-1 occupancies and to provide a scoping statement for the multipurpose areas next to sleeping room exception in lieu of corridors proposed in the new following Section 420.5.1. The language in this Section 420.5 is derived from the same scoping language requiring corridors in I-2 in Section 1014.2.2, then introducing the "suite" exception in the next Section 1014.2.3.

Section 420.5.1 is added to allow "neighborhood designs" often seen in many Alzheimer's facilities. These designs often have 10 to 16 sleeping rooms open into a common shared living, activity, and dining area. Many facilities currently using this design layout use the accessory provisions allowed in the exit access intervening room requirements in Chapter 10, or use Section 407 exceptions if classified as the I-2 occupancy. These proposed provisions utilize concepts and wording from the spaces open to corridor provisions for nursing in found Section 407.2.3.

The intent here is to allow these neighborhood designs when there are only sleeping rooms that open into the spaces as found in Alzheimer's facilities. Typical assisted living units that have their own bathroom, kitchenette, and living rooms, are dwelling units so they are excluded from utilizing this exception. They are not included in this exception due to a self contained dwelling unit not requiring a common shared living, eating and activity area just outside a sleeping room. The key controlling requirement of this exception to corridor protection is the size of the compartment by the further limiting travel distance to 75' within that smoke compartment. This affectively limits travel time before reaching the required protection areas outside the compartment. The 16 sleeping room limit is derived from the maximum number of sleeping rooms allowed in a smoke compartment in the proposed Section 419.4. Other controlling features are from Section 407.2.3.

Table 503 IBC Table 503 is proposed to be revised to reflect changes to the definitions and resident type in the revised Group I-1 occupancy:

- The proposed I-1 basic allowable areas remain with the same limits as the current I-1.
- There are revised limitations on the number of stories allowed that reflect current Federal CMS limits on these occupancies. *(See Attachment D Areas & Height Table)*
- Approximately 36 states reference Federal CMS regulations for their assisted living occupancies, so general continuity between CMS enforced regulations and the IBC should occur. The revisions to the story limitations show a variance from one to three stories. The two story limitation in Type VA construction, also match California's IBC statewide amendments to the story limitations for its similar occupancy. California's state amendments also match other key protection features of CMS board and care regulations. *(See Attachment C-IBC Revision Summary Table)*

- The two story limitation for up to one hour wood protection matches current CMS requirements and is appropriate for this occupancy due to the type of residents. These occupants are expected to be able to evacuate the building with or without assistance in case of emergencies. They are not bedridden as in I-2 nursing, (with one story limits), and with the I-2 occupants that may stay in place during emergencies in a "protect in place" occupancy. This further substantiates the difference in Group I-1 two-stories versus the Group I-2 one story. There are already numerous existing two story wood frame assisted living facilities. This will allow these existing facilities to continue to be in compliance.
- Type IIA with fire sprinklers allows three stories. This matches the Federal CMS limits.
- Type IB is allowed seven stories with fire sprinklers, half way in between the current I-1 and I-2 limits, with two more stories than the current I-2 limits. Type IB construction contains the most differences between various versions of CMS and other state enforced regulations. This proposal is an average of the difference between Federal CMS regulations and Group I-2.

Table 503 is revised for the new Group R-4 to match the current Group I-1, being that the current I-1 is essentially moved to the new R-4. The revisions here are more clerical revisions than actual revisions because of moving the current I-1 occupancy to the R-4.

Section 504.2 Exceptions. Most Group I-1 and all Group R-4 occupancies are still allowed the sprinkler increase of one story and 20 feet in height from Table 503 by the base scoping language of the unrevised Section 504.2. Group I-1 occupancies with specifically designated Alzheimer's facilities are added to the exceptions for not being allowed the sprinkler story and height increases in Type IIB, III, IV, or V construction, similar to the current I-2 exception. The wording of the phrase includes the text "specifically designated or licensed by a state" to clarify that these are specially designated facilities licensed by most state Department of Human Services or Department of Health. This text is included to exclude applying the exception to assisted living facilities that may have some residents with dementia and early Alzheimer's disease as occurs in many assisted living facilities. The exception is only intended for exclusively designated Alzheimer's facilities, due to the likelihood of all residents not being capable of self preservation.

This is an additional requirement for these facilities matching the story limitations of wood frame construction of the I-2, which most jurisdictions have categorized Alzheimer's facilities in the past. The revision affectively keeps Alzheimer's facilities with all the appropriate I-2 protection features except for non applicable protect in place and bedridden requirements. This is a practical exception versus placing these facilities in the I-2 occupancy, which would cause additional exceptions for Alzheimer's facilities due to the additional and reduced protection features required in the I-2 as stated in the Summary Overview. The State of Hawaii study also shows that Alzheimer's facilities are allowed with a special license in 47 state assisted living regulations. So keeping them in the same I-1 occupancy with the additional I-2 protection features, making them almost equivalent to I-2 protection, is appropriate.

The limitation of occurring on the first story in combustible and non protected construction is proposed because numerous state assisted living regulations and states using older CMS life safety codes limit these facilities to the first story in these construction types. (The last three editions of CMS enforced life safety code does allow two stories though.) The first story limitation is appropriate though mostly due to the likelihood that few if any of an exclusive Alzheimer's facility's residents have the capability of responding to an emergency on their own. This is compared to non Alzheimer's assisted living facilities proposed to be allowed to be two stories in height. These proposed two story types of assisted living facilities have fewer to substantially fewer occupants requiring assistance with evacuation.

Section 508.2.4 is revised to reflect the revisions to the I-1 and R-4 occupancies, now incorporating more than 5 residents. Group I-1 and R-4 are moved to number 4 of this section to cover the 16 resident exceptions for both occupancies. The exception for 16 and under residents in I-1 and R-4 occupancies is added to maintain current requirements found in the similar current R-4. This is proposed versus making a whole new occupancy classification based only on the number of residents. The revisions here are more clerical revisions than actual revisions because of revising resident counts in the I-1 and R-4.

Section 508.3.3 is revised to reflect the revisions to the I-1 and R-4 occupancies now incorporating more than 5 residents. Group I-1 and R-4 are moved to number 4 of this section to cover the 16 resident exceptions for both occupancies. The exception for 16 and under residents in I-1 and R-4 occupancies is added to maintain current requirements found in the similar current R-4. This is proposed versus making a whole new occupancy classification based only on the number of residents. The revisions here are more clerical revisions than actual revisions because of revising resident counts in the I-1 and R-4.

Table 706.4 is revised to reflect the revisions to the R-4 occupancy, being that the current I-1 is essentially moved to the new R-4 while now incorporating more than 5 residents. The revisions here are more clerical revisions than actual revisions because of essentially moving the I-1 to the R-4.

Section 710.5 is revised to include cross corridor doors in the new required smoke barriers in Group I-1, matching the same exceptions allowed for I-2. This exception matches current CMS requirements.

Section 903.2.6 is revised to require full NFPA 13 sprinkler coverage in the I-1 occupancy when housing over 16 residents. This is proposed to reflect that the new I-1 residents may require physical assistance to evacuate. The exception is revised to allow NFPA 13R in smaller facilities versus creating a whole new occupancy classification for them for the few exceptions. The requirements also match current CMS and state assisted living regulations in a majority of states. *(See Attachment A-All State Summary Table and C-IBC Revision Summary Table)*

Section 907.2.6.1 is revised to eliminate the exception for eliminating automatic smoke detection when sprinklers are provided. This proposal requires smoke detection even with sprinkler exceptions to reflect that the new less capable I-1 resident type.

Section 907.5.2.3.3 is revised to match the current I-1 and current R-4 requirements. Group R-4 is added because it is now proposed to match the current I-1 in resident capability but not in resident counts. The exception is added to match current R-4 not requiring visible alarms when there are 16 or less residents. The exception for 16 and under residents in I-1 and R-4 occupancies is added to maintain current requirements found in the similar current R-4. This is proposed versus making a whole new occupancy classification based only on the number of residents. The revisions here are more clerical revisions versus technical requirement changes solely due to moving the current I-1 to the new R-4 occupancy and changing resident counts in the occupancies.

Section 1006.1 is revised to match the current I-1 and new R-4 requirements. Group R-4 is added because it is essentially moved from the current I-1. Dwelling units are added in Group I because some I-1 uses have dwelling units, making them consistently exempt.

Section 1107.6.4 is revised to match the current I-1 with the new R-4 requirements. The revisions are clerical revisions versus technical requirement changes solely due to moving the current I-1 to the new R-4 occupancy and changing resident counts in the occupancies.

Cost Impact: The code change proposal will not increase the cost of construction due to current enforcement of similar requirements by other regulations such as CMS and state licensing regulations.

Totals **Medicaid Waiver allowed in 36 States**	**AEA in +/- 46 States** **Y in +/- 35 States X in +/- 15 States**	**Assisted Living or Similar** **Allowed in 50 States**		**Alzheimer's** **Allowed in +/- 47 States**	**AEA in +/-37 States**	**Limited Nursing** **Intermittent for 45-90 days max. allowed in +/- 50 States**	**Short term Bedridden up to** **7 - 45 days max. allowed in +/- 21 States**			**NFPA 101** **referenced in 37 States**	**NFPA and it's** **Board & Care, and Limited Care Occupancies referenced in +/- 28 States**		**IBC used in 50 States** **26 states adopt (S)Statewide** **24 states adopt by each (J) Jurisdiction** **IBC Referenced in 10 state assisted regulations**	**I-1 in +/- 4 States** **I-2 in +/- 14 States** **I-1 & I-2 in +/- 32 States**

FOOTNOTES

1. If no Assisted licensing category exists in a particular State, the closest category is listed. See more detailed description in "Assisted Living Occupancy Criteria Analysis by State."
2. **(M)** Indicates Medicaid Waiver is allowed in State.
3. **AEA:** Assistance with Evacuation Allowed is specifically stated. **NCOSP:** (Not) Capable of Self Preservation
4. **Y:** NFPA resident criteria allowed with its wood construction and limitation on wood stories. No limitation of location of residents on first floor when requiring assistance with evacuation is stated.

5. **X:** Self evacuation or nursing design is required, or location of residents on first floor is required when requiring assistance with evacuation is stated.
6. **IBC**: International Building Code, **NFPA:** National Fire Protection Association, **IFC:** International Fire Code.
7. Assumed base IBC Occupancy classification as determined by this analysis without any individual State amendments or interpretations.
   If "unable to evacuate" is a criteria for discharge, then IBC I-1 (Assisted Living) is the assumed IBC classification under this analysis.
   If "unable to evacuate" is not a criteria for discharge, and assistance with evacuation is allowed, only when noted, then the interpretation by this analysis under the IBC is that the occupancy classification would be I-2 (Nursing "not capable of self preservation" i.e. resident cannot get out on their own).
   If continuous nursing is allowed, and unable to evacuate are not marked, then it is assumed that all facilities would fit into the I-2 occupancy under this analysis.
   If Alzheimer's care is allowed then I-2 occupancy is the assumed designation under this analysis.
   If NFPA Residential Board and Care is referenced, then "prompt" is assumed to be I-1, and "slow" and "impractical" are assumed as I-2.
   Assumed IBC occupancy is stated because the personal care/ assisted living occupancy is not listed as part of the IBC I-2 occupancy.
8. Where noted, most likely 2 occupancies are assumed to be used in the State dependent on "Level of Care," or whether Alzheimer's residents allowed in special licensed units.

ELDER CARE RESIDENT PROFILE GUIDE TABLE [1]				
Retirement/ Apartments	**Assisted Living**			**Skilled Nursing**
Independent	**Minimum Assistance**	**Standby Assistance**	**Hands-on Assistance**	**Total Assistance**
IBC: R-2 [2]	**IBC: I-1 [2]**	**IBC: I-2 [2]**	**IBC: I-2 [2]**	**IBC: I-2 [2]**
NFPA: Apartments[2]	**NFPA: Board & Care[2]**	**NFPA: Board & Care[2]**	**NFPA: Board & Care[2]**	**NFPA: Health Care[2]**
Able to respond independently in an emergency	Able to respond in an emergency	May need assistance in an emergency	Needs assistance in an emergency	Needs supervision and hands-on assistance in an emergency
Able to negotiate stairs in an emergency and exit the building	Walks/transfers independently - infrequent falls	Transfers - Standby assistance may be needed	Transfers- 1 person assist usually needed, and fall risk	Transfers - 2 person assist may be needed/Mechanical lift/bedfast
ADL (Acts of Daily Living)- Resident is able to accomplish all without assistance from staff	ADL - Independent to verbal reminders	ADL - Reminders to giving verbal cues	ADL - Verbal cues and/or hands-on assistance	ADL - Hands-on assistance
Transfer & ambulate. Eats and takes medications	Independent with medications & Dr. appointments	Medication reminders and management	Medication management	Medication adjustments and behavior management
Capable of own toileting and personal hygiene	Continent of bowel and bladder	Occasional incontinence assistance	Incontinence management	Incontinence management
Bathes, dresses, grooms	Independent in bathing	Bathing set up and monitoring	Bathing assistance	Bathing assistance
Meals/housekeeping, provide if chosen. No personal care assistance or monitoring	Meals, nutrition and housekeeping assistance is helpful	Meals, nutrition and housekeeping assistance is helpful	Meals, nutrition and housekeeping assistance is helpful	Verbal cues and hands-on assistance to eat
Would benefit from socialization and activities with minor encouragement	Able to independently plan and participate in social activities	Reminders and encouragement to participate in activities	Encourage and escort to participate inactivities	Encourage and escort to activities
No memory impairment	Little memory impairment	Mild memory impairment - sometimes disoriented	Impaired memory, poor orientation and mild confusion	Needs 24 hour nursing supervision or skilled services such as physical, occupational and/or speech therapy
Capacity for decision-making and understanding consequences	Some decline in capacity for self care and understanding consequences of actions	Declining capacity for self care and understanding consequences	Limited capacity and inability to understand consequences of actions	Limited or no capacity for self care and understanding of consequences of actions
Family does not "need" to move	Family "slightly concerned"	Family "concerned"	Family "very concerned" - "Have to do something"	Family must do something

1. Based on and edited from Nevada Elder Care Assisted Living Guidelines.
2. This analysis assumed occupancy designations from the 2006 IBC and 2003 NFPA 101.

(From the State of Hawaii Analysis)

Specific Criteria of Self-Preservation:
There are very specific details of the ability of occupants of a building to be "capable of self-preservation." NFPA and its codes and guides outline very specific details of this topic. The NFPA 101A Guide on Alternative Approaches to Life Safety (2001 Edition) is referenced and summarized here to underscore the many details of self-preservation.

Chapter 6 of the NFPA defines variations of capabilities of occupants for Residential Board and Care occupancies. This is the most important aspect of determining if a building should have additional life safety elements incorporated into its design, therefore the topic is discussed in detail here. This NFPA Chapter 6 reviews capability and then offers calculation tables to determine occupant's ability of self-preservation. The review below summarizes some specific points of this NFPA Chapter 6. It then assumes the determination of self-preservation at the end of each category in *italics.*

Risk of Resistance

Some residents may resist leaving the building during an emergency situation. “Minimal risk” indicates that there is no specific evidence to suggest that the resident might resist an evacuation.

“Mild resistance” indicates that there is specific evidence that the resident had previously resisted instructions from staff or may have hidden from the staff and then might resist leaving the building in a situation similar enough to a fire emergency. “Strong resistance” includes resistance by the resident who necessitates the full attention of one or more staff members. The resident may have struggled vigorously, refused to cooperate, or has hidden in similar fire situations to predict that behavior recurring in an actual emergency.

Residents who show mild and strong resistance are considered not capable of self-preservation.

Impaired Mobility

The resident is rated according to how easily he can leave a building “given the presence of factors such as physical barriers that hinder movement (e.g. stairs), the resident’s ability to get out of bed, or the chairs normally used. The resident should be given credit for being able to use devices that aid movement (e.g., wheelchairs, walkers, crutches, and leg braces) only if those devices are always available in an emergency situation….Guiding or directing the resident by giving gentle pushes or leading by the hand is not considered requiring physical assistance.”

“Self starting” means a resident is physically able to start and complete an evacuation without physical assistance.

“Slow” is when the resident prepares to leave and travels to the exit or area of refuge at a speed significantly slower than the general population. The NFPA classifies the general
population as “prompt,” meaning they can reach an exit (point of safety or area of refuge) within approximately 3 minutes. The NFPA categorizes a resident as being “slow” if it takes the resident more than 90 or 180 seconds to travel from a sleeping room to an exit, point of safety, or area of refuge. NFPA describes “very slow” as requiring over 150 seconds to reach an exit.

Residents who are self starting and slow or very slow are considered being capable of self-preservation. Residents who are not self starting and are considered beyond slow are not capable of self-preservation.

“Needs limited assistance” means “that the resident might need some initial or brief intermittent assistance but can accomplish most of the evacuation without assistance.” The residents may require help getting into a wheelchair, descending stairs, getting out of bed, or opening a door, for example.

“Needs full assistance” means the resident either needs physical assistance from a staff member during most of the evacuation or must be assisted by staff by being carried from the facility, helped into the wheelchair and wheeled out of the facility, or helped into leg braces and helped to descend stairs.

Residents who require limited and full assistance are considered not capable of self-preservation.

Impaired Consciousness

The resident has experienced seconds or minutes of temporary impairment of consciousness over six times during the previous three months. The resident is only classified this way if the impairment would significantly interfere with his or her ability to exit the building. Temporary medical problems are also not counted in this definition. “Partially” impaired consciousness means the resident is still able to participate in an evacuation to some degree. “Totally” impaired consciousness means the resident needs full assistance by at least one staff member to evacuate out of a building.

Residents who are partially or totally impaired are considered not capable of self-preservation.

Need for Extra Help

The resident may need assistance in various circumstances from more than one staff to egress a building, whether to initially get out of bed or other individual actions or if the resident requires assistance during the duration of exiting the building.

Response to Instructions

This is the resident’s ability to receive, comprehend and follow through with simple instructions during a self directed evacuation. Residents may require non constant “supervision, considerable attention, or might not respond during an evacuation.”

Residents who need extra help or require supervision, considerable attention, or might not respond during an evacuation are considered not capable of self -preservation.

Waking Response to Alarm

Buildings with non-centralized alarm systems, residents who are on medication that inhibits responses to alarms, residents who have apparent hearing impairment (unless they are in a room with visual alarms), or if hearing aids are removed during the night, or residents who are exceptionally sound sleepers are all considered as “response not probable” to responding to an alarm.

Residents who are not probable to responding to an alarm are considered not capable of self-preservation.

ATTACHMENT C

The following Table summarizes the proposed IBC revisions **(Underlined & Bold)** and shows the correlation to CMS regulations which enforce NFPA 101 that is referenced or enforced in approximately 37 state assisted living regulations. The current 2003 and 2006 NFPA 101 requirements are referenced here, which are believed to be enforced in a growing number of states, currently estimated to be about half of the states.

ADDITIONAL DETAILED SUBSTANTIATION

SUMMARIZATION OF THE 2007 HAWAII ASSISTED LIVING ANALYSIS

The following information is a summarization based on the information found in the "Assisted Living Analysis of All State Regulations Relative to Building Codes and Life Safety Codes," conducted for the State of Hawaii in 2007, from here on referenced as the "Assisted Living Analysis."

The I-1 occupancy is appropriately categorized as a "personal care" occupancy in the IBC. It is different than Group I-2 "health care," which includes nursing and hospitals for health and medical treatment. The largest population base of the personal care uses is assisted living, matching the current nursing population nationwide. Assisted living is the category of concern for the current I-1 occupancy. Nationwide assisted living is regulated by each state differently. Generally speaking assisted living residents:

- Are given assistance with activities of daily living (ADL's) by being given "personal care" services of meals, social and physical assistance, housekeeping, bathing, medication and similar assistance.
- Are generally slower to ambulate than the general population.
- May require staff assistance to evacuate.
- May have different levels of dementia, including Alzheimer's.
- May be incapable of following directions under emergency conditions.
- May require assistance in transferring to and from a wheelchair.
- Are never allowed to be permanently bedridden.
- Are never allowed to have continuous nursing care beyond temporary illness

The Assisted Living Analysis was commissioned by the State of Hawaii to review their assisted living resident types relative to building code regulations. It accomplished the following:

- Researched all 50 States regulations relative to the subject of capabilities of residents and associated regulations.
- Created a 2 page Summary Table of all 50 States regulations, evacuation capability requirements, and IBC assumptions or requirements (Attached).
- Noted that CMS or state regulations required NFPA 101 conformance or was referenced in 37 states, so analyzed NFPA requirements and cross referenced them with IBC requirements.
- Compared nearby State IBC amendments.
- Created Findings and Conclusions.
- Gave national recommendations.
- Made recommendations specific to the State of Hawaii based on the findings and preferences of the State of Hawaii Department of Health.

The findings are summarized as follows:

- "Assisted living or similar State licensed designation is allowed in all 50 States.
- Assistance with evacuation for residents is allowed in assisted living in approximately 46 States.
- Assistance with evacuation is allowed in 51 of the total 89 assisted living categories serving more than five residents in the 50 states.
- NFPA 101 Life Safety Code compliance is referenced in approximately 37 State assisted living licensing requirements.
- Alzheimer residents are allowed in assisted living facilities or in specially designated assisted living facilities in approximately 47 States.
- Temporary limited intermittent nursing care for up to 45 to 90 days is allowed in all 50 States, if care can be properly provided by the facility.
- Residents in assisted living are allowed to be short-term bedridden for up to 7 – 45 days due to temporary illness in approximately 21 States, if care can be properly provided by the facility.
- The IBC is used in all 50 States by local jurisdiction or State-wide adoption.
- The IBC occupancy designation of I-1 and its criteria for residents is exclusively applicable in approximately 4 States for assisted living."

OTHER REFERENCED STANDARDS

The Assisted Living Analysis shows that approximately 37 states require or reference NFPA 101 Life Safety Code conformance in their licensed assisted living facility regulations. The NFPA 101 code is often enforced by the Centers for Medicare and Medicaid Services (CMS) which is related to Medicaid reimbursement.

All of the states that utilize the NFPA 101 Life Safety Code for their assisted living regulations, classify them as the NFPA personal care Residential Board and Care occupancy. This occupancy classification allows residents that may not be fully capable of self preservation, requiring physical assistance to evacuate. The NFPA 101 from the 1980's and up to the 2000 edition, allows residents categorized as "prompt" and "slow" to reside in this occupancy. Residents up to and including the slow category are able to reach a point of safety within 13 minutes. Assisted living facilities with over five residents and with residents categorized as "impractical (over 13 minutes) are then required to conform to NFPA 101 "Limited Care" requirements found in its Health Care Chapter 18.

Essentially the NFPA Limited Care has slightly less stringent requirements than the rest of their Chapter 18 Health Care requirements. Those regulations essentially match the IBC I-2 requirements. Conformance requires the following:

- Wood frame is limited to one story. Three stories require 1 hour non combustible construction.
- Allows nonrated and open corridors.
- Requires smoke barriers.
- Requires NFPA 13 automatic sprinklers.
- Limited Care allows exceptions to the requirements for 44" door and 8' corridors.

It also be noted that due to federal regulation of the nursing industry, conformance to NFPA 101 is required nationally. The IBC I-2 and NFPA New Health Care Occupancy requirements are generally and specifically the same.

The 2003 and the most current 2006 NFPA 101 Life Safety Code revised its approach to the large (over 16) personal care Residential Board and Care (assisted living) occupancy. This occupancy classification is NFPA's equivalent IBC I-1 occupancy classification. Approximately 25 of the 37 states reference compliance with these two most recent editions of NFPA 101:

- **The timing of residents is removed as a requirement for classification and is now just referenced in its Guide on Alternative Approaches to Life Safety. The occupancy now allows prompt, slow and impractical residents.**
- **Facilities with impractical residents are now allowed in this Residential Board and Care occupancy and are not required to be in the Limited Care occupancy anymore.**

- It reduces wood frame construction from 4 stories to 2 stories.
- It adds the requirements for smoke barriers.
- It adds the requirements for NFPA 13 automatic sprinklers.
- It does not require corridor door rating.
- It requires evacuation drills meet its health care chapter requirements.
- It keeps most other Residential Board and Care requirements the same, which are generally consistent with the other current IBC I-1 requirements.

Revisions to the IBC should better generally match the current NFPA 101 Residential Board and Care occupancy criteria and requirements. There should be more consistency in assisted living regulations similar to the consistency between The IBC I-2 and NFPA 101 Health Care requirements.

OTHER STATES IBC AMENDMENTS

There are also at least three states that amend the IBC at a statewide level to incorporate similar aspects of allowing residents that may require assistance with evacuation. Hawaii is also currently in the process of approving similar amendments.

- California, Oregon, and Washington all allow residents that may require assistance in evacuation in their amended IBC I-1 (assisted living) occupancies.
- Oregon and California further limit wood frame stories. Oregon limits wood frame to three stories and requires a horizontal exit in multi story wood frame structures. California limits wood frame to two stories.
- All Add smoke barrier requirements.
- Oregon and California add NFPA 13 automatic sprinklers.

PROTECTION FEATURE SAMPLING OF RECENT PROJECTS

The proponent of this proposal works in an architectural firm that has designed over 200 senior housing projects in 19 states during the past 20 years. The firm has seen inconsistent application of the I-1 occupancy classification since numerous states started enforcing the IBC after 2003. The below information gives a sampling of what is occurring nationally, and offers insight into the inconsistent application of the code due to the issue presented in this proposal. The conclusion that this firm has is that every individual jurisdiction has to be negotiated as to what occupancy requirements are to be applied to assisted living facilities. This is due to the occupant type limitations the IBC places in the I-1 and R-4 requirements when compared to what most states licensing agencies allow. Negotiating each individual project's occupancy requirements is a time consuming, costly, and increased risk issue for developers. The only exceptions for this firm are for projects in the three states that have already amended their building code at a state-wide level (California, Oregon, and Washington.)

Many States are more similar to the Idaho, Nevada, Oklahoma, and Texas examples below. They have no actual IBC amendments to the I-1 or R-4 occupancy. They are like the 37 states that also require compliance with NFPA Residential Board and Care criteria referenced in their State assisted living regulations.

The examples below show different life safety design solutions on a sampling of ten of the firm's last similar assisted living projects since 2004. The two Idaho examples show two different occupancy classifications and construction type requirements for very similar projects. This exemplifies one of the key issues when designing these facilities. It is the construction cost difference between wood frame and steel frame construction. The limited jurisdictions that require assisted living construct to I-2 standards are not necessarily adding appropriate protection to the occupants of these facilities. They may add up to 25 percent in construction cost by requiring I-2 steel frame construction type in a two story building. That subject will be reviewed in more detail later in this substantiation.

A review of the IBC, NFPA 101 and its referenced building code NFPA 5000, along with the State licensing criteria is required when designing facilities in most States like Idaho and Nevada. The most stringent requirements of each code must be found and implemented. Complying with up to three different sets of regulations is complicated when all three may have differing criteria and requirements. The main issue is that most State regulations and NFPA allow evacuation assistance but the IBC does not. That compounds the complexities of dealing with overlapping requirements. That is the main reason why the IBC should be revised. The examples below show how this variation of requirements can cause undo increases in construction cost. It also shows inconsistent application of the IBC causing inconsistent building design.

The summarization of these 10 similar assisted living projects shows:

- 10 required IBC conformance.
- 10 allowed assistance with evacuation mostly through IBC alternate means.
- 9 different states.
- 9 implemented smoke barriers, mostly as alternate means.
- 8 implemented NFPA 13 sprinklers, mostly as alternate means.
- 7 allowed the Group I-1 occupancy classification, implementing some I-2 requirements.
- 7 required NFPA 101 compliance due to state licensing criteria.
- 7 were allowed to be built with wood frame of either two or three stories.
- 3 were required to be built with steel frame of either two or three stories.
- 2 required conformance to I-2 requirements because no equivalency was allowed.
- Construction cost varied from $110 to $170 per square foot, mostly due to requirements for different construction types even though the use was the same.

2005 Alaska Assisted Living Project

- The building cost was $130 per square foot.
- The IBC with no amendments was enforced by the local jurisdiction.
- The local fire marshal enforced the NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- A building code alternate means was accepted to allow the resident type for the **Group I-1** occupancy:
    - Residents requiring assistance with evacuation were limited to the first floor.
    - Smoke barriers were required.
    - NFPA 13 sprinklers were required.
    - The two story building was allowed to be Type VA (wood frame).

2007 California Assisted Living Project

- The building cost was $120 per square foot.
- The IBC was enforced with California statewide amendments.
- There were no NFPA 101 requirements.

- State assisted living licensing allows residents that may need assistance with evacuation.
- No Alternate means were required due to the California IBC amendments allowing the resident type in its **Group I-1** occupancy, and being consistent with NFPA 101 current Board and Care requirements:
    - Residents requiring assistance with evacuation were allowed.
    - Smoke barriers were required.
    - NFPA 13 sprinklers were required.
    - The two story building was allowed to be Type VA (wood frame), the maximum allowed under California's amendments.

2007 Colorado Assisted Living Project

- The building cost was $130 per square foot.
- The IBC with no amendments was enforced by the local jurisdiction.
- State assisted living licensing required conformance to the 2006 NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- A building code alternate means was accepted to allow the resident type for the **Group I-1** occupancy, allowing for the implementation of NFPA 101 requirements as an equivalency:
    - Residents requiring assistance with evacuation were allowed.
    - Smoke barriers were required.
    - NFPA 13 sprinklers were required.
    - The two story building was allowed to be Type VA (wood frame).

2005 Idaho Assisted Living Project

- The building cost was $110 per square foot.
- The IBC with no amendments was enforced by the local jurisdiction.
- State assisted living licensing required conformance to 2000 NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- A building code alternate means was accepted to allow the resident type for the **Group I-1** occupancy, allowing for the implementation of NFPA 101 and Oregon's SR IBC amendments as an equivalency:
    - Residents requiring assistance with evacuation were allowed.
    - Smoke barriers were required.
    - Horizontal exits were required.
    - NFPA 13 sprinklers were required.
    - The two story building was allowed to be Type VA (wood frame).

2006 Idaho Assisted Living Project

- The building cost was $160 per square foot.
- The IBC with no amendments was enforced by the local jurisdiction.
- State assisted living licensing required conformance to 2003 NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- A building code alternate means was not accepted to allow the resident type, then requiring the building comply with IBC **Group I-2** requirements:
    - Residents requiring assistance with evacuation were allowed.
    - Smoke barriers were required.
    - NFPA 13 sprinklers were required.
    - The two story building was required to be Type IIA (steel frame).

2008 Nevada Assisted Living Project

- The building cost was $170 per square foot.
- The IBC with no amendments was enforced by the local jurisdiction.
- State assisted living licensing required conformance to 2006 NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- A building code alternate means was accepted to allow the resident type for the **Group I-1** occupancy, allowing for the implementation of some I-2 requirements, and NFPA 101 Limited Care requirements as an equivalency:
    - Residents requiring assistance with evacuation were allowed.
    - Smoke barriers were required.
    - NFPA 13 sprinklers were required.
    - The negotiations exempted other I-2 requirements for metal conduit, I-2 fire detection, 44" doors, 8' corridors, and structural redundancy to save cost, since it was not considered a nursing or health care facility.
    - The three story building was required to be Type IIA (steel frame).

2008 Oklahoma Assisted Living Project

- The building cost is $110 per square foot.
- The IBC with no amendments was enforced by the local jurisdiction.
- State assisted living licensing required conformance to 2003 NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- A building code alternate means was **not** accepted to allow the resident type. The builing is currently being designed to meet **IBC current Group I-2** requirements to allow residents not capable of self preservation. This increased the cost of the project by approximately $25 per square foot required for I-2 and steel frame construction cost. The State is also considering legislation in a statute to require "I-II" (meaning I-2) design in a hastily written statute for assisted living with residents needing assistance, based mostly on the IBC current limitations.
    - Residents requiring assistance with evacuation are allowed.
    - IBC Group I-2 NFPA 13 sprinklers were required.
    - The two story building was allowed to be Type IIA (steel frame).

2006 Oregon Assisted Living Project

- The building cost was $110 per square foot.
- The IBC was enforced with Oregon statewide amendments.
- State assisted living licensing required conformance to 2000 NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- No Alternate means were required due to the Oregon IBC amendments allowing the resident type in its **Group I-1** (Oregon SR-1) occupancy, and being consistent with NFPA 101 current Board and Care requirements:
    - Residents requiring assistance with evacuation were allowed.
    - Smoke barriers were required.
    - NFPA 13 sprinklers were required.
    - Horizontal exits are required in multi story wood frame buildings.
    - The three story building was allowed to be Type VA (wood frame), the maximum allowed under Oregon's amendments.

2008 Texas Assisted Living Project

- The building cost is $170 per square foot.
- The IBC with no amendments is enforced by the local jurisdiction.
- State assisted living licensing require conformance to 2000 NFPA 101.
- State assisted living licensing allows residents that may need assistance with evacuation.
- A building code alternate means was accepted to allow the resident type for the **Group I-1** occupancy, allowing for the implementation of some I-2 requirements, and NFPA 101 Limited Care requirements as an equivalency:
    - Residents requiring assistance with evacuation are allowed.
    - Smoke barriers are proposed.
    - NFPA 13 sprinklers are proposed.
    - The request exempts other I-2 requirements for metal conduit, I-2 fire detection, 44" doors, 8' corridors, and structural redundancy to save cost, since it was not considered a nursing or health care facility.
    - The three story building is proposed to be Type IIA (steel frame).

2006 Washington Assisted Living Project

- The building cost was $110 per square foot.
- The IBC was enforced with Washington statewide amendments.
- There were no NFPA 101 requirements.
- State assisted living licensing allows residents that may need assistance with evacuation.
- No Alternate means were required due to the Washington IBC amendments allowing the resident type in its **Group I-1** (Washington LC) occupancy, and being consistent with NFPA 101 current Board and Care requirements:
    - Residents requiring assistance with evacuation were allowed.
    - Smoke barriers were required.
    - NFPA 13R sprinklers were required.
    - The three story building was allowed to be Type VA (wood frame), the maximum allowed in Washington is four stories.

This review shows that there is inconsistent implementation of evacuation criteria, construction type, sprinkler type, and smoke barriers. This inconsistency can be corrected by incorporating the proposed IBC amendments.

IBC I-1 VERSUS I-2 OCCUPANCY CLASSIFICATION

Some jurisdictions believe that these assisted living facilities should be categorized in the Group I-2 occupancy. This proponent believes that personal care assisted living requiring physical evacuation assistance, should remain in the Group I-1 occupancy.

The Group I-1 and R-4 occupancies provide personal care services as currently defined in the IBC. They do not allow bedridden residents, or provide nursing or health care services, except for short term illness. The current IBC definitions for personal care and assisted living are consistent with the general assisted living regulations across the country except for the requiring of residents to have full capability to egress. There are enough differences between actual I-1 personal care residents and staff and the I-2 health care residents and staff to warrant different occupancy classifications. There are also I-2 nursing exceptions that reduce protection that may not be appropriate for I-1 occupancies. The three key differences between I-1 assisted living and I-2 nursing occupancies are as follows:

- Capabilities of the residents are different. Assisted living residents may require more limited physical assistance in evacuation than nursing residents. Assisted living residents are not bedridden except for temporary illness. Nursing facility residents can be require more physical assistance in evacuation and may be permanently bedridden.
- Assisted living residents participate in fire drills and are trained to egress to a point of safety and then to exit the building in an emergency, with or without assistance. Nursing I-2 occupancies are considered "protect in place," meaning that residents do not generally participate in fire drills, and may wait for rescue in their rooms.
- Assisted living uses generally may have less required staffing levels, notably during the evening and overnight shifts than required nursing facility staff levels. There may not be the same amount of staff in assisted living to allow for the "protect in place" concept that I-2 nursing affords (including allowing I-2 unprotected corridors).

The attached "Current IBC Occupancy Requirements Comparison Table" for I-2, I-1, R-4, and R-2, shows all the detailed differences between the I-1 and I-2 requirements. That table is summarized as follows:

- I-2 exclusively has exceptions for rating corridors and open spaces to corridors.
- I-2 exclusively requires smoke barriers.
- I-2 has more restrictive area and story limitations than I-1.
- I-2 has Class B interior ratings versus B and C for I-1.
- I-2 requires NFPA 13 sprinklers versus NFPA 13R for I-1.
- I-2 means of egress has a more restrictive .3 egress width load factor, corridor and door width bed movement provisions, and a 200' travel distance limitation.
- I-2 has a .3 structural redundancy load factor requirement that is not required in I-1.
- The National Electric Code requires health and nursing care in I-2 use metal conduit and hard wired nurse call that is not generally required in I-1.

The proposed code revisions utilize an appropriate mix of I-1 and I-2 requirements for the Group I-1 that best fits personal care and assisted living occupancies. Refer to the "Proposed IBC Occupancy Requirements Comparison Table" (Attached) for a detailed list of the proposed revisions concepts for all the occupancies discussed. The proposed revisions are consistent with what NFPA and other states require in similar occupancies that are noted in detail prior in this justification. The Group I-1 occupancy is proposed to:

- Allow assistance with evacuation.
- Uses the terms "personal care" for I-1 and R-4.
- Uses the term "health care" for I-2 differentiating I-2 from I-1 and to correlate I-2 with the term "health care" used in the following regulations: IBC Chapter 16, State licensing, State and jurisdictional enforcement of NFPA 101, and The National Electrical Code (NEC).
- Keep the occupancy as personal care, not health care.
- Limit wood frame and non combustible construction to between current I-1 and I-2 requirements.
- Add smoke barrier requirements due to the new resident type allowed.
- Requires additional smoke detection requirements.
- Add NFPA 13 automatic sprinkler requirements.
- Keep the 6-16 resident facilities in place by adding exceptions for areas, construction, and sprinklers.

The proposed revisions utilizes only key provisions from I-2 into the I-1 for allowing persons who may need physical evacuation assistance, including story limitations, smoke barriers, and NFPA 13 sprinklers. This is consistent with other states amendments and current NFPA101 requirements.

The revisions do not utilize the current IBC I-2 Chapter 4 corridor exceptions reducing protection, Chapter 8 interior finish requirements, Chapter 10 bed movement egress limitations, or Chapter 16 additional structural redundancy requirements. The corridor, finish, and bed movement egress limitations are specifically for nursing or health care occupancies so it is not appropriate to include these in personal care occupancies. The non protected corridor allowance in nursing makes the correct assumption of higher staff levels than in assisted living. It also takes into account that nursing is protect in place. The structural redundancy requirements are for non essential health care facilities with over 50 occupants. This is appropriate for those protect in place occupancies that may keep the occupants in the building during emergencies. Personal care occupancies have occupants that leave the building during emergencies. This difference eliminates the need for additional structural redundancy. These I-2 requirements are not included in the new I-1 because they are only appropriate for health care and not for personal care uses.

IBC I-1 VERSUS R OCCUPANCY CLASSIFICATION

The proposed amendments essentially move the current resident type in Groups I-1 and R-4 to Group R-4. This keeps an occupancy group for personal care uses that do not allow assistance with evacuation, such as some categories of assisted living in some states. It also moves other personal care uses capable of evacuation without assistance from the current I-1 to the proposed R-4, including halfway houses, congregate care, social rehabilitation and other types of residential facilities. The proposed amendments keep the current 6-16 resident facilities with residents who may need assistance with self evacuation in the Group R-4 occupancy by adding exceptions. The proposed revisions are also consistent with current I-1, R-4, and R-2 requirements. The Current IBC Occupancy Requirements Comparison Table (Attached) shows that the current I-1 and R-2 have essentially the same requirements. Both occupancies assume that occupants are generally capable of responding to emergencies.

The Current IBC Occupancy Requirements Comparison Table shows basically no substantial life safety differences between Groups I-1, R-4 and R-2 occupancy requirements. The only real measurable difference is allowable story and area differences in Chapter 5. A summary of the only differences shown in the table between the current I-1 and R-2 substantiates why the current I-1 best fits in the current general "Group R" occupancy:

- I-1 is for personal care versus R-2 is general "residential."
- I-1 is for over 16 persons and R-2 is one or two family dwellings and for non transient sleeping residents.
- I-1 has less area and sometimes less story limitations with no extra stories allowed in Section 508. There are two construction types in the I-1 that require one less story. The allowable area is less in the I-1 from 1,500 to 6,000 square feet when compared to the R-2.
- There are some minor differences in smoke and visual alarm requirements.

The proposed code revisions for the R-4 are consistent with current I-1 and R-4 requirements. Refer to the "Proposed IBC Occupancy Requirements Comparison Table" (Attached) for a detailed list of the proposed revisions concepts for all the occupancies discussed. The Group R-2 occupancy is proposed to:

- Not allow assistance with evacuation.
- Adds personal care uses to the occupancy.
- Keeps the I-1 area and story limitations converted to the new R-4.
- Keep current I-1 requirements for NFPA 13R automatic sprinkler requirements.
- Keep current I-1 requirements for manual fire alarms, smoke alarms, and visual alarms.
- Keep the capable of self evacuation 6-16 resident facilities in the R-4 occupancy allowing for exceptions in various sections.

OTHER OPTIONS

The proposed solution for the I-1 and R-4 occupancies is not the only option for correcting the issue with these classifications in the IBC. The proponent believes the proposed amendments are the best overall most practical solution when all things are considered. The proposed revisions are not a "perfect solution. Advocates in the "personal" care industry prefer not being classified with the "I-Institutional" occupancies. They prefer being considered "residential." Note that even the existing I-1 classification description in Section 308.2 states that "residents live in a supervised residential environment that provides personal care services." This seems a contradiction to many in the industry, including the proponent of these amendments. There is a preference stated by some that all personal care be moved out of the "I" occupancy to the "R-Residential" occupancy. The proponent is not an advocate of this option because it would most likely create too many other issues as noted below.

The proponent does not advocate this "R" option because of the following:

- The main reason is that it would probably require creating a new occupancy classification (R-5?) versus the proposed keeping the existing occupancies in tact.
- It would require serious questions about what to do with the current I-1 designation. It could be used for Alzheimer's, but there is not enough difference to create an occupancy classification for Alzheimer's. Otherwise, if all personal care moved to the R classification, then the I-1 may end up not being used at all.
- Finally, another main issue is that moving all personal care to the R occupancy would most likely cause a major amount of code section changes. This "complete move" option would probably require two to three times the amount of code section changes than in this proposal.
- There were already major occupancy revisions in most states between 2003 and 2005 when the old regional codes were deleted for the adoption of the new IBC. Moving all personal care to the R classification would cause another major occupancy revision to the relatively newly established IBC personal care occupancies. This could cause confusion with occupancy permits, classifications, and requirements with three major occupancy classification revisions in 10 years for personal care uses.
- Due to the above, the argument for moving all personal care to the Group R is more philosophical than practical.

Finally, this proponent has a second option that encompasses similar concepts found in the submitted proposal but maintains the resident counts as currently in the I-1 and R-4 occupancies. This option keeps the R-4 as the 6-16 person occupancy but allowing non capable residents. It allows non capable resident in I-1 with over 16 residents. It moves all capable personal care to the R-2. It was not submitted for two main reasons: The proponent did not think it was as appropriate to continue to split personal care between the Group I and R based solely on the number of occupants. It was also perceived that advocates of keeping occupancies similar would not have approved moving capable personal care to the R-2 even though it has similarities. This other option has its merit only requiring 13 code section changes and no occupant number changes. Overall the proposal submitted was chosen due to the fact that it conceptualizes a long term solution to continuity of occupancy classification between to different letter groups. It makes the Group I for persons not capable of self preservation and for persons under detention. It makes the R for overnight occupancies for persons generally capable of self preservation. This proposal is the most appropriate and practical solution for the revision of the personal care occupancies.

Proponent: Jay Hall, Virginia Fire Safe Construction Advisory Committee

Revise as follows:

SECTION 308
INSTITUTIONAL GROUP I

308.1 (IFC [B] 202) Institutional Group I. Institutional Group I occupancy includes, among others, the use of a building or structure. or a portion thereof, in which people are cared for or live in a supervised environment, having physical limitations because of health or age are harbored for medical treatment or other care or treatment, or in which people are detained for penal or correctional purposes or in which the liberty of the occupants is restricted. Institutional occupancies shall be classified as Group I-1, 1-2, 1-3 or 1-4.

308.2 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or parts thereof housing more than 16 persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. The occupants are capable of responding to slow evacuation in an emergency situation without physical assistance from staff. This group shall include, but not be limited to, the following:

Alcohol and drug centers
~~Assisted living facilities~~
Congregate care facilities
~~Convalescent facilities~~
Group homes
Halfway houses
Residential board and care facilities
Residential care
Social Rehabilitation facilities

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2. A facility such as above, housing at least six and not more than 16 persons shall be classified as Group R-4.

308.3 (IFC [B] 202) Group 1-2. This occupancy shall include buildings and structures used for medical, surgical, psychiatric, nursing, assisted living or custodial care for persons who are not capable of self-preservation or where complete evacuation is impractical. This group shall include, but not be limited to, the following:

Assisted living facilities
Child care facilities
Convalescent facilities
Detoxification facilities
Hospice care
Hospitals
Mental hospitals
Nursing homes

308.3.1 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

ASSISTED LIVING FACILITIES. Buildings, or portions thereof housing persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment which provide personal care services and in addition could provide convalescent, medical, nursing or hospice care. The occupants are not capable of responding to an emergency situation without physical assistance from staff. This classification shall include, but not be limited to the following: Mental care facilities, nursing homes, assisted living facilities, convalescent facilities, and hospice care facilities.

CHILD CARE FACILITIES. Facilities that provide care on a 24-hour basis ~~to more than five~~ for children, 2½ years of age or less.

DETOXIFICATION FACILITIES. Facilities that serve patients who are provided treatment for substance abuse on a 24-hour basis and who are incapable of self-preservation or who are harmful to themselves or others.

EVACUATION LEVELS

Impractical evacuation. The movement of all occupants, residents and staff to an exit in more than 13 minutes.

Slow evacuation. The movement of all occupants, residents, and staff to an exit in more than three minutes, but not more than thirteen minutes.

HOSPITALS AND MENTAL HOSPITALS. Buildings or portions thereof used on a 24-hour basis for the medical, psychiatric, obstetrical or surgical treatment of inpatients who are incapable of self-preservation.

INDEPENDENT LIVING STATUS. A resident that is assessed as capable of performing all activities of daily living and instrumental activities of daily living for himself without requiring the assistance of another person and is assessed as capable of taking medications without the assistance of another person. Where the policy of a facility dictates that medications are administered or distributed centrally without regard for the residents' capacity, this policy shall not be considered in determining independent status.

NURSING HOMES. Nursing homes are long-term care facilities on a 24-hour basis, including both intermediate care facilities and skilled nursing facilities, serving more than five persons and any of the persons are incapable of self-preservation.

310.2 Definitions. The following words and terms shall, fro the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

RESIDENTIAL CARE/~~ASSISTED LIVING~~ A building or part thereof housing persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment which provides *personal care services.* The occupants are capable of responding to an emergency situation without physical assistance from staff. This classification shall include, but not be limited to the following: residential board and care facilities, ~~assisted living facilities~~, halfway houses, group homes, congregate care facilities, social rehabilitation facilities, alcohol and drug abuse centers and ~~convalescent facilities~~ residential care facilities where all residents have independent living status.

1107.5.2 Group I-2 nursing homes and assisted living facilities. Accessible units and Type B units shall be provided in nursing homes and assisted living facilities of Group I-2 occupancies in accordance with Sections 1107.5.2.1 and 1107.5.2.2.

Reason: This proposal addresses a disconnect between assisted living facilities (ALF) and the current building code.

Based on the current definition for Group I-1, which include ALF, residents are expected to be able to respond to an emergency without any assistance from staff. Today's ALF simply do not operate that way and even the Dept. of Social Services regulations in many states allow for or demand a percentage of non-ambulatory patients.

The census shows a continued increase in the population of older adults, age 65 and older. Given that fact, it is not surprising that we have already seen large increases in senior marketed housing and Assisted Living Facilities (ALF). Construction starts for Assisted living facilities are expected to grow even more to accommodate the rising number of adults who will need assistance for daily activities. Bathing, dressing, toileting, and transferring are a few examples of assistance.

In placing the Assisted Living Facilities use under the Group I-1 there is a tacit acknowledgement that residents in these facilities will eventually need protection levels beyond that provided by the Group I-1, however, no guidance is given to the code official to determine when the level of assistance needed has reached a maximum and the resident needs to be moved to an Group I-2 facility.

Based on the statistics from the U.S. fire Administration, and the National fire data center, older adults are at the highest risk of dying in a fire. The concept behind the existing placement of the ALF use within the Group I-1 is that though the residents may be slower to evacuate, they are still capable of self evacuation without physical assistance. Facilities that house residents not capable of responding to an emergency without physical assistance are classified as Nursing homes or hospitals. Higher degrees of fire safety and life safety are required in these facilities because the code recognizes a higher need for defend in place protection and that evacuation would be difficult or impractical, depending on the condition of the resident and involvement of fire and smoke. In practice most ALF would find themselves in a similar predicament if faced with a fire emergency.

The reality is that many of the residents in ALF are not capable of self preservation. As a result, many facilities go out of compliance with the building code soon after opening, and enforcement is difficult due to a lack of measurable performance standard in the code to be applied by code enforcers. Code enforcers cannot be expected to perform medical/physical/psychiatric assessments of the facility residents, nor should they. Most times the facility operators itself is also not aware of building code limitations based upon their group designation and they are also wrestling with the desires of the resident and family members who may not wish to be moved to a different facility, or even a different wing in the same facility.

In an emergency it obvious that many residents will need assistance to evacuate. Staffing levels nor building construction have been enhanced to balance the added time needed to evacuate. Some patients may not even be able to physically endure evacuating depending on their condition and the amount of smoke and heat present. This may be compounded by the responding fire department having limited resources during the initial response phase.

The lack of definitive guidance for code officials on when a resident goes from needing the protection levels or an R Group, to a Group I-1 to an Group I-2 is incomprehensible when the International Fire Code requires emergency action plans to be developed, submitted and approved by the fire code official for the Group I and specifies that drills be conducted, including evacuation of all residents in an ALF occupancy. What criteria is used to determine if the evacuation was timely?

The criteria has been available and progressive jurisdictions, such as the State of New Jersey, have used that criteria to provide for improved levels of safety for residents of these facilities, and clear guidance to designers and code officials. Virginia is also currently considering a similar proposal and many other states recognize the same problem and are seeking a solution.

The guidance is found in the NFPA 101 Life Safety Code.

From the 2008 edition (and is in previous editions):

3.3.70* Evacuation Capability*. The ability of occupants, residents, and staff as a group either to evacuate a building or to relocate from the point of occupancy to a point of safety.*

3.3.70.1 Impractical Evacuation Capability. *The inability of a group to reliably move to a point of safety in a timely manner.*

3.3.70.2 Prompt Evacuation Capability*. The ability of a group to move reliably to a point of safety in a timely manner that is equivalent to the capacity of a household in the general population.*

3.3.70.3 Slow Evacuation Capability*. The ability of a group to move reliably to a point of safety in a timely manner, but not as rapidly as members of a household in the general population.*

A.3.3.70 Evacuation Capability. *The evacuation capability of the residents and staff is a function of both the ability of the residents to evacuate and the assistance provided by the staff. It is intended that the evacuation capability be determined by the procedure acceptable to the authority having jurisdiction. It is also intended that the timing of drills, the rating of residents, and similar actions related to determining the evacuation capability be performed by persons approved by or acceptable to the authority having jurisdiction. The evacuation capability can be determined by the use of the definitions in 3.3.70, the application of NFPA 101A, Guide on Alternative Approaches to Life Safety, Chapter 6, or a program of drills (timed).*

Where drills are used in determining evacuation capability, it is suggested that the facility conduct and record fire drills six times per year on a bimonthly basis, with a minimum of two drills conducted during the night when residents are sleeping, and that the facility conduct the drills in consultation with the authority having jurisdiction. Records should indicate the time taken to reach a point of safety, date and time of day, location of simulated fire origin, escape paths used, and comments relating to residents who resisted or failed to participate in the drills.
Translation of drill times to evacuation capability is determined as follows

(1) 3 minutes or less — prompt
(2) Over 3 minutes, but not in excess of 13 minutes — slow
(3) More than 13 minutes — impractical

Evacuation capability, in all cases, is based on the time of day or night when evacuation of the facility would be most difficult, such as when residents are sleeping or fewer staff are present.

Evacuation capability determination is considered slow if the following conditions are met:

(1) All residents are able to travel to centralized dining facilities without continuous staff assistance.
(2) There is continuous staffing whenever there are residents in the facility.

This proposal addresses the problem by building the evacuation criteria into the group designation language. When an applicant submits a set of plans for review the plans must include the Group and the requirements of that group become a condition of occupancy when the facility is constructed and occupied. This is no different than when an applicant provides information on how much hazardous materials will be present in an effort to show that the proposed use is not an H Group. The MAQ for hazardous materials becomes a measurable condition of occupancy.

Once occupied, the evacuation parameters in the group designations become the standard the fire code official can measure against when fire drills are conducted or a violation of the certificate of occupancy is suspected. This will help ensure that residents are in the facilities that can provide the proper level of safety.

This proposal also includes moving Assisted Living Facilities from the Group I-1 to the Group I-2 as the most appropriate designation based upon the limitations of many residents of assisted living facilities and the fact that most, if not all of the residents transition to needing increased levels of care once admitted to a facility.

There is no getting around the fact that today's ALF does not fit into an Group I-1. Read Virginia's Assisted Living regulations at http://www.dss.virginia.gov/files/division/licensing/alf/regulations_code/applicable_regulations/032-05-010-17.pdf

Other States have similar regulations.

You will see that ALF facilities are allowed by their regulations to provide care for those cannot sense or even recognize danger, much less respond to it, as well as a multitude of other health conditions where the resident cannot respond to an emergency. Interestingly enough it also says that the facility shall comply with all fire safety regulations by the USBC. So, there is the first disconnect. They are out of compliance with both their regulations and the building code. It is hard to blame the assisted living people, the building code has been evolving too. It now clearly recognizes, that those that cannot reasonably respond be provided with added fire safety, Group I-2 construction and safety features. Those who can respond and under the care of a facility are provided with the systems to give more time for evacuation such as early detection, NFPA 13R, and some light compartmentation in corridors and dwelling units.

Realizing that people who move in and are perfectly capable of responding, will all age in place at the same rate but with different affects. Some will remain healthy and some will not. Some slow down and some will require wheel chairs, walkers etc. and this can change from day to day. Who will ever know, except the resident and maybe the facility, if the resident can or cannot respond to emergency without assistance on a day to day basis? How can this ever be regulated and monitored closely for each resident? Nightmare for all concerned, especially the resident.

The 13 minute evacuation time is an objective time limit that is a combination of the facilities ability and the resident's ability to manage getting the residents out and to safety in a reasonable time. If by combination of both, the facility can achieve total evacuation of the premises in 13 min. then we have a reasonably safe condition no matter how many times the resident/s needed a little more assistance in getting themselves in the right direction. If the residents are the type of residents that the code expects, then 13 minutes should be very achievable with no increase in staffing.

When the resident in no longer able to respond, yes they will need to be relocated, to a facility where they can age in place, and have the systems in place that acknowledge the resident will not be evacuating. From that point on, the building code cares not whether the resident went to a nursing home or an assisted living facility, either way and based on any changes that the DSS may have, assisted living facilities will be in compliance with the building code without the fire official or the facility being concerned with how many might be non-ambulatory at one time on any given day, week or month.

If applied at the time of construction the cost impact is minimal.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Robert J Davidson, Code Consultant, Alan Shuman, President, The National Association of State Fire Marshals (NASFM)

Revise as follows:

308.2 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or parts thereof housing more than ~~16~~ five persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. The occupants are capable of ~~responding to~~ slow evacuation in an emergency situation without physical assistance from staff. This group shall include, but not be limited to, the following:

Alcohol and drug centers
~~Assisted living facilities~~
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Social rehabilitation facilities
Residential board and care facilities

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2 provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.8. ~~A facility such as above, housing at least six and not more than 16 persons, shall be classified as Group R-4~~.

308.3 (IFC [B] 202) Group I-2. This occupancy shall include buildings and structures used for medical, surgical, psychiatric, nursing or custodial care for persons ~~who are not capable of self-preservation~~ where evacuation is impractical. This group shall include, but not be limited to, the following:

Assisted living facilities
Child care facilities
Detoxification facilities
Hospitals
Mental hospitals
Nursing homes

308.3.1 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

CHILD CARE FACILITIES. Facilities that provide care on a 24-hour basis ~~to more than five~~ for children, 2½ years of age or less.

DETOXIFICATION FACILITIES. Facilities that serve patients who are provided treatment for substance abuse on a 24-hour basis and who are incapable of self-preservation or who are harmful to themselves or others.

EVACUATION LEVELS

Impractical evacuation. The movement of all occupants, residents and staff to an exit in more than 13 minutes.

Slow evacuation. The movement of all occupants, residents, and staff to an exit in more than three minutes, but not more than thirteen minutes.

Prompt evacuation. The movement of all occupants, residents, and staff to an exit in three minutes or less.

HOSPITALS AND MENTAL HOSPITALS. Buildings or portions thereof used on a 24-hour basis for the medical, psychiatric, obstetrical or surgical treatment of inpatients who are incapable of self-preservation.

NURSING HOMES. Nursing homes are long-term care facilities on a 24-hour basis, including both intermediate care facilities and skilled nursing facilities, serving more than five persons and any of the persons are incapable of self-preservation.

308.5 (IFC [B] 202) Group I-4, day care facilities. This group shall include buildings and structures occupied by persons of any age who receive custodial care for less than 24 hours by individuals other than parents or guardians, relatives by blood, marriage or adoption, and in a place other than the home of the person cared for. A facility such as the above ~~with~~ accessory to a dwelling unit and having five or fewer persons shall be classified as a Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2 provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.8. Places of worship during religious functions are not included.

308.5.1 (IFC [B] 202) Adult care facility. A facility that provides ~~accommodations for less than 24 hours for more than five unrelated adults and provides~~ supervision and personal care ~~services~~ on less than a 24-hour basis where evacuation is slow or impractical, shall be classified as Group I-4.

Exception: A facility where occupants are capable of ~~responding to an emergency situation~~ prompt evacuation without physical assistance from the staff, is accessory to a dwelling unit and having five or fewer persons shall be classified as Group R-3.

308.5.2 (IFC [B] 202) Child care facility. A facility that provides supervision and personal care on less than a 24-hour basis for ~~more than five~~ children 2 1/2 years of age or less shall be classified as Group I-4.

~~Exception: A child day care facility that provides care for more than five but no more than 100 children 2 1/2 years or less of age, when the rooms where such children are cared for are located on a level of exit discharge serving such rooms and each of these child care rooms has an exit door directly to the exterior, shall be classified as Group E.~~

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the International Residential Code in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing sleeping units where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (not transient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two dwelling units.
Adult facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Congregate living facilities with ~~16~~ five or fewer persons.

Adult and child care facilities that are within a single-family home are permitted to comply with the International Residential Code provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.8.

R-4 Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code or shall comply with the *International Residential Code* provided the building is protected by an *automatic sprinkler system* installed in accordance with Section 903.2.8.

1107.5.2 Group I-2 nursing homes and assisted living facilities. Accessible units and Type B units shall be provided in nursing homes and assisted living facilities of Group I-2 occupancies in accordance with Sections 1107.5.2.1 and 1107.5.2.2.

Reason: The purpose of this proposal is to correct a serious disconnect in life safety between what is contained within the IBC and what occurs in the field and to provide a sound solution that is both fair and effective.

The census shows a continued increase in the population of older adults, age 65 and older. Given that fact, it is not surprising that we have already seen large increases in senior marketed housing and Assisted Living Facilities (ALF). New construction for assisted living facilities are expected to grow even more to accommodate the rising number of adults who will need assistance for daily activities. Bathing, dressing, toileting, and transferring are a few examples of assistance.

In placing the Assisted Living Facilities use under the I-1 Group there is a tacit acknowledgement that residents in these facilities will eventually need protection levels beyond that provided by the I-1, however, no guidance is given to the code official to determine when the level of assistance needed has reached a maximum and the resident needs to be moved to an I-2 Group facility.

Based on the statistics from the U.S. fire Administration, and the National fire data center, older adults are at the highest risk of dying in a fire. The concept behind the existing placement of the ALF use within the I-1 Group is that though the residents may be slower to evacuate, they are still capable of self evacuation without physical assistance. Facilities that house residents not capable of responding to an emergency without physical assistance are classified as I-2 such as Nursing homes or hospitals. Higher degrees of fire safety and life safety are required in these facilities because the code recognizes a higher need for defend in place protection and that evacuation would be difficult or impractical, depending on the condition of the resident and involvement of fire and smoke. In practice most ALF would find themselves in a similar predicament if faced with a fire emergency.

The reality is that many of the residents in ALF are not capable of self preservation. As a result, many facilities go out of compliance with the building code soon after opening, and enforcement is difficult due to a lack of measurable performance standard in the code to be applied by code enforcers. Code enforcers cannot be expected to perform medical/physical/psychiatric assessments of the facility residents, nor should they. Most times the facility operators themselves are not aware of building code limitations based upon their group designation and they are also wrestling with the desires of the resident and family members who may not wish to be moved to a different facility, or even a different wing in the same facility.

In an emergency it obvious that many residents will need assistance to evacuate. Neither staffing levels nor building construction have been enhanced to balance the added time needed to evacuate. Some patients may not even be able to physically endure evacuating depending on their condition and the amount of smoke and heat present. This may be compounded by the responding fire department having limited resources during the initial response phase.

The lack of definitive guidance for code officials on when a resident goes from needing the protection levels or an R Group, to a I-1 Group to an I-2 Group is incomprehensible when the International Fire Code requires emergency action plans to be developed, submitted and approved by the fire code official for the I Group and specifies that drills be conducted, including evacuation of all residents in an ALF occupancy. What criteria is used to determine if the evacuation was timely?

The criteria has been available and progressive jurisdictions, such as the State of New Jersey and the State of Georgia, have used that criteria to provide for improved levels of safety for residents of these facilities, and clear guidance to designers and code officials.

The guidance is found in the NFPA 101 Life Safety Code.

From the 2008 edition (and is in previous editions):

***3.3.70* Evacuation Capability**. The ability of occupants, residents, and staff as a group either to evacuate a building or to relocate from the point of occupancy to a point of safety.*

***3.3.70.1 Impractical Evacuation Capability.** The inability of a group to reliably move to a point of safety in a timely manner.*

***3.3.70.2 Prompt Evacuation Capability**. The ability of a group to move reliably to a point of safety in a timely manner that is equivalent to the capacity of a household in the general population.*

***3.3.70.3 Slow Evacuation Capability**. The ability of a group to move reliably to a point of safety in a timely manner, but not as rapidly as members of a household in the general population.*

***A.3.3.70 Evacuation Capability.** The evacuation capability of the residents and staff is a function of both the ability of the residents to evacuate and the assistance provided by the staff. It is intended that the evacuation capability be determined by the procedure acceptable to the authority having jurisdiction. It is also intended that the timing of drills, the rating of residents, and similar actions related to determining the evacuation capability be performed by persons approved by or acceptable to the authority having jurisdiction. The evacuation capability can be determined by the use of the definitions in 3.3.70, the application of NFPA 101A, Guide on Alternative Approaches to Life Safety, Chapter 6, or a program of drills (timed).*

Where drills are used in determining evacuation capability, it is suggested that the facility conduct and record fire drills six times per year on a bimonthly basis, with a minimum of two drills conducted during the night when residents are sleeping, and that the facility conduct the drills in consultation with the authority having jurisdiction. Records should indicate the time taken to reach a point of safety, date and time of day, location of simulated fire origin, escape paths used, and comments relating to residents who resisted or failed to participate in the drills.

Translation of drill times to evacuation capability is determined as follows:

(1) 3 minutes or less — prompt
(2) Over 3 minutes, but not in excess of 13 minutes— slow
(3) More than 13 minutes — impractical

Evacuation capability, in all cases, is based on the time of day or night when evacuation of the facility would be most difficult, such as when residents are sleeping or fewer staff are present.

Evacuation capability determination is considered slow if the following conditions are met:

(1) All residents are able to travel to centralized dining facilities without continuous staff assistance.
(2) There is continuous staffing whenever there are residents in the facility.

This proposal addresses the problem by building the evacuation criteria into the group designation language. When an applicant submits a set of plans for review the plans must include the Group and the requirements of that group become a condition of occupancy when the facility is constructed and occupied. This is no different than when an applicant provides information on how much hazardous materials will be present in an effort to show that the proposed use is not an H Group. The MAQ for hazardous materials becomes a measurable condition of occupancy.

Once occupied, the evacuation parameters in the group designations become the standard the fire code official can measure against when fire drills are conducted or a violation of the certificate of occupancy is suspected. This will help ensure that residents are in the facilities that can provide the proper level of safety.

This proposal also includes moving Assisted Living Facilities from the Group I-1 to the Group I-2 as the most appropriate designation based upon the limitations of many residents of assisted living facilities and the fact that most, if not all of the residents transition to needing increased levels of care once admitted to a facility. If applied at the time of construction the impact is minimal.

Wherever there is an allowance to construct a facility under the International Residential Code language has been added, *"provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.8*." to make sure this important level of protection is provided. Though the IRC was amended to require the installation of automatic sprinkler systems, various builder groups have been waging a state by state campaign to prevent that change from taking effect. They have been successful in some states making this modification imperative to provide the necessary level of safety.

The proposal also reduces from 16 to 5 the number of residents considered appropriate for applying the I-1 Group. While even 5 individuals in home with limited abilities to self evacuate can present a challenge to responding fire service personnel, That number is the traditional number associated with one and two family occupancies and even under legacy code would not have been prohibited. But to allow greater than that number of individuals lacking the ability to self evacuate in a building without the proper levels of protection places the residents at risk and risks the lives of the fire service that arrive and have to attempt rescue of the residents lacking the proper level of protection.

The adult care and child care uses have been modified. The adult care has been modified in a manner similar to the I-1 and I-2 to provide for a qualifier on resident self evacuation capabilities. Many of these occupants have the same personal care needs as those in an assisted living facility, but because of family only need part-time care. The designation of the R-3 group in this case was modified to specify that the option is only available if the adult day care is "accessory" to the dwelling use which is the appropriate allowance. R-3 with its lower safety requirements should not be permitted for someone simply establishing an adult care business not associated with their dwelling.

Child care has been modified that the activity is an I-4 regardless of the number of children below the age of 2.5 years of age. Children that young are for the most part required to be physically removed from harms way during an evacuation, many times on a one ton one basis and as a result the higher level of protection features is needed.

The change to Section 1107.5.2 is a companion change to a proposal to move assisted living facilities to Group I-2 as the appropriate classification for assisted living facilities due to the limitations in mobility and cognitive awareness on the part of many of those living in an assisted living facility. These individuals are also entitled to accessible units to address their limitations just as occupants of a nursing home. In many cases it is a fine line between whether someone lives within an assisted living facility or needs the care provided by a nursing home with occupants having disabilities prevalent in both types of occupancies.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-G2-308.2.doc

G24–09/10
308.2 (IFC [B] 202)

Proponent: Tom Lariviere, Chairman, representing Joint Fire Service Review Committee

Revise as follows:

308.2 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or parts thereof housing more than 16 persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. The occupants are capable of responding to an emergency situation without physical assistance from staff. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Residential board and care facilities
Social rehabilitation facilities

A facility such as the above ~~with~~ housing five or fewer persons shall be classified as Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2, provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.8. A facility such as above, housing at least six and not more than 16 persons, shall be classified as Group R-4.

Reason: This proposal will continue to allow the smaller congregate care facilities to be constructed either as an R-3, or under the IRC. But when the IRC is used for this facility, the facility must be sprinklered.

If a new structure is built, it will be required to be sprinklered. A new facility can be constructed either as an R-3 under the IBC which will require a fire sprinkler system, or as a one-family dwelling under the IRC which will also require a fire sprinkler system is installed. However, many congregate care facilities open and occupy an existing structure. This revision will require that when an existing single family home is used as a small congregate care facility, it will also be sprinklered.

These occupancies, even though housing less than six occupants, still have the same clientele as the I-1 occupancy. The facility is still a Group Home, a Congregate Care Facility, or an Assisted Living Facility, etc. Many of the occupants in these facilities have limited capability or delayed response for self-preservation in an emergency.

This proposed wording in this proposal was approved in Item G36 07-08 for R-4 occupancies where a similar concept applies. The sprinkler system provides the desired level of life safety regardless of whether the facility houses 5 or 6 occupants.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-G1-308.2

G25–09/10
309.1 (IFC [B] 202)

Proponent: Gene Boecker, AIA, Code Consultants, Inc., representing Code Consultants, Inc.

Revise as follows:

309.1 (IFC [B] 202) Mercantile Group M. Mercantile Group M occupancy includes, among others, the use of a building or structure, or a portion thereof, for the display and sale of merchandise and involves stocks of goods, wares or merchandise incidental to such purposes and accessible to the public.

Exceptions:

1. A building used for mercantile purposes with an occupant load of less than 50 persons shall be classified as a Group B occupancy.
2. A room or space used for mercantile purposes with an occupant load of less than 50 persons and accessory to another occupancy shall be classified as Group B occupancy or as part of that occupancy.

Mercantile occupancies shall include, but not be limited to, the following:

(Portions of text not shown remain unchanged)

Reason: This is similar to the provision already included in 303.1 for assembly spaces. If a deli serves food and has a place to sit, it could be an Assembly occupancy. However the exception in 303.1 allows the space to be classified as a Group B occupancy. If that deli does not have seating it would logically be classified as a Group M occupancy without the exception.

Similarly, a small gift shop in a large facility would need to be addressed as a separate occupancy. The same size café would be granted the exception in 303.1 of being considered as a part of that main occupancy. The gift shop, however, would not. This is incongruous with a reasonable approach to similar conditions. The exceptions will allow small spaces where goods are sold to be treated in a like manner whether seating is provided or not.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: BOECKER-G1-309.1

G26–09/10
310.1(IFC 202), 310.2

Proponent: Sarah A. Rice, CBO, representing self

Revise as follows:

310.1 (IFC 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing sleeping units where the occupants are primarily transient in nature, including:

~~Boarding houses (transient)~~
Congregate living facilities (transient) accommodating more than 10 occupants.
Bed and breakfast
Boarding house
Hotels (transient)
Motels (transient)

~~Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements of Group R-3.~~

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

Apartments
Congregate living facilities (nontransient) accommodating more than 16 occupants
Boarding House ~~(non-transient)~~
Convents
Dormitories
Fraternities ~~and sororities~~
Monastaries
Sororities
Hotels ~~(non-transient)~~
Live/work units
~~Monastaries~~
Motels ~~(nontransient)~~
Vacation Timeshare properties

~~Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3~~

R-3 Residential occupancies where the occupants are primarily permanent in nature (non-transient) and are not classified as a Group R-1, R-2, R-4 or I occupancy, including:

Buildings that do not contain more than two dwelling units
Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours
Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours
Congregate living facilities ~~with 16 or fewer persons~~ (nontransient) accommodating 16 or fewer occupants
Boarding house
Convents
Dormitories
Fraternities
Monastaries
Sororities
Congregate living facilities (transient) accommodating 10 or fewer occupants
Bed and breakfast
Boarding house

Adult care and child care facilities that are within a single-family home are permitted to comply with the International Residential Code

R-4 Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code or shall comply with the International Residential Code provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.8.

310.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

CONGREGATE LIVING FACILITY: A building or portion of a building ~~or part thereof~~ that contains sleeping units where residents share bathroom and/or kitchen facilities. Congregate living facilities including, but not limited to, bed and breakfast homes, boarding houses, convents, monasteries, dormitories, fraternities and sororities.

Boarding house. ~~A building~~ A type of congregate living facility arranged or used for lodging for compensation, with or without meals, and not occupied as a ~~single-family~~ dwelling unit.

Dormitory. ~~A space in a building~~ A type of congregate living facility where group sleeping accommodations are provided in one room, or in a series of closely associated rooms, for persons not members of the same family group, under joint occupancy and single management, as in college dormitories, ~~or fraternity houses~~ fraternities and sororities.

Reason: When congregate living facility was added to the code, the proponent explained that this was a generic category of which many of the codes existing categories were subsets. This change simply carries through with that original concept. In addition, the list of occupancies with the R category have become muddled with some uses listed and some explained in paragraphs below the list. Finally there is confusion resulting from the paragraph at the end of the R-1 and R-2 lists which says that certain congregate living facilities are 'permitted to comply with the construction requirements of R-3, but doesn't say there are R-3's, This would seem to imply that they are to be categorized as R1 or R2, but everything else about them will be R-3. That makes no sense.

Finally this eliminates the inconsistent placement of transient and nontransient after various uses. The charging language for each group says either transient or permanent (non-transient), the lists afterward don't need to, with one exception. Because the R-3 can have both transient and non-transient congregate living facilities, that distinction must be provided.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-G1-310.2.doc

G27–09/10
310.1 (IFC [B] 202)

Proponent: Maureen Traxler, City of Seattle, WA, Seattle Dept of Planning & Development

Revise as follows:

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing *sleeping units* where the occupants are primarily transient in nature, including:

Boarding houses (transient) with more than 10 occupants
Congregate living facilities (transient) with more than 10 occupants
Hotels (transient)
Motels (transient)

~~*Congregate living facilities* (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.~~

R-2 Residential occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (nontransient) with more than 16 occupants
Congregate living facilities (nontransient) with more than 16 occupants
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

~~*Congregate living facilities* with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.~~

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two *dwelling units*.
Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Boarding houses (nontransient) with 16 or fewer occupants
Boarding houses (transient) with 10 or fewer occupants
Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Congregate living facilities (nontransient) with 16 or fewer ~~persons~~ occupants.
Congregate living facilities (transient) with 10 or fewer occupants.

R-4 Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code or shall comply with the *International Residential Code* provided the building is protected by an *automatic sprinkler system* installed in accordance with Section 903.2.8.

Reason: Boarding houses and congregate living facilities as defined in Section 310 are very similar and should be classified the same. Current code language found under the R-1 and R-2 classifications indicates when congregate living facilities shall comply with the construction requirements for R-3, but this leaves the question of how they shall be classified. This proposal clarifies how congregate living facilities and boarding houses shall be classified, based on the transient and nontransient occupant load thresholds.

Cost Impact: The code change proposal will not increase the cost of construction.

310.1(IFC [B] 202), 310.2; IRC R101.2, R202

Proponent: Maureen Traxler, City of Seattle, Seattle Dept of Planning & Development

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

1. Revise as follows:

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing *sleeping units* where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
<u>Lodging houses with more than 5 guest rooms</u>
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (nontransient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two *dwelling units*.
Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Congregate living facilities with 16 or fewer persons.
Lodging houses with 5 or fewer guest rooms

Adult care and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*.
Lodging houses with five or fewer guest rooms are permitted to comply with the *International Residential Code*.

R-4 Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code or shall comply with the *International Residential Code* provided the building is protected by an *automatic sprinkler system* installed in accordance with Section 903.2.7.

2. Add new definitions as follows:

310.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

GUEST ROOM. Any room or rooms used or intended to be used by one or more guests for living or sleeping purposes.

LODGING HOUSE. A dwelling occupied as a single-family unit where rent is paid for guest rooms.

PART II – IRC BUILDING AND ENERGY

1. Revise as follows:

R101.2 Scope. The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures*.

Exceptions:

1. Live/work units complying with the requirements of Section 419 of the *International Building Code* shall be permitted to be built as one- and two-family *dwellings* or townhouses. Fire suppression required by Section 419.5 of the *International Building Code* when constructed under the *International Residential Code for One- and Two-family Dwellings* shall conform to Section 903.3.1.3 of the *International Building Code*.
2. Lodging houses with five or fewer guest rooms shall be permitted to be constructed in accordance with the *International Residential Code for One- and Two-family Dwellings.*

2. Add new definitions as follows:

SECTION R202
DEFINITIONS

GUEST ROOM is any room or rooms used or intended to be used by one or more guests for living or sleeping purposes.

LODGING HOUSE is a one-family dwelling where one or more occupants are primarily permanent in nature, and rent is paid for guest rooms.

Reason: This proposal allows small bed and breakfasts to be constructed according to the International Residential Code. Currently, the IRC does not address whether nightly rentals are allowed, so jurisdictions across the country are applying the code differently. We chose to add a definition of "lodging house" to generally encompass rental lodging within dwelling units, distinct from hotels and boarding houses which are "not occupied as a single-family unit." We are proposing a general term rather than the more common term "bed and breakfast" partly because that term would imply that the building official would monitor what meals were served at the lodging.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: TRAXLER-G10-310.DOC

G29–09/10
310.1 (IFC [B] 202), 310.2

Proponent: John England, MCO, England Enterprises Inc., representing Cities of Beaufort and Hardeeville, SC

1. Revise as follows:

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing *sleeping units* where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (nontransient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
~~Vacation timeshare properties~~

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two *dwelling units*.
Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.

Congregate living facilities with 16 or fewer persons. Adult care and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*.

R-4 Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code or shall comply with the *International Residential Code* provided the building is protected by an *automatic sprinkler system* installed in accordance with Section 903.2.8.

R-5 Residential occupancies in which the building and common area are owned by an association. Dwelling units are individually owned either wholly or as part of a time share agreement.

Condominium, residential
Vacation timeshare properties

Group R-5 occupancies shall meet the requirements for construction as defined for Group R-2, except as otherwise provided for in this code.

2. Add new definitions as follows:

310.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

CONDOMINIUM, RESIDENTIAL. A building, including common areas, consisting of two or more dwelling units which is owned by a common association and in which each dwelling unit is individually owned.

VACATION TIMESHARE PROPERTIES. A building, including common areas, which are owned by a homeowners association in which each dwelling units have multiple owners and the dwelling units can be used on a transient basis by their owners or rented out to nonowners on a daily, weekly or monthly basis.

Reason: Special provisions need to be taken for condos and timeshares since the associations owns the buildings.
When Apartment building (R-2) or Hotels (R-1) are converted to condo's or timeshares the occupancy classification of the building changes requiring the owner to bring it up to code before selling the units.
This is a life safety issue because many buildings will now have to be sprinkled and accessibility issues will be corrected when the conversion occurs.
As the code progresses other changes may change specific requirements for Group R-5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-G1-310.1.doc

402.2.1 (New), 402.3, 402.4, 402.4.1 402.4.1.1, 402.4.1.4, 402.4.3, 402.4.4, 402.4.5, 402.5.1, 402.5.2, 402.6, 402.6.1, 402.7.1, 402.7.3, 402.8, 402.9, 402.11, 402.12, 402.12.2, 402.12.3, 402.14, 402.15, 402.16, 905.3.3, 905.4 (IFC 905.3.3, 905.4).

Proponent: Sarah A. Rice, CBO, representing self

1. Add new text as follows:

402.2.1 Open mall building perimeter line. For the purpose of this code, a perimeter line shall be established. The perimeter line shall encircle all buildings and structures which comprise the open mall building, and shall encompass any open-air interior walkways, open-air courtyards or similar open-air spaces. The perimeter line shall define the extent of the open mall building. Anchor buildings shall be outside of the perimeter line and are not considered as part of the open mall building.

2. Revise text as follows:

402.3 Lease plan. Each ~~*covered mall building*~~ owner of a covered mall building or of an open mall building shall provide both the building and fire departments with a lease plan showing the location of each occupancy and its exits after the certificate of occupancy has been issued. No modifications or changes in occupancy or use shall be made from that shown on the lease plan without prior approval of the *building official*.

402.4 Means of egress. ~~Each tenant space and the~~ *Covered mall buildings, open mall buildings and each tenant space within a mall building* shall be provided with *means of egress* as required by this section and this code. Where there is a conflict between the requirements of this code and the requirements of ~~this section~~ Sections 402.4.1 through 402.4.6, the requirements of ~~this section~~ Sections 402.4.1 through 402.4.6 shall apply.

402.4.1 Determination of occupant load. The *occupant load* permitted in any individual tenant space in a *covered or open mall building* shall be determined as required by this code. *Means of egress* requirements for individual tenant spaces shall be based on the *occupant load* thus determined.

402.4.1.1 Occupant formula. In determining required *means of egress* of the mall, the number of occupants for whom *means of egress* are to be provided shall be based on gross leasable area of the *covered or open mall building* (excluding *anchor buildings*) and the *occupant load* factor as determined by the following equation.

$$OLF = (0.00007)\ (GLA) + 25 \qquad \textbf{(Equation 4-1)}$$

where:
OLF = The *occupant load* factor (square feet per person).
GLA = The gross leasable area (square feet).

Exception: Tenant spaces attached to a *covered or open mall building* but with a *means of egress* system that is totally independent of the open mall of an open mall building or of ~~the~~ a *covered mall building* shall not be considered as gross leasable area for determining the required *means of egress* for the *covered mall building*.

402.4.1.2 OLF range. (No change to current text)

402.4.1.3 Anchor buildings. (No change to current text)

402.4.1.4 Food courts. The *occupant load* of a food court shall be determined in accordance with Section 1004. For the purposes of determining the *means of egress* requirements for the mall, the food court *occupant load* shall be added to the *occupant load* of the *covered or open mall building* as calculated above.

402.4.2 Number of means of egress. (No change to current text)

402.4.3 Arrangements of means of egress. Assembly occupancies with an *occupant load* of 500 or more within a covered mall building shall be so located in the *covered mall building* that their entrance will be immediately adjacent to a principal entrance to the mall and shall have not less than one-half of their required *means of egress* opening directly to the exterior of the *covered mall building*. Assembly occupancies with an occupant load of 300 or more within an open mall building shall be permitted to have their main exit open to the open mall.

402.4.3.1 Anchor building means of egress. (No change to current text)

402.4.4 Distance to exits. Within each individual tenant space in a *covered* or open *mall building*, the maximum distance of travel from any point to an *exit* or entrance to the mall shall not exceed 200 feet (60 960 mm).

The maximum distance of travel from any point within a mall of a covered mall building to an *exit* shall not exceed 200 feet (60 960 mm). The maximum distance of travel from any point within an open mall to the perimeter line of the open mall building shall not exceed 200 feet.

402.4.5 Access to exits. Where more than one *exit* is required, they shall be so arranged that it is possible to travel in either direction from any point in a mall of a covered mall building to separate *exits* or from any point in an open mall to two separate locations on the perimeter line of an open mall building. The minimum width of an *exit passageway* or *corridor* from a mall shall be 66 inches (1676 mm).

Exception: Dead ends not exceeding a length equal to twice the width of the mall measured at the narrowest location within the dead-end portion of the mall.

402.4.5.1 Exit passageways. (No change to current text)

402.4.6 Service areas fronting on exit passageways. (No change to current text)

402.5 Mall width. For the purpose of providing required egress, malls are permitted to be considered as *corridors* but need not comply with the requirements of Section 1005.1 of this code where the width of the mall is as specified in this section.

402.5.1 Minimum width The ~~minimum~~ aggregate clear egress width of the mall in either a covered or open mall building shall be a minimum of 20 feet (6096 mm). The mall width shall be sufficient to accommodate the *occupant load* served. ~~There shall be a minimum of 10 feet (3048 mm) clear exit width~~ No portion of the minimum required aggregate egress width of shall be less than 10 feet measured to a height of 8 feet (2438 mm) between any projection of a tenant space bordering the mall and the nearest kiosk, vending machine, bench, display opening, food court or other obstruction to *means of egress* travel.

402.6 ~~402.5.2 Minimum width~~ Open malls. Floor assemblies in, and roof assemblies over the mall of an open mall buildings shall be open for a minimum of 20 feet, measured perpendicular from the face of the tenant spaces on the lowest level, from edge of balcony to edge of balcony on upper floors or from edge of roof line to edge of roof line. The opening, or the unroofed area shall extend from the lowest/grade level of the mall to the sky above the roof. Balconies on upper levels of the mall shall not project into the required width. ~~The minimum floor and roof opening width above grade shall be 20 feet (9096 mm) in open malls.~~

Exception: Interior pedestrian bridges connecting balconies shall be permitted in the required width.

~~402.6~~ 402.7 Types of construction. The building area of any *covered mall or open building*, including *anchor buildings*, of Types I, II, III and IV construction, shall not be limited provided the *covered mall building* or open mall building, and ~~attached~~ adjoining *anchor buildings* and parking garages are surrounded on all sides by a permanent open space of not less than 60 feet (18 288 mm) and the *anchor buildings* do not exceed three *stories above grade plane*. For open mall buildings, the width of the permanent open space shall be measured from the perimeter line established by Section 402.2.1.

The type of construction allowable building height and building area of *anchor buildings* greater than three *stories above grade plane* shall comply with Section 503, as modified by Sections 504 and 506. The construction type of *open parking garages* and enclosed parking garages shall comply with Sections 406.3 and 406.4, respectively.

~~402.6.1~~ 402.7.1 Reduced open space. The permanent open space of 60 feet (18 288 mm) shall be permitted to be reduced to not less than 40 feet (12 192 mm), provided the following requirements are met:

1. The reduced open space shall not be allowed for more than 75 percent of the perimeter of the *covered or open mall building* and *anchor buildings*.
2. The *exterior wall* facing the reduced open space shall have a minimum *fire-resistance rating* of 3 hours.
3. Openings in the *exterior wall* facing the reduced open space shall have opening protectives with a minimum *fire protection rating* of 3 hours.
4. Group E, H, I or R occupancies are not within the *covered or open mall building* or *anchor stores*.

~~402.7~~ **402.8 Fire-resistance-rated separation.** Fire-resistance-rated separation is not required between tenant spaces and the mall. Fire-resistance-rated separation is not required between a food court and adjacent tenant spaces or the mall.

~~402.7.1~~ **402.8.1 Attached garage.** An attached garage for the storage of passenger vehicles having a capacity of not more than nine persons and *open parking garages* shall be considered as a separate building where it is separated from the *covered or open mall building* by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both.

Exception: Where an *open parking garage* or enclosed parking garage is separated from the *covered or open mall building* or *anchor building* a distance greater than 10 feet (3048 mm), the provisions of Table 602 shall apply. Pedestrian walkways and tunnels that attach the *open parking garage* or enclosed parking garage to the *covered or open mall building* or *anchor building* shall be constructed in accordance with Section 3104.

~~402.7.2~~ **402.8.2 Tenant separations. (**No change to current text)

~~402.7.3~~ **402.8.3 Anchor building separation.** An *anchor building* shall be separated from the *covered or open mall building* by *fire walls* complying with Section 706.

Exceptions:

1. *Anchor buildings* of not more than three *stories above grade plane* that have an occupancy classification the same as that permitted for tenants of the ~~*covered*~~ *mall building* shall be separated by 2-hour fire-resistive *fire barriers* complying with Section 707.
2. The exterior walls of anchor buildings separated from an open mall building by an open mall shall comply with Table 602.

~~402.7.3.1~~ **402.8.3.1 Openings between anchor building and mall. (**No change to current text)

~~402.8~~ **402.9 Interior finish.** *Interior wall* and *ceiling finishes* within the mall of a covered mall and within the *exits* of covered or open mall buildings shall have a minimum *flame spread index* and smoke-developed index of Class B in accordance with Chapter 8. *Interior floor finishes* shall meet the requirements of Section 804.

[F] ~~402.9~~ **402.10 Automatic sprinkler system.** ~~The~~ *Covered and open mall* ~~*building*~~ *buildings* and buildings connected shall be ~~equipped~~ protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, which shall comply with the all of the following:

1. The *automatic sprinkler system* shall be complete and operative throughout occupied space in the ~~*covered*~~ *mall building* prior to occupancy of any of the tenant spaces. Unoccupied tenant spaces shall be similarly protected unless provided with *approved* alternative protection.
2. Sprinkler protection for the mall of a covered mall building shall be independent from that provided for tenant spaces or ~~anchors~~ anchor buildings.
3. Sprinkler protection for the tenant spaces of an open mall building shall be independent from that provided for anchor buildings.
4. Sprinkler protection shall be provided beneath exterior circulation balconies located adjacent to an open mall.
5. Where tenant spaces are supplied by the same system, they shall be independently controlled.

   Exception: An *automatic sprinkler system* shall not be required in spaces or areas of *open parking garages* separated from the covered or open mall in accordance with Section 402.7.1 and constructed in accordance with Section 406.3.

~~402.9.1~~ **[F] 402.11 Standpipe system. (**No change to current text)

~~402.10~~ **402.12 Smoke control. (**No change to current text)

~~402.11~~ **402.13 Kiosks.** Kiosks and similar structures (temporary or permanent) located within the mall of a covered mall building or within the perimeter line of an open mall building shall meet the following requirements:

1. Combustible kiosks or other structures shall not be located within ~~the~~ a covered or open mall unless constructed of any of the following materials:

(Text not shown remains unchanged)

~~402.12~~ **402.14 Children's playground structures.** Where located within the mall of a covered mall or within the perimeter line of an open mall building, structures intended as children's playgrounds that exceed 10 feet (3048 mm) in height and 150 square feet (14 m^2) in area shall comply with Sections 402.12.1 through 402.12.4.

~~402.12.1~~ **402.14.1 Materials. (**No change to current text)

~~402.12.2~~ **402.14.2 Fire protection.** Children's playground structures located within ~~the~~ a mall or open mall shall be provided with the same level of *approved* fire suppression and detection devices required for kiosks and similar structures.

~~402.12.3~~ **402.14.3 Separation.** Children's playground structures shall have a minimum horizontal separation from other structures within ~~the~~ a mall or open mall of 20 feet (6090 mm).

~~402.12.4~~ **402.14.4 Area limits. (**No change to current text)

~~402.13~~ **402.15 Security grilles and doors. (**No change to current text)

~~402.14~~ **[F] 402.16 Standby power.** *Covered mall buildings* exceeding 50,000 square feet (4645 m^2) and open mall buildings exceeding 50,000 square feet within the established perimeter line shall be provided with standby power systems that are capable of operating the emergency voice/alarm communication system.

~~402.15~~ **[F] 402.17 Emergency voice/alarm communication system.** ~~*Covered mall buildings* exceeding 50,000 square feet (4645 m^2) in total floor area shall be provided with an emergency voice/alarm communication system.~~ Where the total floor area exceeds 50,000 square feet within either a covered mall building or within the perimeter line of an open mall building, an emergency voice/alarm communication system shall be provided.

Emergency voice/alarm communication systems serving a mall, required or otherwise, shall be accessible to the fire department. The system shall be provided in accordance with Section 907.5.2.2.

~~402.16~~ **402.18 Plastic signs.** Plastic signs affixed to the storefront of any tenant space facing ~~the~~ a mall or open mall shall be limited as specified in Sections ~~402.16.1 through 402.16.5.2~~ 402.17.1 through 402.17.5.2.

(Text not shown remains unchanged)

~~402.17~~ **[F] 402.19 Fire department access to equipment. (**No change to current text)

905.3.3 (IFC 905.3.3) Covered and open mall buildings. ~~A~~ *Covered mall ~~building~~ and open mall buildings* shall be equipped throughout with a standpipe system where required by Section 905.3.1. ~~*Covered*~~ *Mall buildings* not required to be equipped with a standpipe system by Section 905.3.1 shall be equipped with Class I hose connections connected to the *automatic sprinkler system* sized to deliver water at 250 gallons per minute (946.4 L/min) at the most hydraulically remote hose connection while concurrently supplying the *automatic sprinkler system* demand. The standpipe system shall be designed not to exceed a 50 pounds per square inch (psi) (345 kPa) residual pressure loss with a flow of 250 gallons per minute (946.4 L/min) from the fire department connection to the hydraulically most remote hose connection. Hose connections shall be provided at each of the following locations:

1. Within the mall at the entrance to each *exit* passageway or *corridor*.
2. At each floor-level landing within enclosed stairways opening directly on the mall.
3. At exterior public entrances to the mall of a covered mall building
4. At public entrances at the perimeter line of an open mall building.
5. At other locations as necessary so that the distance to reach all portions of a tenant space does not exceed 200 feet (60 960 mm) from a hose connection.

[F] 905.4 (IFC 905.4) Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. through 3. **(**No change to current text)
4. In covered and open mall buildings, adjacent to each exterior public entrance to ~~the~~ a covered mall, adjacent to each public entrance at the perimeter line of an open mall and adjacent to each entrance from an *exit* passageway or *exit corridor* to the covered mall or an open mall.
5. and 6. **(**No change to current text)

Reason: The 2009 IBC was amended to allow an open mall to be built under the Covered Mall provisions of Section 402. However, the change was minimal in that it defined an open mall and open mall building and provided some specificity about the openness of the mall from the ground to the sky, but it did not address how each of the requirements within Section 402 would be applied to an open mall situation. For example, measuring the travel distance from a tenant space within a mall to an exit is unclear when the whole mall is 'exterior' to the buildings. This proposal goes through each section and revises each to clarify application to open malls. In general this required adding 'and open mall' or 'and open mall building' in various locations. Other locations the existing text stating application to a 'mall' was sufficient to allow application to both covered and open mall situations. Without providing revisions of this sort, the application of Section 402 will result in inconsistent interpretation from designer to designer and from jurisdiction to jurisdiction.

The intent of the 2009 change was to allow an open mall building to enjoy all of the benefits of being considered one unlimited area building with various tenants and occupancies. The key difference is that instead of the mall being covered, it is open to the sky. One then can begin wondering if the mall is 'exterior' to the building and therefore needs to be treated as exit discharge and the walls of the tenant spaces as exterior walls facing an assumed property line, or is it simply a covered mall building without a roof. The balance of this proposal takes the latter position, that the open mall building is simply a covered mall building without a roof.

Sec. 402.2.1. Only one new concept is established by the proposal – 'open mall building perimiter line'. The premise is that the designer establishes a boundary between what is considered to be part of the open mall building and what is outside of the building. This allows determination of the equivalent of exit travel distance for an exterior mall similar to a covered mall without there being a physical separation between the 'mall' and what is outside of the mall.

Sec. 402.3. Editorially revised to address owners of both types of malls and the required lease plan.

Sec. 402.4. Editorially revised to make it clear the egress provisions apply to covered and open malls. "This section' is replaced in two places with the specific section numbers for clarity of reference.

Sec. 402.4.1. Editorially revised in 3 subsections to clarify application of occupant load determinations.

Sec. 402.4.3. This is substantive change for open malls compared to covered mall buildings. Currently assembly occupancies with an occupant load over 500 needs to be located so that the entrance to the occupancy is adjacent to the mall entrance and 50% of the egress capacity goes directly outdoors. This proposal limits the application of this existing section to covered mall buildings. It then goes on to permit the open mall to be used as the discharge location for a main exit for assembly spaces over 300. There are many examples of this arrangement around the country including the theaters on the Citywalk open mall at Universal City in the Los Angeles area.

Sec.402.4.4 and 4.5. These sections use the open mall perimiter line as a substitute for the exterior wall of a covered mall to determine when means of egress transitions from 'within' the mall to 'outside' of the mall.

Sec. 402.5.1 The proposal makes section 402.5.1 generic for both types of malls. There is no intent to make a substantive change here.

Sec. 402.5.2. The existing code is currently in the wrong place –the requirement for 20 foot open is not related to egress but rather to the need for floor and roof assemblies in the mall portion of an open mall building to be open. There is no intent to make a substantive change here only to move to be a separate unique criteria.

Sec. 402.6. Since the concept of an open mall building is that there are many detached buildings, this provision of indicating the 60 foot open perimeter was around the attached buildings needed to be fixed to address that the anchor buildings next to an open mall building may not be physically attached.

Sec. 402.7.3. In an open mall building design, it is likely that the anchor buildings won't actually be attached. Therefore neither the fire wall nor fire barrier concept is appropriate. Therefore an exception is provided to treat such walls as exterior walls. But Section 402.7.3.1 will still apply and the openings in the wall need not be rated.

Sec. 402.8. This section currently requires wall and ceilings of the covered mall to meet specified flame spread of interior finishes. This applies to the mall itself. Tenant spaces need to comply with Chapter 8 independently. However, the walls of the open mall are not interior walls but actually exterior walls, which makes application of Chapter 8 inappropriate in most cases. The added language would still apply to any enclosed exits in an open mall building as well as the exits in a covered mall building.

Sec. 402.9. Since the open mall is open, without roof, there would be no requirement to provide sprinkler protection in the 'mall'. However, this proposal would still require sprinkler protection under exterior balconies which are providing circulation in the open mall. The concept here is there could be a multilevel open mall building with pedestrian walkways paralleling the front of the upper tenant spaces or bridges crossing the open mall. This would require sprinkler protection under such walkways.

Sec. 402.9.1 is changed to 402.10. This section refers to the standpipe requirements in Chapter 9. It is not a subset of sprinklers as is implied by the current numbering. This proposal moves it to its own equal section. Section 402 could use a reformatting of the sections similar to that provided to the 403 Highrise provisions in the 2009 code.

Sec. 402.11 Kiosks and 402.12 Children's play structures. This proposal treats those within the established perimiter line of an open mall building as if they were 'within' the mall.

Sec. 402.14 Standby power and 402.15 Emergency Communication. These would use the open mall building perimiter line to determine when the 50,000 square foot threshold was reached.

Sec. 402.16 Signs. The consistent approach of this proposal is to treat the 'open mall' as if it were interior facades along a mall which will have lots of occupants that are in restricted pathways until there get outside of the perimiter line. Therefore the limitation on signs should apply to those facing the open mall as well.

Sec. 905.3.3 and 905.4. These sections state the requirement for standpipes in a mall building and requires placement near the exits. As the open mall doesn't have 'exits' per se between the mall and the outside, the building perimiter line is used in lieu of the exits to specify the standpipe locations.

Other locations. The term 'covered mall building' is also used in the following sections of the IBC: 507.12, 709.1, 709.4, 716.5.4, Table 903.2.11.6, 907.2.7, 907.2.14, 2702.2.14, 2902.3.2, 2902.3.3 and 3412.6.19. In most of these locations the code should be editorially revised for consistency with this proposal. In most of these sections it will be sufficient to change 'covered mall building to 'covered and open mall buildings'.

Cost Impact: The code change proposal to the extent that it clarifies the application of the code in various situations may result in an increase the cost of construction where otherwise a designer or building official may have not thought that a provision of Section 402 applied.

Analysis: If this change is approved, staff can provide editorial revisions to the balance of the code and to the other I-Codes to be consistent with the intent of this proposal.

402.1, 402.6, 402.6.1, 402.6.2 (New), 402.6.3 (New), 402.6.4 (New)

Proponent: Sarah A. Rice, CBO, representing self

Revise text as follows:

402.1 Scope. The provisions of this section shall apply to buildings or structures defined herein as covered mall or open mall buildings ~~not exceeding three floor levels at any point nor more than three stories above grade plane~~. Except as specifically required by this section, covered mall buildings shall meet applicable provisions of this code.

Exceptions:

1. Foyers and lobbies of Groups B, R-1 and R-2 are not required to comply with this section.
2. Buildings need not comply with the provisions of this section when they totally comply with other applicable provisions of this code.

402.6 ~~Types of construction.~~ ~~The area of any covered mall building, including anchor buildings, of Type I, II, III and IV construction, shall not be limited provided the covered mall building and attached anchor buildings and parking garages are surrounded on all sides by a permanent open space of not less than 60 feet (18 288 mm) and the anchor buildings do not exceed three stories in height. The allowable height and area of anchor buildings greater than three stores in height shall comply with Section 503, as modified by Sections 504 and 506. The construction type of open parking garages and enclosed parking garages shall comply with Sections 406.3 and 406.4, respectively.~~ **Construction limitations**. Covered or open mall buildings, anchor buildings and parking garages shall comply with Sections 402.6.1 through 402.6.4, as applicable.

402.6.1 Height limits - covered or open mall buildings. Covered or open mall buildings shall not exceed three stories at any point, nor exceed three stories above grade plane.

402.6.2 Type of construction – covered or open mall buildings. Covered and open mall buildings shall be Type I, II, III or IV construction. The building height for a covered or open mall building shall be as specified in Table 503 as modified by Section 504. The building area shall be as specified in Table 503 as modified by Section 506.

Exception. The building area limits of Table 503 shall not apply to covered or open mall buildings when the following are met:

1. The permanent open space specified in Section 402.6.4 shall be provided around the covered or open mall building, all adjoining anchor buildings and parking garages.
2. Any adjoining anchor buildings shall not exceed three stories in height.

402.6.3 Type of construction – anchor buildings and parking garages. The construction type for anchor buildings and parking garages shall be in accordance with Section 503, as modified by Sections 504 and 506.

Exceptions.

1. The building area limits of Table 503 shall not apply to anchor buildings when the building is three stories or less above grade plane, and a permanent open space specified in Section 402.6.4 is provided around the anchor building, the adjoining covered or open mall building and all parking garages.
2. The building height and area limits of Table 503 shall not apply to open parking garages and enclosed parking garages when they comply with Sections 406.3 and 406.4, respectively, and are separated from the covered or open mall building in accordance with Section 402.7.1.

402.6.4 Permanent open space. Where required, covered mall building, and any adjoining anchor buildings and parking garages shall be surrounded on all sides by a permanent open space of not less than 60 feet (18 288 mm).

~~402.6.1 Reduced open space.~~ Exception: The permanent open space of 60 feet (18 288 mm) shall be permitted to be reduced to not less than 40 feet (12 192 mm), provided the following requirements are met:

1. The reduced open space shall not be allowed for more than 75 percent of the perimeter of the covered mall building and anchor buildings.

2. The exterior wall facing the reduced open space shall have a minimum fire-resistance rating of 3 hours.
3. Openings in the exterior wall facing the reduced open space shall have opening protectives with a minimum fire protection rating of 3 hours.
4. Group E, H, I, or R occupancies are not within the covered mall building or anchor stores.

Reason: This proposal is intended to add clarity to the size and type of construction provisions for covered mall buildings. It essentially does 3 things:

1) Takes a requirement out of the "scoping" section (402.1) and places into the body of the section in new Section 402.6.1. The language is also changed from "not exceeding three floor levels" to "not have more than three stories." This is done to address when there are mezzanines within a tenant space. The current language could be interpreted to say a small mezzanine within a tenant space is a "floor level" and thus count towards the overall height and configuration of the covered or open mall building.
2) Revises how the requirements in 402.6 are presented – NOT changing any of the requirements. The title of section is "Type of Construction" but the content as currently written is not really about type of construction but rather limits on size IF a specific type of construction is used. The proposed language seeks to make it clear what types of construction are allowed for covered and open malls, anchor buildings and parking garages.
3) Change to use the term "adjoin" vs "attach when talking about anchor buildings and garages, as in the case where there is an "open mall building" the anchor stores may not physically be "attached" to the other structures.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-G7a 402.1.doc

G33–09/10
402.2, 402.4.6

Proponent: Gene Boecker, Code Consultants, Inc.

1. Add new definition as follows:

402.2 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

REMOTE STORAGE ROOM. A storage room located in a mall building which is not part of, nor attached to, a specific tenant space.

2. Revise as follows:

402.4.6 Service areas fronting on exit passageways. Mechanical rooms, electrical rooms, building service areas, ~~and~~ service elevators, and remote storage rooms are permitted to open directly into exit passageways, provided the exit passageway is separated from such rooms with not less than 1-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. The minimum fire protection rating of openings in the fire barrier shall be 1 hour. A fire partition in accordance with Section 709 shall be provided between remote storage rooms, which are accessed from an exit passageway, and tenant spaces and other remote storage rooms.

Reason: Reason: In the development of a covered mall project, it is necessary to locate building service rooms in an area that is accessible at all times to mall personnel. The Code acknowledges this need and specifically allows these typically unoccupied areas to open onto exit passageways in covered malls. The list of "service areas" seems to indicate utility-type rooms and not "storage rooms".

Due to leasing arrangements, there may be instances where vacant leasable space is available at the rear of tenants, adjacent to exit passageways. These vacant spaces can be leased to tenants throughout the covered mall building that may be in need of additional storage space. These areas are also used by mall management for storage rooms of holiday decorations and other miscellaneous mall storage.

The current code text already establishes the fire rated construction associated with the exit passageway wall assemblies. The proposed last sentence will require a 1-hour fire partition between the storage room and adjacent tenant spaces.

This proposal is consistent with that required for building service rooms that open onto exit passageways.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

1. Revise as follows:

SECTION 402
COVERED MALL AND OPEN MALL BUILDINGS

402.6 Type of Construction. ~~The area of any covered mall building, including anchor buildings. of Types, I, II, III and IV construction shall not be limited provided the covered mall building and attached anchor buildings and parking garages are surrounded on all sides by a permanent open space of not less than 60 feet and the anchor buildings do not exceed three stories above grade plane~~. The allowable height ~~and area~~ of anchor buildings greater than three stories above grade plane shall comply with Section 503, as modified by Section~~s~~ 504 ~~and 506~~. The construction type of open parking garages and enclose parking garages shall comply with Sections 406.3 and 406.4, respectively

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

406.1.1 Classification. Buildings or parts of buildings classified as Group U occupancies because of the use or character of the occupancy shall not exceed ~~1,000 square feet (93 m2) in area or~~ one *story* in height ~~except as provided in Section 406.1.2~~. Any building or portion thereof that exceeds the limitations specified in this section shall be classified in the occupancy group other than Group U that it most nearly resembles.

~~**406.1.2 Area increase.** Group U occupancies used for the storage of private or pleasure-type motor vehicles where no repair work is completed or fuel is dispensed are permitted to be 3,000 square feet (279 m2) when the following provisions are met:~~

~~1. For a mixed occupancy building, the *exterior wall* and opening protection for the Group U portion of the building shall be as required for the major occupancy of the building. For such a mixed occupancy building, the allowable floor area of the building shall be as permitted for the major occupancy contained therein.~~
~~2. For a building containing only a Group U occupancy, the *exterior wall* shall not be required to have a *fire-resistance rating* and the area of openings shall not be limited when the *fire separation distance* is 5 feet (1524 mm) or more.~~

~~More than one 3,000-square-foot (279 m2) Group U occupancy shall be permitted to be in the same building, provided each 3,000-square-foot (279 m2) area is separated by *fire walls* complying with Section 706~~

406.3.5 ~~Area and height~~ Height. ~~Area and~~ ~~height~~ Height of open parking garages shall be limited as set forth in Chapter 5 for Group S-2 occupancies ~~and as further provided for in Section 508.1~~.

TABLE 406.3.5
OPEN PARKING GARAGES ~~AREA AND~~ HEIGHT

TYPE OF CONSTRUCTION	~~AREA PER TIER (square feet)~~	HEIGHT (in tiers)		
		Ramp access	Mechanical access	
			Automatic sprinkler system	
			No	Yes
IA	~~Unlimited~~	Unlimited	Unlimited	Unlimited
IB	~~Unlimited~~	12 tiers	12 tiers	18 tiers
IIA	~~50,000~~	10 tiers	10 tiers	15 tiers
IIB	~~50,000~~	8 tiers	8 tiers	12 tiers
IV	~~50,000~~	4 tiers	4 tiers	4 tiers

For SI: 1 square foot = 0.0929 m^2.

406.3.5.1 Single use. When the open parking garage is used exclusively for the parking or storage of private motor vehicles, with no other uses in the building, the ~~area and~~ height shall be permitted to comply with Table 406.3.5, along with increases allowed by Section 406.3.6.

~~**Exception:** The grade-level tier is permitted to contain an office, waiting and toilet rooms having a total combined area of not more than 1,000 square feet (93 m2). Such area need not be separated from the *open parking garage*.~~

~~In *open parking garages* having a spiral or sloping floor, the horizontal projection of the structure at any cross section shall not exceed the allowable area per parking tier.~~ In the case of an *open parking garage* having a continuous spiral floor, each 9 feet 6 inches (2896 mm) of height, or portion thereof, shall be considered a tier.

The clear height of a parking tier shall not be less than 7 feet (2134 mm), except that a lower clear height is permitted in mechanical-access *open parking garages* where *approved* by the *building official*.

406.3.6 ~~Area and height~~ Height increases. The allowable ~~area and~~ height of open parking garages shall be increased in accordance with the provisions of this section. Garages with sides open on three-fourths of the building's perimeter are permitted to be increased ~~by 25 percent in area and~~ one tier in height. Garages with sides open around the entire building's perimeter are permitted to be increased ~~by 50 percent in area and~~ one tier in height. For a side to be considered open under the above provisions, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier.

~~Allowable tier areas in Table 406.3.5 shall be increased for open parking garages constructed to heights less than the table maximum. The gross tier area of the garage shall not exceed that permitted for the higher structure. At least three sides of each such larger tier shall have continuous horizontal openings not less than 30 inches (762 mm) in clear height extending for at least 80 percent of the length of the sides and no part of such larger tier shall be more than 200 feet (60 960 mm) horizontally from such an opening. In addition, each such opening shall face a street or yard accessible to a street with a width of at least 30 feet (9144 mm) for the full length of the opening, and standpipes shall be provided in each such tier.~~

~~*Open parking garages* of Type II construction, with all sides open, shall be unlimited in allowable area where the *building height* does not exceed 75 feet (22 860 mm). For a side to be considered open, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. All portions of tiers shall be within 200 feet (60 960 mm) horizontally from such openings or other natural ventilation openings as defined in Section 406.3.3.1. These openings shall be permitted to be provided in *courts* with a minimum dimension of 20 feet (6096 mm) for the full width of the openings.~~

406.4.1 Heights and areas. Enclosed vehicle parking garages and portions thereof that do not meet the definition of open parking garages shall be limited to the allowable heights ~~and areas~~ specified in Table 503 as modified by Section~~s~~ 504, ~~506 and 507~~. Roof parking is permitted.

SECTION 503
GENERAL BUILDING HEIGHT ~~AND~~
~~AREA LIMITATIONS~~

503.1 General. The *building height* ~~*and area*~~ shall not exceed the limits specified in Table 503 based on the type of construction as determined by Section 602 and the occupancies as determined by Section 302 except as modified hereafter. Each portion of a building separated by one or more *fire walls* complying with Section 706 shall be considered to be a separate building.

2. Delete entire Table 503 and substitute new Table as follows:

~~**TABLE 503**~~
~~**ALLOWABLE BUILDING HEIGHTS AND AREASa**~~

TABLE 503
ALLOWABLE BUILDING HEIGHTS
Building height limitations shown in feet above grade plane.

	TYPE OF CONSTRUCTION								
	Type I		Type II		Type III		Tye IV	Type V	
	A	B	A	B	A	B	HT	A	B
HEIGHT (feet)	UL	160	65	55	65	55	65	50	40

3. Delete Sections 506, 507 and 508 without substitution:

~~**SECTION 506**~~
~~**BUILDING AREA MODIFICATIONS**~~

~~**SECTION 507**~~
~~**UNLIMITED AREA BUILDINGS**~~

~~**SECTION 508**~~
~~**MIXED USE AND OCCUPANCY**~~

4. Revise as follows:

SECTION 509
SPECIAL PROVISIONS

509.1 General. The provisions in this section shall permit the use of special conditions that are exempt from, or modify, the specific requirements of this chapter regarding the allowable heights ~~and areas~~ of buildings based on the occupancy classification and type of construction, provided the special condition complies with the provisions specified in this section for such condition and other applicable requirements of this code. The provisions of Sections 509.2 through 509.8 are to be considered independent and separate from each other.

~~**509.2 Horizontal building separation allowance.** A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of fire walls, limitation of number of stories and type of construction where all of the following conditions are met:~~

~~1. The buildings are separated with a *horizontal assembly* having a minimum 3-hour *fire-resistance rating*.~~
~~2. The building below the *horizontal assembly* is no more than one *story above grade plane*.~~
~~3. The building below the *horizontal assembly* is of Type IA construction.~~
~~4. Shaft, *stairway*, ramp and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 715.4.~~

~~**Exception:** Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire resistance rating* with opening protectives in accordance with Section 715.4, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:~~

~~1. The building above the *horizontal assembly* is not required to be of Type I construction;~~
~~2. The enclosure connects less than four *stories*; and~~
~~3. The enclosure opening protectives above the *horizontal assembly* have a minimum 1-hour *fire protection rating*.~~

~~5. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less than 300, or Group B, M, R or S occupancies.~~
~~6. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any of the following occupancies:~~
~~6.1. Group S-2 parking garage used for the parking and storage of private motor vehicles;~~
~~6.2. Multiple Group A, each with an *occupant load* of less than 300;~~

~~6.3. Group B;~~
~~6.4. Group M;~~
~~6.5. Group R; and~~
~~6.6. Uses incidental to the operation of the building (including entry lobbies, mechanical rooms, storage areas and similar uses).~~

~~7. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the *grade plane*.~~

509.3 Group S-2 enclosed parking garage with Group S-2 open parking garage above. A Group S-2 enclosed parking garage with no more than one story above grade plane and located below a Group S-2 open parking garage shall be classified as a separate and distinct building for the purpose of determining the type of construction where all of the following conditions are met:

~~1. The allowable area of the building shall be such that the sum of the ratios of the actual area divided by the allowable area for each separate occupancy shall not exceed 1.~~

~~2.~~ 1. The Group S-2 enclosed parking garage is of Type I or II construction and is at least equal to the fire-resistance requirements of the Group S-2 open parking garage.

~~3~~ 2. The height and the number of tiers of the Group S-2 open parking garage shall be limited as specified in Table 406.3.5.

~~4~~ 3. The floor assembly separating the Group S-2 enclosed parking garage and Group S-2 open parking garage shall be protected as required for the floor assembly of the Group S-2 enclosed parking garage. Openings between the Group S-2 enclosed parking garage and Group S-2open parking garage, except exit openings, shall not be required to be protected.

~~5~~ 4. The Group S-2 enclosed parking garage is used exclusively for the parking or storage of private motor vehicles, but shall be permitted to contain an office, waiting room and toilet room having a total area of not more than 1,000 square feet (93 m2), and mechanical equipment rooms incidental to the operation of the building.

509.7 Open parking garage beneath Groups A, I, B,M and R. Open parking garages constructed under Groups A, I, B, M and R shall not exceed the height ~~and area~~ limitations permitted under Section 406.3. The height ~~and area~~ of the portion of the building above the open parking garage shall not exceed the limitations in Section 503 for the upper occupancy. The height, in both feet and stories, of the portion of the building above the open parking garage shall be measured from grade plane and shall include both the open parking garage and the portion of the building above the parking garage.

Revise as follows: A study group of the ICC's Codes Technology Committee worked for almost four years to examine the rationale and background for the criteria within Table 503 and to determine what needed to be corrected. The study group examined the origins of the table and the procedure used to develop it. No rational basis was identified or established for any of the values within the table. Nothing exists that correlates the performance of a building by construction type and occupancy to fire performance, life safety or property damage. NFPA's latest analysis of the available data indicates that social conditions are far more predictable of likely loss.

Codes limit the arrangement of building areas by several limitations. Means of egress travel distance limits the exposure of the building occupants, the requirements of stairs to discharge to the outside, distance of standpipes and even Appendix B in the IFC, all limit the configuration of a building. Area limits in Table 503 affect little except to provide market share for materials interests.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-G1-402.6.doc

G35–09/10
402.7.1

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

402.7.1 Attached garage. An attached garage for the storage of passenger vehicles having a capacity of not more than nine persons and open parking garages shall be considered as separate buildings where it is separated from the covered mall building or anchor building by not less than 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

Exceptions:

1. Where an open parking garage or enclosed parking garage is separated from the covered mall building or anchor building ~~a distance greater than 10 feet (3048 mm)~~, the provisions of Table 602 shall apply.
2. Pedestrian walkways and tunnels, which attach the open parking garage or enclosed parking garage to the covered mall building or anchor building, shall be constructed in accordance with Section 3104.

Reason: The proposal does two things – it divides the existing large exception into separate exceptions for clarity and it deletes the reference to the 10 ft distance threshold for application of Table 602.

The section initially addresses a separation to the garage based on the assumption that it is immediately next to the covered mall building. The first exception addresses the condition where there may be a physical separation. However, the application of Table 602 should not be applicable only at a certain distance. If the physical separation is provided, then it must be addressed accordingly.

Section 3104 already addresses the construction of exterior walls (including opening protection) of buildings connected by a pedestrian walkway. The exception continues to include code language acknowledging that pedestrian walkways should comply with Section 3104. However, by combining the two sentences in one exception leads a person to think that both Table 602 and Section 3104 should apply to a pedestrian walkway connecting two buildings. This yields confusion if trying to apply the Exception to Section 3104.5.

The added word in the main body of the text is only correcting a typographical error. The separation applies to the entire covered mall building – not just the portion where the pedestrian mall is located. As written, it could be interpreted that there is no separation between the garage and a tenant space.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOECKER-G3-402.7.1.doc

G36–09/10
402.7.2.1 (New)

Proponent: John England, MCO, England Enterprises Inc., representing the Cities of Beaufort and Hardeeville

Add new text as follows:

402.7.2.1 Tenant spaces in open malls: Each tenant space in an un-sprinkled open mall shall be separated from other tenant spaces by a fire barrier complying with Section 707.

Reason: Sections 402.7.2 assumes the building is a closed mall and is sprinkled. It does not give guidance for open malls that are sprinklered or unsprinklered. This addition to the code would accomplish this and make it compliant with Section 707.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-G2-402.7.2.1.doc

G37–09/10
402.10

Proponent: Michael Perrino, Code Consultants, Inc.

Revise as follows:

402.10 Smoke control. Where a covered mall building contains an atrium, the portion of the covered mall building that constitutes an atrium shall be provided with a smoke control system ~~shall be provided~~ in accordance with Section 404.5.

Exception: A smoke control system in not required in covered mall buildings when the portion of the covered mall building that constitutes an atrium connects only two stories.

Reason: Current language can be interpreted to require smoke control throughout a covered mall building, even if an atrium is located in only a portion of the building. This was clearly not the intent of the code change that brought this language into the code. This language clarifies that only the portion of the building that constitutes and atrium must be provided with smoke control.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal will decrease the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G39–09/10
403.2.1 (New)

Proponent: Gary Lewis, Chair, ICC Ad Hoc Committee on Terrorism-Resistant Buildings

Add new text as follows:

403.2.1 Compartmentation. Buildings more than 420 feet (128 m) in building height containing Group B, E, I or M occupancies shall be separated into compartments not exceeding 10,000 square feet (930 m^2). Compartments shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both, having a fire-resistance rating of not less than 1 hour.

(Renumber subsequent sections)

Reason: This code change proposal would add new requirements to the IBC for super high-rise structures only. The National Institute of Standards and Technology (NIST) Final Report on the Collapse of World Trade Center (WTC) Building 7 recommendations for high rise buildings provides justification for this proposal. A key observation from that report that "*buildings should not collapse in infrequent fires that may occur when active fire protection systems are rendered ineffective, e.g., when sprinklers do not exist, are not functional, or are overwhelmed by the fire*",[1] is a message that quantifiable compartmentation is needed in this building type for several reasons.

Recommendation #4 from the original NIST WTC Report[2] reads as follows:
NIST recommends evaluating, and where needed improving, the technical basis for determining appropriate construction classification and fire rating requirements (especially for tall buildings) --- and making related code changes now as much as possible --- by explicitly considering factors including:[23]

- timely access by emergency responders and full evacuation of occupants, or the time required for burnout without partial collapse;
- the extent to which redundancy in active fire protection (sprinkler and standpipe, fire alar, and smoke management) systems should be credited for occupant life safety;
- the need for redundancy in fire protection systems that are critical to structural integrity;
- the ability of the structure and local floor systems to withstand a maximum credible fire scenario without collapse, recognizing that sprinklers could be compromised, not operational, or non-existent;
- compartmentation requirements (e.g. 12,000 $ft^{2\,(27)}$) to protect the structure, including fire rated doors and automatic enclosures, and limiting air supply (e.g. thermally resistant window assemblies) to retard fire spread in buildings with large, open floor plans; (emphasis added)
- the effect of spaces containing unusually large fuel concentrations for the expected occupancy of the building; and
- the extent to which fire control systems, including suppression by automatic or manual means, should be credited as part of the prevention of fire spread.

NIST added a new recommendation for WTC 7's Final Report, over and above those already mentioned in the NIST WTC 1 Reports covering Towers I and II. In NIST NCSTAR 1A, WTC 7 investigation, 5.2.2, Group 2, Recommendation B (NEW):

NIST recommends that buildings be explicitly evaluated to ensure adequate performance of the structural system under maximum credible (infrequent) design fires with any active fire protection system rendered ineffective. Of particular concern are the effects of thermal expansion in buildings with one or more of the following features:

- Long span floor systems which experience thermal expansion and sagging effects;
- connection designs (especially shear connections) that cannot accommodate thermal effects;
- floor framing that induces asymmetric thermally induced (i.e. net lateral) forces on girders;
- shear studs that could fail due to differential thermal expansion in composite floor systems; and
- lack of shear studs on girders. Careful consideration should also be given to the possibility of other design features that may adversely affect the performance of the structural system under fire conditions.[3]

The TRB Committee and others have attempted in prior cycles to deal with this phenomenon by proposing requirements that a more global view of thermal performance of a building frame be considered during the design. That approach included full-floor contents burnout analysis, worst credible fire design and other methodologies that the membership has not yet found acceptable…..but the issue remains unregulated.

For structural purposes, smaller compartments means less rapid fire spread and smaller fuel loads, slowing heat exposure to large lineal footages of beams and columns, and most importantly, the connections. Less heat in smaller areas means less likelihood of warping several structural members simultaneously, meaning less likelihood of collapse due to the conditions stated by NIST in the WTC 7 report, NEW Recommendation B.

Additionally, in Recommendation C, (NIST NCSTAR 1A, Recommendation C (also in NIST WTC report for towers I & II, recommendation 4, bullet 3, & footnote 5), NIST recommends….'the need for redundancy in fire protection systems that are critical to life structural integrity; (passive fire protection system, (including SFRM, compartmentation and firestopping) and the active sprinkler system each provide redundancy for maintaining structural integrity in a building fire, should one of the systems fail to perform it's intended function.' Bullet 5 then adds, "the ability of the structure and local floor systems to withstand a maximum credible fire scenario, without collapse, recognizing that sprinklers could be compromised, not operational, or non existent.".

Although NIST promotes 'redundancy' as a way to improve building safety and structural integrity, we recognize that compartment sizes limited by a 10000 SF fire area can play a large role in fuel load, which in turn reduces possibility of structural collapse, while providing horizontal evacuation for firefighter and occupant staging when egress systems are compromised due to power outage, sabotage or high levels of use.

The 10,000 SF fire area in the proposal stems from the NIST report recommendation, which while it specifically states, 12,000 SF, by footnote 27 clarifies that the value could also be a smaller limit, which represents a reasonable area for active firefighting operations. It is not much less than the fire area used elsewhere in the code when assuming no sprinkler protection in buildings. The area is also associated with the size able to be fought effectively suppressed by firefighters, according to NIST.

In NIST's WTC 7 Report, Chapter 4, 4.6, 'Factors that could have mitigated structural collapse' – "improved compartmentation in tenant areas to limit the spread of fires'[2], was cited as a way to limit the spread of fires, and the impending warpage, connection failures, that may result. There are additional ways to limit the spread of fires in buildings as well.

We believe the code change proposal using fire barriers limiting fire area to 10000 SF adds safety and structural integrity to buildings through compartmentation that meets the intent of NIST's recommendations in the FINAL Report on the Collapse of World Trade Center Building 7.

ICCFILENAME: LEWIS-G1-403.2.doc

G40–09/10
403.2.3.5 (New)

Proponent: Gary Lewis, Chair, ICC Ad Hoc Committee on Terrorism-Resistant Buildings

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

403.2.3 Structural integrity of exit stairway and elevator hoistway enclosures. For all high-rise buildings of occupancy category III or IV buildings in accordance with Section 1604.5, and for all buildings that are more than 420 feet (128 m) in building height, exit enclosures and elevator hoistway enclosures shall comply with Sections 403.2.3.1 through ~~403.2.3.4~~ 403.2.3.5.

403.2.3.1 Wall assembly. The wall assemblies making up the exit enclosures and elevator hoistway enclosures shall meet or exceed Soft Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.

403.2.3.2 Wall assembly materials. The face of the wall assemblies making up the exit enclosures and elevator hoistway enclosures that are not exposed to the interior of the exit enclosure or elevator hoistway enclosure shall be constructed in accordance with one of the following methods:

1. The wall assembly shall incorporate not less than two layers of impact-resistant construction board each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.
2. The wall assembly shall incorporate not less than one layer of impact-resistant construction material each that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.
3. The wall assembly shall incorporate multiple layers of any material, tested in tandem, that meet or exceed Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.

403.2.3.3 Concrete and masonry walls. Concrete or masonry walls shall be deemed to satisfy the requirements of Sections 403.2.3.1 and 403.2.3.2.

403.2.3.4 Other wall assemblies. Any other wall assembly that provides impact resistance equivalent to that required by Sections 403.2.3.1 and 4.3.2.3.2 for Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M shall be permitted.

403.2.3.5 Blast resistance. The wall assemblies of stairway and hoistway enclosures, from the top of each floor to the underside of the floor or roof above and connections to supporting members, shall be capable of resisting a factored load using strength design, expressed as a uniform pressure, of not less than 2 psi (13.8 kPa) applied perpendicularly to the exterior of the enclosure. This load need not be assumed to act concurrently with the loads specified in Chapter 16 and shall be assumed to apply to one floor at a time.

Reason: The purpose of this change is to establish a standard for the structural robustness of exit stairway and elevator shaft enclosures. It implements Recommendation 18 of the National Institute of Standards and Technology (NIST) report on the World Trade Center (WTC) tragedy.

The Code has traditionally looked upon a stair enclosure as a place of relative safety. There are any number of carefully crafted code provisions designed to ensure that goal, but they are based upon only one hazard – fire. The enclosures of these stairways are made fire resistive through the traditional rating and listing system, but the Code does not establish a criterion for structural robustness. The proponents do not believe that the existing "hose stream" test addresses this issue. The hose stream does not and cannot represent the real world impact of blast loads that a stair shaft might encounter. Neither does the ongoing industry work designed to develop an impact resistance test standard. That work relates to durability rather than safety. The proponents believe that a structural standard is needed.

The stairway enclosures of the WTC were destroyed by an aircraft impact. Far lesser events, such as a gas explosion or a vehicle impact (on lower floors) can destroy a stairway enclosure, especially when one considers that the Code contains no structural criteria at all. The 2 psi load requirement is consistent with the overpressure associated with a gas explosion. NIST has performed an analysis to verify this statement. Any structural robustness that existing stairway enclosures have is a by-product of the fire rating process; a process that was never intended to provide structural integrity.

A new criterion is needed for exit stair enclosures – a structural one.

The NIST WTC Report suggests a standard based upon resistance to over-pressure. This approach has two real advantages. It reflects one possible damage scenario and can represent others as well. Secondly, it is a performance standard. All materials can be analyzed and engineered to comply.

Compliance with this standard is determined by engineering analysis, not a test. This is a simple and direct approach that can be implemented immediately.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE.

Delete without substitution as follows:

~~**403.2.4 Sprayed fire-resistive materials (SFRM).** The bond strength of the SFRM installed throughout the building shall be in accordance with Table 403.2.4.~~

~~**TABLE 403.2.4**~~
~~**MINIMUM BOND STRENGTH**~~

~~**HEIGHT OF BUILDING**~~ [a]	~~**SFRM MINIMUM BOND STRENGTH**~~
~~Up to 420 feet~~	~~430 psf~~
~~Greater than 420 feet~~	~~1,000 psf~~

~~For SI: 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kW/m^2~~
~~a. Above the lowest level of fire department vehicle access~~

Reason: Heilstedt - The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public

This proposed change is a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:

> Review the recommendations issued by NIST in its report entitled "Final Report on the Collapse of the World Trade Center Towers", issued September 2005, for applicability to the building environment as regulated by the I-Codes. To evaluate the necessity of developing code changes in response to the NIST report.

The current provisions for minimum bond strength were added to the code via G68-06/97. The following is the committees reason for inclusion:

Committee Reason: Although the data which provides technical support was not provided within the proposal, this does go along with the NIST recommendations and should provide better safety in high-rise buildings. Using the greater bond strengths will increase the probability that the protection will stay in place and will reduce the likelihood of being dislodged. These factors should provide for a longer time of safety. Placing the requirements in the high-rise provisions of Chapter 4 instead of within Chapter 7 makes sense because they are only applicable to high-rises and will be more likely to be found within that section. The committee did agree with the different bond strength requirements based upon the thought the taller buildings are at a higher risk and that items such as the vibration of tall buildings will affect the long term performance. Based on testimony which was provided, the cost impact of this requirement was considered as being relatively small. The higher density products which are currently available will generally meet these requirements. The modifications included a revision of the terminology Aspray applied@ to Asprayed@ to be consistent with the action of FS156-06/07 and to create a more global point of reference for building height by moving footnote a to the main title of the first column.

In submitting a public comment to G69-07/08 last cycle to remove the minimimum and retain the 150 psf in Chapter 17, CTC noted that the current provisions for minimum bond strength were the results of G68-06/07 last cycle. As noted in the reason statement for the code change, it

notes “The purpose of this proposal is to increase the required adhesions of Spray Applied Fire Resistant Materials (SFRM).” The proposal further sites Recommendation 6 of the NIST WTC report which calls for improvement of the in-place performance of SFRM. NIST Recommendation 6 reads as follows:

NIST recommends the development of criteria, test methods, and standards: (1) for the in-service performance of sprayed fire-resistive materials (SFRM, also commonly referred to as fireproofing or insulation) used to protect structural components; and (2) to ensure that these materials, as-installed, conform to conditions in tests used to establish the fire resistance rating of components, assemblies, and systems.

The CTC notes that the prior to the approval of the increased bond strength in Table 403.15 that the code mandated cohesive/adhesive bond strength, regardless of height, was 150 psf in Section 1704.10.5. In fact, this section has remained unchanged and was not coordinated with the new provisions in Table 403.15.

Based on input received by the CTC, the CTC position remains that the bond strength should not be increased as a function of height. As noted in the NIST recommendation, the concern is one of in-service performance of the SFRM which means the material must remain in place to perform its intended function, regardless of height. This is an inspection related issue, one for which the CTC submitted code change S39-06/07 to improve the inspection provisions, including:

- Increased number of sampling locations
- Specific sampling for columns, beams, joists and trusses
- Physical and visual tests for: substrates; thickness; density, bond strength

S39-06/07 was approved and the provisions will be incorporated in the 2009 edition of the IBC.

There is no credible technical evidence or documented experience to indicate that the increased minimum bond strength requirements specified in the subject text and Table improve the long term durability of sprayed fire –resistive materials (SFRM) in high-rise buildings or improve the chances of SFRM to be in place when it is needed (in the event of a fire). The single proven effect of these increased bond provisions is to dramatically increase the SFRM installed cost by up to 250%. SFRM minimum bond strength of 150 psf (Section 1704.12.6), in conjunction with inspections and field tests, specified in Section 1704.12, are adequate to ensure SFRM is in place after completion of the construction phase. Regular inspections and timely repairs are needed to ensure SFRM in-place condition over the life of the building, regardless of the bond strength of SFRM.

A survey of the commercially available SFRM products in terms of their bond strength and density, conducted by the American Iron and Steel Institute (AISI) in 2007 clearly indicates that the provisions in Section 403.2.4 and Table 403.2.4 are specifically calibrated and targeted to ban standard-density SFRM products from the high-rise market – i.e., these provisions create an artificial commercial barrier, but do not address any measurable risks or safety concerns tied to any meaningful bond strength values (in terms of SFRM in-place durability).

The current provisions in Section 403.2.4and Table 403.2.4 resulted from proposal G68-06/07 (and further slightly modified by proposal G68-07/08), based on misleading technical information and flawed cost impact analysis provided in the proposal and relevant testimonies during the public hearings:

- G68-06/07 reason statement suggested “building sway” as a “known” “initiating event” for SFRM dislodgement. Testimony during the public hearings also suggested building vibration as a possible cause for SFRM dislodgement. To date, no evidence has been found to document either of these claims.
- G68-06/07 reason statement noted that “The purpose of this proposal is to increase the required adhesions of Spray Applied Fire Resistant Materials (SFRM)”, seeking to achieve the improvements called for in Recommendation 6 of NIST WTC Report. Testimonies during the hearings further suggested that proposal G68-06/07 is somehow based on NIST WTC Investigation and its recommendations. In fact, NIST Recommendation 6 reads as follows:

  “NIST recommends the development of criteria, test methods, and standards: (1) for the in-service performance of sprayed fire-resistive materials (SFRM, also commonly referred to as fireproofing insulation) used to protect structural components; and (2) to ensure that these materials, as-installed, conform to conditions in tests used to establish the fire resistance rating of components, assemblies, and systems.”

  There is nothing in Recommendation 6, or in any other part of the NIST WTC Investigation Report, to justify the immediate need to arbitrarily increase the SFRM bond strength. Nothing in the published NIST report suggested that the SFRM bond strength was inadequate for any of the intended purposes. The compiled records actually indicated that WTC towers endured numerous fires prior to 9/11 with minimal or no structural damage. Nothing in the NIST Report suggested that any existing SFRM product with higher bond strength and/or higher density would have performed better, or would have changed the sequence or the outcome of events.
- G68-06/07 proposal noted that “Many tall buildings already utilize these higher strength materials”. However, in 2006, there was only one high-rise building known to utilize medium-density SFRM throughout the building (the reconstructed WTC 7), and the owner did it for understandable reasons In fact, the absence of long-term nation-wide experience with the “throughout” application of medium-density and high-density SFRM in high-rise buildings should be a cause for concern – due to the lack of long term data to support their use.
- G68-06/07 offered flawed cost impact analysis stating that the associated cost increase will be only marginal. In fact, credible estimates for real projects indicated very significant cost increase for installed medium-density and high-density SFRM. Independent estimates by government agencies (reported in G69-07/08) indicated that minimum bond strength requirement of 430 psf increases the SFRM cost by over 50%, while the requirement of 1000 psf increases SFRM cost by about 170%. Other independent estimates in the 2007 AISI report show similar cost increases: by over 50% for medium-density SFRM, and by over 230% for high-density SFRM. These increases cannot be characterized as “marginal” or “relatively small”. The cost impact of Table 403..2.4 provisions needs to be fully considered, and society’s fire protection resources need to be effectively allocated in a meaningful way.
- Several testimonies during the public hearing exploited the notion of standard-density SFRM dislodgement under its own weight for no apparent reason or due to the lack of bond strength. In fact, SFRM dislodgement are almost always linked to very specific reasons that are irrelevant to bond strength – over the building lifetime, the overwhelming majority of documented dislodgement cases are caused by direct contact/impact removals of SFRM associated with human activities such as construction, demolition, remodeling, testing, structural inspections, maintenance operations, electrical/mechanical installations, and also, associated with equipment failures, such as water leaks, improper elevator operations, and similar reasons. The information compiled in WTC Investigation Report NCSTAR 1-6A clearly illustrates typical cases, e.g.:

  “Section 3.7 with photographs in Figures 3-5 through 3-10 states that, “There were many instances where SFRM had obviously been dislodged in the process of installing utilities. In some cases hardware was attached directly to the lower chords and SFRM was dislodged. These damaged areas should have been repaired when the various trades had completed their work”. Section 3.7 also states that “the overall views of the trusses showed that regions of missing insulation were minor in extent when compared with the total area of applied SFRM”.

  Figure A-36 points to SFRM damage on trusses due to “tenant construction work” or “works over the years in the ceiling” by the Port Authority.

  Figure A-37 points to SFRM damage on trusses "during demolition after tenants move out" as "ductwork, partitions, hangers, etc. are removed".

  Figure A-38 points to SFRM "damaged by installation of new construction".

  Figure A-39 points to SFRM "disturbed by remodeling operations"

Figure A-49 points to SFRM re-occurring "extensive damage" in the elevator shafts caused by "the slack condition in compensating cables, especially on shuttle cars, causing a chafing condition against finished spray-on fireproofing on structural steel within hoistways". Figure A-56 and A-57 (excerpts from LERA reports dated 1993 and 1995) point to SFRM damage in elevator shafts due to "rubbing of the hoist cable against the face of column", or "due to testing purposes". In one instance, the LERA reports also point to the installation of bracket as the cause for missing fireproofing.

The entire compilation of maintenance and inspections documents in the published reports of NIST WTC Investigation does not contain a single case of SFRM dislodgement linked to the lack of SFRM bond strength, despite the fact that all structural steel and steel joists in WTC towers was primed (SFRM application over primed and/or painted steel is known to reduce bond strength).

Similar causes of SFRM dislodgement, irrelevant to bond strength, were reported in the 2007 AISI report of building architects and construction contractors to evaluate their use of SFRM and their experiences with it. This survey is more relevant to the initial construction and/or major renovation phases in buildings' lifetime, and identifies intentional removal of SFRM by construction trades as the primary cause of SFRM dislodgement.

In summary, the two leading causes of SFRM dislodgement during construction and maintenance of buildings are:

- Primary cause - intentional removal of SFRM associated with human activities, such as construction, renovation, electrical/mechanical installations, testing, inspections, maintenance operations, etc. This type of SFRM dislodgement is completely irrelevant to SFRM bond strength. Only inspections and timely repairs could address intentional removal of SFRM.
- Secondary cause - unintentional/accidental removal of SFRM associated with human activities and equipment failures. While the use of higher-density SFRM products could slightly reduce dislodgements associated with some accidental abuses, such as light abrasive actions and light impacts, existing medium-density and high-density SFRM products are still by far incapable to substantially reduce dislodgements or address all common causes of accidental removals (e.g. water leaks, repeated and stronger abrasive actions and impacts, etc). Concealment of SFRM-protected steel elements in protective envelopes (e.g. gypsum board) or behind suspended ceilings is the most effective way in avoiding accidental dislodgement due to most accidental impacts and abrasions. Again, only inspections and timely repairs could adequately address unintentional/accidental removal of SFRM.

Analysis of Proposed Change G68-06/07 to the 2006 Edition of IBC", by Farid Alfawakhiri, Ph.D., American Iron and Steel Institute, January 2007.

Bibliography: NIST NCSTAR 1, "Federal Building and Fire Safety Investigation of the World Trade Center Disaster: Final Report on the Collapse of the World Trade Center Towers", National Institute of Standards and Technology, September 2005 (available at http://wtc.nist.gov/).

Carino et al, NIST NCSTAR 1- 6A, "Federal Building and Fire Safety Investigation of the World Trade Center Disaster: Passive Fire Protection", National Institute of Standards and Technology, September 2005 (available at http://wtc.nist.gov/).

Perry - In their approval of the new SFRM requirements during the 2006/2007 cycle, the Fire Safety Committee specifically noted that neither technical substantiation nor cost data had been provided to the committee. Last cycle (2007/2008), cost information was provided to the committee, clearly indicating that costs are far beyond the moderate 'incremental' increases alluded to by proponents last cycle. The Fire Safety Committee voted to maintain the increased SFRM bond strength provisions, "based on a lack of technical substantiation to take them out".

This committee is on record that they had no technical substantiation when they added this requirement to the code, yet they now will not remove the provisions unless they receive technical substantiation?

There is no evidence that arbitrarily tripling (from 150 psf to 430 psf) the bond strength of SFRM will provide any additional degree of safety in 75' tall buildings, and no evidence that increasing the bond strength by a factor of 7 (from 150 psf to 1000 psf) will provide any additional degree of safety in buildings >420' in height.

The extent of the cost impacts calculated by both GSA and the steel industry make it clear that the first response to this provision, if it remains, will be to look for alternatives. There has been no explanation from those touting the need for increasing SFRM bond strength for how a gypsum-board encased column (which can achieve the required hourly ratings) would compare to columns with any of the various types of SFRM.

Cost Impact: Heilstedt - The code change proposal will not increase the cost of construction.
Perry - The code change proposal will not increase the cost of construction. This change will decrease the cost of construction.

Public Hearing:

ICCFILENAME: HEILSTEDT-G6-403.2.4.doc

G42–09/10
403.2.4

Proponent: Farid Alfawakhiri, American Iron and Steel Institute (AISI)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE.

Revise as follows:

403.2.4 Sprayed fire-resistant materials (SFRM). The bond strength of the SFRM installed throughout the building shall be in accordance with Table 403.2.4.

TABLE 403.2.4
MINIMUM BOND STRENGTH

HEIGHT OF BUILDING [a]	SFRM MINIMUM BOND STRENGTH
Up to 420 feet	~~430~~ 250 psf
Greater than 420 feet	1,000 psf

For SI: 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kW/m^2.

a. Above the lowest level of fire department vehicle access.

Reason: This proposal attempts to balance reasonable economic considerations with safety concerns (whether substantiated or not) in buildings 75 ft to 420 ft in height. The proposed SFRM minimum bond strength of 250 psf is economically feasible, because it can be achieved with the majority of standard-density SFRM products and attention to application technology practices. The proposed 250 psf bond strength is significantly higher that the 150 psf SFRM minimum bond strength (Section 1704.12.6) required in low and mid-rise buildings.

The current requirement of SFRM minimum bond strength of 430 psf in Table 403.2.4 is not tied to any measurable risks or meaningful performance/durability criteria, i.e. there is no evidence that this increased bond strength requirement reduces SFRM dislodgement or improves the chances of SFRM to remain in place. However, the 430 psf bond strength requirement effectively bans standard-density SFRM products from the high-rise market and dramatically increases the SFRM installed cost by over 50%.

Buildings 75 ft to 420 ft (roughly 6 to 35 stories) in height are very common in urban areas, and they do not pose very high evacuation risks or very high loss risks, associated with "super-high-rises". The broad and lengthy experience with these buildings has not resulted in any documented cases of structural fire damage (let alone structural failure due to fire) linked to poor SFRM bond strength. Therefore, the unsubstantiated and expensive requirement of 430 psf SFRM bond strength can hardly be justified.

The current provisions in Section 403.2.4and Table 403.2.4 are the result of code change proposal G68-06/07, based on misleading technical information and flawed cost impact analysis, stating that the associated cost increase will be only marginal. However, credible estimates for real projects indicated very significant cost increases associated with the substitution of standard-density SFRM by medium-density SFRM. Independent estimates by government agencies (reported in G69-07/08) indicated that minimum bond strength requirement of 430 psf increases the SFRM installed cost by over 50%. Other independent estimates commissioned by the American Iron and Steel Institute (AISI) show similar cost increases. The details of these estimates are provided in the substantiation report referenced below. These increases cannot be characterized as "marginal".

AISI supports cost effective code changes that will improve the real world performance of SFRM. We share the desire to take action that would adequately respond to the events of September 11 and address credible safety concerns. Unfortunately, we believe that the current provisions of 403.2.4 achieve marginal (if any) risk reduction and they have economic implications that are not cost effective. We urge the membership to support this proposed revision.

Substantiation: "Analysis of Proposed Change G68-06/07 to the 2006 Edition of IBC", by Farid Alfawakhiri, Ph.D., American Iron and Steel Institute, January 2007 (available at http://www.iccsafe.org/cs/cc/ctc/WTC/resource/AISI_Analysis_of_Bond_Strength.pdf).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ALFAWAKHIRI-G1-TABLE 403.2.4

G43–09/10
403.3.3 (New), Table 508.2.5

Proponent: Wayne R. Jewell, CBO, City of Southfield, representing self

1. Add new text as follows:

403.3.3 Fire pump room. Fire pumps shall be located in rooms protected in accordance with Section 913.2.1.

2. Revise table as follows:

TABLE 508.2.5
INCIDENTAL ACCOSSORY OCCUPANCIES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic fire-extinguishing system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic fire-extinguishing system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen cut-off rooms, not classified as Group H	1-hour in Group B, F, M, S and U occupancies. 2-hour in Group A, E, I and R occupancies.
Incinerator rooms	2 hours and automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic fire-extinguishing system
Laboratories and vocational shops, not classified as Group H, located in Group E or I-2 occupancies	1 hour or provide automatic fire-extinguishing system
Laundry rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system
Group I-3 cells equipped with padded surfaces	1 hour
Group I-2 waste and linen collection rooms	1 hour
Waste and linen collection rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system
Stationary storage battery systems having a liquid electrolyte capacity of more than 50 gallons or a lithium-ion capacity of 1,000 pound used for facility standby power, emergency power or uninterrupted power supplies	1-hour in Group B, F, M, S and U occupancies. 2-hour in Group A, E, I and R occupancies
~~Rooms containing fire pumps in nonhigh-rise buildings~~	~~2 hours; or 1 hour and provide automatic sprinkler system throughout the building~~
~~Rooms containing fire pumps in high-rise buildings~~	~~2 hours~~

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L.

Reason: Adding Section 403.3.3 provides a proper link to the protection requirements found in Section 913.2.1 added during the last cycle for a fire pump room in a high-rise building. Revising Table 508.2.5 in striking the two lines removes the confusion that could occur since all options under Section 508 are not required to use the provisions of the table, yet fire pumps can occur in the multiple types of buildings permitted under Section 508 and these protection provisions are required under all instances.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

G44–09/10
403.4.5, 403.4.8.1, 708.14.1, Chapter 35; IFC 508.1.5 (IBC [F] 911.1.5)

Proponent: Gary Lewis, Chair, ICC Ad Hoc Committee on Terrorism-Resistant Buildings

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

1. Add new text as follows:

403.4.5 Video surveillance system. A video surveillance system installed in accordance with NFPA 731, shall be installed in each elevator lobby provided in accordance with Section 708.14.1 and at every fifth floor of each required stairway and connected to an approved, constantly attended station. The surveillance system shall not be required to provide positive visual recognition of individual persons.

(Renumber subsequent sections)

2. Revise as follows

403.4.8.1 Emergency power loads. The following are classified as emergency power loads:

1. Exit signs and *means of egress* illumination required by Chapter 10;
2. Elevator car lighting;
3. Emergency voice/alarm communications systems;
4. Automatic fire detection systems;
5. Video surveillance systems;
6. Fire alarm systems; and
7. Electrically powered fire pumps.

708.14.1 Elevator lobby. An enclosed elevator lobby shall be provided at each floor where an elevator shaft enclosure connects more than three stories. The lobby enclosure shall separate the elevator shaft enclosure doors from each floor by fire partitions. In addition to the requirements of Section 709 for fire partitions, doors protecting openings in the elevator lobby enclosure walls shall also comply with Section 715.4.3 as required for corridor walls and penetrations of the elevator lobby enclosure by ducts and air transfer openings shall be protected as required for corridors in accordance with Section 716.5.4.1. Elevator lobbies shall have at least one means of egress complying with Chapter 10 and other provisions within this code. In high-rise buildings the elevator lobby shall be provided with a video surveillance system installed in accordance with NFPA 731.

Exceptions:

1. through 7. (No change to exceptions)

3. Add new standard to Chapter 35 as follows:

NFPA
731-2008 The Standard for the Installation of Electronic Premises Security Systems

PART II – IFC

Revise as follows:

508.1.5 (IBC [F] 911.1.5) Required features. The fire command center shall comply with NFPA 72 and shall contain the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.
3. Fire detection and alarm system annunciator.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air handling systems.
6. The fire-fighter's control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking stairway doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, means of egress, fire protection systems, firefighting equipment and fire department access and the location of fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions.
13. Work table.
14. Generator supervision devices, manual start and transfer features.
15. Public address system, where specifically required by other sections of this code.
16. Elevator fire recall switch in accordance with ASME A17.1.
17. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.
18. Video monitoring for video surveillance system required by this code.

Reason: This proposal adds new requirements to the code for high-rise buildings. The purpose of this change is to increase the ability of firefighters, and other emergency responders, to develop a clear picture of conditions throughout the building which will enable them to better manage evacuation, fire suppression and other emergency response activities. The purpose is also to enhance the safety of emergency responders by enabling them to maintain better situational awareness.

The National Institute of Standards and Technology's (NIST) report on the World Trade Center (WTC) tragedy amply documented the tactical and informational difficulties experienced by emergency responders and occupants during the WTC event. Similar difficulties occur in much smaller events and they place lives at risk.

The Code already requires many systems which enhance emergency responder and occupant awareness. Their use can be improved and they can be further supplemented. Recommendation 23 of the WTC Report specifically calls for:

The establishment and implementation of detailed procedures and methods for gathering, processing, and delivering critical information through integration of relevant voice, video, graphical and written data to enhance situational awareness of all emergency responders.

This proposal seeks to improve responder awareness of conditions in the building to assist in management of an incident and improve the existing fire command center to enhance its value. Awareness is improved by requiring control center monitoring of video surveillance in stairway shafts and elevator lobbies. With the introduction of dedicated fire service elevators and occupant egress elevators into the IBC, the necessity of monitoring the status of the elevator lobbies becomes even more significant.

There will be those opponents that will claim that that the amount of information generated by the video monitoring in a large building will cause "information overload". They will question the ability of the staff in the fire command center to observe all of the required video feeds at once. In response to this, please be aware that there is commercial off-the-shelf "intelligent software" that is available such that the staff of the fire command center need not observe all of these feeds; the software is "event driven" and will select information that is pertinent and display just this information. This software is currently available off-the-shelf from companies such as Johnson Control and Honeywell. The Port Authority of New York and New Jersey is currently installing a system to monitor the perimeter of the Newark airport by the use of *ONE* video screen. Clearly the perimeter of this airport is substantially larger than the portions of the building that are required to be monitored as a result of this code change. By requiring these video feeds, the situational awareness of the staff in the fire command center is substantially increased. While researching the availability of this software, we were informed by Mr. Alan Reiss the building manager of the World Trade Center, that he was unaware of the magnitude of the event on September 11, 2001. In fact, he commented that the people at home watching the television had a better situational awareness than he did because of the lack of information available at the fire command center. This has to be changed and this proposal will change it.

Bottom line, the video monitoring system will provide fire and emergency responders' immediate information on the life safety condition and status of the areas noted. Having such ability will exceed any expense incurred for the installation of the video monitoring system - the expense is minor to the benefit of the system. (Note: Regardless of this requirement, electronic data access systems can be installed for a reasonable cost in most buildings today). A video monitoring system will provide fire and emergency responders with accurate and up to date information on the condition and activities of the given areas for emergency responders to make tactical decisions under emergency conditions. With that said, the TRB committee encourages consideration and support for this proposal.

Bibliography: National Institute of Standards & Technology, Final Report of the National Construction safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.

Referenced Standards
National Fire Protection Association Standard 731, the Standard for the Installation of Electronic Premises Security Systems

Cost Impact: The code change proposal will not increase the cost of construction. These proposed amendments will increase the cost of construction, but, the increase will be modest when viewed as a percentage of total construction costs.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 731, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IBC GENERAL

G45–09/10
403.4.7, 403.4.7.2

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII)

Revise as follows:

[F] 403.4.7 Standby power. A standby power system complying with Chapter 27 and Section 3003 shall be provided for standby power loads specified in 403.4.7.2. Where elevators are provided in a high-rise building for accessible means of egress, fire service access or occupant self-evacuation, the standby power system shall also comply with Sections 1007.4, 3007 or 3008, as applicable.

[F] 403.4.7.1 Special requirements for standby power. (No change to current text)

[F] 403.4.7.2 Standby power loads. The following are classified as standby power loads:

1. Power and lighting for the fire command center required by Section 403.4.5;
2. Ventilation and automatic fire detection equipment for smokeproof enclosures; and
3. Elevators. ~~Standby power shall be provided for elevators in accordance with Sections 1007.4, 3003, 3007, and 3008.~~

Reason: As currently formatted and written, the 2009 IBC is unclear that elevators in high-rise buildings which aren't used for compliance with 1007.4, 3007 or 3008 have to have standby power. It almost does. Section 403.4.7.2 should be a simple list of the items that are "defined' as standby power loads'. Section 403.4.7 says there has to be a system for the listed loads. Item 3 however says: Standby power shall be provided in accordance with four other sections in Chapter 30. Three of those four sections have specific requirements for standby power and what it should cover. Section 3003 simply tells you how to design the system for elevators – when it is required in a building. But 3003 isn't the scoping requirement, it's the design requirement.

This proposal makes elevators just another listed item in the standby power loads and then it moves up to Section 403.4.7, the references to the design requirements. Section 403.4.7 is already a reference to part of the design requirements – by sending the user to Chapter 27 – from which one gets to the Electrical Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BLACK-G1-403.4.7.doc

G46–09/10
403.5.2, 3008.4

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing: California Fire Safety Advisory Council (CFSAC); Bill Ziegert, representing Smoke Guard, Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

2. Revise as follows:

403.5.2 Additional exit stairway. For buildings other than Group R-2 that are more than 420 feet (128 000 mm) in building height, one additional exit stairway meeting the requirements of Sections 1009 and 1022 shall be provided in addition to the minimum number of exits required by Section 1021.1. The total width of any combination of remaining exit stairways with one exit stairway removed shall not be less than the total width required by Section 1005.1. Scissor stairs shall not be considered the additional exit stairway required by this section.

~~**Exception:** An additional exit stairway shall not be required to be installed in buildings having elevators used for occupant self-evacuation in accordance with Section 3008.~~

2. Delete without substitution:

~~**3008.4 Additional exit stairway.** Where an additional means of egress is required in accordance with Section 403.5.2, an additional exit stairway shall not be required to be installed in buildings having elevators used for occupant self-evacuation in accordance with this section.~~

Reason:

Thornberry: We are proposing to delete the Exception to Section 403.5.2 as well as Section 3008.4 which allow the use of occupant evacuation elevators in lieu of the additional exit stairway where required by Section 403.5.2 for super high-rise buildings (buildings greater than 420 ft in height). We believe this technology is too new and unproven to allow it to substitute for a required means of egress. This position is also consistent with Section 1003.7 Elevators, Escalators and Moving Walks which prohibits elevators from being used as a component of a required means of egress. Until such time as occupant evacuation elevators (which are allowed to be used on a voluntary basis without reducing the required means of egress) have proven to be safe, reliable, and effective, this exception should be deleted from the code.

Ziegert: When the concept of Occupant Evacuation Elevators was proposed during the Palm Springs hearings in 2008, while many committee members were in favor of such a concept, the change was Disapproved primarily because it sought a tradeoff of reducing exit stair capacity (width). The proponent brought this change back to the Minneapolis Final Action hearings with substantial modifications and replaced the reduction in exit stair width with this alternate tradeoff to reduce the third stair in High Rise buildings over 420 feet (a different form of tradeoff but still a reduction in exit capacity). Justification for this tradeoff of exit capacity was never sufficiently provided, particularly when one recognizes that the elevator occupant evacuation system will only be operational until the Fire Service arrives (typically in 10 minutes or less from the first alarm). At this time Phase 1 Elevator Recall will normally be implemented which will immediately terminate the use of elevators for occupant evacuation. Following that, occupants needing to use stairs for evacuation in these very tall buildings would be limited to only the two stair systems, rather than the three stair systems the code currently mandates.

Cost Impact: The code change proposal will increase the cost of construction.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

403.5.4 Smokeproof enclosures. Every required exit *stairway* serving floors more than 75 feet (22 860) above the lowest level of fire department vehicle access shall comply with Sections 909.20 and 1020.1.7. The smokeproof enclosure shall be continuous to the level of exit discharge.

> **Exception:** Portions of stairways which extend to serve floors below the level of exit discharge shall not be required to comply with Sections 909.20 and 1020.1.7 provided the portion of the stairway below the level of exit discharge is separated from the smokeproof enclosure with not less than 1-hour fire barriers constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both.

Reason: This code change clarifies where a smokeproof exit enclosure is required. It isn't clear what a required level exit stairway is intended to be. The proposed exception clarifies the Section does not apply to levels below the point of exit discharge if enclosed with a 1 Hr. fire barrier.

Cost Impact: The code change proposal will not increase the cost of construction. This will reduce the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-G5-403.5.2

403.6.1, 3007.1, 3007.1.1 (New)

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

403.6.1 Fire service access elevator. In buildings with an occupied floor more than 120 feet (36 576 mm) above the lowest level of fire department vehicle access, a minimum of ~~one~~ two elevators having a minimum 3,500 pounds (1588 kilograms) capacity serving every floor within the subject building shall be provided to serve as a fire service access elevator ~~shall be provided~~ in accordance with Section 3007.

> **Exception:** One elevator having a minimum capacity of 4,000 pounds (1814 kilograms) shall be permitted instead of 2 elevators of 3,500 pounds (1588 kilograms) capacity.

3007.1 General. Where required by Section 403.6.1, every floor of the building shall be served by ~~a~~ fire service access ~~elevator~~ elevators. Except as modified in ~~this section, the~~ Sections 3007.1 through 3007.7, fire service access ~~elevator~~ elevators shall be installed in accordance with this chapter and ASME A17.1/CSA B44.

3007.1.1 Ambulance stretcher. At least one fire service access elevator shall be sized to accommodate a stretcher in conformance with Section 3002.4.

Reason: Last Code Development Cycle, a code change was submitted to require a minimum of 3 fire service elevators. The subject proposal was disapproved by the Code Committee based on concerns that requiring a minimum of 3 fire service access elevators would have an adverse impact on a small footprint high-rise building and that requiring a minimum of 3 fire service access elevators seemed excessive. The intent of this code change is to provide a compromise that addresses the minimum number of fire service access elevators that are required in a building based on the size and capacity of the elevator and not strictly the number of elevators. The proposed text also allows for design flexibility as well as providing minimum requirements for the size and capacity of the fire service access elevators by correlating with Section 3002.4

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII); Sean DeCrane, representing International Association of Fire Fighters (IAFF); Jack Murphy, representing Fire Safety Directors of Greater New York (FSDAGNY)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

403.6.1 Fire service access elevator. In buildings with an occupied floor more than 120 feet (36 576 mm) above the lowest level of fire department vehicle access, a minimum of ~~one~~ three fire service access elevators, or all elevators, whichever is less, shall be provided in accordance with Section 3007.

Reason: The proponents performed a survey of firefighters from across the country to explore the sufficiency of this current code requirement. Thirty-five responses were received from cities such as Charlotte, Orlando, San Francisco, Houston, Los Angeles, Fort Worth, Boston and Pittsburgh, all indicating that the number of elevators used for firefighting operations varies from 2 to 6. (Only one respondent, a suburban bedroom community indicated one elevator is sufficient for firefighting.) Firefighters experienced in high rise operations stated that the Fire Service must be able to count on **at least two** elevators at all times. They are necessary for 1) transporting firefighters to and from the staging area, usually located two floors below the fire floor; 2) moving firefighters to other floors for the purpose of search and rescue, fire extension, recon; hauling of equipment such as spare cylinders, exhaust fans, etc; and, 3) transporting those with disabilities to the building lobby.

Past experience during fires of this type (high-rise), is that on many occasions elevators are not available due to shut downs for various reasons, including problems in operation, routine maintenance, modernization programs, EMS operations in the building prior to firefighter arrival and other reasons. Without this change there will be a high chance that there will not be a Fire Service Access Elevator available for the firefighters' to perform their critical firefighting and life-saving rescue duties.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: BLACK-G5-403.6.1

G50–09/10
404.6

Proponent: Michael Perrino, Code Consultants, Inc.

Delete and substitute as follows:

404.6 Enclosure of atriums. Atrium spaces shall be separated from adjacent spaces by a 1-hour fire barrier constructed in accordance with Section 707 or a horizontal assembly constructed in accordance with Section 712, or both.

Exceptions:

~~1. A glass wall forming a smoke partition where automatic sprinklers are spaced 6 feet (1829 mm) or less along both sides of the separation wall, or on the room side only if there is not a walkway on the atrium side, and between 4 inches and 12 inches (102mmand 305 mm) away from the glass and designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction. The glass shall be installed in a gasketed frame so that the framing system deflects without breaking (loading) the glass before the sprinkler system operates.~~

1. A glass wall and doors forming a smoke partition in accordance with Section 711, constructed of a tempered, wired or laminated glass wall and doors, complying with all of the following:

1.1. Automatic sprinklers are spaced 6 feet (1829 mm) or less along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the atrium side, and between 4 inches and 12 inches (102 mm and 305 mm) away from the glass. When activated the sprinkler system shall completely wet the entire surface of the glass.
1.2. The glass shall be in a gasketed frame and installed in a manner that the framing system will deflect without breaking (loading) the glass before the sprinklers operate.
1.3. Obstructions shall not be installed between the sprinklers and the glass wall or doors.

2. A glass-block wall assembly in accordance with Section 2110 and having a 3/4-hour fire protection rating.
3. The adjacent spaces of any three *floors* of the atrium shall not be required to be separated from the atrium where such spaces are accounted for in the design of the smoke control system.

Reason: The change brings to the atrium section the allowance for doors to be protected in the same manner as is permitted for walls and doors separating a pedestrian walkway from a building by Section 3104.5, exception 1. The allowances are almost identical as currently written, the only difference being the specific allowance for doors to be installed in the glass walls separating buildings, but not in glass walls separating atrium spaces.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal will decrease the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PERRINO-G2-404.5

G51–09/10
404.6

Proponent: Clay Aler, PE, Koffel Associates

Revise as follows:

404.6 Enclosure of atriums. Atrium spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 712, or both.

Exceptions:

1. A glass wall forming a smoke partition where automatic sprinklers are spaced 6 feet (1829 mm) or less along both sides of the separation wall, or on the room side only if there is not a walkway on the atrium side, and between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction. The glass wall shall be installed in a gasketed frame so that the framing system deflects without breaking (loading) the glass before the sprinkler system operates. Self-closing glass doors shall be permitted in the glass wall.
2. A glass-block wall assembly in accordance with Section 2110 and having a 3/4-hour *fire protection rating*.
3. The adjacent spaces of any three floors of the atrium shall not be required to be separated from the atrium where such spaces are accounted for in the design of the smoke control system.

Reason: Where glass walls are used as an atrium enclosure, it is typical to include glass doors in the glass walls to maintain material continuity. The current code text makes no reference to whether glass doors are permitted as part of the atrium enclosure. The proposed revised text will make it clear that glass doors are permitted in glass walls, so long as the glass doors are sprinkler protected in a manner consistent with that provided for the glass wall.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: ALER-G1-404.5.doc

G52–09/10
404.6 (New), 1022.1(IFC [B] 1022.1)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

1. Add new text as follows:

404.6 Exit stairway. Up to 50 percent of the exits required by Section 1021 shall be permitted to be located within an atrium without enclosure required by Section 1022, provided:

1. The stairway discharges to the floor of the atrium;
2. The floor of the atrium is at the level of exit discharge and conforms with Section 1027.1; and
3. The footprint of the stairway when measured horizontally within the perimeter of the atrium floor opening shall not equal more than 25 percent of the area of the atrium on a per floor basis.

(Renumber subsequent sections)

2. Revise as follows:

1022.1 (IFC [B] 1022.1) Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. Exit enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. In all occupancies, other than Group H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.
   1.1. The stairway is open to not more than one story above its level of exit discharge; or
   1.2. The stairway is open to not more than one story below its level of exit discharge.
2. Exit stairways in atriums conforming to Section 404.6 are not required to be enclosed.
~~2~~3. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
~~3~~4. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
~~4~~5. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
~~5~~6. Stairways in Group I-3 occupancies, as provided for in Section 408.3.8, are not required to be enclosed.
~~6~~7. Means of egress stairways as required by Sections 410.5.3 and 1015.6.1 are not required to be enclosed.
~~7~~8. Means of egress stairways from balconies, galleries or press boxes as provided for in Section 1028.5.1 are not required to be enclosed.

Reason: The atrium enclosure provides adequate protection for occupants of the building by providing fire suppression, smoke removal systems and provides additional features that a stair enclosure lacks; the ability to observe the environment in which the stair is located. It would be a simple matter to glance down into the atrium prior to mounting the stairs to see if there are problems associated with the environment, making the decision to use the atrium stair much simpler than a stair whose environment is unknown beyond the one visible flight of stairs.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

SECTION 406
MOTOR-VEHICLE RELATED OCCUPANCIES

406.1 General. Motor vehicle related occupancies shall comply with Sections 406.1 through 406.8 and the *International Fire Code, International Mechanical Code* and *International Fuel Gas Code*.

~~**406.3.2**~~ **406.2 Definitions.** The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

MECHANICAL-ACCESS OPEN PARKING GARAGES. *Open parking garages* employing parking machines, lifts, elevators or other mechanical devices for vehicles moving from and to street level and in which public occupancy is prohibited above the street level.

OPEN PARKING GARAGE. A structure or portion of a structure with the openings as described in Section 406.5.3 on two or more sides that is used for the parking or storage of private motor vehicles as described in Section 406.5.4.

RAMP-ACCESS OPEN PARKING GARAGES. *Open parking garages* employing a series of continuously rising floors or a series of interconnecting ramps between floors permitting the movement of vehicles under their own power from and to the street level.

~~**406.1**~~ **406.3 Private garages and carports.**

406.3.1 General. Private garages and carports shall comply with Sections 406.3.1 through 406.3.6.

(No change in text here or in the subsequent sections, except where shown.)

~~**406.1.1**~~ **406.3.2 Classification.**

~~**406.1.2**~~ **406.3.3 Area increase.**

~~**406.1.3**~~ **406.3.4 Garages and carports.**

~~**406.1.4**~~ **406.3.5 Separation**

~~**406.1.5**~~ **406.3.6 Automatic garage door openers.**

~~**406.2**~~ **406.4 Public parking garages.**

~~**406.2.1 Classification**~~ **406.4.1 General**. Parking garages other than private parking garages, shall be classified as public parking garages and shall comply with the provisions of Sections 406.4.2 through 406.4.9 and shall be classified as either an open ~~as defined in Section 406.3~~, parking garage or an enclosed parking garage ~~and shall meet appropriate criteria of Section 406.4~~. Open parking garages as defined in Section 406.2 shall also comply with Section 406.5. Enclosed parking garages shall also comply with Section 406.6. Also see Section 509 for special provisions for parking garages.

~~**406.2.2**~~ **406.4.2 Clear height.**

~~**406.2.3**~~ **406.4.3 Guards.**

~~**406.2.4**~~ **406.4.4 Vehicle barrier systems.**

~~406.3.13~~ **406.5.13 Prohibitions.**

~~406.4~~ **406.6 Enclosed parking garages.**

406.6.1 General. Enclosed parking garages shall comply with Sections 406.6.1 through 406.6.3

~~406.4.1~~ **406.6.2 Heights and areas.**

~~406.4.2~~ **406.6.3 Ventilation.**

~~406.5~~ **406.7 Motor fuel-dispensing facilities.**

~~**406.5.1 Construction**~~ **406.7.1 General.** Motor fuel dispensing facilities shall ~~be constructed in accordance~~ comply with the *International Fire Code* and Sections ~~406.5.1 through 406.5.3~~.406.7.2 through 406.7.3.

~~406.5.2~~ **406.7.2 Vehicle fueling pad.**

~~406.5.3~~ **406.7.3 Canopies.**

~~406.5.3.1~~ 406.7.3.1 Canopies used to support gaseous hydrogen systems.

~~406.6~~ 406.8 Repair Garages.

~~406.6.1~~ 406.8.1 General.

~~406.6.2~~ 406.8.2 Mixed uses.

~~406.6.3~~ 406.8.3 Ventilation.

~~406.6.4~~ 406.8.4 Floor surface.

~~406.6.5~~ 406.8.5 Heating equipment.

[F] ~~406.6.6~~ 406.8.6 Gas detection system.

[F] ~~406.6.6.1~~ 406.8.6.1 System design.

[F] ~~406.6.6.2~~ 406.8.6.2 Operation.

[F] ~~406.6.6.3~~ 406.8.6.3 Failure of the gas detection system.

Reason: This is primarily a reformat similar to the reformat of Section 412 Aircraft Related occupancies, which occurred for the 2009 code. It is also making clear there relationship between the various sections on parking. It also provides consistent format for each subcategory such that each set of requirements starts with a General section. Some of these are new, some are revised sections that had different titles. Finally, there are key provisions in the other I-Code which apply to these occupancies. Only a few are listed and many are not. For example the Fuel Gas code requires appliances located in private garages to have the flame at least 18 inches above the floor. While that is hinted at in 406.2.8, that section doesn't cover the private garages. The existing Section 406 has sections on private garages and then simply 'parking garages'. Parking garages are then distinguished whether they are open or enclosed. Thi s change proposes to call all garages that are not private garages as 'public' garages'. This is not to imply that they are all open to the public, but just as a comparison to private garages. The actual distinction between private garages and others is primarily size. Perhaps the proper titles of Sections 406.3 and 406.4 should be "Small parking garages" and "Big parking garages', respectively.

Cost Impact: The code change proposal will not increase the cost of construction.

1. Add new text as follows:

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

406.1 General. Motor –vehicle related occupancies shall comply with Sections 406.1 through 406.8 and other applicable provisions of this code, the *International Fire Code* and *International Mechanical Code*.

406.2 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

PARKING GARAGE. A building, structure, or portion thereof used for the parking, storage, or both, of motor vehicles less than 6500 lbs empty curb weight.

PARKING GARAGE, OPEN. A parking garage that meets the requirements of Section 406.3.

PARKING GARAGE, ENCLOSED. Any parking garage that is not an open parking garage.

PARKING GARAGE, RAMP TYPE. A parking garage that utilizes sloped floors for vertical vehicle circulation.

PARKING GARAGE, ASSISTED MECHANICAL TYPE. A parking garage that uses lifts or other mechanical devices to transport vehicles to the upper or lower floors of a parking garage, where the vehicles are then parked by an attendant.

PARKING GARAGE. AUTOMATED MECHANICAL TYPE. A parking garage that utilizes computer-controlled machines to store and retrieve vehicles, without drivers, in multi-level storage bays.

(Renumber subsequent sections)

2. Delete without substitution as follows:

406.2 Parking garage

~~**406.2.1 Classification.** Parking garages shall be classified as either open, as defined in Section 406.3, or enclosed and shall meet the appropriate criteria in Section 406.4. Also see Section 509 for special provisions for parking garages.~~

(Renumber subsequent sections)

3. Revise as follows:

406.3 Open parking garages.

406.3.1 Scope. Except where specific provisions are made in Sections 406.3.2 through ~~406.3.13~~ 406.3.12, other requirements of this code shall apply.

4. Delete text as follows:

~~**406.3.2 Definitions.** The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.~~

~~**MECHANICAL-ACCESS OPEN PARKING GARAGES.** *Open parking garages* employing parking machines, lifts, elevators or other mechanical devices for vehicles moving from and to street level and in which public occupancy is prohibited above the street level.~~

~~**OPEN PARKING GARAGE.** A structure or portion of a structure with the openings as described in Section 406.3.3.1 on two or more sides that is used for the parking or storage of private motor vehicles as described in Section 406.3.4.~~

~~**RAMP-ACCESS OPEN PARKING GARAGES.** *Open parking garages* employing a series of continuously rising floors or a series of interconnecting ramps between floors permitting the movement of vehicles under their own power from and to the street level.~~

(Renumber subsequent sections)

Reason: Section 406 applies to parking garages in general. Therefore, the different types of parking garages should be defined in this section. Listing the definitions under Section 406.3 is inappropriate as that section is a special subset of parking garages that only applies to Open Parking Garages. In particular, it is necessary to define the different types of mechanical access garages, as some types of mechanical access garages use freight elevators to lift a vehicle to another floor where it is then parked by an attendant. Therefore, ventilation of vehicle emissions is important for that type of garage. However, automated, mechanical access parking garages are finding their way into the U.S. market from Europe and Asia. These garages use computer-controlled machines to store and retrieve vehicles without the vehicle engine running and without human intervention. The vehicles are stored in an unoccupied, enclosed storage vault. Therefore, the life safety provisions inside that unoccupied storage vault are considerably different than in an occupied space. Only access by maintenance personnel and firefighter personnel is required in the storage vault. Ventilation of vehicle emissions is not required. These garages are not defined in the current building code. Further, up to double the number of vehicles can be accommodated in automated mechanical garages so they represent “Green” design in addition to the reduction in vehicle emissions that make this type of garage greener than traditional garages.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MONAHAN-G4-406.2.1

G55–09/10
406.1.4

Proponent: Jeff Inks, representing the Window and Door Manufacturers Association (WDMA)

Revise as follows:

406.1.4 Separation. Separations shall comply with the following:

1. The private garage shall be separated from the *dwelling unit* and its *attic* area by means of a minimum 1/2-inch (12.7 mm) gypsum board applied to the garage side. Garages beneath habitable rooms shall be separated from all habitable rooms above by not less than a 5/8-inch Type X gypsum board or equivalent. Door openings between a private garage and the dwelling unit shall be equipped with either solid wood doors or solid or honeycomb core steel doors not less than 1 3/8 inches (34.9 mm) thick, or doors in compliance with Section 715.4.3 with a minimum fire protection rating of 20 minutes. Openings from a private garage directly into a room used for sleeping purposes shall not be permitted. Doors shall be self-closing and self-latching.
2. Ducts in a private garage and ducts penetrating the walls or ceilings separating the dwelling unit from the garage shall be constructed of a minimum 0.019-inch (0.48 mm) sheet steel and shall have no openings into the garage.
3. A separation is not required between a Group R-3 and U carport, provided the carport is entirely open on two or more sides and there are not enclosed areas above.

Reason: This section of the IBC implies that doors in compliance with Section 715.4.3 are to have a 20 minute fire protection rating. However, the language here and in Section 715.4.3 doesn't explicitly require that performance rating. This proposal addresses this oversight and is essentially an editorial improvement to this section of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

Revise as follows:

406.1.4 Separation. Separations shall comply with the following:

1. The private garage shall be separated from the *dwelling unit* ~~and~~ including its *attic* area by means of gypsum board, or its equivalent, applied to the wall and ceiling surfaces on the garage side. ~~a~~ A minimum of 1/2-inch (12.7 mm) gypsum board shall be applied to ~~the garage side. Garages beneath habitable rooms shall be separated from all habitable rooms above by~~ wall surfaces of the separation or to protect members supporting the ceiling separation and not less than a 5/8-inch (15.9 mm) Type X gypsum board ~~or equivalent~~ shall be applied to form the ceiling surfaces of the separation. The wall and ceiling surfaces as applicable shall combine to form a complete separation between the garage and any habitable areas of the dwelling unit, including its attic area. Door openings between a private garage and the d*welling unit* shall be equipped with either solid wood doors or solid or honeycomb core steel doors not less than 1 3/8 inches (34.9 mm) thick, or doors in compliance with Section 715.4.3. Openings from a private garage directly into a room used for sleeping purposes shall not be permitted. Doors shall be self-closing and self-latching.
2. Ducts in a private garage and ducts penetrating the walls or ceilings separating the *dwelling unit,* including its *attic* area*,* from the garage shall be constructed of a minimum 0.019-inch (0.48 mm) sheet steel and shall have no openings into the garage.
3. A separation is not required between a Group R-3 and U carport, provided the carport is entirely open on two or more sides and there are not enclosed areas above.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R302.6 Dwelling/garage fire separation. The garage shall be separated by wall and ceiling surfaces combined as applicable to form a complete separation between the garage and any habitable areas of the dwelling unit, including its attic area as required by Table R302.6. Openings in garage walls shall comply with Section R302.5. This provision does not apply to garage walls that are perpendicular to the adjacent *dwelling unit* wall unless providing support for ceilings or members used as part of the separation required by this section.

TABLE R302.6
DWELLING/GARAGE SEPARATION

SEPARATION	MATERIAL
~~From the residence and attics~~ Wall surfaces	Not less than ½-inch gypsum board or equivalent applied to the garage side of walls
~~From all habitable rooms above the garage~~ Ceiling surfaces	Not less than 5/8-inch Type X gypsum board or equivalent applied to the garage ceiling
Structure(s) supporting ~~floor/~~ceiling assemblies used for separation required by this section	Not less than 1/2-inch gypsum board or equivalent applied to the wall or structural members.
Garages located less than 3 feet from a dwelling unit on the same lot	Not less than 1/2-inch gypsum board or equivalent applied to the interior side of exterior walls that are within this area

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

Reason: (IBC) The current language in section 406.1.4 does not adequately convey the intent of this section which is to provide a complete separation between garage areas and any habitable areas of the dwelling unit including its attic and to provide protection of walls and members providing support of assemblies used for this separation. The existing language is also confusing because it refers to "garages beneath habitable rooms shall be separated from all habitable rooms above by not less than a 5/8-inch (15.9 mm) Type X gypsum board or equivalent" but fails to describe what to do if the ceiling surface forming the attic space above the garage is utilized fully or partially to form the separation and if the habitable rooms are offset but contiguous to the attic space above the garage.

The proposed language is superior to the existing language because it clarifies there is to be a complete separation including members providing support of the separation which is consistent with the IRC. The proposed language also makes it clear that all ceiling surfaces that are utilized as part of the separation are to be protected by an equivalent of 5/8" type x gypsum board regardless if they are located directly below the habitable room or not. The added strength and fire resistance of 5/8" gypsum board is appropriate in all portions of the separation where gypsum board is applied on horizontal or sloped ceiling surfaces where the gypsum board must support its own weight as well as insulation resting on it while being exposed to a fire directly below.

(IRC) The current language in section R302.6 and Table R302.6 does not adequately convey the intent of this section which is to provide a complete separation between garage areas and any habitable areas of the dwelling unit including its attic. The existing language is confusing because it refers to separations "From all habitable rooms above the garage" is to be separated by "not less than 5/8-inch (15.9 mm) Type X gypsum board or equivalent" but fails to describe what to do if the ceiling surface forming the attic space above the garage is utilized fully or partially to form the separation and if the habitable rooms are offset but contiguous to the attic space above the garage.

The proposed language is superior to the existing language because it clarifies there is to be a complete separation. The proposed language also makes it clear that all ceiling surfaces that are utilized as part of the separation are to be protected by an equivalent of 5/8" type x gypsum board regardless if they are located directly below the habitable room or not. The added strength and fire resistance of 5/8" gypsum board is appropriate in all portions of the separation where gypsum board is applied on horizontal or sloped ceiling surfaces where the gypsum board must support its own weight as well as insulation resting on it while being exposed to a fire directly below.

The proposed language also clarifies walls that are perpendicular to the dwelling unit wall must be protected if they provide support to ceilings or members used as part of this separation.

Cost Impact: (IBC) The code change proposal will increase the cost of construction. This proposal would increase the cost of construction if the current language is interpreted as not requiring the protection of elements supporting the separation. Otherwise this proposed change clarifies the designer has the option to utilize the garage ceiling as part of the separation even when the second floor is not located directly above the garage. When the designer has options there is an opportunity for cost savings.

(IRC) The proposed change clarifies the designer has the option to utilize the garage ceiling as part of the separation even when the second floor is not located directly above the garage. When the designer has options there is an opportunity for cost savings.

406.2.2

Proponent: Donald R. Monahan/Walker Parking Consultants/Representing National Parking Association, and Automated & Mechanical Parking Association

Revise as follows:

406.2.2 Clear Height. The clear height of each floor level in vehicle and pedestrian traffic areas shall not be less than 7 feet (2134 mm). Vehicle and pedestrian areas accommodating van accessible parking required by Section 1106.5 shall conform to ICC A117.1.

> **Exception:** A lower clear height is allowed in computerized, mechanical-access parking structures equipped with sensors to measure the dimensions of vehicles at entry prior to activation of the storage machinery. Clear height shall not be less than 5 feet (1524 mm). The machinery shall not activate when over-size vehicles are detected.

Reason: Automated parking systems that utilize computer-controlled machines to store and retrieve vehicles are finding their way into the U.S. market from Europe and Asia. Analysis of vehicle dimensions by the Parking Consultants Council of the National Parking Association indicates that 53 percent of vehicles on the road are less than 5-feet high and 83 percent of vehicles are less than 6-feet high. In an automated, mechanical-access garage, sensors are used to measure vehicles and computers are used to sort vehicles to prescribed compartments according to size. Therefore, it is possible to customize different levels in the storage vault for different height vehicles. Also, the public is prohibited from entering the vehicle storage vault where the low clearance vehicle compartments are located.

Cost Impact: The code change proposal will not increase the cost of construction. The lower clear height in an automated parking facility will reduce the construction cost.

406.3.2

Proponent: Daniel E. Nichols, PE, New York State Div. of Code Enforcement and Administration

Revise as follows:

406.3.2 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meaning shown herein.

OPEN PARKING GARAGE. A structure or portion of a structure with the openings as described in Section 406.3.3.1 ~~on two or more sides~~ that is used for the parking or storage of private motor vehicles as described in Section 406.3.4.

Reason: Section 406.3.3.1 permits the use of only one side as appropriate openings in the exception on Section 406.3.3.1. The definition is in conflict with the code requirements referenced therein.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICHOLS-G4-406.3.2.doc

G59–09/10
406.3.3.1

Proponent: Jason J. Krohn, P.E., Precast/Prestressed Concrete Institute

Revise as follows:

406.3.3.1 Openings. For natural ventilation purposes, the exterior side of the structure shall have ~~uniformly~~ distributed openings on two or more sides. The area of ~~such~~ the openings in exterior walls on a tier ~~must~~ shall be at least 20 percent of the total perimeter wall area of each tier~~.~~ and shall comply with one of the following:

1. The aggregate length of the openings considered to be providing natural ventilation shall constitute a minimum of 40 percent of the perimeter of the tier, or
2. The openings shall be distributed around at least 40 percent of the perimeter distance, whereby no portion of the perimeter distance shall be counted when it is further than 6 feet (1829 mm) from an opening, and each opening shall be a least 30 inches (762 mm) in the smallest dimension.

Interior walls shall be at least 20 percent open with uniformly distributed openings.

Exception: Openings are not required to be distributed over 40 percent of the building perimeter where the required openings are uniformly distributed over two opposing sides of the building.

Reason: The current IBC wording for the 40 percent requirement does not reflect what the current IBC commentary describes. The IBC states "*The aggregate length of the openings considered to be providing natural ventilation shall constitute a minimum of 40 percent of the perimeter of the tier.*" The commentary states "This section requires that 40 percent of the building perimeter have openings that are uniformly distributed on no less than two sides of the structure". Previous model codes such as the Standard Building Code stated "*required openings must be distributed along at least 40% of the building perimeter".* We believe the intent of the IBC is to assure that the openings used for natural ventilation be distributed over 40 percent of the building perimeter, not that the sum of their lengths be 40 percent of the perimeter. This change in wording has a significant impact on a "punched opening" parking garage. The figures below show two garages with the same size openings. Since the openings are the same size, they both achieve the 20 percent openness requirement. However, by rotating the openings 90 degrees, one of the garages does not meet the "aggregate length of at least 40 percent of the building perimeter" so it would not be considered an "open" parking garage.

Language is included stating that a designer will not be allowed to count any portion of the exterior that is 6'-0" from an opening and that such openings must be at least 30" in each direction. The selection of 30" was somewhat arbitrary, but has been used in other sections of fire codes. The logic was that fire personnel can access through an opening this size or larger. It is felt that this definition was necessary to preclude a designer from placing a very small opening (4" square for example) every 12'-0" or so, to meet the perimeter distance requirement.

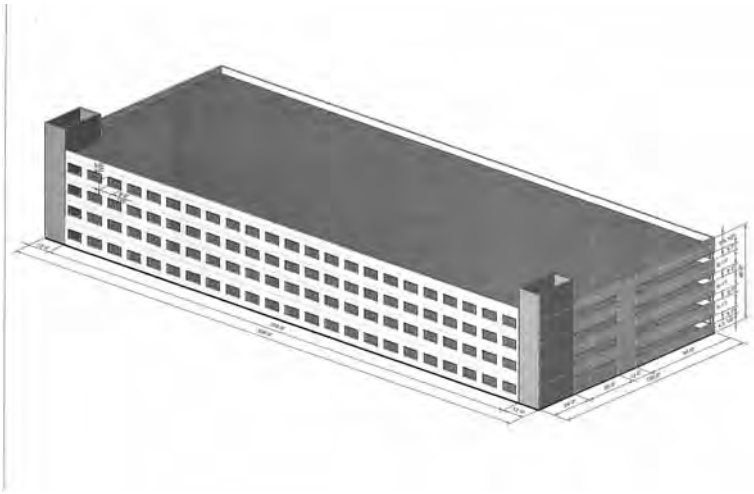

Figure 1: Spandrel type parking garage

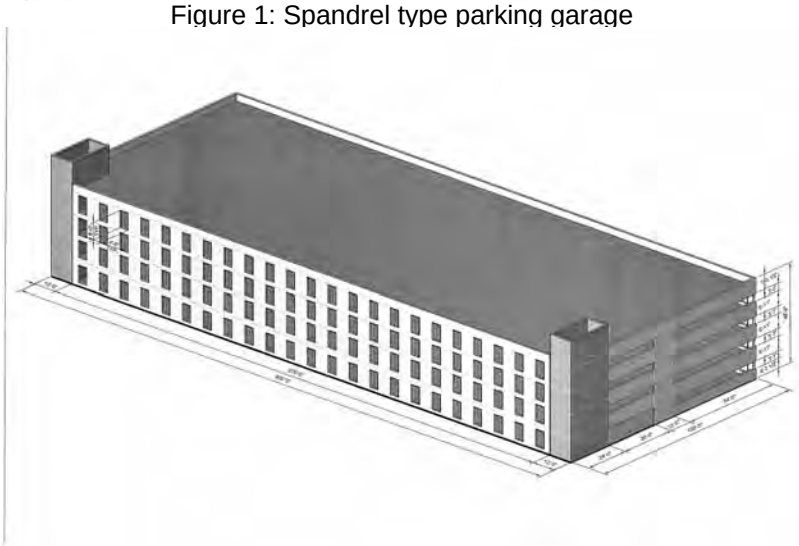

Figure 2: Punched opening parking garage

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: KROHN-G1-406.3.3.1

G60–09/10
406.3.3.1.1 (New)

Proponent: Daniel E. Nichols, PE, New York State Div. of Code Enforcement and Administration

Add new text as follows:

406.3.3.1.1 Openings below grade. Where openings below grade provide required natural ventilation, the outside horizontal clear space measured perpendicular to the opening shall be one and one-half times the depth of the opening. The depth of the opening shall be measured from the average adjoining ground level to the bottom of the opening.

Reason: One of the main differences between open parking garages and enclosed garages is the ability of the openness on one or two walls to provide adequate natural ventilation. IBC Section 406.3.1.1 clearly states in the section that the openness is for natural ventilation purposes. This is supported by the IMC being completely silent on any requirements for ventilation in an open parking garage.

Open parking garages are generally separated from a surrounding structure due to limitations of fire separation distance (10 feet). However, fire separation distance isn't needed from grades and retaining walls. A condition has been experienced where an open parking garage has been built into a steep grade, and the openings are provided. In one case, a retaining wall is 5 feet away from the exterior wall of the open parking garage and the vertical distance from the lowest level of the open parking garage to the top of the wall is approximately 50 feet.

IBC Section 1203 has requirements for the use of below ground openings being used for natural ventilation. This proposal uses the exact language in Section 1203 to provide recognized design standards for below ground openings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: NICHOLS-G1-406.3.3.1.1.doc

G61–09/10
406.3.6

Proponent: Jason J. Krohn, PE, Precast/Prestressed Concrete Institute

Revise as follows:

406.3.6 Area and height increases. The allowable area and height of *open parking garages* shall be increased in accordance with the provisions of this section and Sections 504 and 506. Garages with sides open on three-fourths of the building's perimeter are permitted to be increased by 25 percent in area and one tier in height. Garages with sides open around the entire building's perimeter are permitted to be increased by 50 percent in area and one tier in height. For a side to be considered open under the above provisions, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier.

Allowable tier areas in Table 406.3.5 shall be increased for *open parking garages* constructed to heights less than the table maximum. The gross tier area of the garage shall not exceed that permitted for the higher structure. At least three sides of each such larger tier shall have continuous horizontal openings not less than 30 inches (762 mm) in clear height extending for at least 80 percent of the length of the sides and no part of such larger tier shall be more than 200 feet (60 960 mm) horizontally from such an opening. In addition, each such opening shall face a street or *yard* accessible to a street with a width of at least 30 feet (9144 mm) for the full length of the opening, and standpipes shall be provided in each such tier.

Open parking garages of Type II construction, with all sides open, shall be unlimited in allowable area where the *building height* does not exceed 75 feet (22 860 mm). For a side to be considered open, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. All portions of tiers shall be within 200 feet (60 960 mm) horizontally from such openings or other natural ventilation openings as defined in Section 406.3.3.1. These openings shall be permitted to be provided in *courts* with a minimum dimension of 20 feet (6096 mm) for the full width of the openings.

Reason: The only section that currently allows for height and area increases to Table 406.3.5 is section 406.3.6. This section gives increases to Table 406.3.5 but they are related to "openness". This section does not give increases for automatic sprinkler systems or building frontage as is allowed by sections 504 and 506 to Table 503 which must be used for "enclosed" parking garages. This means that it is possible to have an "enclosed" parking garage with bigger area per floor than an "open" parking garage.

Sections 406.3.5, 406.3.5.1, and 406.3.6 set the limitations for the Heights and Areas of open parking garages. The logic presumably is that an open garage can be constructed to a greater area per floor for a given construction type than an enclosed garage. However, enclosed parking garage floor areas are able to be increased for multi-story parking garages by 200 percent provided they are sprinklered. No such area increase is allowed for open parking garages. Consequently, an enclosed, sprinklered parking garage of Type IIA can be constructed to 39,000 sf + (200%* 39,000 sf) = 117,000 sf per floor. While an open parking garage of Type IIA construction can be constructed to only 50,000 sf per floor, regardless of whether or not it has fire sprinklers. Therefore, the requirements for the open parking garage are far more stringent under this scenario. Other height and area increases are allowed as outlined in section 406.3.6, yet none allow any additional increase for fire sprinklers as is allowed for almost all other structures.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KROHN-G2-406.3.6

G62–09/10
406.3.6

Proponent: Jason J. Krohn, PE, Precast/Prestressed Concrete Institute

Revise as follows:

406.3.6 Area and height increases. The allowable area and height of *open parking garages* shall be increased in accordance with the provisions of this section. Garages with sides open on three-fourths of the building's perimeter are permitted to be increased by 25 percent in area and one tier in height. Garages with sides open around the entire building's perimeter are permitted to be increased by 50 percent in area and one tier in height. For a side to be considered open under the above provisions, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. For purposes of calculating the interior area of the side, the height shall not exceed 7 feet (2134 mm).

Allowable tier areas in Table 406.3.5 shall be increased for *open parking garages* constructed to heights less than the table maximum. The gross tier area of the garage shall not exceed that permitted for the higher structure. At least three sides of each such larger tier shall have continuous horizontal openings not less than 30 inches (762 mm) in clear height extending for at least 80 percent of the length of the sides and no part of such larger tier shall be more than 200 feet (60 960 mm) horizontally from such an opening. In addition, each such opening shall face a street or *yard* accessible to a street with a width of at least 30 feet (9144 mm) for the full length of the opening, and standpipes shall be provided in each such tier.

Open parking garages of Type II construction, with all sides open, shall be unlimited in allowable area where the *building height* does not exceed 75 feet (22 860 mm). For a side to be considered open, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. For purposes of calculating the interior area of the side, the height shall not exceed 7 feet (2134 mm). All portions of tiers shall be within 200 feet (60 960 mm) horizontally from such openings or other natural ventilation openings as defined in Section 406.3.3.1. These openings shall be permitted to be provided in *courts* with a minimum dimension of 20 feet (6096 mm) for the full width of the openings.

Reason: Currently, the IBC does not include a definition of "interior area of the side". Consequently, the interior area values have been interpreted differently by building officials in various jurisdictions. To clarify the code, a value of 7 feet is added for the height dimension of interior area. This value of 7 feet is consistent with the minimum height requirement of Sections 406.2.2 and 406.3.5.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KROHN-G3-406.3.6

G63–09/10
406.3.6

Proponent: Donald R. Monahan, PE, Walker Parking Consultants, representing the National Parking Association and the Automated & Mechanical Parking Association

Revise as follows:

406.3.6 Area and height increases. The allowable area and height of open parking garages shall be increased in accordance with the provisions of this section. Garages with sides open on three-fourths of the building's perimeter are permitted to be increased by 25 percent in area and one tier in height. Garages with sides open around the entire building's perimeter are permitted to be increased by 50 percent in area and one tier in height. For a side to be considered open under the above provisions, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier.

Allowable tier areas in Table 406.3.5 shall be increased for open parking garages constructed to heights less than the table maximum. The gross tier area of the garage shall not exceed that permitted for the higher structure. At least three sides of each such larger tier shall have continuous horizontal openings not less than 30 inches (762 mm) in clear height extending for at least 80 percent of the length of the sides and no part of such larger tier shall be more than 200 feet (60 960 mm) horizontally from such an opening. In addition, each such opening shall face a street or yard accessible to a street with a width of at least 30 feet (9144 mm) for the full length of the opening, and standpipes shall be provided in each such tier.

Open parking garages of Type II construction, with all sides open, shall be unlimited in allowable area where the building height does not exceed 75 feet (22 860 mm). For a side to be considered open, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. All portions of tiers shall be within 200 feet (60 960 mm) horizontally from such openings or other natural ventilation openings as defined in Section 406.3.3.1. These openings shall be permitted to be provided in courts with a minimum dimension of 20 feet (6096 mm) for the full width of the openings.

<u>The interior area as used in the paragraphs above shall mean the clear height from the floor to the bottom of the structural frame above times the length of a side.</u>

Reason: There is no definition in the IBC for the interior area. As a result, the interior area has been interpreted differently by many building officials. Since the structural frame inhibits air flow through the garage, the natural ventilation is then accommodated by the clear distance from the floor to the bottom of the structural frame above such that the required opening on each side should be a function of that clear height.

Cost Impact: The code change proposal will not increase the cost of construction. Cost savings as a result of allowing Type II construction with increased height and area as a result of increased openness versus needing Type I construction with higher fire rating.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MONAHAN-G2-406.3.6

G64–09/10
IBC 406.7 (New), IFC 2303.2

Proponent: Donald R. Monahan, PE, Walker Parking Consultants, representing the National Parking Association and the Automated & Mechanical Parking Association

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC GENERAL COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE IBC GENERAL COMMITTEE.

PART I – IBC GENERAL

1. Add new section as follows:

<u>406.7 Parking garages, automated mechanical type.</u>

<u>406.7.1 General.</u> <u>Automated mechanical type parking garages shall comply with Sections 406.7.1 through 406.7.3.</u>

406.7.2 Construction. The storage vault enclosure is classified as a high-bay storage warehouse for motor vehicles, and shall meet the requirements of Chapter 23 of the *International Fire Code*.

406.7.3 Storage Racks. The storage racks shall consist of non-combustible construction. Steel storage racks shall designed in accordance with Section 2208.

PART II – IFC

Revise text as follows:

2303.2 Class I commodities. Class I commodities are essentially noncombustible products on wooden or nonexpanded polyethylene solid deck pallets, in ordinary corrugated cartons with or without single-thickness dividers, or in ordinary paper wrappings with or without pallets. Class I commodities are allowed to contain a limited amount of Group A plastics in accordance with Section 2303.7.4. Examples of Class I commodities include, but are not limited to, the following:

Alcoholic beverages not exceeding 20-percent alcohol
Appliances noncombustible, electrical
Cement in bags
Ceramics
Dairy products in nonwax-coated containers (excluding bottles)
Dry insecticides
Foods in noncombustible containers
Fresh fruits and vegetables in nonplastic trays or containers
Frozen foods
Glass
Glycol in metal cans
Gypsum board
Inert materials, bagged
Insulation, noncombustible
Motor vehicles less than 6500 pounds empty curb weight
Noncombustible liquids in plastic containers having less than a 5-gallon (19 L) capacity
Noncombustible metal products

Reason: (IBC) Automated, mechanical-access parking garages are finding their way into the U.S. market from Europe and Asia. These facilities utilize computer-controlled machines and lifts to store and retrieve vehicles on a platform without the engine running and without human intervention in an unoccupied, high-bay storage vault. They have unique fire and life safety issues and as such need a separate code section to define the code requirements for these unique facilities.

(IFC) Automated, mechanical-access parking garages are finding their way into the U.S. market from Europe and Asia. These facilities utilize computer-controlled machines and lifts to store and retrieve vehicles without the engine running and without human intervention in an unoccupied, high-bay storage vault. They have unique fire and life safety issues that are similar to high piled storage of commodities covered by Chapter 23 of the IFC and therefore should be included in this Chapter. The reference below indicates that the amount of combustibles in a typical passenger vehicle is less than 5 pounds per sf, which then classifies passenger vehicles as low hazard in accordance with NIST standards and qualifies as a Class I commodity in this section.

References: *Parking Structure Fires* by the Parking Consultants Council of the National Parking Association, Washington, DC, December 2008

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Paul K. Heilstedt, PE, Chair, representing ICC Code Technology Committee (CTC)

Revise as follows:

SECTION 407
GROUP I-2

407.1 General. Occupancies in Group I-2 shall comply with the provisions of Sections 407.1 through 407.9 and other applicable provisions of this code.

407.2 Corridors. Corridors in occupancies in Group I-2 shall be continuous to the exits and separated from other areas in accordance with Section 407.3 except spaces conforming to Sections 407.2.1 through 407.2.4.

407.2.1 Waiting and similar areas. Waiting areas and similar spaces constructed as required for corridors shall be permitted to be open to a corridor, only where all of the following criteria are met:

1. The spaces are not occupied for ~~patient~~ care recipient's sleeping units, treatment rooms, hazardous or incidental accessory occupancies in accordance with Section 508.2.
2. The open space is protected by an automatic fire detection system installed in accordance with Section 907.
3. The corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with Section 907, or the smoke compartment in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
4. The space is arranged so as not to obstruct access to the required exits.

407.2.2 ~~Nurses'~~ Care providers' stations. Spaces for care providers', supervisory staff, doctors' and nurses' charting, communications and related clerical areas shall be permitted to be open to the corridor, when such spaces are constructed as required for corridors.

407.2.3 ~~Mental health~~ Psychiatric treatment areas. Areas wherein ~~mental health~~ psychiatric ~~patient~~ care recipient's who are not capable of self-preservation are housed, or group meeting or multipurpose therapeutic spaces other than incidental accessory occupancies in accordance with Section 508.2.5, under continuous supervision by facility staff, shall be permitted to be open to the corridor, where the following criteria are met:

1. Each area does not exceed 1,500 square feet (140 m^2),
2. The area is located to permit supervision by the facility staff.
3. The area is arranged so as not to obstruct any access to the required exits.
4. The area is equipped with an automatic fire detection system installed in accordance with Section 907.2.
5. Not more than one such space is permitted in any one smoke compartment.
6. The walls and ceilings of the space are constructed as required for corridors.

407.2.4 Gift shops. Gift shops and associated storage that are less than 500 square feet (455 m^2) in area shall be permitted to be open to the corridor ~~provided the gift shop and storage areas are fully sprinklered and storage areas are protected in accordance with Section 508.2.5~~ when such spaces are constructed as required for corridors.

407.3 Corridor walls. Corridor walls shall be constructed as smoke partitions in accordance with Section 711.

407.3.1 Corridor doors. Corridor doors, other than those in a wall required to be rated by Section 508.2.5 or for the enclosure of a vertical opening or an exit, shall not have a required fire protection rating and shall not be required to be equipped with self-closing or automatic-closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted. Other doors shall conform to Section 715.4.

407.3.2 Locking devices. Locking devices that restrict access to the ~~patient~~ care recipient's room from the corridor, and that are operable only by staff from the corridor side, shall not restrict the means of egress from the ~~patient~~ care recipient's room.

Exceptions:

1. This section shall not apply to rooms in psychiatric treatment and similar care areas.
2. Locking arrangements in accordance with Section 1008.1.9.6.

407.4 Smoke barriers. Smoke barriers shall be provided to subdivide every story used by ~~patients for~~ persons receiving care, ~~sleeping or~~ treatment or sleeping and to divide other stories with an occupant load of 50 or more persons, into at least two smoke compartments. Such stories shall be divided into smoke compartments with an area of not more than 22,500 square feet (2092 m^2) and the travel distance from any point in a smoke compartment to a smoke barrier door shall not exceed 200 feet (60 960 mm). The smoke barrier shall be in accordance with Section 710.

407.4.1 Refuge area. ~~At least 30 net square feet (2.8m^2) per patient shall be provided the aggregate area of corridors, patient rooms, treatment rooms, lounge or dining areas and other low-hazard areas on each side of each smoke barrier. On floors not housing patients confined to a bed or litter, at least 6 net square feel (0.56 m^2) per occupant shall be provided on each side of each smoke barrier for the total number of occupants in adjoining smoke compartments.~~ Refuge areas shall be provided within each smoke compartment. The size of the refuge area shall accommodate the occupants and care recipients from the adjoining smoke compartment. Where a smoke compartment is adjoined by two or more smoke compartments, the minimum area of the refuge area shall accommodate the largest occupant load of the adjoining compartments. The size of the refuge area shall provide the following:

1. A minimum of 30 net square feet (2.8m^2) per care recipient confined to bed or litter.
2. A minimum of 6 square feet (0.56m^2) per ambulatory care recipient not confined to bed or litter and for occupants.

Areas or spaces permitted to be included in the calculation of refuge area are corridors, sleeping areas, treatment rooms, lounge or dining areas and other low hazard areas.

407.4.2 Independent egress. A means of egress shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of egress originated.

407.4.3 Horizontal assemblies. *Horizontal assemblies* supporting *smoke barriers* required by this section shall be designed to resist the movement of smoke and shall comply with Section 712.9.

[F] 407.5 Automatic sprinkler system. Smoke compartments containing ~~patient~~ sleeping units shall be equipped throughout with an automatic fire sprinkler system in accordance with Sections 903.3.1.1 and 903.3.2. ~~The smoke compartments shall be equipped with *approved* quick-response or residential sprinklers in accordance with Section 903.3.2.~~

[F] 407.6 Fire alarm system. A fire alarm system shall be provided in accordance with Section 907.2.6.

[F] 407.7 Automatic fire detection. Corridors in nursing homes ~~(both intermediate care and skilled nursing facilities)~~, long-term care facilities, detoxification facilities and spaces permitted to be open to the corridors by Section 407.2 shall be equipped with an automatic fire detection system. Hospitals shall be equipped with smoke detection as required in Section 407.2.

Exceptions:

1. Corridor smoke detection is not required where ~~patient~~ sleeping units are provided with smoke detectors that comply with UL 268. Such detectors shall provide a visual display on the corridor side of each ~~patient~~ sleeping unit and an audible and visual alarm at the ~~nursing~~ care provider's station attending each unit.
2. Corridor smoke detection is not required where ~~patient~~ sleeping unit doors are equipped with automatic door-closing devices with integral smoke detectors on the unit sides installed in accordance with their listing, provided that the integral detectors perform the required alerting function.

407.8 Secured yards. Grounds are permitted to be fenced and gates therein are permitted to be equipped with locks, provided that safe dispersal areas having 30 net square feet (2.8 m^2) for bed and litter ~~patients~~ care recipients and 6 net square feet (0.56 m2) for ambulatory ~~patients~~ care recipients and other occupants are located between the building and the fence. Such provided safe dispersal area shall not be located less than 50 feet (15 240 mm) from the building they serve.

407.9 Hyperbaric facilities. Hyperbaric facilities in Group I-2 occupancies shall meet the requirements contained in Chapter 20 of NFPA 99.

1008.1.9.6 (IFC [B] 1008.1.9.6) Special locking arrangements in Group I-2. Approved special ~~delayed~~ egress locks shall be permitted in a Group I-2 occupancy where the clinical needs of persons receiving care require such locking. Special ~~Delayed~~ egress locks shall be permitted in such occupancies where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an approved automatic smoke or heat detection system installed in accordance with Section 907, provided that the doors are installed ~~unlock~~ in accordance with Items 1 through ~~6~~ 7 below. ~~A building occupant shall not be required to pass through more than one door equipped with a delayed egress lock before entering an exit.~~

1. The doors unlock upon actuation of the automatic sprinkler system or automatic fire detection system.
2. The doors unlock upon loss of power controlling the lock or lock mechanism.
3. The door locks shall have the capability of being unlocked by a signal from the fire command center, a nursing station or other approved location.
4. A building occupant shall not be required to pass through more than one door equipped with a special egress lock before entering an exit.
5. ~~4~~. The procedures for the operation(s) of the unlocking system shall be described and approved as part of the emergency planning and preparedness required by Chapter 4 of the *International Fire Code*.
6. ~~5~~. All clinical staff shall have the keys, codes or other means necessary to operate the locking devices.
7. ~~6~~. Emergency lighting shall be provided at the door.

Exception: Items 1 through ~~3~~ 4 shall not apply to doors to areas where persons which because of clinical needs require restraint or containment as part of the function of a ~~mental hospital treatment facility~~ psychiatric treatment areas.

1106.3 Hospital outpatient facilities. At least 10 percent, but not less than one, of ~~patient~~ care recipient and visitor parking spaces provided to serve hospital outpatient facilities shall be *accessible*.

1106.4 Rehabilitation facilities and outpatient physical therapy facilities. At least 20 percent, but not less than one, of the portion of ~~patient~~ care recipient and visitor parking spaces serving rehabilitation facilities specializing in treating conditions that affect mobility and outpatient physical therapy facilities shall be *accessible*.

TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: • Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. • Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250. • Buildings and other structures containing adult education facilities, such as colleges and universities with an occupant load greater than 500. • Group I-2 occupancies with an occupant load of 50 or more resident ~~patients~~ care recipients but not having surgery or emergency treatment facilities. • Group I-3 occupancies. • Any other occupancy with an occupant load greater than 5,000a. • Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Occupancy Category IV. • Buildings and other structures not included in Occupancy Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released.

(Portions of table not shown remain unchanged)

(Portions of table not shown remain unchanged)

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as:

> Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Day Care Facilities, Section 305.3 and related sections: This public comment represents the collaborative efforts of the CTC Study Group on Care to clarify the scope and intent of the code as it applies to the subject of when care is provided and what are the appropriate elements of the building code to address the risks associated with Day Care. Changes to modify the existing language include:

- Changing the provisions for religious educational facilities to become an exception.
- Adding a definition section for the educational group and moving the definition of personal care services from 310.2 to 305.2, clarifying the day care as a day care facility, and adding the correlation to classify that a Group E, day care facility with five or fewer is allowed in an R-3 or may be constructed per the IRC.
- Adding clarifications to the I-4 Group to include both adult and child day care services, and adding an exception for such services within a place of worship, and clarifying that day care facility with five or fewer is allowed in an R-3 or may be constructed per the IRC.
- Correlating the requirements for fire suppression in Chapter 9 with the provisions for day care.
- Clarifying the requirement for means of egress from day care where more than 10 children receive care.
- Removing the occupancy group designations from the scoping criteria in Chapter 11 as being unnecessary, C
- Clarifying that the plumbing table is applicable for day care, and that the exclusion for partitions is meant to apply to child day care, not all day care.

Issues concerning the multitude of occupancies, conflicting criteria and/or confusion between the occupancies identified as "Day Care vs. Child or Adult Day Care" were the initial impetus for the study of care. The overlap and inconsistencies for all types of care were eventually included once the true scope of the issues was recognized.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HEILSTEDT-G1-407.doc

G66–09/10
407.3.1

Proponent: Robert J Davidson, Code Consultant, Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

407.3 Corridor walls. *Corridor* walls shall be constructed as smoke partitions in accordance with Section 711.

407.3.1 Corridor doors. ~~*Corridor* doors, other than those in a wall required to be rated by Section 508.2.5 or for the enclosure of a vertical opening or an *exit*, shall not have a required *fire protection rating* and shall not be required to be equipped with self-closing or automatic-closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted. Other doors shall conform to Section 715.4.~~ Doors in corridors shall comply with Section 715.4 in the following locations:

1. Doors located in a wall required to be rated by Section 508.2.5;
2. Doors opening into an enclosure of a vertical opening or an exit; and
3. Doors in corridors in assisted living facilities.

Doors in corridors not listed above shall not be required to have a fire protection rating and shall not be required to be equipped with self-closing or automatic-closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted

Reason: This proposal takes the exception language found within the body of Section 407.3.1 and breaks it out into exceptions 1 and 2. Exception 3 is added to provide an appropriate level of protection for occupants of assisted living facilities, many of whom require assistance to evacuate. For this occupancy smoke migration must be controlled until the occupants can be evacuated and for the migration to be controlled the doors must self closing. The purpose of the rating is to recognize that fires starting in a patient's room must be contained until extinguished to protect the corridor and the remaining portions of the occupancy.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: This proposal is related to Davidson/Shuman proposal to Section 308 which relocates assisted living facilities from Group I-1 to the I-2 Occupancy category.

Proponent: Ron Clements, Chesterfield County Virginia Building Inspection Department, representing self; Bill Conner, representing American Society of Theatre Consultants

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

1. Revise as follows:

SECTION 410
STAGES, ~~AND~~ PLATFORMS AND TECHNICAL PRODUCTION AREAS

410.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

~~**FLY GALLERY.** A raised floor area above a stage from which the movement of scenery and operation of other stage effects are controlled.~~

~~**GRIDIRON**. The structural framing over a stage supporting equipment for hanging or flying scenery and other stage effects.~~

TECHNICAL PRODUCTION AREA. Open elevated areas or spaces intended for entertainment technicians to walk on and occupy for servicing and operating entertainment technology systems and equipment. Galleries, including fly and lighting galleries, gridirons, catwalks, and similar areas are designed for these purposes.

(Remaining definitions are unchanged)

2. Delete text as follows:

~~**Section 410.5.3 Stage Exits**. At least one approved means of egress shall be provided from each side of the stage and from each side of the space under the stage. At least one means of escape shall be provided from each fly gallery and from the gridiron. A steel ladder, alternating tread stairway or spiral stairway is permitted to be provided from the gridiron to a scuttle in the stage roof.~~

3. Add text as follows:

410.6 Means of egress. Except as modified or as provided for in this section, the provisions of Chapter 10 shall apply.

410.6.1 Arrangement. Where two or more exits or exit access doorways are required per Section 1015.1 from the stage, at least one exit or exit access doorway shall be provided on each side of a stage.

410.6.2 Stairway and ramp enclosure. Stairways and ramps provided from stages, platforms and technical production areas are not required to be enclosed.

410.6.3 Technical production areas. Technical production areas shall be provided with means of egress andmeans of escape in accordance with Section 410.6.3.1 through 410.6.3.5.

410.6.3.1 Means of egress. At least one means of egress shall be provided from technical production areas.

410.6.3.2 Travel distance. The maximum length of exit access travel shall not exceed 300 feet (91.44 mm) for buildings without a sprinkler system and 400 feet (121.92 m) for buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

410.6.3.3 Two means of egress. Where two means of egress are required the common path of travel shall not exceed 100 feet (30.48 m).

Exception: A means of escape to a roof in place of a second means of egress is permitted.

410.6.3.4 Path of egress travel. The following exit access components are permitted when serving technical production areas:

1. Stairways
2. Ramps
3. Spiral stairways
4. Catwalks
5. Alternating tread devices
6. Permanent ladders

410.6.3.5 Width. The path of egress travel within and from technical support areas shall be a minimum of 22 inches (559 mm).

(Renumber subsequent sections)

4. Revise as follows:

1009.7 Vertical rise. A flight of stairs shall not have a vertical rise greater than 12 feet (3658 mm) between floor levels or landings.

Exceptions:

1. Aisle stairs complying with Section 1028.
2. Alternating tread devices used as a means of egress shall not have a rise greater than 20 feet (6096 mm) between floor levels or landings.
3. Spiral stairways used as a means of egress from technical production areas.

5. Delete without substitution as follows:

~~**1015. 6 (IFC [B] 1015.6) Stage means of egress.** Where two means of egress are required, based on the stage size or occupant load, one means of egress shall be provided on each side of the stage.~~

~~**1015. 6.1 (IFC [B] 1015.6.1) Gallery, gridiron and catwalk means of egress.** The means of egress from lighting and access catwalks, galleries and gridirons shall meet the requirements for occupancies in Group F-2.~~

~~**Exceptions:**~~

1. ~~A minimum width of 22 inches (559 mm) is permitted for lighting and access catwalks.~~
2. ~~Spiral stairs are permitted in the means of egress.~~
3. ~~Stairways required by this subsection need not be enclosed.~~
4. ~~Stairways with a minimum width of 22 inches (559 mm), ladders, or spiral stairs are permitted in the means of egress.~~
5. ~~A second means of egress is not required from these areas where a means of escape to a floor or to a roof is provided. Ladders, alternating tread devices or spiral stairs are permitted in the means of escape.~~
6. ~~Ladders are permitted in the means of egress.~~

6. Revise as follows:

1022.1 (IFC [B] 1022.1) Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. Exit enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. In all occupancies, other than Group Hand I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.
   1.1. The stairway is open to not more than one story above its level of exit discharge; or
   1.2. The stairway is open to not more than one story below its level of exit discharge.
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
4. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
5. Stairways in Group I-3 occupancies, as provided for in Section 408.3.8, are not required to be enclosed.
6. Means of egress stairways as ~~required by Sections 410.5.3 and 1015.6.1~~ provided for in Sections 410.6.2 are not required to be enclosed.
7. Means of egress stairways from balconies, galleries or press boxes as provided for in Section 1028.5.1 are not required to be enclosed.

Reason: Currently special means of egress provisions for stages are located in two separate sections and chapters, Section 410.5.3 and 1015.6. The separate sections are in conflict with one another and are not consistent in terminology . Section 410.5.3 requires two exit access routes, one from each side of the stage regardless of occupant load or travel distance. Section 1015.6, however, allows a singe exit or exit access route if common path of travel and occupant load limits per table 1015.1 are met. Section 410.5.3 allows a singe exit or exit access from the fly gallery or the gridiron without a travel distance restriction. Section 1015.6.1 requires the means of egress for the gallery and gridiron to meet means of egress provisions for F-2, which can require multiple exits or exit access routes and limits the travel distance per group F-2 requirements. Current section 1015.6.1 also refers to gallery instead of the currently defined term fly gallery that is referenced in Section 410.5.3.

The proposed change removes the dated terms and definitions of fly gallery and gridiron and replaces them with a single modern term "Technical Production Area". Technical production area encompasses all areas, regardless of their traditional name, used to support entertainment technology from above the performance area. Technical production areas may also be used is venues without stages or platforms, such as sports arenas; therefore it was added to the title of Section 410 as a stand-alone area regulated by proposed Section 410.7.

Proposed sections 410.6 through 410.7.4.1 will completely replace the conflicting sections 410.5.3 and 1015.6 providing a single coordinated set of means of egress requirements for stages, platforms and technical production areas. The proposed section 410.6 language " Except as modified or as provided for in this section, the provisions of Chapter 10 shall apply" removes a need for any pointers or exceptions in Chapter 10 and the language was modeled from existing Group I-3 language in Section 408.3 so the language is consistent with language already in Chapter 4 used for the same purposed.

Section 410.6.1 retains the current Section 1015.6 concept of requiring the number of exits based on occupant load and travel distance per Section 1015 and keeps the current concept that if 2 means of egress are required from the stage, per Section 1015, then they must be located on either side of the stage. The reference to the space under the stage was deleted as this provision was also a bit outdated because modern configurations of spaces below stages are extremely variable.

Proposed Section 410.7 and sub sections sets specific performance based requirements for all technical production areas, regardless of their name or label. This proposal clarifies that both the travel distance and the common path of travel limits apply. The 100' common path of travel was chosen since stages are generally in sprinklered buildings. The 300' and 400' travel distances were based on the current group F-2 designation assigned to galleries in current Section 1015.6.1. The second egress means of escape is based on current Section 410.5.3 and 1015.6.1 exception #5. The permitted exit access components allowed for serving the technical production and the 22" width in proposed Section 410.7.1 are based on current Section 1015.6.1. The allowance for the use of a ladder in the means of egress serving a fly gallery was changed to require the ladder be permanently installed so that a movable ladder cannot be used for egress.

In Section 1009.7 exception #3 is proposed to address the special case of spiral stairs serving technical production areas without the need for the landing at 12' intervals.

Section 1015.6 is proposed to be removed entirely. The code change puts the special detailed requirements for stage, platform and technical production area means of egress completely in Chapter 4. The reason that the two sections, one in Chapter 4 and one in Chapter 10, were in conflict is because having the provisions in two separate code text locations set up the scenario where changes were not made to each section to keep them synchronized. Special provisions of Chapter 4 do not need to be repeated in the code.

Exception #6 to 1022.1 is deleted and replaced with a reference to proposed Sections 410.6.2.

Cost Impact: The code change proposal will reduce the cost of construction by allowing for smaller stages to be constructed with one exit or exit access instead of two. Additional cost savings will be provided by the reduced confusion and misapplication of the code provisions for stage means of egress; inconsistent and confusion code provisions cost extra money to the code users.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

410.2, 410.3.2

Proponent: Bill Conner, representing American Society of Theatre Consultants

1. Delete without substitution:

410.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

~~**PINRAIL.** A rail on or above a stage through which belaying pins are inserted and to which lines are fastened.~~

2. Revise as follows:

410.3.2 Galleries, gridirons~~,~~ and catwalks ~~and pinrails~~. Beams designed only for the attachment of portable or fixed theater equipment, gridirons, galleries and catwalks shall be constructed of approved materials consistent with the requirements for the type of construction of the building; and a fire-resistance rating shall not be required. These areas shall not be considered to be floors, stories, mezzanines or levels in applying this code.

Exception: Floors of fly galleries and catwalks shall be constructed of any approved material.

Reason: First, this is a nearly antiquated term and feature, replaced by modern lock-rails or completely by electric motors. Second, there is a definition in the Code and the use of the term in a heading of a section but no specific requirements or regulation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CONNER-G4-410.3.2

G69–09/10
410.3.7.1, 410.3.7.2

Proponent: Bill Conner, representing American Society of Theatre Consultants

Revise as follows:

410.3.7.1 Roof vents. Two or more vents constructed to open automatically by approved heat-activated devices and with an aggregate clear opening area of not less than 5 percent of the area of the stage shall be located near the center and above the highest part of the stage area. Supplemental means shall be provided for manual emergency opening ~~operation~~ of the ventilator and for non-emergency manual means to open and close the ventilator. Manual operation shall be possible from the stage floor or other approved location. Curbs shall be provided as required for skylights in Section 2610.2. Vents shall be labeled.

[F] 410.3.7.2 Smoke control. Smoke control in accordance with Section 909 shall be provided to maintain the smoke layer interface not less than 6 feet (1829 mm) above the highest level of the assembly seating or above the top of the proscenium opening where a proscenium wall is provided in compliance with Section 410.3.4. In addition to the manual control provided in accordance with Section 909.16, a manual control for the smoke control system shall be provided from the stage floor or other approved location.

Reason: The requirement to be able for a trained person on stage or the fire service to manual open the vents is fundamental to fire safety. The requirement for manual operation from the stage floor is included in the 1992 BCMC Report on Stages, Platforms, and Sound Stages and in NFPA 101 and 5000.

AThe system shall be activated independently by each of the following; (1) Activation of the sprinkler system in the stage area (2) by manually operated switch at an approved location.@

Fire modeling indicates that the time from a fire starting to detection for automatic operation may exceed 10 minutes. After sprinklers, high extract exhaust over the stage is the most important protection from fire hazards available, and at least anecdotally has been proven to be sufficient protection for very large fires, notably the Empire Palace Theatre in Edinburgh, Scotland, on 9 May 1911, where all 3000 theatre goers escaped without benefit of sprinklers or a fire safety curtain completely closing.

The ability to open and close the vents for testing seems obvious. Without the ability to test manually from the stage floor, and the imposition of having to send someone to the roof to literally push the vent closed, there is little likelihood of periodic testing.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: CONNER-G5-410.3.7.1

G70–09/10
[F] 410.6 (IFC 914.6.1)

Proponent: Bill Conner, representing American Society of Theatre Consultants

THIS PROPOSAL IS ON THE AGENDA OF THE IFC CODE DEVELOPMENT COMMITTEE. SEE THE TENATIVE HEARING ORDER FOR THE IFC CODE DEVELOPMENT COMMITTEE.

Revise as follows:

[F] 410.6 (IFC 914.6.1) Automatic sprinkler system. Stages and associated dressing rooms, performer lounges, shops, storerooms and technical production areas located within and adjoining a stage shall be equipped with an automatic ~~fire-extinguishing~~ sprinkler system in accordance with ~~Chapter 9~~ Section 903.3.1.1. ~~Sprinklers shall be installed under the roof and gridiron and under all catwalks and galleries over the stage. Sprinklers shall be installed in dressing rooms, performer lounges, shops and storerooms accessory to such stages.~~

Exceptions:

1. Sprinklers are not required under stage areas less than 4 feet (1219 mm) in clear height that are utilized exclusively for storage of tables and chairs, provided the concealed space is separated from the adjacent spaces by not less than 5/8-inch (15.9 mm) Type X gypsum board.
2. Sprinklers are not required for stages 1,000 square feet (93 m^2) or less in area and 50 feet (15 240 mm) or less in height where curtains, scenery or other combustible hangings are not retractable vertically. Combustible hangings shall be limited to a single main curtain, borders, legs and a single backdrop.
3. Sprinklers are not required within portable orchestra enclosures on stages.

Reason: Update language to be consistent with other parts of the code. This also provides a specific reference to Section 903.3.1.1 which contains the reference to the NFPA 13 requirements. The NFPA standard provides adequate information regarding the placement of sprinklers in the backstage and other technical production areas, and such language is not needed in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: **C**ode change G67-09/10 contains a definition of technical production areas.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CONNER-G1-410.6

G71 –09/10
412.4.6.2 (IFC 914.8.2.2)

Proponent: A. Hal Key, PE, Mesa, AZ Fire Department

THIS PROPOSAL IS ON THE AGENDA OF THE IFC CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IFC CODE DEVELOPMENT COMMITTEE.

Revise as follows:

412.4.6.2 (IFC 914.8.2.2) Separation of maximum single fire areas. Maximum single *fire areas* established in accordance with hangar classification and construction type in Table 412.4.6 shall be separated by 2-hour *fire walls* constructed in accordance with Section 706. In determining the maximum single fire area as set forth in Table 412.4.6, ancillary uses which are separated from aircraft servicing areas by a minimum of a one-hour *fire barrier* shall not be included in the area.

Reason: Many times there are ancillary areas associated with an aircraft hangar such as business offices, maintenance shops and storage areas. The intent of Section 412.4.6.2 is to establish the minimum requirements for fire suppression in an aircraft hangar servicing and storage area. The fire suppression requirements contained within NFPA 409 are primarily for the protection of aircraft within the servicing and storage area. The fire protection requirements in the ancillary areas are not as extensive as those required for the aircraft servicing and storage areas. This proposal is consistent with the requirements of NFPA 409.

Cost Impact: The code change proposal will not increase the cost of construction. This will reduce the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEY-G2-412.4.6.2

G72–09/10
414.5, 415.3 (New)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

THIS PROPOSAL IS ON THE AGENDA OF THE IFC CODE DEVELOPMENT CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES

1. Revise as follows:

[F] 414.5 Inside storage, dispensing and use. The inside storage, dispensing and use of hazardous materials ~~in excess of the maximum allowable quantities per control area of Tables 307.1(1) and 307.1(2)~~ shall be in accordance with Sections 414.5.1 through ~~414.5.5~~ 414.5.4 of this code and the *International Fire Code*.

[F] 414.5.1 Explosion control. Explosion control shall be provided in accordance with the *International Fire Code* as required by Table 414.5.1 where quantities of hazardous materials specified in that table exceed the maximum allowable quantities in Table 307.1(1) or where a structure, room or space is occupied for purposes involving explosion hazards as required by Section 415 or the *International Fire Code*.

[F] TABLE 414.5.1
EXPLOSION CONTROL REQUIREMENTS[a]

(No change to table contents)

[F] 414.5.2 Monitor control equipment. (No change to current text)

~~**[F] 414.5.3 Automatic fire detection systems.** Group H occupancies shall be provided with an automatic fire detection system in accordance with Section 907.2.~~

[F] ~~414.5.4~~ 414.5.3 Standby or emergency power. Where mechanical ventilation, treatment systems, temperature control, alarm, detection or other electrically operated systems are required by the *International Mechanical Code*, the *International Fire Code* or this code, such systems shall be provided with an emergency or standby power system in accordance with this code or the ICC Electrical Code.

Exceptions*: (Exceptions not shown remain unchanged.)*

[F] ~~415.5.5~~ 414.5.4 Spill control, drainage and containment. (No change to current text)

2. Add new text as follows:

[F] 415.3 Automatic fire detection systems. Group H occupancies shall be provided with an automatic fire detection system in accordance with Section 907.2.

(Renumber Section 415.3 and subsequent sections)

Reason: The main purpose of this change is to correct a conflict with the International Fire Code when Table 911.1 from the fire code was brought over and placed in the International Building Code as Table 414.5.1.

Table 911.1 in the fire code is applied where an explosion hazard exist regardless of the quantity of the hazardous material and where the quantity exceeds the maximum allowable quantity.

"911.1 General.
Explosion control shall be provided in the following locations:
1. Where a structure, room or space is occupied for purposes involving explosion hazards as identified in Table 911.1.
2. Where quantities of hazardous materials specified in Table 911.1 exceed the maximum allowable quantities in Table 2703.1.1(1)."

In reviewing Section [F] 414.5.1 Explosion Control the requirements of [F] Table 414.5.1 are intended to be applied:

"*in accordance with the International Fire Code as required by Table 414.5.1 where quantities of hazardous materials specified in that table exceed the maximum allowable quantities in Table 307.1(1), or,"*

" where a structure, room or space is occupied for purposes involving explosion hazards as required by Section 415 or the International Fire Code"

This language matches the intent of the fire code requirements, however, Section [F] 414.5 as currently written limits application of everything following to only those locations that exceed the MAQ. That is where the conflict lies.

This proposal strikes the reference to the maximum allowable quantities found in Section [F] 414.5 to eliminate the conflict and allow Section [F] 414.5.1 and [F] Table 414.5.1 to be applied consistent with the language found in [F] 414.5.1 and the International Fire Code. It also provides consistency with the overall scope of Section 414.0 which is to provide for requirements for all buildings and structures containing hazardous materials:

"[F] 414.1 General.
The provisions of this section shall apply to buildings and structures occupied for the manufacturing, processing, dispensing, use or storage of hazardous materials."

Section [F] 415.0 applies to occupancies exceeding the maximum allowable quantities:

"[F] 415.1 Scope.
The provisions of this section shall apply to the storage and use of hazardous materials in excess of the maximum allowable quantities per control area listed in Section 307.1. Buildings and structures with an occupancy in Group H shall also comply with the applicable provisions of Section 414 and the International Fire Code."

The proposal includes a change to move existing [F] 414.5.3 to [F] 415.4 since that section only applies to H Group occupancies and that is the scope of Section [F] 415.0. And the proposal suggests modifying Section [F] 414.5.4 by inserting the words "by the *International Mechanical Code*, the *International Fire Code* or this code" to ensure where ever any of the codes requires such systems in relation to the presence of hazardous materials the required safety systems are provided with stand-by or emergency power.,

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Proponent: Larry Fluer, Fluer, Inc*.* representing self

THESE PROPOSALS ARE ON THE AGENDA OF THE IFC CODE DEVELOPMENT COMMITTEE AS TWO SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

PART I – IBC GENERAL

1. Revise as follows:

[F] 415.3.1 Group H occupancy minimum fire separation distance. Regardless of any other provisions, buildings containing Group H occupancies shall be set back to the minimum fire separation distance as set forth in Items 1 through 4 below. Distances shall be measured from the walls enclosing the occupancy to lot lines, including those on a public way. Distances to assumed lot lines established for the purpose of determining exterior wall and opening protection are not to be used to establish the minimum fire separation distance for buildings on sites where explosives are manufactured or used when separation is provided in accordance with the quantity distance tables specified for explosive materials in the *International Fire Code*.

1. Group H-1. Not less than 75 feet (22 860 mm) and not less than required by the *International Fire Code*.

   Exception~~s~~:

   ~~1.~~ Fireworks manufacturing buildings separated in accordance with NFPA 1124.
   ~~2. Buildings containing the following materials when separated in accordance with Table 415.3.1:~~
   ~~2.1. Organic peroxides, unclassified detonable.~~
   ~~2.2. Unstable reactive materials, Class 4.~~
   ~~2.3. Unstable reactive materials, Class 3 detonable.~~
   ~~2.4. Detonable pyrophoric materials.~~

2. Group H-2. Not less than 30 feet (9144 mm) where the area of the occupancy exceeds 1,000 square feet (93 m^2) and it is not required to be located in a detached building.
3. Groups H-2 and H-3. Not less than 50 feet (15 240 mm) where a detached building is required (see Table 415.3.2).
4. Groups H-2 and H-3. Occupancies containing materials with explosive characteristics shall be separated as required by the *International Fire Code*. Where separations are not specified, the distances required shall be determined by a technical report issued in accordance with Section 414.1.3. ~~not be less than the distances required by Table 415.3.1.~~

2. Delete Table 415.3.1 without substitution:

~~[F] TABLE 415.3.1~~
~~MINIMUM SEPARATION DISTANCES FOR BUILDINGS CONTAINING EXPLOSIVE MATERIALS~~

PART II – IFC

Revise text as follows:

3904.1.2 Distance from detached ~~storage~~ buildings to exposures. In addition to the requirements of the *International Building Code*, detached storage buildings for Class I, II, III, IV and V organic peroxides shall be located in accordance with Table 3904.1.2. Detached buildings containing quantities of unclassified detonable organic peroxides in excess of those set forth in Table 2703.8.2 shall be located in accordance with Table 3304.5.2(1).

Reason: Section 415.3.1 was established to give direction to code users to determine location of buildings of Group H character. Users have frequently been confused as to application of Table 415.3.1 which was developed from the American Table of Distances, published by the Institute of Makers of Explosives. As the code evolved siting requirements for explosive materials were resolved with changes made to Chapter 33 of the IFC. Chapter 33 of the IFC contains specific requirements for each category of explosive material under consideration.

Exceptions to item 1 of Section 415.3.1 were intended to provide direction for specific materials as well as for specific occupancies. IBC Table 415.3.1 in application is now in conflict with requirements in the IFC for certain materials. With minor modification to the IFC and the proposed modifications to Section 415.3.1 the inconsistencies can be resolved. Deleting material specific classes of hazardous materials from the IBC results

in occupancy specific guidance in the building code with material specific requirements to be determined by the fire code. Deleting Table 415.3.1 is an essential part of the change that is needed to clarify the approach. This change will result in a consistent application of requirements for building location based on tabular distances or direction determined by the IFC.

The following requirements will apply with this correlating change. By removing Exception items 2.1 through 2.4 from item 1 of Section 415.3.1 the default distances will be found in the IFC as follows:

Hazard Class	Existing Reference	Required distances
Fireworks	Exception 1, item 1	NFPA 1124 (no change)
Organic peroxide, unclassified detonable	Exception 1, item 2.1	IFC Section 3904.1.2 (as proposed for revision)
Unstable reactive materials, Class 4	Exception 1, item 2.2	Indoors IFC 4304.1; Outdoors IFC 4304.2.1
Unstable reactive materials, Class 3 detonable	Exception 1, item 2.3	Indoors IFC 4304.1; Outdoors IFC 4304.2.2
Detonable pyrophoric materials	Exception 1, item 2.4	Indoors, as for H-1 materials. See item 1 (75 feet minimum); Outdoors IFC 4104.2.1

The modification to 415.3.1, item 4 only applies when the materials under consideration are not addressed by the IFC. In these rare circumstances a technical opinion and report is required under the authority granted to the code official by Section 414.1.3.

IFC Section 3904.1.2 has been modified to address the category of unclassified detonable organic peroxides. As the classification system for organic peroxides addresses finished goods e.g., Class I through Class V, the category of unclassified detonable organic peroxides addresses organic peroxides in the manufacturing process. Building siting for such materials is determined by IFC Table 3304.5.2(1). The resultant distances determined using Table 3304.5.2(1) are comparable with those obtained using existing IBC Table 415.3.1 and the approach is consistent with regulation established by NFPA 400 (NFPA's new hazardous materials code) for detonable organic peroxides. It should be noted that the modification to address unclassified detonable material applies to such materials in conditions of storage or use (includes manufacturing).

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: FLUER-G2-415.3.1 (NEW)

G74–09/10
[F] 415.3.2, [F]415.5, 508.1

Proponent: Larry Fluer, Fluer, Inc. and Patrick McLaughlin, McLaughlin & Associates, representing the Compressed Gas Association

THIS PROPOSAL IS ON THE AGENDA FOR THE IFC CODE DEVELOPMENT COMMITTEE. SEE THE TENATIVE HEARING ORDER FOR THE IFC CODE DEVELOPMENT COMMITTEE.

Revise as follows:

[F] 415.3.2 Group H-1 and H-2 or H-3 detached buildings. The storage or use of hazardous materials in excess of those amounts listed in Table 415.3.2 shall be in accordance with the applicable provisions of Sections 415.4 and 415.5.

[F] 415.3.2.1 Wall and opening protection. Where a detached building is required by Table 415.3.2, there are no requirements for wall and opening protection based on fire separation distance.

[F] 415.5 Special provisions for Group H-2 and H-3 occupancies. Group H-2 and H-3 occupancies containing quantities of hazardous materials in excess of those set forth in Table 415.3.2 shall be in detached buildings used for ~~no other purpose~~ manufacturing, processing, dispensing, use or storage of hazardous materials. ~~shall not exceed one story in height and shall be without basements, crawl spaces or other under-floor spaces.~~

Exception: The quantity of materials listed in Section 307.3 shall not exceed the maximum allowable quantity per control area in Table 307.1.(1).

[F] 415.5.1 Detached buildings. Detached buildings shall not exceed one story in height and shall be without basements, crawl spaces or other under-floor spaces.

[F] 415.5.2 Multiple hazards. Group H-2 or H-3 occupancies containing materials which are in themselves both physical and health hazards in quantities exceeding the maximum allowable quantities per control area in Table 307.1(2) shall comply with requirements for Group H-2, H-3 or H-4 occupancies as applicable.

[F] 415.5.3 Separation of incompatible materials. Hazardous materials other than those listed in Table 415.3.2 shall be allowed in manufacturing, processing, dispensing, use or storage areas when separated from incompatible materials in accordance with the provisions of the *International Fire Code*.

[F] 415.5.4 Water Reactives. Group H-2 and H-3 occupancies containing water-reactive materials shall be resistant to water penetration. Piping for conveying liquids shall not be over or through areas containing water reactives, unless isolated by approved liquid-tight construction.

Exception: Fire protection piping shall be permitted over or through areas containing water reactives without isolating it with liquid tight construction.

(Renumber subsequent sections)

508.1 General. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building contains more than one occupancy group, the building or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3 or 508.4, or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section 509.
2. Where required by Table 415.3.2, areas of Group H-1, H-2 and H-3 occupancies shall be located in a ~~separate and~~ detached building or structure.
3. Uses within live/work units, complying with Section 419, are not considered separate occupancies.

Reason: (**Regarding changes to Sec**. **415.3.2)** The quantity of materials in use are also considered in the application of Table 415.3.2 as it is common to have process operations or manufacturing operations where the quantities of regulated materials exceeds the tabular limits. The revision to create a subsection to set the requirements for wall and opening protection in detached buildings apart from the fundamental requirement to provide detached buildings is editorial. There is no change in technical content.

(Regarding changes to Sec. 415.5) A *Detached Building* is defined by Section 307.2 as follows:

DETACHED BUILDING. A separate single-story building, without a basement or crawl space, used for the storage or use of hazardous materials and located an approved distance from all structures.

Section 414.1 establishes the scope of operations addressed by the IBC to include the manufacturing, processing, dispensing, use or storage of hazardous materials. The requirements for detached buildings are triggered when the detached building threshold limits imposed by Table 415.3 are exceeded. This is done in order to limit the risk to other buildings or structures imposed by large quantities of various materials, and to prohibit the use of mixed occupancy buildings that contain offices, lunchrooms or occupancies other than those in Group H.

It is common to have mixed uses involving H-2, H-3 and H-4 materials which are stored or processed in the same building. In some cases flammable materials may be located in the same area as are toxic or highly toxic materials as well as those that may be oxidizing or otherwise reactive. Process areas typically limit the quantities of reactive and possibly incompatible materials in process operations with storage of these same materials isolated to individual storage rooms. It is not unusual for a process area to be classified as an H-2 Occupancy which may be used to mix, blend or process H-3 or H-4 materials which otherwise may be located in independent storage or manufacturing operations that are classified as either H-3 or H-4 Occupancies.

This concept was accepted by the IFC Code Development Committee with modifications to the requirements for detached buildings as contained in Chapter 27 of the IFC under code change Item F134-00. In addition revisions to the table title and the first row of Table 2703.8.2 and Table 415.3.2 (when coordinated) were accepted as changes by the IFC Code Development Committee under F134-00. Although the 2003 through 2009 Editions of the IFC and IBC don't reflect the change, the changes to the table titles have been included by erratum. The reason statement published by the Code Development Committee regarding the use of detached buildings is as follows:

> The manufacture and storage of hazardous materials are frequently integrated into a single building where storage is contained in the same building in which the material is manufactured. Additionally, it is not unusual for certain manufacturing buildings to contain multiple Group H uses where the threshold quantities are exceeded. The existing provisions imply that the only function that can occur within a detached building is storage to the exclusion of manufacturing, although in many cases the quantities used in manufacturing may also exceed the threshold levels where detached buildings would otherwise be required. Limiting the uses of identified hazardous materials to separate buildings containing only Group H uses maintains the intent of the code which is to isolate large quantities of certain physical hazard materials from uses other than those in Group H. The changes offered clarify rather than change the intent of the code.

Section 415.5 has been revised and reorganized to clarify the requirements and to create subsections that focus on the controls that may be applied while maintaining the concept addressed by the IFC Code Development Committee on code changes that were adopted into the IFC. The reasons for each of the subsections follow:

415.5 Exception (New). Materials listed in Section 307.3 are required to be in a Group H-1 occupancy when the MAQ is exceeded. These same materials are allowed in buildings of H-2 or H-3 character when contained in quantities not exceeding the MAQ.

415.5.1 Relocated text from existing 415.5 that separates limits on height, basements and under-floor spaces from the fundamental requirement addressing the activities that can be conducted in detached buildings.

415.5.2 (New). Requires that materials with both a physical and a health hazard comply with the requirements of either the Group H-2 or H-3 occupancy as well as the requirements that recognize the health hazard nature of a material. Similar language is found in paragraph two of Section 415.4. For example one could have nondetonable Class 3 Unstable Reactive materials that are also highly toxic. The area should be required to meet the requirements of a Group H-2 occupancy based on the physical hazards of these materials as well as the requirements of a Group H-4 occupancy to address the health hazards of these same materials. From a construction standpoint, the more restrictive provisions of the H-2 Occupancy will govern. In addition, the requirements for elements such as emergency power, ventilation and/or secondary containment imposed by the H-4 Occupancy will be imposed.

415.5.3 (New). Chemical process areas may contain a wide variety of hazardous materials including those that appear in Table 415.3.2. For example, it is not uncommon to mix toxic gases with pyrophoric gases, or to process or store flammable gases in areas where acetylene (Unstable Reactive Class 2) is present. Similar activities are conducted with various materials used throughout the chemical industry.

Accepting this code change will clarify the intent of the use of detached buildings that are used for manufacturing, processing, dispensing, using or storing hazardous materials which may be stored in various portions of the building which may have hazardous materials of different character. By limiting the building "solely" to hazardous materials operations it is intended that other uses be excluded. The revisions to Section 415.5 do not affect buildings of Group H-1 Occupancy as addressed by Section 415.4.

(Regarding changes to Sec. 508.1) The revision to delete the term "and separate" from Exception 2 to Section 508.1 is to clarify that a "detached building" be used when the detached threshold quantity limits of Table 415.3.2 have been exceeded. The requirements for detached H-1, H-2 or H-3 buildings are found in Sections 414.4 and 414.5 respectively. Revisions made to Section 415.5 recognize that a detached H-2 building can contain materials that would trigger the use of an H-3 occupancy when the maximum allowable quantity (MAQ) imposed by Table 307.1.(1) are exceeded. Literally interpreted an H-2 type of material that is comprised of H-2 and H-3 materials could not be manufactured in the same building. Changes to the IFC made under F134-00 recognize the unique character of detached buildings. Companion changes have been submitted to modify Section 414.5 for clarity.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Fluer-Mclaughlin-G1-415.3.doc

G75–09/10
[F] 415.8.5.2.2

Proponent: Joe Holland and Dave Bueche, Hoover Treated Wood Products

Revise as follows:

[F] 415.8.5.2.2 Liquid storage rooms. Liquid storage rooms shall be constructed in accordance with the following requirements:

1. Rooms in excess of 500 square feet (46.5 m^2) shall have at least one exterior door *approved* for the department access.
2. Rooms shall be separated from other areas by *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both. The *fire-resistance rating* shall be not less than 1 hour for rooms up to 150 square feet (13.9 m^2) in area and not less than 2 hours where the room is more than 150 square feet (13.9 m^2) in area.
3. Shelving, racks, and wainscoting in such areas shall be of noncombustible construction of wood of not less than 1 inch (25 mm) nominal thickness of fire-retardant-treated wood complying with Section 2303.2.
4. Rooms used for the storage of Class I flammable liquids shall not be located in a basement.

Reason: The purpose of using FRTW in this application is to recognize it ability to prevent the spread of fire. This ability is not dependent on a specific thickness. The span and the load placed on the shelf will dictate the thickness.

FRTW responds to a fire differently than untreated wood. It has a flame spread index significantly lower than untreated wood.

Depending on the species, untreated wood has an index of more than 70 to over 190. FRTW is required to have a flame spread index of 25 or less. The products in the market place have indexes of 15 or less. FRTW will produce significantly less smoke than untreated wood. It won't spread the fire and because of the treatment it will char and produce less heat than untreated wood.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOLLAND-BUECHE-G1-415.8.5.2.2.doc

G76–09/10
419.1, 419.1.1

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division

Revise as follows:

419.1 General. A live/work unit is a dwelling unit or sleeping unit ~~in~~ which ~~a significant portion of the space~~ includes a nonresidential use that is operated by the tenant. Live/work units ~~and~~ shall comply with Sections 419.1 through 419.8.

> **~~Exception:~~** ~~Dwelling or sleeping units that include an office that is less than 10 percent of the area of the dwelling unit shall not be classified as a live/work unit.~~

419.1.1 Nonresidental use limitations. ~~The following shall apply to all live/work areas~~ The nonresidential use portion of a live/work unit shall comply with all of the following:

1. ~~The live/work unit is permitted to be a maximum of 3,000 square feet (279 m2)~~ The nonresidential area shall be not less than 10 percent of the total area of the live/work unit;
2. The nonresidential area ~~is permitted to be a maximum 50 percent of the area of each live/work~~ shall not exceed 1,500 square feet (140 m^2) or shall not be more than 50 percent of the total area of the live/work unit, whichever is less;
3. The nonresidential area ~~function~~ shall be ~~limited to the first or main floor only of the live/work unit~~ located on an accessible route; and
4. A maximum of five nonresidential workers or employees ~~are~~ shall be allowed to occupy the nonresidential area at any one time.

Reason: The modifications to Sections 419.1 and 419.1.1 are related to establishing the size of the nonresidential area of the unit. The modification to Item 1 essentially relocates the deleted exception and establishes the minimum size of the nonresidential area required in order to be considered a live/work unit. Item 2 establishes a maximum size of the nonresidential area without regard to the residential portion of the unit. The modification to Item 2 is reasonable as it maintains the existing maximum size of the business use but does not limit the size of the residential portion of the unit as the residential portion of the unit is irrelevant to the intent of the section.

The modification to Item 3 allows the nonresidential use to be located on floors other than the main floor. While providing an accessible route via elevator or lift is costly, as is accessible means of egress per Section 419.3, the option should be available to the tenant.

The modification to Item 4 is editorial to provide consistent language throughout the section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WIEHLE-G1-419.1

G77–09/10
419.1.1

Proponent: John England, MCO, England Enterprises Inc., representing the Cities of Beaufort, Hardeeville

Revise as follows:

419.1.1 Limitations. The following shall apply to all live/work areas:

1. The live/work unit is permitted to be a maximum of 3,000 square feet (279 m^2);
2. The nonresidential area is permitted to be a maximum 50 percent of the area of each live/work unit;
3. The nonresidential area function shall be limited to the first or main floor only of the live/work unit; and
4. A maximum of five nonresidential workers or employees are allowed to occupy the nonresidential area at any one time.
5. The work unit is limited to B or M occupancy.

Reason: Any other occupancy may increase the hazardous conditions to the sleeping occupants. If the limit this to Group B and M ,and storage incidental to the Groups B and M; there is still provisions to have a small restaurant (under 50) on the premises

If there is no limits then the provisions are endless --

> Hazardous chemicals next to a dwelling unit.

> Commercial Garages would not have to be separated from dwelling units
> Warehouse with who know what next to a dwelling unit.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ENGLAND-G3-419.1.1.doc

G78–09/10
419.1.1

Proponent: Tom Rubottom, City of Westminster, representing the Colorado Chapter of ICC

Revise text as follows:

419.1.1 Limitations. The following shall apply to all live/work areas:

1. The live/work unit is permitted to be a maximum of 3,000 square feet (279 m^2);
2. The nonresidential area is permitted to be a maximum 50 percent of the area of each live/work unit;
3. The nonresidential area function shall be limited to the first or main floor only of the live/work unit; and
4. A maximum of five nonresidential workers or employees are allowed to occupy the non-residential area at any one time.
5. The nonresidential area is limited to a maximum occupant load of 49 as determined by Section 1004.

Reason: Section 419 does not include the provisions for the higher occupant loads such as door swing, number of exits, exit signs, emergency egress illumination and panic hardware.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

419.3 Means of egress. Except as modified by this section, ~~the provisions for R-2 occupancies in Chapter 10 shall apply to the entire live/work unit~~ the means of egress components for a live/work unit shall be designed in accordance with Chapter 10 for the function served.

419.3.1 Egress capacity. The egress capacity for each element of the live/work unit shall be based on the occupant load for the function served in accordance with Table 1004.1.1.

~~**419.3.2 Sliding doors.** Where doors in a means of egress are of the horizontal sliding type, the force to slide the door to its fully open position shall not exceed 50 pounds (220 N) with a perpendicular force against the door of 50 pounds (220 N).~~

~~**419.3.3**~~ **419.3.2 Spiral stairways.** Spiral stairways that conform to the requirements of Section 1009.9 shall be permitted.

~~**419.3.4 Locks.** Egress doors shall be permitted to be locked in accordance with Exception 4 of Section 1008.1.9.3.~~

419.7 Accessibility. Accessibility shall be designed in accordance with Chapter 11 for the function served.

Reason: There were a number of issues that were brought up in Palm Springs regarding the code change which introduced live/work units into the IBC. The concern was that Section 419 as written had major flaws and creates more problems than it solves for the following reasons.

Example: A 3,000 square foot live/work unit could contain a 1,500 square foot restaurant containing a 500 square foot kitchen and a 1,000 square foot dining area. Restaurants of this size would probably not require more than 5 employees.

The occupant load of the space would be Kitchen 500/200 = 3; Dining 1,000/15 = 67.

Section 419.2 would classify this area as Group R-2, rather than Group A-2.

Section 419.3 would require the means of egress to comply as a Group R-2 except for specific modifications made by Section 419.

Section 419 would not require panic hardware, egress illumination provided with emergency power, posting of occupant load, exits signs and enclosed stairways.

This same restaurant across the street or next door that did not have a dwelling unit connected would be required to comply.

This proposed change is relatively minor and would address these issues by requiring that the building comply with the means of egress and accessibility requirements for the function served, with some minor exceptions.

The sections allowing sliding doors and locks per exception #4 of 1008.1.9.3 were removed because they would not be consistent with the requirement to comply with means of egress for the function served.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAHONEY-G1-419.3

G80–09/10

419.9 (New)

Proponent: Tom Rubottom City of Westminster, Colorado representing the Colorado Chapter of ICC

Add new text as follows:

419.9 Plumbing facilities. The nonresidential area of the live/work unit shall be provided with minimum plumbing facilities as specified by Chapter 29, based on the function of the nonresidential area.

Reason: The current code requirements do not require toilet facilities for the work area of a live/work unit. Live/work units are classified as Group R-2 occupancies. The only toilet facilities now required are those for the dwelling unit which could be located on the upper floors and therefore there would be no requirements for any plumbing fixtures on the main level work area. The toilet room in the dwelling unit will not be accessible to the same standards as required for an accessible public toilet room in business and commercial occupancies. This code change would add language to make sure the work area would have the same minimum plumbing facilities (both for number of fixtures and for meeting accessibility requirements) as a typical commercial project.

Cost Impact: The code change proposal will increase the cost of construction.

2. Delete without substitution as follows:

~~**509.5 Groups R-1 and R-2 buildings of Type IIIA construction.** The height limitation for buildings of Type IIIA construction in Groups R-1 and R-2 shall be increased to six stories and 75 feet (22 860 mm) where the first floor assembly above the basement has a fire-resistance rating of not less than 3 hours and the floor area is subdivided by 2-hour fire-resistance-rated fire walls into areas of not more than 3,000 square feet (279 m^2).~~

~~**509.6 Groups R-1 and R-2 buildings of Type IIA construction.** The height limitation for buildings of Type IIA construction in Groups R-1 and R-2 shall be increased to nine stories and 100 feet (30 480 mm) where the building is separated by not less than 50 feet (15 240 mm) from any other building on the lot and from lot lines, the exits are segregated in an area enclosed by a 2-hour fire-resistance-rated fire wall and the first floor assembly has a fire-resistance rating of not less than $1^1/_2$ hours.~~

3. Revise as follows:

705.11 Parapets. Parapets shall be provided on *exterior walls* of buildings.

Exceptions:

1. through 4. (No change to current text)

5. In Groups ~~R-2 and~~ R-3 where the entire building is provided with a Class C roof covering, the exterior wall shall be permitted to terminate at the underside of the roof sheathing or deck in Type III, IV and V construction, provided:
   5.1. The roof sheathing or deck is constructed of *approved* noncombustible materials or of *fire-retardant-treated wood* for a distance of 4 feet (1220 mm); or
   5.2. The roof is protected with 0.625-inch (16 mm) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by a minimum of nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members for a minimum distance of 4 feet (1220 mm).
6. (No change to current text)

3. Add new text as follows:

707.3.10 Separation of dwelling units and sleeping units. The fire-resistance rating of the separation between individual dwelling units and sleeping units, and between dwelling units and sleeping units and other spaces in the building shall comply with Table 707.3.9.

Exception: In Group R-3 occupancies, walls separating dwelling units in the same building, walls separating sleeping units in the same building, and walls separating dwelling units or sleeping units in the same building shall be a fire-resistance-rating in accordance with Section 709.3.

4. Revise as follows:

709.3 Fire-resistance rating. Fire partitions shall have a fire-resistance rating of not less than 1 hour.

Exceptions~~:~~

~~1.~~ Corridor walls permitted to have a $^1/_2$ hour fire-resistance rating by Table 1018.1.
~~2. Dwelling unit and sleeping unit separations in buildings of Type IIB, IIIB and VB construction shall have fire-resistance ratings of not less than $^1/_2$ hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.~~

709.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. If the partitions are not continuous to the sheathing, deck or slab, and where constructed of combustible construction, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 717.2 and 717.3 at the partition line. The supporting construction shall be protected to afford the required fire-resistance rating of the wall supported, except for walls separating tenant spaces in covered mall buildings, ~~walls separating dwelling units, walls separating sleeping units~~ and corridor walls in buildings of Type IIB, IIIB and VB construction.

Exceptions:

1. through 4. (No change to current text)
~~5. Fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four stories above grade plane, provided the attic space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m^2) or above every two dwelling units, whichever is smaller.~~
5. ~~6.~~ (No change to current text)

717.3.2 Groups ~~R-1, R-2~~, R-3 and R-4. Draftstopping shall be provided in floor/ceiling spaces ~~in Group R-1 buildings, in Group R-2 buildings with three or more dwelling units,~~ in Group R-3 buildings with two dwelling units and in Group R-4 buildings. Draftstopping shall be located above and in line with the dwelling unit and sleeping unit separations.

Exceptions:

1. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2, provided that automatic sprinklers are also installed in the combustible concealed spaces.

5. Delete without substitution:

~~**717.4.2 Groups R-1 and R-2.** Draftstopping shall be provided in *attics*, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more *dwelling units* and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, *sleeping unit* and *dwelling unit* separation walls that do not extend to the underside of the roof sheathing above.~~

~~**Exceptions:**~~

1. ~~Where *corridor* walls provide a *sleeping unit* or *dwelling unit* separation, draftstopping shall only be required above one of the *corridor* walls.~~
2. ~~Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~
3. ~~In occupancies in Group R-2 that do not exceed four *stories above grade plane*, the *attic* space shall be subdivided by draftstops into areas not exceeding 3,000 square feet (279 m_2) or above every two *dwelling units*, whichever is smaller.~~
4. ~~Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers are also installed in the combustible concealed spaces.~~

Reason: Though the loss of life from fires affecting Group I-1, R-1 and R-2 occupancies is not high the amount of property damage continues to remain high. To reduce this loss this proposal modifies the requirements for Group I-1, R-1and R-2 occupancies to require that all buildings constructed for these occupancies shall be constructed of non-combustible construction and the fire rated separations between sleeping and dwelling units shall be a minimum of 2-hour fire resistance rating. The removal of combustible materials from the building construction and the increase in the fire resistance provides a much higher degree of protection to property in the event of a fire. In addition, when occupants in these types of buildings are sleeping they are less likely to be aware of conditions around them. Fires occurring during these times pose a high risk to the occupants. This increase in the fire resistance provides a higher degree of protection to sleeping occupants in reducing the spread of fire.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Thompson-G4-419

G82–09/10
424 (New)

Proponent: Mike Ashley CBO, representing: The Alliance for Fire & Smoke Containment & Control, Inc. (AFSCC)

1. Add new section as follows:

SECTION 424
TENANT SEPARATIONS

424.1 General. Buildings containing multiple tenants shall comply with the provisions of Sections 424.1 through 424.3 and other applicable provisions of this code.

Exception. Tenant spaces located in covered mall or open mall buildings shall comply with Section 402.7.2

424.2 Tenant separation walls. Walls separating tenant spaces required to have two or more exits or exit access doorways by Section 1015.1 shall be constructed as fire partitions in accordance with Section 709.

424.3 Automatic sprinkler system modifications. In buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the walls required by Section 424.2 shall be permitted to be constructed as smoke partitions in accordance with Section 711.

424.3.1 Doors. Doors protecting openings in the smoke partitions shall comply with Sections 711.5.2, 711.5.3, and 715.4.8.1

424.3.2 Air transfer openings. Air transfer openings in the smoke partitions shall not be required to be protected with a smoke damper where a fire damper is provided in accordance with Section 716.5.4.

2. Revise text as follows:

709.1 General. The following wall assemblies shall comply with this section.

1. Walls separating dwelling units in the same building as required by Section 420.2.
2. Walls separating sleeping units in the same building as required by Section 420.2.
3. Walls separating tenant spaces in covered mall buildings as required by Section 402.7.2.
4. Corridor walls as required by Section 1018.1.
5. Elevator lobby separation as required by Section 708.14.1.
6. Walls separating tenant spaces as required by Section 424.2.

709.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. If the partitions are not continuous to the sheathing, deck or slab, and where constructed of combustible construction, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 717.2 and 717.3 at the partition line. The supporting construction shall be protected to afford the required fire-resistance rating of the wall supported, except for walls separating tenant spaces, ~~in covered mall buildings, walls separating~~ dwelling units, ~~walls separating~~ sleeping units and corridors ~~walls~~ in buildings of Type IIB, IIIB, and VB construction.

Exceptions:

1. The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Where the room-side fire-resistance-rated membrane of the corridor wall is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the corridor shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.
3. Where the corridor ceiling is constructed as required for the corridor walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.
4. The fire partitions separating tenant spaces in a covered mall building~~,~~ complying with Section 402.7.2~~,~~ are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in attic or ceiling spaces above tenant separation walls in covered mall buildings.
5. Fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four stories above grade plane, provided the attic space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m^2) or above every two dwelling units, whichever is smaller.
6. Fireblocking or draftstopping is not required at the partition line in buildings equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces.

Reason: This proposed code change is a follow up to Code Change FS71-07/08 which was submitted by the Alliance for Fire and Smoke Containment and Control (AFSCC). A Public Comment was also submitted by the AFSCC for approval as submitted but it did not achieve the necessary two-thirds affirmative vote of the Class A voting members at the Final Action Hearings in Minneapolis. So it was disapproved.

This version takes a slightly different approach to the 1-hour tenant separation requirement by allowing for a reduction in the tenant separation construction from a 1-hour fire partition to a non-rated smoke partition in accordance with Section 711 when the building is protected throughout with an NFPA 13 sprinkler system. However, it does require the doors in the smoke partition to be smoke- and draft-control type doors with self-closing or automatic-closing devices and latches. These need to be specified for smoke partitions where they are desired since Section 711 does not contain these specific requirements. That's because Section 711 defers to other sections of the code to specify them. Also, a fire damper is allowed to be substituted for the more expensive smoke damper required for air transfer openings in these smoke partitions as a part of the sprinkler modifications. It should also be noted that fire and/or smoke dampers are not specifically required by Section 711 for duct penetrations of smoke partition walls. Since individual tenants are generally served by "express" ducts which serve that tenant only and have no openings into adjacent tenant spaces, in a sprinklered building it would not be necessary to provide a smoke damper or fire damper in a duct penetration of a tenant separation wall.

Section 709.4 Continuity has also been revised to allow for the supporting construction for these 1-hour tenant separation walls to not be fire-resistance-rated when the building is constructed of Types IIB, IIIB, or VB construction. This is consistent with the requirements for walls separating tenant spaces in covered mall buildings, dwelling and sleeping unit separation walls in Group I-1 and R occupancies, and 1-hour corridor walls.

Basically, the intent of the 1-hour tenant separation wall is to provide some minimal built-in fire-resistive protection between tenants in the early stages of fire development to protect the tenants until the fire department can arrive and suppress the fire. This provides additional life safety to the occupants of the tenant spaces adjacent to the tenant space on fire by giving them more time to react and evacuate. It also provides for property protection of the adjacent tenants so that a fire in a neighboring tenant will not necessarily put the adjacent tenants out of business.

One-hour tenant separation walls will also assist the responding fire department in fighting fires in multi-tenant buildings. Fire fighters can focus on containing a fire within the individual tenant space utilizing the 1-hour tenant separation walls to assist them in their fire fighting activities. This can also help them with their rescue and evacuation efforts as well, by providing additional time for the fire fighters to do their search and rescue operations while the fire is contained within the individual tenant space. And the 1-hour tenant separations can also provide for a temporary area of refuge for fire fighters. Should a fire get out of control, they can retreat into an adjacent tenant space if they cannot get direct access to the exterior.

Then they can set up a defensive position in an effort to prevent the fire from spreading to other tenants by relying on the 1-hour tenant separation to help contain the fire or at least slow down its rate of spread throughout the floor.

This code change triggers the requirement for the 1-hour tenant separation based on a tenant space requiring at least two means of egress or exits. For example, in Group B office buildings this would be triggered when a tenant space is greater than 5,000 sq ft in area. For a Group M Mercantile occupancy on the first floor or basement levels, the 1-hour tenant separation would be triggered once the space was greater than 1,500 sq ft. For all other levels in a Group M building, the tenant separation requirement would be triggered at 3,000 sq ft.

This tenant separation approach is consistent with the tenant separation requirements for covered mall buildings, as well as for the dwelling and sleeping unit separations in Group I-1, R-1, R-2, and R-3 occupancies. It is also consistent with the 1-hour corridor wall requirements in Section 1018. It makes sense that if 1-hour corridors are required to serve occupant loads greater than 30 for most occupancies in nonsprinklered buildings, then the tenant separations between adjacent enclosed tenant spaces requiring two exits or means of egress doorways out of the tenant spaces should also be provided with 1-hour fire-resistance ratings for those tenant separations. Obviously, the corridor also provides a tenant separation for the tenants on opposite sides of the corridor.

This code change also clarifies that it only applies to enclosed tenant spaces so it does not impact conditions where there is a large open space with multiple tenants utilizing that space, such as in the front of a Costco or in a food court in a covered mall.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: If approved, this section would be located following Section 420 which provides requirements for dwelling and sleeping unit separations.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ASHLEY-G1-424

G83–09/10
424 (New), Chapter 35

Proponent: Edward L. Repic, Architectural Refuse Solutions, LLC, representing self

Add new text as follows:

SECTION 424
RUBBISH CHUTES, RUBBISH COMPACTORS & LAUNDRY CHUTES

424.1 General. Rubbish and laundry chutes and rubbish compactors shall comply with the provisions of Section 424.1 through 424.7 and other applicable provisions of this code. Rubbish and laundry chutes shall comply with Sections 5.1 and 5.2 of NFPA-82, Rubbish compactors shall comply with Chapter 7 of NFPA-82.

424.2 Chute diameter. Chutes shall have a diameter of not less than 24 inches (610 mm). The diameter of the chute shall be maintained for the entire length of the chute,

424.3 Chute materials. The chute shall be constructed of aluminized steel, stainless steel, or galvanized steel of not less than 16 gage, (0.060 inches). The use of thinner materials shall be prohibited.

424.4 Vent. Chutes shall be provided with a vent of the same diameter of the chute. The vent shall extend through the roof. Reduced diameter vents shall be prohibited.

Exception. Subject to the approval of the building official, where the building configuration constrains the continuation of a round vent, a round-to-rectangular transition shall be used above the highest intake allowing the use of a rectangular vent of equivalent, clear cross-sectional area of the round chute being vented. The rectangular vent may either extend to the top of the vent, or where allowed by the building configuration, the vent shall transition from rectangular-to-round before penetrating the roof to create the vent.

424.5 Shaft enclosure at rubbish and laundry chutes. The shaft enclosure containing a rubbish or laundry chute shall comply with Sections 424.5.1 through 424.5.3.

424.5.1 Single sided construction. The chute shaft enclosure shall be of a listed construction that can be fully assembled in accordance with its approved design, including all required drywall taping when required by the design, from one side after the chute has been installed, regardless of the presence of bearing walls supporting floor framing.

424.5.2 Identical floor and wall ratings. A chute shaft enclosure shall provide the required fire protection rating over its entire length. Fire ratings shall not be lower at floor, ceiling or roof framing intersections.

424.5.3 Extend shaft enclosure to roof. The shaft enclosure shall extend to the underside of the roof. Structural framing members supporting the roof shall be outside of the chute shaft enclosure and shall not be permitted inside the shaft enclosure.

424.6 Electric interlocks. Where used, electric interlocks shall be normally engaged. They shall disengage at the door which is signaled to be open. In the event of loss of power, all interlocks shall be in the engaged position.

424.6.1 Safety switch. Electric interlock safety switch shall be provided in the discharge room to permit maintenance of the chute or chute accessories.

424.6.2 Interconnection. Electric interlocks where used with a rubbish compactor shall be interconnected to the power pack of the rubbish compactor to go off line in the event of an alarm notification from the compactor. Such required notifications shall include: container away, emergency shutoff engaged, pressure overload, motor overheating

424.7. Rubbish compactors. Rubbish compactor provisions included in Section 424.6.2 shall apply to all apartment style compactors.

424.6.1 Power pack. Power packs for apartment-style rubbish compactors shall be UL approved.

2. Add new standard to Chapter 35 as follows:

NFPA
82-2004 Gravity Waste or Linen Chutes

Reason: This submittal is part of four such proposals submitted as independent documents with the intent of adequately addressing Trash Chutes (which can include "recycling" chutes that simply redirect parts of the trash waste stream to locations other than a landfill) and Linen (or Laundry) Chutes. These proposals individually address Life Safety, Sprinkler Placement, Accessibility in new and existing facilities, and actual Chute Construction and a related component to Rubbish Chutes: Compactors . Codes generally address the shaft enclosure but ignore the actual chute being enclosed or the compactor it is feeding.

To quote from an authoritative source:

> *"Internationally, code officials recognize the need for a modern, up-to-date building code addressing the design and installation of building systems through requirements emphasizing performance. The International Building Code®, in this 2009 edition, is designed to meet these needs through model code regulations that safeguard the public health and safety in all communities, large and small. This comprehensive building code establishes minimum regulations for building systems using prescriptive and performance-related provisions. It is founded on broad-based principles that make possible the use of new materials and new building designs."*

The following information seeks to address the design and installation of a two specific building systems, Rubbish & Laundry Chutes and Rubbish Compactors, to enhance the comprehensive aspects of this code in the full spirit of this quoted material from the Preface of your document. As manufacturers of Chutes and Compactors, with distributors throughout the United States, we see the problems a lack of minimum regulation creates on a daily basis for design professionals. Without regulation design professionals resort to the talent they know best: Design. The problem lies in the fact that they undertake that design function without the benefit of knowing what the industry has learned over the last 90 or so years.

This is not to say that guidelines do not exist. In fact, they do. However, the NFPA-82 document is not a referenced standard to this Code. We are not qualified to recommend the adoption of that entire document as the document addresses items other than chutes and compactors (incinerators, for instance) that are beyond our areas of expertise. We can, however, comment upon and even improve upon the basics included in NFPA-82.

We recommend the addition of certain portions of NFPA-82, namely:
Sections: 5.1 General.
5.2 Gravity Waste or Linen Chutes
Chapter 7 Waste Compactors
(Please note that the words "waste" and "linen" in NFPA-82 correspond to the words "rubbish" and "laundry" in the IBC)
These sections cover several chute-related topics: Design, materials, intakes, discharges, offsets, and vents

Per the "Editor's Note" in section 424.1 These sections should be augmented in two ways:
First, we recommend the addition of certain provisions to NFPA-82 already presented/reasoned under separate proposals and obliquely referenced in Section 424.1, namely:
The Accessibility features outlined in our proposal for
1103.1, 1103.1.1 (new), 1103.1.2 (new);
The Latching and Closing features outlined in our proposal for
708.3.1 (new), 708.3.1.1 (new), 708.3.1.2 (new), 708.3.1.3 (new), 708.13.1, 708.13.3, 715.4.1 Exception (new), 715.4.2, 715.4.8, 715.4.8.1, and 715.4.8.3

Secondly, we recommend other modifications outlined in provisions 424.2 through 424.7. Our reasons for these are as follows:

424.2: Diameter lays the foundation for a common problem in chute design: vent diameter which becomes the subject of the paragraph that follows: 424.3.

424.3: Addresses a problem created by some industry participants who publicly claim adherence to the provisions of NFPA-82 and falsely advertise their material thickness as 16 gage material while actually using 18 gage material. The problem most commonly occurs in Spiral Chute construction. Lighter gage material is used on the premise that 18 gage material is stronger than non-spiraled 16 gage material. This is probably true, but the reasoning is, nonetheless, fallacious. At issue are the burn-through properties of the materials. Physical strength of the material is meaningless beyond the ability of the chute to be supported as chutes convey waste materials; they do not "hold" anything. Again, the issues are Life Safety and Fire Prevention, not Structural Strength.

424.4: Presented are an option (the rectangular-equivalent concept) to permit chutes and their enclosing walls to be installed without structural interference. The importance of venting cannot be over estimated as it provides rapid relief of steam buildup in the event of sprinkler activation during a fire. This prevents the intake doors from being blown open, thereby exposing other smoke protection zones from becoming engaged in the fire.

424.5 and subparagraphs: The proposed additions are designed to overcome common mistakes that most commonly, but not exclusively, occur in wood frame structures. The single side construction concept is crucial as most fire wall designs require full fire taping on both sides of the wall. It is impossible to properly install all required fire taping on the inside surface of a chute enclosure because the chute is in place, as is the chute intake door. Wood framing also commonly creates problems with fire ratings at wall and floor intersection as well as at roof framing interferences.

424.6 and sub paragraphs: Electric interlocks are an extremely popular chute accessory that permits all doors to lock when one door is opened to avoid rubbish from above falling on a depositor below if two or more people are depositing waste at the same time. This is a pretty common occurrence as people tend to throw out their garbage after feeding times, causing back-ups at the intake doors. Some interlocks are manufactured in such a way that they actually energize a downward moving locking mechanism to engage when a door is opened. Said another way the interlocks are held in a retracted position by a spring and then forced down to close all the doors not in use. The problem is that these doors are not protected by the electric interlocks when power drops as it does in a fire emergency. Other manufacturers utilize a common power source ... gravity ... to engage their interlocks and retract a single interlock when the system is activated for a deposit at a specific location. In the power loss scenario, these interlocks are engaged and act as a back up system that protects the firewall penetration from unnecessary exposure in the event of the latch failure scenario described in an another proposal submitted as part of this whole chute discussion. The provisions of Section 424.6.2 is designed to provide protection to maintenance personnel in the event of compactor trouble and during the correction of that trouble.

424.7 and sub paragraph: Rubbish compactor provisions establishes the need to interconnect the electric interlock system and this common piece of equipment for the protection of both the equipment and the personnel involved. The UL standardization is a simple protective feature for building owners, residents, and maintenance personnel.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 82, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: REPIC-G1-424 New

G84–09/10
424 (New)

Proponent: Gary Lewis, Chair, ICC Ad Hoc Committee on Terrorism-Resistant Buildings

Add new text as follows:

SECTION 424
BUILDINGS REQUIRING A VULNERABILITY ASSESSMENT

424.1 General. In addition to the other requirements of this code, the following buildings and other structures shall have vulnerabilities assessed and mitigated in accordance with Sections 424.2 through 424.4.

1. Buildings more than 420 feet in building height.
2. Buildings and other structures containing Group A occupancies with an occupant load greater than 10,000.
3. Buildings and other structures with an occupant load greater than 20,000.

424.2 Vulnerability assessment. A vulnerability assessment shall be performed by an approved agency with expertise in vulnerability analysis, and a report shall be provided to the building official for review and approval by the authority having jurisdiction. The analysis shall conform to the generally accepted principles and industry practices for the buildings in Section 424.1. The analysis shall assess risks under intentional threats. Documentation of the analysis shall include scope of analysis, information sources, analytic calculations and methods, findings, referenced guidelines, and suggested mitigation methods. Following acceptance by the building official, the reports and documentation shall be returned to the building owner. Retention of these documents by the building official shall not be required.

424.3 Peer review. The building official is authorized to seek an independent peer review of the vulnerability analysis, findings and proposed mitigation methods. The review shall be at the owner's expense. Upon completion, the reviewer shall submit a report to the building official, indicating the scope of the review performed and the findings of that review.

424.4 Mitigation. Risks identified in the vulnerability analysis shall be mitigated in an approved manner.

Reason: This proposal, if adopted, would add new text to the code for certain buildings of iconic classification. As the potential loads posed to these buildings by the threat of terrorist acts is generally non-quantifiable, normal design thresholds cannot be applied.

The ICC and the code community at large have been struggling since the tragic events of 9/11 to develop an appropriate response to the prospect of terrorism and terror-related events within the built environment. The ICC formulated an Ad Hoc Committee on Terrorism Resistant Buildings to deal with the issue, and assigned another standing committee, the Code Technology Committee, to review the National Institute of Standards and Technology's (NIST) Final Report of the National Construction Safety Team on the Collapses of the World Trade Center Towers.

Throughout that process, it has become apparent that the model building and fire codes do contain some vulnerabilities that had not previously been anticipated, and the codes are currently being amended. Moreso, however, that process has made clear that the solution to terrorism prevention in vulnerable buildings and facilities lies not exclusively within the model codes, but rather in a deliberate, thorough vulnerability analysis of each iconic structure *individually*, with mitigation measures tailored to the level of threat determined by the analysis in each case.

This is not a new concept (References 1 to 9). The federal government has been conducting such analyses on select federal facilities for years now, as have a number of private developers of signature projects such as arenas, malls and super high-rise buildings. It is important to note that this provision does not change anything required of construction under the IBC, nor does it require that the building official become an expert in homeland security matters. A project developer of a new building under the very limited scope of this proposal --- 420 feet represents about 38 stories, or very large assembly arenas or super malls --- would simply have to engage an additional expert as part of their design team to conduct a vulnerability analysis. We would suggest to the membership that such a review is already being conducted now anyway in many cases, driven by the private sector.

It is anticipated that the building code official would engage a peer reviewer, one with the same or similar qualifications as the entity which completed the initial assessment analysis, at the owner's expense, to review the report and documentation and issue a response, ultimately resulting in consensus between the experts as to the risk and the appropriate mitigation measures to be taken during the project and post-occupancy.

The structural engineering community brought forth this proposal in Palm Springs, among other reasons because the load or threat to be considered and designed for in the realm of terrorism is not readily quantifiable, thereby making the solution impossible on a broad brush basis. We believe that a very limited, judicious approach to threat assessment and vulnerability analysis is the overall best response to the threat of terrorism.

Cost Impact: The code change proposal will not increase the cost of construction. The Committee recognizes that the provision for additional expertise in the preliminary design stage will result in some additional expense; the requirement is, therefore, very targeted in scope and applies to a very small subset of structures in the built environment.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LEWIS-G2-424.doc

G85–09/10
503.1, Table 503, 507.1

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing self

Revise as follows:

503.1 General. The building height and area shall not exceed the limits specified in Table 503 based on the type of construction as determined by Section 602 and the occupancies as determined by Section 302 except as modified ~~hereafter~~ by Sections 503.1.1 through 503.1.5 and Sections 504, 506.2 and 506.3. Each portion of a building separated by one or more fire walls complying with Section 706 shall be considered to be a separate building.

503.1.1 Special industrial occupancies. Buildings and structures designed to house special industrial processes that require large areas and unusual building heights to accommodate craneways or special machinery and equipment, including, among others, rolling mills; structural metal fabrication shops and foundries; or the production and distribution of electric, gas or steam power, shall be exempt from the building height and area limitations of Table 503.

503.1.2 Buildings on same lot. Two or more buildings on the same lot shall be regulated as separate buildings or shall be considered as portions of one building if the building height of each building and the aggregate building area of the buildings are within the limitations of Table 503 as modified by Section 504 and 506. The provisions of this code applicable to the aggregate building shall be applicable to each building.

503.1.3 Type I construction. Buildings of Type I construction permitted to be of unlimited tabular building heights and areas are not subject to the special requirements that allow unlimited area buildings in Section 507 or unlimited building height in Sections 503.1.1 and 504.3 or increased building heights and areas for other types of construction.

503.1.4 Unlimited area buildings. The area of buildings complying with Section 507 shall not be limited by Table 503.

503.1.5 Special provisions. The height and area of buildings complying with Section 509, as applicable, shall not be limited by Table 503.

TABLE 503
ALLOWABLE BUILDING HEIGHTS AND AREAS[a]

(Portions of table not shown remain unchanged)

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m^2

A = building area per story. S= stories above grade plane, UL = Unlimited, NP = Not permitted.

~~a. See the following sections for general exceptions to Table 503:~~
~~1. Section 504.2, Allowable building height and story increase due to automatic sprinkler system installation.~~
~~2. Section 506.2, Allowable building area increase due to street frontage.~~
~~3. Section 506.3, Allowable building area increase due to automatic sprinkler system installation.~~
~~4. Section 507, Unlimited area buildings.~~
~~b.~~ a. For open parking structures, see Section 406.3.
~~c.~~ b. For private garages, see Section 406.1.
~~d.~~ c. See Section 415.5 for limitations.

507.1 General. The area of buildings of the occupancies and configurations specified herein shall not be limited by Table 503.

Reason: This code change proposal is editorial. Basically, it deletes Footnote a from Table 503 and incorporates it into the text of the code. We believe that code requirements are better addressed in the body of the code rather than as footnotes to a table unless the footnotes are very specific to the table and not general in nature. However, Footnote a is somewhat broad and can be better handled, in our opinion, by relocating the text to Section 503.1 and making a clarification to Section 507.1. And in order to make Section 503.1 more comprehensive regarding how Table 503 is intended to regulate the allowable building heights and areas, we have incorporated new Subsection 503.1.4 addressing unlimited area buildings regulated by Section 507 and Subsection 503.1.5 Special Provisions regulating heights and areas of buildings complying with Section 509. Thus, the user of the code can find all he or she needs to know regarding the determination of building height and area limitations based on the application of Table 503 and the cases where modifications and/or exceptions are made to that table in accordance with the applicable provisions of the sections referenced in Section 503.1 including its subsections.

The proposed revision to Section 507.1 merely correlates with the revisions made to Section 503.1 to indicate that the building area is not limited by Table 503 for these unlimited area buildings.

In conclusion, we believe that these editorial revisions will provide for better code interpretation, application, and enforcement.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Thornberry-G1-503

G86–09/10
503.1.4 (New)

Proponent: Sarah A. Rice, CBO, representing self

Add new text as follows:

503.1.4 Occupancies on roofs. Open-air roofs occupied by an occupancy different than the primary occupancy of the building shall not be required to be taken into account when determining the minimum type of construction for the building when the means of egress system from the open-air roof complies with Chapter 10.

> **Exception:** Open-air roofs of buildings of Groups A, B, E, F-2, I, M, R and S-2 occupancies shall not be occupied by Group S-1, F-1 or H occupancies.

Reason: Occupied roof gardens, pool levels and similar uses are literally classified as Group A-3 occupancies but the hazard they present to the building is minimal. So this change proposes that even though their occupancy is Group A-3 (assembly) for determining the minimum level of means of egress from that level, the building not be penalized for their location.

Should a fire incident occur, the very openness of the space will provide venting of any smoke or hot gases that may be generated, in other words it will offer the perfect smoke control system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-G6-503.1.4.doc

G87–09/10
503.1.4 (New)

Proponent: Ken Kraus, Los Angeles, CA Fire Department

Add new text as follows:

503.1.4 Occupancy location. An occupancy shall not be located above the story or height limit set forth in Table 503. Where Section 504.2 allows modifications to limits of Table 503, occupancies shall not located above the additional story or increased height limit.

Reason: This proposed addition to the Code is intended to clearly disallow the occupancy of roof areas and stories above the height and story limits prescribed in Table 503 and Section 504.2.

As written, the code can be misapplied if areas above the floor level of the highest story allowed (roof and floor surfaces) are considered part of the highest story allowed for occupant use.

This is due to misinterpretation of the definition of Story which states, in part “The portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above”.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRAUS-G1-503.1.4

G88–09/10
Table 503

Proponent: Daniel E. Nichols, PE, New York State Dept. of State, Div. of Code Enforcement and Administration, Ken Kraus, City of Los Angeles Fire Department

Revise table as follows:

TABLE 503
ALLOWABLE BUILDING HEIGHTS AND AREAS[a]
Building height limitations shown in feet above grade plane. Story limitations shown as stories above grade plane.
Building area limitations shown in square feet, as determined by the definition of "Area, building," per story

		TYPE OF CONSTRUCTION								
		TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
		A	B	A	B	A	B	HT	A	B
	HEIGHT (feet)	UL	160	65	55	65	55	65	50	40
GROUP		STORIES(S) AREA (A)								
H-2[d]	S	~~UL~~ 4	3	2	1	2	1	2	1	1
	A	21,000	16,500	11,000	7,000	9,500	7,000	10,500	7,500	3,000

(Portions of table not shown remain unchanged)

Reason: H-2 occupancies are defined as "Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning." The principal difference between a Group H-1 and H-2 occupancy, by definition, is that the velocity of the spread of the fire. There is not a difference in the severity of fire in a Group H-2 when compared to a Group H-1, after the initial ignition. Examples of hazards that can be found within Group H-2 occupancies include pyrophoric materials, flammable gases, peroxides, and flammable cryogenic fluids.

This proposal limits the floor level of Group H-2 occupancies to four stories. The four story number is based on the limit of H-5 occupancies, where materials like pyrophoric materials and flammable gases are commonly used in a much more controlled atmosphere. The reason to place a limit on Group H-2 occupancies is recognizing the severe fire hazard and the adverse effect for firefighting purposes. An uncontrolled fire within a Group H-2 occupancy will be more than likely fought from the exterior of the building. Placing a Group H-2 occupancy at higher levels will impede safe firefighting operations.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

(Portions of table and footnotes not shown remain unchanged)

Reason: One area of concern identified for study by the ICC Code Technology Committee's Height and Area Study Group was 4 and 5 story buildings of non-fire-resistance-rated types of construction. The table below shows the occupancies in the 2006 International Building Code (IBC) where that condition existed for sprinklered buildings of Types IIB and IIIB construction. In addition, the table shows the sprinklered height allowances for these occupancies in the legacy codes.

Type IIB and Type IIIB Construction
Story Comparison (w/ NFPA 13 Sprinkler System)

	SBC	NBC	UBC	2006 IBC
B	5	4	2	**5**
F-2	4	4	2	**4**
M	5	3	2	**5**
S-1	4	3	2	**4**
S-2	4	4	2	**5**
R* (NFPA 13)	5	4	4	**5**
R* (NFPA 13R)	4	4	3	**4**

* - Applies for R-1, R-2 and R-4 Use Groups

The Study Group noted that for Use Group B, M, S-1, and R buildings of Type IIB and Type IIIB construction, the allowance for 4 or 5 stories in the IBC was premised on the story heights allowed in the SBCCI Standard Building Code (SBC). In all these instances, the SBC sprinklered height allowance for those Use Groups was based on a multiple story sprinkler increase. For example, for Use Group R, the SBC allowed 2 stories for unsprinklered construction and 5 stories for sprinklered construction. This exceeded the consistent one story sprinkler height increase incorporated in the IBC height and area provisions. Based on this review, the Study Group identified two anomalies from what was permitted by the legacy codes. First, the story height allowance for S-2 use groups was not based on any of the legacy code allowances. Second, for Use Groups B, M, S-1, and R in Types IIB and IIIB construction, the IBC story height allowance for unsprinklered buildings exceeded what was allowed by any of the legacy codes. For example, the largest height allowed for an unsprinklered Type IIB construction apartment building (Group R-2 occupancy) in any of the legacy codes was the BOCA National Building Code (NBC) allowance for 3 stories. Currently, the IBC allows 4 stories for this condition. Rather than modify the sprinkler increase in the IBC, the Study Group suggested the following recommended story heights for Table 503:

Unsprinklered 2006 IBC Table 503 Values (Revised)

Use Group	IIB	IIIB
B	3	3
M	2	2
S-1	2	2
S-2	3	3
R*	3	3

* - Applies for R-1, R-2 and R-4 Use Groups

In essence, these reductions would eliminate the anomalies created by the multi-story SBC sprinkler increase and drop the IBC values back to the next least restrictive legacy code (in these cases, the NBC). It should be noted that during the ICC Final Action Hearings in Minneapolis for the last code cycle, all of the code changes submitted by the Study Group to reduce the allowable story heights were approved by the ICC Class A voting members with a greater than two-thirds majority vote except for one. That one was Code Change G118-07/08 which is identical to this code change proposal. Although the voting members were able to overturn the Committee's recommendation for disapproval, the code change was subsequently disapproved because the two-thirds (67%) majority vote could not be achieved. The final vote was 243 in favor and 163 opposed (60%). Since a significant majority of the Class A voters wanted to see that code change approved, the change is being resubmitted for reconsideration by the IBC General Committee.

Although the proposal will reduce the allowable height of Group R buildings of Types IIB and IIIB construction by one story, the maximum area (total of all stories) of the tallest building that will then be permitted will generally still be considerably greater than that permitted by any of the legacy codes (see table below). For example, consider a residential building (Group R occupancy) of Type IIB construction, which does not have an NFPA 13 sprinkler system, with a height of 3 stories; the tallest permitted by any of the legacy codes. If less than 20 feet of open space is provided around the building, the IBC permits the total area of all three stories to be 108% greater than the largest total area permitted by the legacy codes. If the width of the open space is increased to 40 feet, the IBC's total area allowed is still 27% greater than the largest area allowed by any of the legacy codes. If an NFPA 13 sprinkler system is provided in a Group R residential building of Type IIB construction, the height of the building can be increased to four stories. If the building has less than 20 feet of open space, the maximum area allowed by the IBC is 50% greater than the largest area allowed by any of the legacy codes. Although allowable heights are proposed to be reduced, the foregoing illustrates that residential buildings will still be able to have total areas that are comparable to or greater than that permitted by the largest areas allowed by any of the legacy codes.

It should be noted that this proposal has no impact on residential buildings equipped with NFPA 13R or NFPA 13D sprinklers since they are not currently allowed to use the height increase for sprinklers.

Occupancy Group	Type of Construction	NFPA 13 Sprinklers – Yes/No	Width of Open Space (ft.)[a, b]	Ratio of IBC Maximum Building Area to the Largest Maximum Building Area Permitted by Legacy Codes				
				Number of Stories				
				1	2	3	4	5
R-1 R-2 R-4	IIB	No	< 20	1.33	1.33	2.08	NPLC	NP
			40	1.17	1.17	1.27	NPLC	NP
		Yes	< 20	1.78	1.67	2.00	1.50	1.20
			40	1.39	1.39	1.67	1.25	1.00
	IIIB	No	< 20	1.33	1.33	2.08	NPLC	NP
			40	1.17	1.17	1.27	NPLC	NP
		Yes	< 20	1.78	1.67	2.00	1.50	1.20
			40	1.39	1.39	1.67	1.25	1.00

NPLC means not permitted by any of the legacy codes, but permitted by the IBC.
NP means not permitted by any of the legacy codes or the IBC.
If this code change is approved, building heights represented by shaded cells will not be permitted by the IBC.

a. Width of open space around 100% of building perimeter.
b. 40 feet was used because the ICBO Uniform Building Code (UBC) required a minimum 40 feet of open space on all sides of the building in order to qualify for a 100% area increase; the maximum permitted by that code. The NBC and SBC permitted maximum open space increases of 150% and 100%, respectively, at 30 feet.

Cost Impact: The code change proposal will increase the cost of construction.

e. For aircraft hangars, see Section 412.2.

(Portions of table not shown remain unchanged)

Reason: During the last cycle, changes were made to Section 412.2 classifying aircraft hangars by the NFPA 409 classifications to determine the fire suppression requirements. These changes created area limitations that a user of the Building Code may not find without going to Section 412.2. The addition of footnote "e" sends the user of the Building Code to this section similarly to other footnotes found in this table.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KEY-G1-TABLE 503.doc

G91–09/10
504.2

Proponent: Jason Thompson, National Concrete Masonry Association, representing the Masonry Alliance for Codes and Standards

Revise as follows:

504.2 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one story. These increases are permitted in addition to the area increase in accordance with Sections 506.2 and 506.3. ~~For Group R buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.2, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one story, but shall not exceed four stories or 60 feet (19 288 mm), respectively.~~

Exceptions:

1. Buildings, or portions of buildings, classified as a Group I-2 occupancy of Type IIB, III, IV or V construction.
2. Buildings, or portions of buildings, classified as a Group H-1, H-2, H-3 or H-5 occupancy.
3. *Fire-resistance rating* substitution in accordance with Table 601, Note d.

Reason: This code change proposes to eliminate the special allowances given for Group R occupancy buildings that are protected with an NFPA 13R automatic sprinkler system as specified in Section 903.3.1.2. Currently, Section 504.2 will allow an increase in the building height of one story and 20 feet where an NFPA 13R sprinkler system is provided, as long as the building does not exceed a total height of four stories or 60 feet. Furthermore, Section 506.4 allows an area increase for the installation of an NFPA 13R sprinkler system for Group R buildings that are greater than three stories in height. It is not appropriate to provide for both an allowance of an area increase and height increase for the types of construction. Where an NFPA 13R sprinkler system is installed the net result in the overall level of safety is a lessening of the passive built-in fire resistance that would be required if one of the NFPA 13R reductions (area or height) were not permitted.

NFPA 13R sprinkler systems primarily provide for life safety in buildings. They were developed for that purpose as clearly stated in Section 1.2 of the 2002 edition of the standard. It is interesting to note the Annex A discussion of the purpose of NFPA 13R which states: "Various levels of sprinkler protection are available to provide life safety and property protection. This standard is designed to provide a high, but not absolute, level of life safety and a lesser level of property protection. Greater protection to both life and property could be achieved by sprinklering all areas in accordance with NFPA 13… it should be recognized that the omission of sprinklers from certain areas could result in the development of untenable conditions in adjacent spaces. Where evacuation times could be delayed, additional sprinkler protection and other fire protection features, such as detection and compartmentation, could be necessary." That statement says it all about an NFPA 13R sprinkler system.

The intent of the IBC as expressed in Section 101.3 Intent is as follows: "The purpose of this code is to establish the minimum requirements to safeguard the public health, safety, and general welfare… and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations." Allowing the use of an NFPA 13R sprinkler system to increase the size of a building is counter to the intent and purpose of the IBC. Types of construction are designed to limit the height and area of buildings based on the occupancy and the degree of built-in fire-resistive protection and use of combustible or noncombustible construction materials. Buildings are allowed to get larger in area and taller in height with more fire-resistance built in and the reduced use of combustible construction for the building's structural elements. Therefore, property protection is a primary outcome of the types of construction used. Of course, type of construction also plays a role in life safety, especially in multi-story buildings, and has an impact on fire fighter safety as well. But an NFPA 13R sprinkler system is basically a partial sprinkler system because the standard does not require sprinklers in many concealed combustible areas including attics. So why should a building protected with an NFPA 13R sprinkler system be given the same credit for a building with more complete protection based on NFPA 13 sprinkler system?

Within the last few years there have been many fires involving buildings protected with NFPA 13R sprinkler systems which have burned to the ground. In most of those cases, the fire was able to get into the unprotected combustible attic space and spread throughout the building and then burn downward, overpowering the sprinkler system. It is not logical to allow increases in height and area for sprinkler systems that can not reduce the risk of a building being burned to the ground.

There have been several code changes in the recent two cycles to eliminate this height increase for NFPA 13R sprinkler systems. Though not previously approved the Masonry Alliance for Codes and Standards (MACS) still agrees with the previous proponents' supporting statements on why this reduction is not warranted. The issues have been clearly stated and adequate reasons given to support this particular code change proposal. Therefore, we respectfully request the Committee approve this code change proposal as submitted for the reasons stated.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THOMPSON-G6-504.2

G92–09/10
504.2, 506.3

Proponent: Robert J Davidson, Code Consultant, Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

504.2 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one. These increases are permitted in addition to the area increase in accordance with Section~~s~~ 506.2 ~~and 506.3~~. For Group R buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.2, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one, but shall not exceed 60 feet (18 288 mm) or four stories, respectively.

Exceptions~~:~~ The use of an automatic sprinkler system to increase building heights shall not be permitted for the following conditions:

1. Buildings, or portions of buildings, classified as a Group I-2 occupancy of Type IIB, III, IV or V construction.
2. Buildings, or portions of buildings, classified as a Group H-1, H-2, H-3 or H-5 occupancy.
3. ~~Fire-resistance rating substitution~~ Buildings where an automatic sprinkler system is substituted for fire-resistance rated construction in accordance with Table 601, Note d.
4. Buildings where an automatic sprinkler system is used to increase the building height or number of stories accordance with Section 506.3.

506.3 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, the area limitation in Table 503 is permitted to be increased by an additional 200 percent (I_s = 2) for buildings with more than one story above grade plane and an additional 300 percent (I_s = 3) for buildings with no more than one story above grade plane. ~~These increases are permitted in addition to the height and story increases in accordance with Section 504.2.~~

Exception: The use of an automatic sprinkler system to increase the building area limitation ~~increases~~ shall not be permitted for the following conditions:

1. ~~The automatic sprinkler system increase shall not apply to Buildings with an occupancy in Group H-1~~. Buildings classified as a Group H-1 occupancy.
2. ~~The automatic sprinkler system increase shall not apply to the building area of an occupancy in Group H-2 or H-3~~. Buildings, or portions of buildings, classified as either a Group H-2 or H-3 occupancy. For buildings containing such occupancies, the allowable area shall be determined in accordance with Section 508.4.2, with the sprinkler system increase applicable only to the portions of the building not classified as Group H-2 or H-3.
3. Buildings where an automatic sprinkler system is substituted for fire-resistance rated construction ~~Fire-resistance rating substitution~~ in accordance with Table 601, Note d.
4. Buildings where an automatic sprinkler system is used to increase the building height or number of stories in accordance with Section 504.2.

Reason: In reviewing this comment we ask that you keep in mind that when the IBC was created, there was a policy decision made that when merging the three legacy codes into one, any conflict between legacy code provisions would default to the lesser requirement. This reportedly was done to avoid adoption problems for jurisdictions when moving to the IBC from a legacy code, i.e., if the new code was more restrictive there could be opposition to adoption. The concept of balance is constantly bandied about when examining specific code provisions in that when looking at the code as a whole, one requirement balances out the other. This concept is spoken of specifically when dealing with automatic sprinkler system trade offs. If we accept the fact that the three separate legacy codes were balanced, i.e., they had some requirements less restrictive than the same topic in another legacy code but they had other topics that were more restrictive, what happened when we merged the three codes? We went through and took the lowest requirement from each code without taking the more restrictive. What happened to the balancing effect that each legacy code had developed over the years? It does not exist in the IBC.

Another way to look at this issue is that in many jurisdictions the building code is the minimum standard to apply, in some it is the minimum and the maximum standard, (mini-max code). In any jurisdiction that previously applied one of the legacy codes, at the time they had a legacy code effective, the current IBC provisions would be less than that applicable code permitted. In other words, application of many of the provisions in the IBC would be illegal. It is for that reason we seek to reduce the size of some of the buildings permitted to be built under the IBC to start to bring balance back to the code.

Those of us that have been proposing to modify some of the height and area requirements have been asked by opponents why we are so focused on this issue, what is so wrong with the height and areas. To be honest, we are not focused on this one issue. We have been active in many areas of the code we felt need clarification or tightening of requirements. But our specific interest in the height and area is because of the cumulative effect of the process we describe in the first two paragraphs of this reasoning statement.

We not only get bigger buildings under the IBC as compared to various legacy codes, we get them with less protective features and a reduced ability to withstand attack by fire. In much of the country Type 1A construction required 4 hour protection. Now it only requires 3 hour protection. So the buildings are bigger and when attacked by fire they may come down quicker.

The size of the buildings directly relates to how much area a responding fire department must deal with and possibly how much area must be searched. No one checked with the fire service to see if their manning levels could handle the increased size allowance coupled with the reduction in protection features. Take a look at the legacy codes and compared the restrictions on communicating floor levels with what the IBC allows now. So not only are the buildings bigger with reduced fire resistance requirements, we now allow the smoke and heat to travel to more of the building.

The answer we get on this topic is that the buildings in question will have an automatic fire suppression system and that takes care of all of your concerns. Though we are strong believers in the installation of automatic sprinkler systems and we would like to eventually see them installed in all buildings and structures, we also believe in striking a balance. Being safe means not relying on a single method of protection, or in this case a single protective system.

This position is supported by the recent NFPA report, "U.S. Experience with Sprinklers and Other Automatic Fire Extinguishing Equipment", http://www.nfpa.org/assets/files//PDF/OSsprinklers.pdf . Though overall sprinklers operate in 95% of all reported structure fires and are effective 96% of that time, resulting in a combined overall effectiveness of 91%. The actual percentage changes based upon occupancy with warehouses at the 78% level.

They are out of service for maintenance, construction, (tenant improvements), unintentional human error. There is also a vulnerability factor-besides seismic, we have experience where systems were taken out by vehicle crash or explosion. In instances of improper design/use or arson, the system can be overcome. Most sprinkler systems as designed don't extinguish the fire, they only control it and there can be tremendous smoke generation and spread (particularly smoldering or shielded fires, etc). In fact, sprinklers drive the smoke lower and impede visibility, building size becomes more of an issue to both rescue (panic) and firefighting.

To balance this out we seek buildings to have increased fire-resistive design and they get larger. The larger the building the more time the fire service needs to deal with rescue and fire extinguishment. The more time the fire service needs to be in the building during adverse conditions, the better protected the building needs to be.

This proposal seeks to strike a balance. An increase would still be permitted based upon the presence of the automatic sprinkler protection, but a choice would have to be made to take either an area increase or a height increase, not both.

This proposal does not stop larger buildings from being constructed, what it does is change the trigger for the use of non-combustible versus combustible types of construction and changes the trigger of when protected types of construction would be required and at what fire resistance rating to building a larger building.

As already stressed fire departments suffer through wave after wave of cut backs in staff, equipment and fire stations, this issue increases in importance every day.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-G4-504.2.doc

G93–09/10
505.1 through 505.5.3

Proponent: Sarah A. Rice, CBO, representing self

Revise as follows:

SECTION 505
MEZZANINES AND EQUIPMENT PLATFORMS

505.1 General. Mezzanines shall comply with Section 505.2. Equipment platforms shall comply with Section 505.3.

505.2 Mezzanines. A mezzanine or mezzanines in compliance with Section ~~505~~ 505.2 shall be considered a portion of the story below. Such mezzanines shall not contribute to either the building area or number of stories as regulated by Section 503.1. The area of the mezzanine shall be included in determining the fire area defined in Section 702. The clear height above and below the mezzanine floor construction shall not be less than 7 feet (2134 mm).

505.2.1 Area limitation. The aggregate area of a mezzanine or mezzanines within a room shall not exceed one-third of the floor area of that room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the mezzanine is located. In determining the allowable mezzanine area, the area of the mezzanine shall not be included in the floor area of the room.

Where a room contains both a mezzanine and an equipment platform the aggregate area of the two raised floor levels shall not exceed two thirds of the floor area of that room or space in which they are located with neither occupying more than one-third of the floor area of the room..

Exceptions:

1. The aggregate area of mezzanines in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall not exceed two-thirds of the area of the room.
2. The aggregate area of mezzanines in buildings and structures of Type I or II construction shall not exceed one-half of the area of the room in buildings and structures equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 and an approved emergency voice/alarm communication system in accordance with Section 907.2.12.2.

~~505.3~~ **505.2.2 Egress.** Each occupant of a mezzanine shall have access to at least two independent means of egress where the common path of egress travel exceeds the limitations of Section 1014.3. Where a stairway provides a means of exit access from a mezzanine, the maximum travel distance includes the distance traveled on the stairway measured in the plane of the tread nosing. Accessible means of egress shall be provided in accordance with Section 1007.

Exception: A single means of egress shall be permitted in accordance with Section 1015.1.

~~505.4~~ **505.2.3 Openness.** A mezzanine shall be open and unobstructed to the room in which such mezzanine is located except for walls not more than 42 inches (1067 mm) high, columns and posts.

Exceptions:

1. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the occupant load of the aggregate area of the enclosed space does not exceed 10.
2. A mezzanine having two or more means of egress is not required to be open to the room in which the mezzanine is located if at least one of the means of egress provides direct access to an exit from the mezzanine level.
3. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the aggregate floor area of the enclosed space does not exceed 10 percent of the mezzanine area.
4. In industrial facilities, mezzanines used for control equipment are permitted to be glazed on all sides.
5. In other than Groups H and I occupancies no more than two stories in height above grade plane and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, a mezzanine having two or more means of egress shall not be required to be open to the room in which the mezzanine is located.

~~505.5~~ **505.3 Equipment platforms.** Equipment platforms in buildings shall not be considered as a portion of the floor below. Such equipment platforms shall not contribute to either the building area or the number of stories as regulated by Section 503.1. The area of the equipment platform shall not be included in determining the fire area. Equipment platforms shall not be a part of any mezzanine and such platforms and the walkways, stairs and ladders providing access to an equipment platform shall not serve as a part of the means of egress from the building.

~~505.5.1~~ **505.3.1 Area limitations.** The aggregate area of all equipment platforms within a room shall not exceed two-thirds of the area of the room in which they are located. Where an equipment platform is located in the same room as a mezzanine, the area of the mezzanine shall be determined by Section ~~505.2~~ 505.2.1 and the combined aggregate area of the equipment platforms and mezzanines shall not exceed two-thirds of the room in which they are located.

Exception. Where a room contains both a mezzanine and an equipment platform the aggregate area of the two raised floor levels shall not exceed two thirds of the floor area of that room or space in which they are located.

[F] ~~505.5.2~~ **505.3.2 Fire suppression.** Where located in a building that is required to be protected by an automatic sprinkler system, equipment platforms shall be fully protected by sprinklers above and below the platform, where required by the standards referenced in Section 903.3.

~~505.5.3~~ **505.3.3 Guards.** Equipment platforms shall have guards where required by Section 1013.1.

Reason: To clarify which provisions apply to mezzanines and which ones apply to equipment platforms and to address when you have both types of raised platforms in one room.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-G8-505.doc

G94–09/10
505.2

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

505.2 ~~Area limitation~~ Limitations. Limitations on area and levels of mezzanines shall be in accordance with Sections 505.2.1 and 505.2.2.

505.2.1 Area. The aggregate area of a mezzanine or mezzanines within a room shall not exceed one-third of the floor area of that room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the mezzanine is located. In determining the allowable mezzanine area, the area of the mezzanine shall not be included in the floor area of the room.

Exceptions:

1. The aggregate area of mezzanines in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall not exceed two-thirds of the floor area of the room.
2. The aggregate area of mezzanines in buildings and structures of Type I or II construction shall not exceed one-half of the floor area of the room in buildings and structures equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 and an approved emergency voice/alarm communication system in accordance with Section 907.2.12.2.

505.2.2 Levels. There shall not be more than two levels of mezzanines in a room.

Reason: This addition to the code is required in order to limit the number of levels that can be built in one room. By not having any limitations on the levels, a high-ceiling room with many levels can be created; hence, an atrium. Limiting to two levels, will be in conformance with Exception in Section 404.5 where smoke control system will be required when number of stories (or levels, in this case) exceed two. Since a mezzanine is located above the floor of which the mezzanine is considered a part of, untenable smoke concentrations and the associated loss of visibility due to smoke obscuration may affect the mezzanine level. The occupants of the mezzanine by means of sight, smell or hearing will have to be able to determine if there is some emergency or fire that takes place on other mezzanines or in the room in which the mezzanine is located. Allowing more than two levels of mezzanines could compromise this feature.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-G2-505.2

G95–09/10
505.3

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

505.3 Egress. The means of egress for mezzanines shall comply with the applicable provisions of Chapter 10. ~~Each occupant of a *mezzanine* shall have access to at least two independent *means of egress* where the *common path of egress travel* exceeds the limitations of Section 1014.3. Where an unenclosed *stairway* provides a means of *exit access* from a *mezzanine*, the maximum travel distance includes the distance traveled on the *stairway* measured in the plane of the tread nosing. *Accessible means of egress* shall be provided in accordance with Section 1007.~~

~~**Exception:** A single *means of egress* shall be permitted in accordance with Section 1015.1.~~

Reason: A review of current Section 505.3 mezzanine egress requirements reveals a restatement of some, but not all, means of egress design requirements. Such partial cross-references can be confusing for code users. Some practitioners might assume that those provisions (such as separation or arrangement of multiple exits or access to exits) that are not stated, do not apply. The current first sentence of Section 505.3 readdresses common path of egress travel requirements. The definition of "Common Path of Egress Travel," Section 1014.3 and Section 1015.1 all state or infer that common path of egress travel provisions apply to all portions of the exit access—to include mezzanines. The last sentence reinforces the concept of accounting for exit access travel distance on unenclosed interior stairways, a fundamental provision of Section 1016.1. Lastly, Section 1015.1 numbers of exit or exit access requirements stand on their own merit. They are universally applicable to all spaces in the exit access portion of the means of egress system, to include mezzanines.

In summary, means of egress requirements from a mezzanine are no different than from any other room, space or area within the exit access portion of the means of egress system. The incomplete restatement of certain means of egress design requirements erroneously alludes to the notion that there may be special means of egress requirements for mezzanines. It is felt that a simple and appropriate reference to applicable Chapter 10 provisions would clarify intent and lend to the more consistent design of means of egress from mezzanines.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-G2-505.3.doc

G96–09/10
506.2.1, 507.1

Proponent: Jerry R. Tepe, JRT-AIA Architect, representing American Institute of Architects

Revise as follows:

506.2.1 Width limits. The value of *W* shall be at least 20 feet (6096 mm). Where the value of *W* varies along the perimeter of the building, the calculation performed in accordance with Equation 5-2 shall be based on the weighted average of each portion of *exterior wall* and open space where the value of *W* is greater than or equal to 20 feet (6096 mm). Where the value of *W* exceeds 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the weighted average, regardless of the actual width of the open space. *W* shall be measured perpendicular from the face of the building to the closest interior *lot line*. Where the building fronts on a *public way*, the entire width of the *public way* shall be used. Where two or more buildings are on the same lot, *W* shall be measured from the exterior face of a building to the exterior face of an opposing building, as applicable.

Exception: The value of *W* divided by 30 shall be permitted to be a maximum of 2 when the building meets all requirements of Section 507 except for compliance with the 60-foot (18 288 mm) *public way* or *yard* requirement, as applicable.

507.1 General. The area of buildings of the occupancies and configurations specified ~~herein~~ Sections 507.1 through 507.12 shall not be limited. Where Sections 507.2 through 507.12 require buildings to be surrounded and adjoined by public ways and yards, those open spaces shall be determined as follows:

1. Yards shall be measured from the building perimeter in all directions to the closest interior lot lines or to the exterior face of an opposing building located on the same lot, as applicable.
2. Where the building fronts on a public way, the entire width of the public way shall be used.

Reason: Section 506.2.1: The change provides further clarification on how to measure the value "W." The IBC currently does not provide this. The IBC does provide guidance on the fire separation distance (FSD) in Chapter 7, but is not the proper way to measure "W" and often is mistakenly used or enforced as the required method. The only real difference is in determining "W" the entire width of a public way is used, whereas when determining the FSD, the measurement is taken to the centerline of the public way as the other half belongs to the building(s) on the opposite side. Current text already addresses buildings on the same lot.

Section 507: This change provides clarification on how to measure the yards and public ways needed for buildings to qualify as unlimited area buildings. Each subsection of 507 except 507.8 requires the buildings to be surrounded and adjoined by yards and public ways but none speak to how to measure it. As 507 is about unlimited building area, it should be measured the same as the open spaces for determining area increases. This change is consistent with the commentary for these provisions published for the 2009 code. Because this applies throughout Section 507, the best place for the amendment is in 507.1 – General.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TEPE-G1-506.2.1

G97–09/10
506.2.1

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing self

Revise as follows:

506.2.1 Width limits. To apply this section the value of *W* shall be at least 20 feet (6096 mm). Where the value of *W* varies along the perimeter of the building, the calculation performed in accordance with Equation 5-2 shall be based on the weighted average of each portion of exterior wall and open space where the value of *W* is greater than or equal to 20 feet (6096 mm). Where the value of *W* exceeds 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the weighted average, regardless of the actual width of the open space. Where two or more buildings are on the same lot, *W* shall be measured from the exterior face of ~~a~~ each building to the opposing exterior face of ~~an opposing~~ each adjacent building, as applicable.

Exception: ~~The value of *W* divided by 30 shall be permitted to be a maximum of 2 when~~ Where the building meets ~~all~~ the requirements of Section 507, as applicable, except for compliance with the 60-foot (18 288 mm) public way or yard requirement, and the value of *W* exceeds 30 feet (9144 mm), the value of *W* divided by 30 shall be limited to a maximum of 2~~, as applicable~~.

Reason: The purpose of this code change proposal is to clarify the Exception to the maximum allowable area increase that can be achieved to the allowable area in Table 503 with open space provided around a building. The intent of the Exception is to recognize the special requirements in Section 507 for unlimited area buildings by giving credit for the open space around such buildings where the open space is not sufficient to meet the minimum 60 ft separation specified to qualify as an unlimited area building but where the open space is greater than the 30 ft maximum allowed for the calculation of the frontage area increase under Section 506.2. We have seen the Exception interpreted to allow the value of W divided by 30 to be 2 even though W may be less than 60. Also, it has not been clear what is intended by this Exception regarding the application of the other provisions of Section 507 when those buildings do not qualify as unlimited area buildings.

We believe that this proposed editorial revision will improve the application of the Exception by clearly indicating that the value of W divided by 30 is allowed to exceed 1 for the purpose of this Exception but cannot exceed 2, with the actual value being the value of W divided by 30. So in other words, if 45 ft of open space is provided around the entire building perimeter, the value of W divided by 30 would be 1.5. This is 50% more than the maximum that would otherwise be allowed for buildings utilizing the open space frontage increase provisions. This should result in better interpretation, application, and enforcement of the frontage increase provisions of the IBC for determining the allowable area of a building based on Table 503.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

506.2.1

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

506.2.1 Width limits. The value of W shall be at least 20 feet (6096 mm). Where the value of W varies along the perimeter of the building, the calculation performed in accordance with Equation 5-2 shall be based on the weighted average calculated in accordance with Equation 5-3 for portions of the exterior perimeter walls ~~of each portion of exterior wall and open space~~ where the value of W is greater than or equal to 20 feet (6096 mm). Where the value of W exceeds 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the weighted average, regardless of the actual width of the open space. Where two or more buildings are on the same lot, W shall be measured from the exterior face of a building to the exterior face of an opposing building, as applicable.

Exception: The value of *W* divided by 30 shall be permitted to be a maximum of 2 when the building meets all requirements of Section 507 except for compliance with the 60-foot (18 288 mm) *public way* or *yard* requirement, as applicable.

Weighted average $W = (L_1 \times w_1 + L_2 \times w_2 + L_3 \times w_3 \ldots)/F.$ **(Equation 5-3)**

Where:

L_n = Length of a portion of the exterior perimeter wall,
w_n = Width of open space associated with that portion of the exterior perimeter wall.
F = Building perimeter that fronts on a public way or open space having 20 feet (6096 mm) minimum width.

Reason: The term "weighted average" is not defined in the code. Although common to engineers, to many others, (who need to use this section) it is not a term they are familiar with. This is essentially an editorial change.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-G3-506.2.1

G99–09/10
506.3

Proponent: Sam Francis, American Forest & Paper Association

Revise as follows:

506.3 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, in addition to the height and story increases in accordance with Section 504.2, the building area limitation in Table 503 is permitted to be increased by the amounts specified in either Item 1 or Item 2 as follows: ~~the building area limitation in Table 503 is permitted to be increased by an additional 200 percent (I_s = 2) for buildings with more than one story above grade plane and an additional 300 percent (I_s = 3) for buildings with no more than one story above grade plane. These increases are permitted in addition to the height and story increases in accordance with Section 504.2,~~

1. An additional 200 percent (I_s = 2) for buildings with more than one story above grade plane and an additional 300 percent (I_s = 3) for buildings with no more than one story above grade plane.
2. An additional 100 percent (I_s = 1) for buildings up to four stories above grade plane when the automatic sprinkler system is omitted from the unoccupied attic space and the roof is sheathed with fire retardant treated wood structural panels,

Exception: ~~The~~ Building area limitation increases shall not be permitted for the following conditions:

1. The automatic sprinkler system increase shall not apply to buildings with an occupancy in Group H-1.
2. The automatic sprinkler system increase shall not apply to the building area of an occupancy in Group H-2 or H-3. For buildings containing such occupancies, the allowable building area shall be determined in accordance with Section 508.4.2, with the sprinkler system increase applicable only to the portions of the building not classified as Group H-2 or H-3.
3. Fire-resistance rating substitution in accordance with Table 601, Note d.

Reason: AF&PA commissioned testing of three roof attic assembly configurations[1]:

1) FRT wood trusses and FRT wood sheathing
2) Untreated wood trusses and untreated wood sheathing
3) Untreated wood trusses and FRT wood sheathing.

These tests were conducted to the same ad-hoc test protocol[2] used to modify sprinkler head spacing and water pressure requirements in NFPA 13.

AF&PA tests demonstrated that the fire performance of a roof assembly constructed with fire retardant treated (FRT) wood trusses and FRT wood sheathing (Configuration 1) resulted in no fire growth which is better performing than a roof assembly protected with a NFPA 13 sprinkler system. This configuration is exempt from attic sprinkler systems in NFPA 13.

Configuration 2, a roof assembly constructed with untreated wood trusses and untreated wood sheathing, had sustained fire growth when using the ad-hoc test protocol.

Configuration 3, a roof assembly constructed with untreated wood trusses and FRT wood sheathing, had similar results to Configuration 1 affording better protection than the NFPA 13 attic sprinkler system. This code change proposal recognizes the improved fire performance demonstrated by this configuration. The area limitation in Table 503 for buildings using this configuration and otherwise sprinklered throughout in accordance with NFPA 13 are permitted to be increased 100%.

1. "Flammability of Full Scale Roof Attic Assemblies by Ignition with 6 lb and 35 lb Wood Crib and Measurement of Heat Release," Omega Point Maboratories, Project 15475-117047, November 2004.
2. "Spray Sprinklers Installed in Sloped Combustible Concealed Spaces," Underwriters Laboratories Inc., Project 01NK32756, EX5985, September 2001

Cost Impact: The code change proposal will not increase the cost of construction. Will reduce cost of construction by approximately $3/sq.ft. of roof area.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME:FRANCIS-G1-506 3.doc

G100–09/10
506.4.1, 506.5.2

Proponent: Dennis Richardson PE, dbr Group Inc., representing self

Revise as follows:

506.4 Single occupancy buildings with more than one story. The total allowable *building area* of a single occupancy building with more than one *story above grade plane* shall be determined in accordance with this section. The actual aggregate *building area* at all *stories* in the building shall not exceed the total allowable *building area*.

Exception: A single basement need not be included in the total allowable *building area*, provided such basement does not exceed the area permitted for a building with no more than one *story above grade plane*.

506.4.1 Area determination. The total allowable *building area* of a single occupancy building with more than one *story above grade plane* shall be determined by multiplying the allowable *building area* per *story* (*Aa*), as determined in Section 506.1, by the number of *stories above grade plane* as listed below:

1. For buildings with two *stories above grade plane*, multiply by 2;
2. For buildings with three or more *stories above grade plane*, multiply by 3; and
3. No *story* shall exceed the allowable *building area* per *story* (A_a), as determined in Section 506.1, for the occupancies on that *story*.

Exceptions:

1. Unlimited area buildings in accordance with Section 507.
2. The maximum area of a building equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2 shall be determined by multiplying the allowable area per *story (Aa),* as determined in Section 506.1, by the number of *stories above grade plane*.
3. The first story of a single occupancy building with more than one *story above grade plane* shall not exceed the allowable *building area* permitted for a building of the same occupancy with one *story above grade plane* when all of the following criteria are met:
   - 3.1. The allowable area (A_a) of the first *story above grade plane* shall be determined individually based on the provisions in Section 506.1 for a building with no more than one *story above grade plane*.
   - 3.2. Each additional *story* shall not exceed the allowable *building area* per *story* (A_a), as determined in Section 506.1 for the occupancies on that *story*.
   - 3.3. The total allowable *building area* shall comply with Items 1 or 2 of Section 506.4.1 computed based on a building with more than one story above grade plane.

506.5 Mixed occupancy area determination. The total allowable *building area* for buildings containing mixed occupancies shall be determined in accordance with the applicable provisions of this section. A single basement need not be included in the total allowable *building area*, provided such basement does not exceed the area permitted for a building with no more than one *story above grade plane*.

506.5.1 No more than one story above grade plane. For buildings with no more than one *story above grade plane* and containing mixed occupancies, the total *building area* shall be determined in accordance with the applicable provisions of Section 508.1.

506.5.2 More than one story above grade plane. For buildings with more than one *story above grade plane* and containing mixed occupancies, each *story* shall individually comply with the applicable requirements of Section 508.1. For buildings with more than three *stories above grade plane*, the total *building area* shall be such that the aggregate

sum of the ratios of the actual area of each *story* divided by the allowable area of such *stories* based on the applicable provisions of Section 508.1 shall not exceed 3.

Exception: The first story of a multi-story building shall not exceed the area permitted for a building with no more than one story above grade plane when all of the following criteria are met:

1. The allowable area of the first story above grade plane shall be determined individually in accordance with the applicable total building area provisions of Section 508.1 and comply with the building area provisions for a building with no more than one story above grade plane.
2. Each additional story shall individually comply with the applicable requirements of Section 508.1.
3. For buildings with two stories above grade plane, the total building area shall be such that the aggregate sum of the ratios of the actual area of each story divided by the allowable area of such story, computed based on a building with more than one story above grade plane, based on the applicable provisions of Section 508.1, shall not exceed 2.
4. For buildings with three or more stories above grade plane, the total building area shall be such that the aggregate sum of the ratios of the actual area of each story divided by the allowable area of such story, computed based on a building with more than one story above grade plane, based on the applicable provisions of Section 508.1, shall not exceed 3.

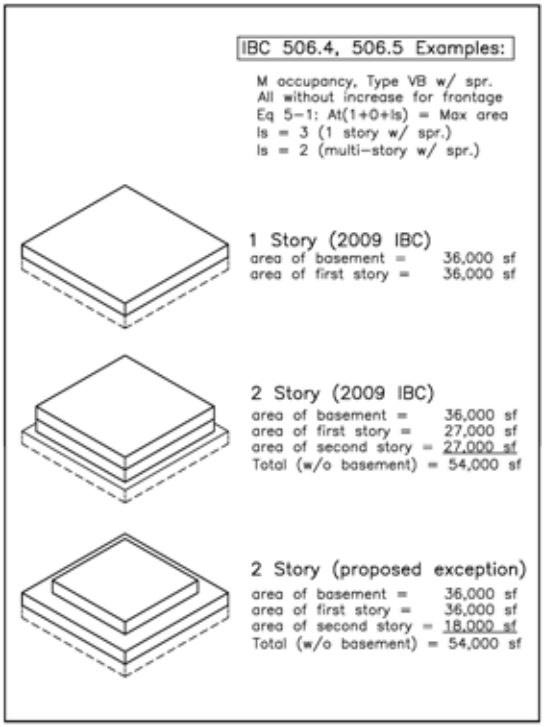
Reason: The proposed change would provide an exception allowing the first floor of a multi story building to be as large as a single story building which could be constructed on the same site as long as the total building area does not exceed the applicable code maximum allowable floor area.

Currently, based on Equation 5-1 and Section 506.3, a one story building with fire sprinklers throughout is permitted to be 4 times the Table 503 tabular area before considering any available area increase for frontage. However the first story of a multi-story building is limited to three times the tabular building area without consideration of any increase for frontage, even if the upper story levels are less than the maximum permitted area. The step function in the value of I_S between a one story building and all multistory buildings effectively limits the first story of multi-story buildings to 75% of the area allowed on that level for a one story building. This is true regardless of how small the second story is.

The current Section 506.4.1, item 3 indicates: No *story* shall exceed the allowable *building area* per *story* (Aa), as determined in Section 506.1 for occupancies on that *story*. This provision of the code encourages the construction of buildings that are box like in order to maximize building area with similar sized floors instead of allowing the flexibility for the designer to step back the upper floors giving the building the appearance of less mass and allowing more light to the street.

The exception to Section 506.4 and the last sentence in Section 506.5 each allow a single basement not to be included in the area calculation so long as the "basement area does not exceed the area permitted for a building with no more than one story above grade plane." Since a building with no more than one story above grade plane can be larger than the first floor of a similar multi-story building, this exception has the effect of allowing the basement to be larger in area than the area of first floor above it on a multi-story building.

The proposed code change is formatted as an exception so that it clear it does not change the existing code provisions unless utilized. When it is utilized it is intended to merely allow the first floor to be as large as it would otherwise be as a single story building without creating an increase in the total floor area of the entire building. As such the area of upper floors may have to be decreased from the maximum area that would otherwise be allowed so the total floor area is less than or equal to the total allowable building area. See attached example for a Group M occupancy, Type VB construction building. Similar examples would occur with other occupancies.



Cost Impact: The code change proposal will not increase the cost of construction. Because this exception does not have to be utilized by the designer and since it has the effect of allowing more construction to occur at grade where it is less expensive this proposed change would have the effect of decreasing construction cost if utilized by the designer.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICHARDSON-G1-506.4.1 AND 506.5.2

G101–09/10
507.1.1 (New)

Proponent: Sarah A. Rice, CBO, representing herself

Add new text as follows:

507.1.1 Accessory occupancies. Occupancies not specifically listed in Section 507 shall be allowed to be located in unlimited area buildings provided the occupancy complies with Section 508.2 for an accessory occupancy.

Reason: The current text of Section 507 has been interpreted that unless an occupancy is specifically listed in that section it cannot be located within an unlimited area building. Unlimited area buildings are subject to the same guidelines as other buildings when it comes to 'accessory occupancies'. If the occupancy is one that is allowed and the area it occupies meets the size limitations of 508.2 they are allowed to be in an unlimited area building. The proposed language makes clear that occupancies which are not specifically listed in Section 507 are not prohibited from being in an unlimited area building as long as they meet the accessory occupancy provisions (including the 10% area limit in Section 508.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-G10-507.1.1.doc

G102–09/10
507.3

Proponent: Dallas Dixon representing BRR Architecture INC.

Revise as follows:

507.3 Sprinklered, one story. The area of a Group B, F, M or S building no more than one story above grade plane of any construction type, or the area of a Group A-4 building no more than one story above grade plane of other than Type V construction, shall not be limited when the building is provided with an automatic sprinkler system throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by public ways or yards not less than 60 feet (I8 288 mm) in width.

Exceptions: (No change to current text)

Reason: The intent of this proposal is to provide clarity of which occupancy classifications design professionals are allowed to design as unlimited area buildings while choosing any construction type and to clarify which occupancy classification is restricted to construction types 1 through 4.

On many occasion design professionals come across jurisdictions that interpreted section 507.3 to disallow Type 5 construction for all occupancies listed. Many deny that unlimited area is applicable to Type 5 construction when they read the existing text. The code commentary clearly explains that only Group A-4 is restricted. All remaining listed occupancy classifications are permitted to qualify for unlimited area when the building is fully sprinkled and surrounded by 60 feet of open yard on all sides. The addition of the text "of any construction type" and "the area of" will provide greater clarity to the intention and understanding of the code section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DIXON-G1-507.3

G103–09/10
507.3

Proponent: Tom Lariviere, Chairman, representing Joint Fire Service Review Committee

Revise as follows:

507.3 Sprinklered, one story. The area of a Group B, F, M or S building no more than one *story above grade plane*, or a Group A-4 building no more than one *story above grade plane* of other than Type V construction, shall not be limited when the building is provided with an *automatic sprinkler system* throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Exceptions~~:~~

~~1.~~ Buildings and structures of Type I and II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.3 and 903.3.1.1 and Chapter 23 of the *International Fire Code*.

~~2. The *automatic sprinkler system* shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that:~~
~~2.1. *Exit* doors directly to the outside are provided for occupants of the participant sports areas; and~~
~~2.2. The building is equipped with a *fire alarm system* with *manual fire alarm boxes* installed in accordance with Section 907.~~

Reason: Code change F132-07/08 deleted the exception which allowed the elimination of a fire sprinkler system over participant sport areas in Group A-4 occupancies (See Section 903.2.1.4). However, when that code change was approved, a corresponding section in the IBC was overlooked. IBC 507.3 contains a similar exception to the item that was deleted in Chapter 9. Therefore, Exception 2 is proposed for deletion to be consistent with the action take last cycle in F132-07/08.

Section 507.3 allows for unlimited area buildings. Exception 2 would allow for an unlimited area Group A-4 occupancy and yet not require sprinklers over a major portion of the building.

The intention of the exception was for gymnasiums and similar areas where the probable occupant load was significantly less than what would be determined based on a square footage per occupant factor. However, these facilities have become multi-use and the occupant load is frequently higher than what was anticipated or expected when the exception was developed, and the fire load can vary based on the used to far exceed what would be expected for a sporting area.

For example, a community recreation center is constructed with no sprinklers over the gymnasium floor. The same area is also utilized for receptions and various community activities such as work fairs, rummage sale, art exhibits, emergency shelters for persons displaced by natural disasters, etc. Such uses could even include eating, sleeping, and fire loads far in excess of a few uniforms and leather volleyballs.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-G3-507.3

G104–09/10
507.8

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

507.8 Group H occupancies. Group H-2, H-3 and H-4 occupancies shall be permitted in unlimited areas buildings containing Group F and S occupancies~~,~~ in accordance with Sections 507.3 and 507.4 and the provisions ~~limitations~~ of ~~this section~~ Sections 507.8.1 through 507.8.3.

507.8.1 Allowable area. The aggregate floor area of ~~the~~ Group H occupancies located ~~at the perimeter of the~~ in an unlimited area building shall not exceed 10 percent of the area of the building nor the area limitations for the Group H occupancies as specified in Table 503 as modified by Section 506.2.

507.8.1.1 Located on building perimeter. Except as provided for in Section 507.8.1.2, Group H occupancies shall be located on the perimeter of the building. ~~,based upon the percentage of the perimeter of each Group H floor area that fronts~~ In Group H-2 and H-3 occupancies, not less than 25 percent of the perimeter of such occupancies shall front on a public way or open ~~street or other unoccupied~~ space.

507.8.1.2 Located within the building. The aggregate floor area of Group H occupancies not located at the perimeter of the building shall not exceed 25 percent of the area limitations for the Group H occupancies as specified in Table 503.

507.8.1.2.1 Liquid use, dispensing and mixing rooms. Liquid use, dispensing and mixing rooms having a floor area of not more than 500 square feet (46.5m^2) need not be located on the outer perimeter of the building where they are in accordance with the International Fire Code and NFPA 30.

507.8.1.2.2 Liquid storage rooms. Liquid storage rooms having a floor area of not more than 1,000 square feet (93 m^2) need not be located on the outer perimeter where they are in accordance with the *International Fire Code* and NFPA 30.

507.8.1.2.3 Spray paint booths. Spray paint booths that comply with the *International Fire Code* need not be located on the outer perimeter.

507.8.2 Occupancy separations. Group H occupancies shall be separated from the remainder ~~rest~~ of the unlimited area building and from each other in accordance with Table 508.4.

507.8.3 Height limitations. For two-story unlimited area buildings, ~~the~~ Group H occupancies shall not be located more than one story above grade plane unless permitted based on ~~by~~ the allowable height in stories and feet as set forth in Table 503 for ~~based on~~ the type of construction of the unlimited area building.

Reason: This proposal is intended to clarify the provisions governing the placement of Group H occupancies in certain unlimited area buildings. Currently, all requirements are placed within a single run-on paragraph that does not separate thoughts or provisions. In its present format, it is easy to attempt to overlay requirements that are intended to address different design conditions. Additionally, Section 507.8 contains a very vague provision in that it states that Group H occupancies shall be located on the perimeter of the building based upon the "percentage of the perimeter" of each Group H floor area. No percentage figure is provided. Presumably, that is an indirect reference to Section 415.3. For purposes of continuity, Section 415.3 requirements have been incorporated into Section 507.8, including allowances for certain interior spaces. The format and clarity provided in this proposal will assist code users in the proper identification of requirements in this fairly rare, but very important provision.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-G3-507.8.doc

G105–09/10
507.10

Proponent: Joe Holland and Dave Bueche, Hoover Treated Wood Products

Revise as follows:

507.10 Group E buildings. The area of a Group E building no more than one *story above grade plane*, of Type II, ~~IIA~~ III or IV construction, shall not be limited when all of the following criteria are met:

1. Each classroom shall have not less than two *means of egress*, with one of the *means of egress* being a direct *exit* to the outside of the building complying with Section 1020.
2. The building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. The building is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason: The exterior wall fire resistance required in Table 601 is greater for Type III than what is required for Type II and is equal to what is required for Type IV. The interior fire resistance in Type III construction is equivalent to Type II and therefore should be allowed. In addition, in Table 503 for E occupancies, the code recognizes that Type IIB and IIIB are equivalent in overall height, number of stories, and allowable area.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOLLAND-BUECHE-G2-507.10

G106–09/10
507.11

Proponent: Joe Holland and Dave Bueche, Hoover Treated Wood Products

Revise as follows:

507.11 Motion picture theaters. In buildings of Type II or III construction, the area of a motion picture theater located on the first *story above grade plane* shall not be limited when the building is provided with an *automatic sprinkler system* throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason: This change recognizes that Type III offers equivalent or superior fire resistance to Type II construction. The exterior wall fire resistance required in Table 601 is greater for Type III than what is required for Type II (2 hours versus 1 hour or none). The interior fire resistance in Type III construction is equivalent to Type II. In Table 503 for Group A-1 occupancies, the code recognizes that Type IIB and IIIB are equivalent in overall height, number of stories, and allowable area.

Cost Impact: The code change proposal will not increase the cost of construction.

G107–09/10
508, 509 (New)

Proponent: Maureen Traxler, City of Seattle, WA, Seattle Dept of Planning & Development

Revise as follows:

SECTION 508
MIXED USE AND OCCUPANCY

508.1 General. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building contains more than one occupancy group, the building or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3 or 508.4, or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section ~~509~~ 510.
2. Where required by Table 415.3.2, areas of Group H-1, H-2 and H-3 occupancies shall be located in a separate and detached building or structure.
3. Uses within live/work units, complying with Section 419, are not considered separate occupancies.

508.2 Accessory occupancies. Accessory occupancies are those occupancies that are ancillary to the main occupancy of the building or portion thereof. Accessory occupancies shall comply with the provisions of Sections 508.2.1 through 508.2.4 ~~508.2.5.3~~.

508.2.1 Area limitations. Aggregate accessory occupancies shall not occupy more than 10 percent of the *building area* of the *story* in which they are located and shall not exceed the tabular values in Table 503, without *building area* increases in accordance with Section 506 for such accessory occupancies.

508.2.2 Occupancy classification. Accessory occupancies shall be individually classified in accordance with Section 302.1. The requirements of this code shall apply to each portion of the building based on the occupancy classification of that space.

508.2.3 Allowable building area and height. The allowable *building area and height* of the building shall be based on the allowable *building area and height* for the main occupancy in accordance with Section 503.1. The height of each accessory occupancy shall not exceed the tabular values in Table 503, without increases in accordance with Section 504 for such accessory occupancies. The *building area* of the accessory occupancies shall be in accordance with Section 508.2.1.

508.2.4 Separation of occupancies. No separation is required between accessory occupancies and the main occupancy.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Incidental ~~accessory occupancies~~ uses required to be separated or protected by Section ~~508.2.5~~ 509.
3. Group I-1, R-1, R-2 and R-3 *dwelling units* and *sleeping units* shall be separated from other *dwelling* or *sleeping units* and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.

(Relocate Section 508.2.5 through 508.2.5.3 to new Section 509)

508.3 Nonseparated occupancies. Buildings or portions of buildings that comply with the provisions of this section shall be considered as nonseparated occupancies.

508.3.1 Occupancy classification. Nonseparated occupancies shall be individually classified in accordance with Section 302.1. The requirements of this code shall apply to each portion of the building based on the occupancy classification of that space except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the building or portion thereof in which the nonseparated occupancies are located.

508.3.2 Allowable building area and height. The allowable *building area and height* of the building or portion thereof shall be based on the most restrictive allowances for the occupancy groups under consideration for the type of construction of the building in accordance with Section 503.1.

508.3.3 Separation. No separation is required between nonseparated occupancies.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Group I-1, R-1, R-2 and R-3 *dwelling units* and *sleeping units* shall be separated from other *dwelling* or *sleeping units* and from other occupancies contiguous to them in accordance with the requirements of Section 420.

508.4 Separated occupancies. Buildings or portions of buildings that comply with the provisions of this section shall be considered as separated occupancies.

508.4.1 Occupancy classification. Separated occupancies shall be individually classified in accordance with Section 302.1. Each separated space shall comply with this code based on the occupancy classification of that portion of the building.

TABLE 508.4
REQUIRED SEPARATION OF OCCUPANCIES (HOURS)

(No change to table contents)

508.4.2 Allowable building area. In each *story*, the *building area* shall be such that the sum of the ratios of the actual *building area* of each separated occupancy divided by the allowable *building area* of each separated occupancy shall not exceed 1.

508.4.3 Allowable height. Each separated occupancy shall comply with the *building height* limitations based on the type of construction of the building in accordance with Section 503.1.

Exception: Special provisions permitted by Section ~~509~~ 510.

508.4.4 Separation. Individual occupancies shall be separated from adjacent occupancies in accordance with Table 508.4.

508.4.4.1 Construction. Required separations shall be fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both, so as to completely separate adjacent occupancies.

SECTION 509
INCIDENTAL USES

~~508.2.5~~ 509.1 Separation of incidental uses ~~accessory occupancies~~. The incidental uses ~~accessory occupancies~~ listed in Table ~~508.2.5~~ 509.1 shall be separated from the remainder of the building or equipped with an automatic fire-extinguishing system, or both, in accordance with Table ~~508.2.5~~ 509.1.

Exception: Incidental uses ~~accessory occupancies~~ within and serving a *dwelling unit* are not required to comply with this section.

~~508.2.5.1~~ 509.2 Fire-resistance-rated separation. Where Table ~~508.2.5~~ 509.1 specifies a fire-resistance-rated separation, the incidental uses ~~accessory occupancies~~ shall be separated from the remainder of the *building* by a *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 712, or both. Construction supporting 1-hour fire-resistance-rated *fire barriers* or *horizontal assemblies* used for incidental use ~~accessory occupancy~~ separations in buildings of Type IIB, IIIB and VB construction are not required to be fire-resistance rated unless required by other sections of this code.

TABLE ~~508.2.5~~ 509.1
INCIDENTAL ~~ACCESSORY OCCUPANCIES~~ USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic fire-extinguishing system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic fire-extinguishing system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen cutoff rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Incinerator rooms	2 hours and automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic fire-extinguishing system
Laboratories and vocational shops, not classified as Group H, located in a Group E or I-2 occupancy	1 hour or provide automatic fire-extinguishing system
Laundry rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system
Group I-3 cells equipped with padded surfaces	1 hour
Group I-2 waste and linen collection rooms	1 hour
Waste and linen collection rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system
Stationary storage battery systems having a liquid electrolyte capacity of more than 50 gallons, or a lithium-ion capacity of 1,000 pounds used for facility standby power, emergency power or uninterrupted power supplies	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Rooms containing fire pumps in nonhigh-rise buildings	2 hours; or 1 hour and provide automatic sprinkler system throughout the building
Rooms containing fire pumps in high-rise buildings	2 hours

For SI: 1 square foot = 0.0929 m2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L.

~~508.2.5.2~~ 509.2.1 Nonfire-resistance-rate separation and protection. Where Table ~~508.2.5~~ 509.1 permits an automatic fire-extinguishing system without a *fire barrier*, the incidental uses ~~accessory occupancies~~ shall be separated from the remainder of the building by construction capable of resisting the passage of smoke. The walls shall extend from the top of the foundation or floor assembly below to the underside of the ceiling that is a component of a fire-resistance-rated floor assembly or roof assembly above or to the underside of the floor or roof sheathing, deck

or slab above. Doors shall be self- or automatic closing upon detection of smoke in accordance with Section 715.4.8.3. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80. Walls surrounding the incidental use shall not have air transfer openings unless provided with smoke dampers in accordance with Section 711.7.

~~**508.2.5.3**~~ **509.2.2 Protection.** Except as specified in Table ~~508.2.5~~ 509.1 for certain incidental uses ~~accessory occupancies~~, where an automatic fire-extinguishing system or an *automatic sprinkler system* is provided in accordance with Table ~~508.2.5~~ 509.1, only the space occupied by the incidental use ~~accessory occupancy~~ need be equipped with such a system.

(Renumber subsequent sections)

Reason: A change occurred in the 2009 IBC that we believe has unintended consequences. As written, "incidental accessory occupancies" are only required to be separated when they are part of an accessory occupancy. They are mentioned only in Section 508.2.5, and, since it is a subsection of Section 508.2, it only applies where 508.2 applies.

This proposal creates a separate section so that the incidental use provisions will apply in all buildings, including single use buildings. The rooms and areas listed in the incidental use table present special hazards that require special protection. They should be separated from other occupancies and uses regardless of whether the other occupancies in the building are treated as separated or nonseparated occupancies.

We are also proposing to change the term to "incidental uses" instead of "incidental accessory occupancies". Many of the items listed in the table are not occupancies in themselves—they are special uses that don't fall neatly into any occupancy category. The use of this term should be changed throughout the code if this code change proposal is approved.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAXLER-G5-508.DOC

G108–09/10
508.1

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

508.1 General. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building contains more than one occupancy group, the building or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3 or 508.4, or a combination of these sections. Under all circumstances, where a building contains a use listed in Table 508.2.5, the applicable provisions of Section 508.2.5 shall apply.

Exceptions:

1. Occupancies separated in accordance with Section 509.
2. Where required by Table 415.3.2, areas of Group H-1, H-2 and H-3 occupancies shall be located in a separate and detached building or structure.
3. Uses within live/work units, complying with Section 419, are not considered separate occupancies.

Reason: This proposal is intended to clarify that incidental accessory occupancy provisions apply to all building occupancy configurations. Section 508.1 currently states, "…the building or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3 or 508.4, or a combination of these sections." Although Section 508.2.5 states, "The incidental accessory occupancies listed in Table 508.2.5 shall be separated from the remainder of the building or equipped with an automatic fire-extinguishing system, or both, in accordance with Table 508.2.5," there is a concern that all code practitioners may not make the legislative tie between Section 508.1 and Section 508.2.5. The added provision makes it very clear that incidental occupancy requirements apply regardless of the building occupancy condition. Approval of this proposal will result in more consistent application of IBC occupancy provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G109–09/10
508.2, 508.2.1, 508.2.2, 508.2.3, 508.2.4

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

508.2 Accessory occupancies. Buildings or portions of buildings that comply with the provisions of this section shall be considered as accessory occupancies. Accessory occupancies are those occupancies that are ancillary to the main occupancy of the building or portion thereof. Accessory occupancies shall comply with the provisions of Section 508.2.1 through ~~508.2.5.3~~ 508.2.4.3.

~~**508.2.1 Area limitations.** Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without area increases in accordance with Section 506 for such accessory occupancies.~~

~~**508.2.2**~~ **508.2.1 Occupancy classification.** Accessory occupancies shall be individually classified in accordance with Section 302.1. The requirements of this code shall apply to each portion of the building based on the occupancy classification of that space.

~~**508.2.3**~~ **508.2.2 Allowable area and height.** The allowable area and height of the building shall be based on the allowable area and height for the main occupancy in accordance with Section 503.1. Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without area increases in accordance with Section 506 for such accessory occupancies. The height of each accessory occupancy shall not exceed the tabular values in Table 503, without increases in accordance with Section 504 for such accessory occupancies. ~~The area of the accessory occupancies shall be in accordance with Section 508.2.1~~

~~**508.2.4**~~ **508.2.3 Separation of occupancies.** No separation is required between accessory occupancies and the main occupancy or each other.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Incidental accessory occupancies required to be separated or protected by Section ~~508.2.5~~.508.2.4.
3. Group I-1, R-1, R-2 and R-3 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.

~~**508.2.5**~~ **508.2.4 Separation of incidental accessory occupancies.**

(The text of this and following sections are not changed, renumbering is shown for context of number changes in preceding sections.)

Table ~~508.2.5~~ 508.2.4 Incidental Accessory Occupancies
~~508.2.5.1~~ 508.2.4.1 Fire-resistance-rated separation.
~~508.2.5.2~~ 508.2.4.2 Nonfire-resistance-rated separation and protection.
~~508.2.5.3~~ 508.2.4.3 Protection.

Reason: This proposal is intended to clarify accessory occupancy mixed occupancy provisions. Charging language has been added to Section 508.2 to duplicate that contained in Sections 508.3 and 508.4 for purposes of editorial and legal consistency. The area provisions in current Section 508.2.1 have been placed in context in proposed Section 508.2.2, "Allowable area and height." Having accessory occupancy allowable area provisions in two different sections could result in oversight. Proposed Section 508.2.3 clarifies that no occupancy separation is required between adjacent accessory occupancies, the exceptions notwithstanding. Approval of this proposal will result in more consistent application of IBC accessory occupancy provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-G5-508.2.doc

G110–09/10
508.2.1

Proponent: Lee J. Kranz, CBO, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee.

Revise as follows:

508.2.1 Area limitations. Aggregate accessory occupancies shall not occupy more than 10 percent of the building area of the story in which they are located and shall not exceed the tabular values in Table 503, without building area increases in accordance with Section 506 for such accessory occupancies. In multi-tenant buildings, aggregate accessory occupancies within each tenant space shall be limited to 10 percent of the area of each story of the tenant space.

Reason: In multi-tenant buildings, it is not reasonable to penalize one tenant because another tenant has exceeded 10% of their tenant space with an accessory use. The code currently allows a single tenant to exceed 10% of their space with an accessory use as long as the aggregate areas stay within the 10% limit. It is also impractical for many large multi-tenant commercial buildings to provide an up-to-date ratio inventory of accessory spaces in order to obtain a tenant improvement permit. The accessory occupancy limit should be on a tenant-by-tenant basis in multi-tenant buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRANZ-GI-508.2.1.DOC

G111–09/10
508.2.3

Proponent: Todd Andersen, representing self

Revise as follows:

508.2.3. Allowable building area and height.. The allowable building area and height of the building containing accessory occupancies shall be based on the allowable building area and height for the main occupancy in accordance with Section 503.1. ~~The height of any accessory occupancy shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies. The building area of the accessory occupancies shall be in accordance with Section 508.2.1.~~

Reason: The current text would limit the location of an accessory occupancy within a building such that it could not be located any higher in a building than the building area and height limits of Table 503 for the accessory would allow. From the Reason statement and testimony by the proponent this was never the intent. Code Change G14-04/05 relocated and rewrote the provisions for Mixed Occupancies in the 2006 IBC to move from Section 302 to new Section 508.

In the Reason statement the proponent wrote – "The purpose of this proposal is to organize and clarify the requirements for the various mixed occupancy and use design options recognized in the International Building Code…The various technical requirements for each design option have been articulated using consistent terminology and style. These requirements generally parallel current intent."

As stated in the Reason statement to Code Change G14-04/05, the intent of code change was to relocate the provisions in Section 302.2 of the 2003 IBC and put their requirements in a consistent format, not to make technical changes. Therefore to understand that the current language was never part of the requirements we need to look at the language in Section 302.2 of the 2003 IBC – it reads:

> **302.2 Accessory use areas.** A fire barrier shall be required to separate accessory use areas classified as Group H in accordance with Section 302.3.1, and incidental use areas in accordance with Section 302.1.1. Any other accessory use area shall not be required to be separated by a fire barrier provided the accessory use area occupies an area not more than 10 percent of the area of the story in which it is located and does not exceed the tabular values in Table 503 for the allowable height or area for such use.
> **302.2.1 Assembly areas.** Accessory assembly areas are not considered separate occupancies if the floor area is equal to or less than 750 square feet (69.7 m2). Assembly areas that are accessory to Group E are not considered separate occupancies. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

Nowhere in Section 302.2 (2006 IBC) was there ever a limit on the location of an accessory use area within a building, and it was not the intent of the proponents of Code Change G14-04/05 to ever impose one in the 2006 IBC nor to carry over to the 2009 IBC.

Without this code change building design as we know it today would literally not be allowed.

Without this code change a conference room would never be allowed to be located on the top story in a office building (Group B) of Type IIA construction because the building height limit (in stories) for a Group A-3 occupancies is 3 stories, where the Group B building would be allowed to be 5 stories in building height (or 6 stories if sprinklered). The current language would limit the location of any conference room to not more than the 3rd story.

Another example would be storage rooms (Group S-1). Based on Table 503 the building height limit (in stories) for a Group S-1 occupancy is 4 stories, again where the Group B building would be allowed to be 5 stories in building height (or 6 stories if sprinklered). The current language would limit the location of any store rooms to not more than the 4th story.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: ANDERSEN G-1(FORMER RICE-G9)-508.2.3.DOC

G112–09/10
508.2.5, Table 508.2.5

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

508.2.5 Separation of incidental accessory occupancies. The incidental accessory occupancies listed in Table 508.2.5 shall be separated from the remainder of the building or equipped with an automatic fire-extinguishing system or both, in accordance with Table 508.2.5.

Exceptions:

1. Incidental accessory occupancies within and serving a dwelling unit are not required to comply with this section.
2. In other than Group I-2 occupancies, where incidental accessory occupancies listed in Table 508.2.5.2 conform to the requirements of Sections 508.3 or 508.4, using the occupancy indicated in Table 508.2.5, Section 508.2.5 shall not apply.

Table 508.2.5
INCIDENTAL, ACCESSORY OCCUPANCIES

ROOM OR AREA	SEPARATION AND/OR PROTECTION	OCCUPANCY
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic fire-extinguishing system.	F-1
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic fire-extinguishing system.	F-2,
Refrigeration machinery room	1 hour or provide automatic fire-extinguishing system.	F-1
Hydrogen cutoff-rooms, not classified as H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.	NA
Incinerator rooms	2 hours and automatic sprinkler system	F-1
Paint shops, not classified as Group H, located in occupancies other than F	2 hours; or 1 hour and provide automatic fire-extinguishing system	F-1
Laboratories and vocational shops, not classified as Group H, located in a Group E or I-2 occupancy	1 hour or provide automatic fire-extinguishing system	B, where no gas is piped to, or stored in the laboratory room or space
Laundry rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system	F-2
Group I-3 cells equipped with padded surfaces	1 hour	I-2
Group I-2 waste and linen collection rooms	1 hour or provide automatic fire-extinguishing system	NA
Waste and linen collection rooms over 100 square feet	1-hour in Group B, F, M, S and U occupancies. 2-hour in Group A, E, I and R occupancies.	S-1
Stationary storage battery systems having a liquid electrolyte capacity of more than 50 gallons, or a lithium-ion capacity of 1,000 pounds used for facility standby power, emergency power or uninterrupted power supplies	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A	NA
~~Rooms containing fire pumps in high-rise buildings~~	~~2 hours; or 1 hour and provide automatic sprinkler system throughout~~	
~~Rooms containing fire pumps in nonhigh-rise buildings~~	~~2 hours~~	

NA – Not applicable
For SI: 1 square foot = 0.0929 m2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L

Reason: Currently Section 508.1 allows the option to use "the applicable provisions of Section 508.2, 508.3 or 508.4, or a combination of these sections" when the occupancies are mixed. However, Section 508.2.5 does not designate what occupancy is anticipated when the listed occupancies are to be considered either separated or nonseparated mixed use and occupancy. This change indicates which occupancies these areas are to be considered a part of for such purposes.

"Incidental accessory" is not a defined term in the IBC. Several sections include the term incidental, and Section 508.2 describes what constitutes an accessory condition. Using the code's prescribed limits, larger areas for waste and linen collection could be built exceeding the 10% limit requiring that these occupancies be dealt with as mixed use separated or nonseparated. Without an occupancy designation the designer and the code official are unable to determine the means for compliance.

The criteria for rooms containing fire pumps is to be removed as this duplicates the criteria in Section 913 of the IBC and isn't an appropriate classification of an incidental accessory occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-G3-508.2.5.doc

G113–09/10
Table 508.2.5

Proponent: Paul K. Heilstedt, PE, Chair, representing ICC Code Technology Committee (CTC)

Revise table as follows:

TABLE 508.2.5
INCIDENTAL ACCESSORY OCCUPANCIES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Group I-2 waste and linen collection rooms	1 hour
Waste and linen collection rooms over 100 square feet	1 hour or provide automatic fire extinguishing system
Ambulatory Care Facility Waste and linen collection rooms	1 hour

(Portions of table not shown remain unchanged)

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC’s investigation of the area of study entitled “Care Facilities”. The scope of the activity is noted as:

> Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of “care”. “Care” as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a “Patient” is now identified as a “care recipient” and “nurse” is now “care provider”. People receive care of varying types but they are not always referred to as “patients”. They receive care from a wide range of persons with different technical abilities, not just a “nurse” or “staff”. Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Ambulatory Care Facility - Waste and Linen Collection Room

The code currently requires waste and linen collection rooms in Group I-2 facilities to have a 1 hour separation. The Care Facilities committee proposals for Ambulatory Care Facilities are intended to make this type of facility consistent with a higher level of protection required when some occupants rely on staff for assisted evacuation, similar to nursing homes and hospitals; therefore, it is consistent to protect these types of rooms in a similar manner.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HEILSTEDT-G9-TABLE 508.2.5.doc

G114–09/10
508.3.3

Proponent: Jody Hilton, Sunrise Engineering, Utah Chapter of International Code Council (ICC)

Revise as follows:

508.3 Nonseparated occupancies. Buildings or portions of buildings that comply with the provisions of this section shall be considered as nonseparated occupancies.

508.3.1 Occupancy classification. Nonseparated occupancies shall be individually classified in accordance with Section 302.1. The requirements of this code shall apply to each portion of the building based on the occupancy classification of that space except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the building or portion thereof in which the nonseparated occupancies are located.

508.3.2 Allowable building area and height. The allowable *building area and height* of the building or portion thereof shall be based on the most restrictive allowances for the occupancy groups under consideration for the type of construction of the building in accordance with Section 503.1.

508.3.3 Separation. No separation is required between nonseparated occupancies.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Group I-1, R-1, R-2 and R-3 *dwelling units* and *sleeping units* shall be separated from other *dwelling* or *sleeping units* and from other occupancies contiguous to them in accordance with the requirements of Section 420.
3. Group S-2 parking garages shall be separated from all other occupancies in accordance with footnote b of Table 508.4.

Reason: When G163-07/08 was passed and included in the 2009 I.B.C to require a minimum of a one-hour separation from parking garages and all other uses it was intended that the minimal separation of one-hour fire-resistance rated construction apply in all cases. Since parking garages were deleted from the incidental use Table 508.2.5 which would have required a two-hour separation between a nonsprinkled six story B occupancy and an S-2 open parking garage uses which are side- by- side there needs to be some safeguard in the code to not allow this. Since the uses could be nonseparated they could be entirely open to each other allowing products of combustion to spread throughout the building as well as carbon monoxide and nitrogen dioxide emissions. Even though these uses are inherently separated it is still necessary to insure that there will always be a separation in all instances.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis. Would it be preferable to place the requirement in the body of the code rather than its current location in a footnote to a table? With a location within the code text, the footnote of the table would instead refer to a requirement in the code text.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HILTON-G1-508.3.3

G115–09/10
508.4

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

508.4 ~~Separated~~ Calculated occupancies. Buildings or portions of buildings that comply with the provisions of this section shall be considered as ~~separated~~ calculated occupancies.

508.4.1 Occupancy classification. ~~Separated~~ Calculated occupancies shall be individually classified in accordance with Section 302.1. Each ~~separated~~ individual space shall comply with this code based on the occupancy classification of that portion of the building.

508.4.2 Allowable area. In each story, the building area shall be such that the sum of the ratios of the actual building area of each ~~separated~~ individual occupancy divided by the allowable area of each ~~separated~~ such occupancy shall not exceed one.

508.4.3 Allowable height. Each ~~separated~~ individual occupancy shall comply with the height limitations based on the type of construction of the building in accordance with Section 503.1.

Exception: Special provisions permitted by Section 509.

508.4.4 Separation. Individual occupancies shall be separated from adjacent occupancies in accordance with Table 508.4.

508.4.4.1 Construction. Required separations shall be fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both, so as to completely separate adjacent occupancies.

Reason: This proposal is intended to clarify separated occupancy mixed occupancy provisions. First, "separated" occupancy is a misnomer. This is due to the fact that Table 508.4 does not necessarily require an occupancy separation based on similar risk of the occupancies under consideration. Section 508.4.2, however, always requires the performance of the sum of the ratios calculation. Given that this calculation is a common denominator of all Section 508.4 mixed occupancy design option applications, the term "calculated occupancies" has been chosen as the appropriate section title. The reference to "separated" occupancies in several locations has been changed to use an appropriate, less confusing term. Approval of this proposal will result in more consistent application of IBC mixed occupancy provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-G6B-508.4

G116–09/10
508.4

Proponent: John England, MCO, England Enterprises Inc., representing the Cities of Beaufort and Hardeeville, SC

Revise as follows:

508.4 Separated occupancies. Buildings or portions of buildings that comply with the provisions of this section shall be considered separated occupancies.

Exception: Covered mall and open mall buildings complying with Section 402 shall not be required to separate occupancies.

Reason: Since retails malls (open and enclosed) are unique. Reference should be given to the correct code sections when doing separation of spaces.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-G4-508.4.5.doc

G117–09/10
508.4.4

Proponent: Mike Ashley, CBO, representing: The Alliance for Fire and Smoke Containment and Control (AFSCC)

Revise as follows:

508.4.4 Separation. ~~Individual occupancies~~ Uses classified as different occupancy groups in accordance with Section 302.1 shall be separated from ~~adjacent occupancies~~ each other in accordance with Table 508.4.

Reason: This is an editorial clarification of this charging paragraph which implements the separation of occupancies option for buildings containing multiple occupancies of different occupancy groups. Currently, this section indicates that individual occupancies (which may be the same) are required to be separated from adjacent occupancies. However, that is not the case since this section deals with different occupancies located in the same building requiring fire barrier or horizontal assembly separations with fire-resistance ratings as specified in Table 508.4 to implement the separated occupancies option. Approving this code change proposal should result in better code interpretation and enforcement regarding the separation of mixed occupancies in buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

For SI: 1 square foot = 0.0929 m^2.
NP = Not permitted.

a. Except for Group H and I-2 occupancies, where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, the fire-resistance ratings shall be reduced by 1 hour but to not less than 1 hour and to not less than the required floor construction according to the type of construction.
b. Occupancy separation need not be provided for storage areas within Groups B and M if the:
   1. Area is less than 10 percent of the floor area;
   2. Area is provided with an automatic sprinkler system and is less than 3,000 square feet; or
   3. Area is less than 1,000 square feet.

c. Areas used only for private or pleasure vehicles shall be allowed to reduce separation by 1 hour.
d. See Section 406.1.4. for private garages and carports.
e. Commercial kitchens need not be separated from the restaurant seating areas that they serve.

Reason: This proposal aims to restore the previous Table 302.3.2 from the 2003 IBC, but retain the modified text of section 508 on Mixed Use & Occupancy. In addition to restoring the separated uses (occupancies) concept previously prescribed in Section 302 of the 2003 IBC (and 2003 Supp), the proposal clarifies the distinction between separated uses and the non-separated use options. During the 2006 cycle the separated uses section of the IBC was changed based on public proposal G32-04/05 on the basis that it presented no significant technical changes. To the contrary, there are more than 100 changes in fire resistance ratings resulting from this proposal, most without justification or supporting rationale. The result of this Code change is to reduce the level of protection provided by the IBC over any of the previous Legacy Codes.

Approximately 40% of the jurisdictions who have adopted the IBC are now using the 2006 (or later) edition. In contrast, when this Code change was first accepted in the 2006 IBC, few jurisdictions had any history with the lack of fire resistance rated construction between occupancies which the 2006 and 2009 IBC now permits. As a result, there is a growing level of concern with the reductions in fire resistance ratings between separated occupancies in mixed occupancy buildings in the 2006 IBC. The adoption of this Code change in the 2006 and 2009 IBC arbitrarily reduced fire resistance ratings to levels significantly below most of the Legacy Codes, without providing any compensating safety measures. The full impact of this change has not yet been felt. This change needs to be corrected, and a selective process of review, consideration, and justification undertaken to determine which, if any, of these changes are desirable and justifiable.

The concept of separation of major occupancies exists in Building regulations throughout the world. Certainly, those occupancy separations requirements used in the separated occupancies option have stood the test of time. There continues to be a critical need to separate adjacent major occupancies of dissimilar use, with fire-resistance rated construction. This proposal would delete the current Table 508.4 in its entirety and substitute the previous Table 302.3.2 which was replaced in Code Change G32-04/05. The previous Table 302.3.2 had been is use for the three plus years it existed in the 2000 and 2003 editions of the IBC. Furthermore, the occupancy separation fire resistance ratings from this predecessor table were taken directly from the BOCA National Building Code, along with the entire concept of the non-separated and separated occupancies in mixed occupancy buildings. The occupancy separation Table had existed in the BOCA National Building Code for a very long time, and was incorporated into the first edition of the IBC. The concept of separation of major occupancies exists in Building regulations throughout the world. Certainly, those occupancy separations requirements used in the separated occupancies option have stood the test of time. There continues to be a

In the published "Report of the Public Hearing on the 2003 editions of the International Building Code", the committee's published reason for recommending adoption of G32-04/05 is reported as follows: "The proposal does not have any significant technical changes from the current requirements." In reality, this code change proposals has lead to over 100 changes to required fire resistance ratings for occupancy separation, in both sprinklered and unsprinklered occupancies, without providing individual justifications of any kind.

To illustrate some specific examples, this change has unilaterally reduced the fire separation between a mixed use office and a moderate hazard warehouse from the previously existing 3-hour minimum fire separation to zero, while providing no technical justification or compensating measures. Table 302.3.2 of the 2003 IBC, as well as the Exception to Section 302.2.3 (IBC 2003 Supplement), specified a minimum fire resistance for every occupancy separation and did not permit a fire resistance rating to be less than one hour, even when an automatic sprinkler system was provided. In contrast, the new Table 302.3.2 allows numerous instances where the fire resistance ratings are waived entirely. Further, while Exception 1 of the old section 302.3.2 did not apply to Group H and I-2 areas, the revised Table in the new section 508 shows a reduction of 1-h in fire resistance rating between all I occupancies and for F-2, S-2, U, B, F-1, M, and S-1 without any justification or compensation. While it has been argued that a number of these separated use combinations are unrealistic, an equal number are very realistic and represent an unjustified reduction from current code requirements for fire-resistant construction. To unilaterally propose that a mixed use office and moderate hazard warehouse be reduced from the current 3-hour minimum fire separation to a zero separation is unjustifiable.

Bibliography & References:

H-2															N	NP	1	NP
H-3, H-4, H-5																	1[e,f]	NP

For SI: 1 square foot = 0.0929 m^2.

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.
a. For Group H-5 occupancies, see Section 903.2.4.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than one hour.
c. See Section 406.1.4, 709.1, and 712.3.
d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.

Reason: Confusion has existed as to why there is for fire partitions to separate dwelling units and sleeping units in Groups R-1 and R-2 when there is no need to separate Group R occupancies. Similar to the required separation between the dwelling unit and a garage, the additional language will clarify that the requirements of Sections 709.1 and 712.3 still apply.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KOFFELL-G1-TABLE 508.3.3

Revise table notes as follows:

TABLE 508.4
REQUIRED SEPARATION OF OCCUPANCIES (HOURS)

(Portions of table not shown are unchanged)

For SI: 1 square foot = 0.0929 m^2.
S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.

a. For Group H-5 occupancies, see Section 903.2.4.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than one hour.
c. See Section 406.1.4.
d. Commercial kitchens need not be separated from the ~~restaurant seating~~ dining areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.

Reason: Even though footnote e is included with the E occupancies in Table 508.4, a code official has interpreted that this footnote does not apply to the cafeteria in a school. In my opinion there is no difference in the two uses. However, it can be argued that a cafeteria in a school is not a "restaurant" which is specifically stated in the footnote. This change clarifies the intent that the footnote applies to any type of dining area that is adjacent to a commercial kitchen.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

H-3, H-4, H-5	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	1 [d,e,f]	NP

For SI: 1 square foot = 0.0929 m^2.
S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.

a. For Group H-5 occupancies, see Section 903.2.4.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than 1 hour.
c. See Section 406.1.4.
~~d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.~~
~~e~~ d. Separation is not required between occupancies of the same classification.
~~f~~ e. For Group H-5 occupancies, see Section 415.8.2.2.

303.1 (IFC [B] 202) Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

A-2 Assembly uses intended for food and/or drink consumption including, but not limited to:

Banquet halls
Nightclubs
Restaurants (including associated commercial kitchens)
Taverns and bars

(Portions of text not shown remain unchanged)

Reason: This proposal deletes a somewhat confusing and unnecessary commercial kitchen exception from Table 508.4 in favor of clarifying that the restaurant and associated kitchen are the same Group A-2 occupancy in Section 303.1. The current footnote reference d is shown as applicable to Group A occupancies. Occupancy separations are not required within Group A occupancies, therefore the footnote is extraneous and moot. Approval of this proposal will place the commercial kitchen provision in the proper context of occupancy classification as opposed to mixed occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Because the code requires buildings containing either Group I or R occupancies to be fully sprinkler protected, the Code Correlation Committee has replaced all numeric values in cells indicating a NS (non sprinklered) Group I or R occupancy building with NP for not permitted.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KEITH-G6A-508.4

R							N	N	1[c]	2[c]	1	2	NP	NP	3	NP	2	NP
F-2, S-2[b], U									N	N	1	2	NP	NP	3	4	2	3[a]
B, F-1, M, S-1											N	N	NP	NP	2	3	1	2[a]
H-1													N	NP	NP	NP	NP	NP
H-2															N	NP	1	NP
H-3, H-4, H-5																	1[e,f]	NP

a. For Group H-5 occupancies, see Section 903.2.4.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than one hour.
c. See Section 406.1.4.
d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.
g. Where this table does not require a separation between individual occupancies, such occupancies must be separated by full height partitions (floor to ceiling), fire partitions, fire barriers, smoke barriers, smoke partitions, fire walls, rated or non-rated horizontal assemblies or other approved means.

Reason: Unless the area of these occupancies not requiring separation is clearly delineated on the plans, there is no way to determine compliance with Section 508.4.2 (mixed area ratio). The issue here is that the building area limitations in Table 503 are not the same for each of the occupancies that are not required to be separated, thus if the areas of each separated occupancy are not clearly delineated, there is no way to establish the area of each of occupancy and the mixed area ratio. For example, a Group B occupancy is not required to be separated from a Group M occupancy; however, a Group B occupancy of Type IIB Construction has a base area of 23,000 s.f. where a Group M occupancy has a base area of 12,500 s.f.

Cost Impact: The code change proposal may increase the cost of construction.

Analysis: The reference to footnote g is placed at the end of the title of the table. Because the code requires buildings containing either Group I or R occupancies to be fully sprinkler protected, the Code Correlation Committee has replaced all numeric values in cells indicating a NS (non sprinklered) Group I or R occupancy building with NP for not permitted.

F-2, S-2[b], U	—	—	—	—	—	—	—	—	N	N	1	2	NP	NP	3	4	2	3[a]
B, F-1, M, S-1	—	—	—	—	—	—	—	—	—	—	N	N	NP	NP	2	3	1	2[a]
H-1	—	—	—	—	—	—	—	—	—	—	—	—	N	NP	NP	NP	NP	NP
H-2	—	—	—	—	—	—	—	—	—	—	—	—	—	—	N	NP	1	NP
H-3, H-4, H-5	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	1[e,f]	NP

For SI: 1 square foot = 0.0929 m^2.

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.

a. For Group H-5 occupancies, see Section 903.2.5.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than 1 hour.
c. See Section 406.1.4.
d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.

Reason: Group R occupancies involve a living environment that has persons sleeping and who may not be aware of their surroundings should an emergency due to fire begin to develop. Because of this there is need to provide a higher degree of fire resistive separation than might normally be provided between occupancies where the persons in the buildings are alert to their surroundings such as Group A, B, E, F, M or S . This proposal increases the fire resistance between Group R occupancies and all other occupancies to 2-hours to reduce the risk of fire spreading while the occupants are sleeping.

The code change also corrects several cells in the table where the table implies you can have fire separation between an unsprinklered Group I-1, I-3, I-4 and R occupancies and other occupancy groups. All Group I-1, I-3, I-4 and R occupancies are required to be fully sprinklered.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A question is how this proposed change would coordinate with the separation requirements in Section 406.1.4, which is referenced in note c.

(Notes to the table remain unchanged)

Reason: Table 508.4 allows an unrated separation between Groups B/M/U occupancies and Group F-1/S-1 (moderate-hazard) occupancies yet requires a 2-hr separation between Groups B/M/U occupancies and Group F-2/S-2 (low-hazard) occupancies. It is not appropriate to require a higher level of separation from an occupancy of lower hazard. This proposal amends the separation requirements so the low-hazard occupancies Group F-2 and S-2 no longer require a level of separation higher than that of the moderate-hazard occupancies Groups F-1 and S-1.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Because the code requires buildings containing either Group I or R occupancies to be fully sprinkler protected, the Code Correlation Committee has replaced all numeric values in cells indicating a NS (non sprinklered) Group I or R occupancy building with NP for not permitted.

H-1																	N	NP	NP	NP	NP	NP
H-2																			N	NP	1	NP
H-3, H-4, H-5																					1[e,f]	NP

For SI: 1 square foot = 0.0929 m^2.

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.

a. For Group H-5 occupancies, see Section 903.2.4.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than one hour.
c. See Section 406.1.4.
d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.
g. Occupancy separation need not be provided for storage areas within Groups B and M occupancies if the:
   1. Area is less than 10 percent of the floor area;
   2. Area is provided with an automatic sprinkler system and is less than 3,000 square feet; or
   3. Area is less than 1,000 square feet.

Reason: There change provides for separation of the B and M occupancies into their own position within the chart and corresponds to a chart that is in the proposed adoption of the 2009 IBC for the state of New York. The purpose is to provide for closer correlation within the codes in an effort to have fewer amendments in various jurisdictions.

Cost Impact: The code change proposal will not increase the cost of construction. Increase in a small percentage of projects.

Analysis: Alternative locations for this allowance rather than as a footnote to a table would be as exceptions to Sections 508.3.3 and 508.4.4. Because the code requires buildings containing either Group I or R occupancies to be fully sprinkler protected, the Code Correlation Committee has replaced all numeric values in cells indicating a NS (non sprinklered) Group I or R occupancy building with NP for not permitted.

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.

a. For Group H-5 occupancies, see Section 903.2.5.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than 1 hour.
c. See Section 406.1.4.
d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.
g. Occupancy separation need not be provided for storage areas associated with a Group B occupancy if the:
   1. Area is less than 10 percent of the floor areas;
   2. Area is provided with an automatic sprinkler system and is less than 3,000 square feet; or
   3. Area is less than 1,000 square feet.

Reason: The purpose of this Code change is to break out the Group B Occupancies from Groups F-1, M, and S-1 since the current grouping in Table 508.4 does not represent similar hazards, and results in no fire separations being required between these.

This proposal aims to restore a portion of the level of protection afforded in the 2003 IBC and many of the Legacy Codes. While the current Table 508.4 was first revised for the 2006 IBC, few jurisdictions had any history with the lack of fire resistance rated separations between occupancies which the 2006 IBC would now permit.

As the table is currently formatted for required separation of occupancies under the separated occupancies option of Section 508.4, there is no occupancy separation required between any of the occupancies in the B, F-1, M, and S-1 Grouping, as indicated by the letter "N" contained in the table for those occupancy groups. However, a Group B occupancy generally has a significantly lower fire load than the Group F-1, M, and S-1 occupancies, and the occupancy hazard is different as well.

If Table 508.4 truly implements the separated occupancies option which mandates occupancy separations as compared to the nonseparated occupancies option in Section 508.3 which does not, it follows that there should be occupancy separations required between occupancies with different hazard characteristics. Group B occupancies generally have combustible fire loads less than 10 pounds per sq ft, as compared to the Group F-1, M, and S-1 occupancies which could have fire loads as much as 20 to 30 pounds per sq ft or more. Therefore, we have proposed a minimum 2-hour occupancy separation between the Group B occupancies and the Group F-1, M, and S-1 occupancies in nonsprinklered buildings and a minimum 1-hour fire-resistance rating in sprinklered buildings. This is consistent with the other occupancy classifications requiring occupancy separations between them and the Group F-1, M, and S-1 occupancies.

It should also be noted that this is consistent with the required occupancy separation for Group B/M mixed occupancies in former Table 302.3.2 of the 2003 IBC which Table 508.4 replaced in the 2006 IBC. And it is actually less restrictive than former Table 302.3.2 for the Group B/F-1 and Group B/S-1 mixed occupancies separations.

The concept of separation of major occupancies exists in Building regulations throughout the world. Certainly, those occupancy separations requirements used in the separated occupancies option have stood the test of time. There continues to be a critical need to separate adjacent major occupancies of dissimilar use, with fire-resistance rated construction. The previous Table 302.3.2 had been is use for the three plus years it existed in the 2000 and 2003 editions of the IBC. Furthermore, the occupancy separation fire resistance ratings from this predecessor table were taken directly from the BOCA National Building Code, along with the entire concept of the non-separated and separated occupancies in mixed occupancy buildings.

As currently published, the 2009 Code provisions in Section 508 blur the distinction between separated uses and the non-separated use options previously prescribed in Section 302.3.1. The full impact of this change has not yet been felt.

The proposal also adds a footnote g which is essentially the footnote that was provided for storage associated both Group B and M occupancies in Table 508.3.3 of the 2006 IBC. Based on the limited separations between the B, M and S occupancies, the footnote was determined unneeded and removed for the 2009 edition. With the reestablishment of separations between Group B and the S occupancies, this previous footnote should be re-established.

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.

a. For Group H-5 occupancies, see Section 903.2.5.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than 1 hour.
c. See Section 406.1.4.
d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.
g. Occupancy separation need not be provided for storage areas associated with a Group M occupancy if the:
   1. Area is less than 10 percent of the floor areas;
   2. Area is provided with an automatic sprinkler system and is less than 3,000 square feet; or
   3. Area is less than 1,000 square feet.

Reason: In this code change we propose to separate out the Group M occupancies from the grouping of occupancies which includes Groups B, F-1, M, and S-1 as is currently the case in Table 508.4 which is used for implementing the separated occupancies option of Section 508.4. It should be noted that the separated occupancies option requires different occupancies in the same building to be separated from each other based on the fire-resistance ratings specified in Table 508.4, as compared to the nonseparated occupancies option in Section 508.3 which does not require any fire-resistance-rated separation between occupancies. However, no occupancy separations are required between any of the occupancies in the grouping containing Group B, F-1, M, and S-1 occupancies since the letter "N" is entered in the table for those occupancy groups. This means that there is no separation requirement whatsoever.

By removing the Group M occupancies from that grouping and creating a separate entry for them, we have achieved a required separation of occupancies for the Group M occupancy from any of the Group B, F-1, or S-1 occupancies. We believe Group M occupancies should be separated from these other occupancies because of the relative hazard of a Group M occupancy as compared to the other occupancies both in terms of fire load and occupant life safety. Group M occupancies can contain fire loads as much as 20 pounds per sq ft or more depending upon the type of retail operations and, of course, they can contain high densities and numbers of people, especially during holiday seasons and special sales events, as compared to the other occupancies. Group B occupancies generally contain fire loads less than 10 pounds per sq ft so they should be separated in order to protect that occupancy from the higher fire exposure of the Group M occupancies. The Group F-1 and S-1 occupancies should be separated from the Group M occupancies mainly because of the occupant life safety hazard exposures from those occupancies to the occupants of the Group M occupancy. In this code change we are proposing a 2-hour occupancy separation for fire barrier walls and horizontal assemblies in nonsprinklered buildings and 1-hour for sprinklered buildings. This is consistent with the occupancy separations contained in the current table between the Group B, F-1, M, and S-1 occupancies and all other occupancies except Group H-2. We believe that those occupancy combinations represent similar relative hazards in terms of fire and life safety.

The proposal also adds a footnote g which is essentially the footnote that was provided for storage associated both Group B and M occupancies in Table 508.3.3 of the 2006 IBC. Based on the limited separations between the B, M and S occupancies, the footnote was determined unneeded and removed for the 2009 edition. With the reestablishment of separations between Group M and the S occupancies, this previous footnote should be re-established.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Alternative locations for this allowance rather than as a footnote to a table would be as exceptions to Sections 508.3.3 and 508.4.4. Because the code requires buildings containing either Group I or R occupancies to be fully sprinkler protected, the Code Correlation Committee has replaced all numeric values in cells indicating a NS (non sprinklered) Group I or R occupancy building with NP for not permitted.

H-3, H-4, H-5	__	__	__	__	__	__	__	__	__	__	__	__	__	__	__	__	1[e,f]	NP

For SI: 1 square foot = 0.0929 m^2.

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
N = No separation requirement.
NP = Not permitted.

a. For Group H-5 occupancies, see Section 903.2.5.2.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than 1 hour.
c. See Section 406.1.4.
d. Commercial kitchens need not be separated from the restaurant seating areas that they serve.
e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.

Reason: This proposed code change accomplishes several things. First, it relocates the Group I-3 occupancies to the same cells as the Group I-2 occupancies. Second, it requires that the Group I-1 and Group I-4 occupancies be separated from each other with a minimum 1-hour fire-resistance rating. Third, it also clarifies the table regarding the Group I occupancies for the NS columns where some of the individual cell entries have been changed to "NP." This recognizes the fact that the entire building containing a Group I occupancy is required to be protected with an automatic sprinkler system throughout even where there are other mixed occupancies that may be separated with fire barriers or horizontal assemblies that would otherwise not be required to be sprinklered.

Group I-3 occupancies should be treated the same as the Group I-2 occupancy when the separated occupancies option of Section 508.4 is used since they have similar relative hazards. This is also consistent with the 2009 NFPA 101 Life Safety Code which requires a minimum 2-hour fire-resistance rating for all occupancy separations involving detention and correctional facilities and other occupancies in the same building as specified in Tables 6.1.14.4.1(a) and (b) Required Separation of Occupancies (hours), Part 1 and Part 2. The separated occupancies option section in Section 508.4 of the 2009 IBC, refers to Table 508.4 Required Separation of Occupancies (hours) for determining the fire-resistance rating of the occupancy separation depending upon the occupancies being separated. However, the way the table is currently structured, a Group I-3 occupancy would not be required to be separated from a Group I-1 or I-4 occupancy because they are grouped together.

As indicated previously, this amendment will also require that a Group I-1 occupancy be separated from a Group I-4 occupancy with a minimum 1-hour fire-resistance-rated separation. This would be consistent with the Table 508.4 requirement that these occupancies be separated from Group R occupancies with a minimum 1-hour fire-resistance rating.

Also Footnote e has been added to the 1-hour rating for the I-1/I-4 occupancies to indicate that where the occupancy classification is the same, then there is no separation required. In other words, this would not require, as is currently the case, an occupancy separation for a Group I-1 occupancy and an adjacent Group I-1 occupancy in the same building, or similarly for a Group I-4 occupancy adjacent to another Group I-4 occupancy in the same building. And, a footnote has been added for the Group I-2 and I-3 occupancies for the same reason.

Finally, for the Group I-1 occupancies, this amendment is consistent with Exception 3 to Section 508.2.4 Separation of Occupancies for accessory occupancies, Exception 2 to Section 508.3.3 Separation for nonseparated occupancies, and Section 420.2 Separation Walls for Group I-1 sleeping/dwelling units.

The code change also corrects several cells in the table where the table implies you can have fire separation between an unsprinklered Group 1-1, I-3, I-4 occupancies and other occupancy groups. All Group I and R occupancies are required to be fully sprinklered.

In conclusion, this amendment will clarify where the required occupancy separations are to be provided under the separated occupancies option of the 2009 IBC for all Group I occupancies while making the code internally consistent.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Because the code requires buildings containing either Group I or R occupancies to be fully sprinkler protected, the Code Correlation Committee has replaced all numeric values in cells indicating a NS (non sprinklered) Group I or R occupancy building with NP for not permitted.

e. Separation is not required between occupancies of the same classification.
f. For H-5 occupancies, see Section 415.8.2.2.

Reason: In this code change Group F-1 and S-1 occupancies are proposed to be separated out from the grouping of occupancies which includes Groups B, F-1, M, and S-1 as is currently the case in Table 508.4 which is used for implementing the separated occupancies option of Section 508.4. It should be noted that the separated occupancies option requires different occupancies in the same building to be separated from each other based on the fire-resistance ratings specified in Table 508.4 as compared to the nonseparated occupancies option in Section 508.3 which does not require any fire-resistance-rated separation between different occupancies. However, no occupancy separations are required between any of the occupancies in the grouping containing Group B, F-1, M, and S-1 occupancies since the letter "N" is entered in the table for those occupancy groups. This means that there is no separation requirement whatsoever even though the Group F-1 and S-1 occupancies may contain significantly greater fire loads than the Group B and M occupancies.

If Table 508.4 truly implements the separated occupancies option which mandates occupancy separations between mixed occupancies in the same building as compared to the nonseparated occupancies option in Section 508.3 which does not, it follows that there should be occupancy separations required between occupancies with different hazard characteristics. By removing the Group F-1 and S-1 occupancies from the grouping of the Group B, F-1, M, and S-1 occupancies and creating a separate entry for them in the table, a required separation of occupancies for the Group F-1 and S-1 occupancies from any of the Group B and M occupancies is achieved. This is based on the premise that the Group F-1 and S-1 occupancies should be separated from these occupancies because of the relative hazard of the Group F-1 and S-1 occupancy as compared to the Group B and M occupancies both in terms of the fire load and occupant life safety. Group F-1 and S-1 occupancies can contain fire loads as much as 20 to 30 pounds per sq ft or more. This can represent a significant fire exposure to the adjacent Group B and/or M occupancies in the same building which may also have significant numbers of occupants representing a potential life safety hazard.

Therefore, this proposal requires a minimum 3-hour occupancy separation for fire barrier walls and horizontal assemblies in nonsprinklered buildings and 2-hours for sprinklered buildings. This is consistent with the occupancy separations contained in the current table between the Group B, F-1, M, and S-1 occupancies and the Group H-2 occupancies. This occupancy usually has an occupancy combination that represents a similar relative hazard in terms of fire and life safety. This is also consistent with Table 707.3.9 for the separation of fire areas and Table 706.4 Fire Wall Fire-Resistance Ratings. It should also be noted that these proposed occupancy separations are consistent with the required occupancy separations for Group F-1 and S-1 mixed occupancies in former Table 302.3.2 of the 2003 IBC which Table 508.4 replaced in the 2006 IBC.

The code change also corrects several cells in the table where the table implies you can have fire separation between an unsprinklered Group I-1, I-3, I-4 and R occupancies and other occupancy groups. All Group I-1, I-3, I-4 and R occupancies are required to be fully sprinklered.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Because the code requires buildings containing either Group I or R occupancies to be fully sprinkler protected, the Code Correlation Committee has replaced all numeric values in cells indicating a NS (non sprinklered) Group I or R occupancy building with NP for not permitted.

G131–09/10
509.2

Proponent: Lou Malattia representing Washington Association of Building Officials

Revise as follows:

509.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls,* limitation of number of stories and type of construction where all of the following conditions are met:

1. The buildings are separated with a horizontal assembly having a minimum 3-hour fire-resistance rating.
2. The building below the horizontal assembly is no more than one story above grade plane.
3. The building below the horizontal assembly is of Type IA construction.
4. Shaft, stairway, ramp and escalator enclosures through the horizontal assembly shall have not less than a 2-hour fire-resistance rating with opening protectives in accordance with Section 715.4.

   Exception: Where the enclosure walls below the horizontal assembly have not less than a 3-hour fire resistance rating with opening protectives in accordance with Section 715.4, the enclosure walls extending above the horizontal assembly shall be permitted to have a 1-hour fire-resistance rating, provided:

   1. The building above the horizontal assembly is not required to be of Type I construction;
   2. The enclosure connects less than four stories above the horizontal assembly; and
   3. The enclosure opening protectives above the horizontal assembly have a minimum 1-hour fire protection rating.

5. The building or buildings above the horizontal assembly shall be permitted to have multiple Group A occupancy uses, each with an occupant load of less than 300, or Group B, M, R or S occupancies.
6. The building below the horizontal assembly shall be protected throughout by an approved automatic sprinkler system in accordance with Section 903.3.1.1, and shall be permitted to be any of the following occupancies:
   6.1. Group S-2 parking garage used for the parking and storage of private motor vehicles;

6.2. Multiple Group A, each with an occupant load of less than 300;
6.3. Group B;
6.4. Group M;
6.5. Group R; and
6.6. Uses incidental to the operation of the building (including entry lobbies, mechanical rooms, storage areas and similar uses).

7. The maximum building height in feet shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the grade plane.

Reason: To provide clarification of this exception. There has been some conflicting code opinions and this exception. Section 509.2, Condition #4, the exception Item 4.2, which reads, "The enclosure connects less than four stories;", has been interpreted by some jurisdictions to mean that the Group S-2 level below the 3-hour separation is considered to be a level for the purposes of this exception, and therefore only permitting two stories above the horizontal separation.

The intent of the code is to permit Group A occupancies less than 300, Groups B or M occupancies to be considered separate buildings for the purpose of determining area limitations, continuity of fire wall, limitation of number of stories and type of construction. A typical building type using this provision is a three story wood framing apartment building above an enclosed concrete parking level.

The exception to condition #4 permits the two hour shaft to be reduced to one hour provided that the enclosure walls below the horizontal assembly is increased to a three hour fire-resistance rating. This additional protection permits three levels above the horizontal assembly to be protected with one hour shafts instead of the two- hour assembly.

Cost Impact: The code change proposal will not increase the cost of construction.

509.2

Proponent: David Maret, New World Plan Review, LLC

Revise as follows:

509.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls,* limitation of number of stories and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a minimum 3-hour *fire-resistance rating*.
2. The building below the *horizontal assembly* is no more than one *story above grade plane*.
3. The building below the *horizontal assembly* is of Type IA construction.
4. Shaft, *stairway*, ramp and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 715.4.

   Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 715.4, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

   1. The building above the *horizontal assembly* is not required to be of Type I construction;
   2. The enclosure connects less than four *stories* measured from above the 3-hour horizontal assembly; and
   3. The enclosure opening protectives above the *horizontal assembly* have a minimum 1-hour *fire protection rating*.

5. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less than 300, or Group B, M, R or S occupancies.
6. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any of the following occupancies:
   6.1. Group S-2 parking garage used for the parking and storage of private motor vehicles;
   6.2. Multiple Group A, each with an *occupant load* of less than 300;
   6.3. Group B;
   6.4. Group M;
   6.5. Group R; and
   6.6. Uses incidental to the operation of the building (including entry lobbies, mechanical rooms, storage areas and similar uses).

7. The maximum *building height* in feet shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the *grade plane*.

Reason: To provide clarification and remain consistent with model code language of exception.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MARET-G1-509.2

G133–09/10
509.9

Proponent: Marshall Klein PE, Marshall A. Klein & Associates Inc.

Revise as follows:

509.9 Multiple buildings above ~~Group S-2 parking garage~~ a horizontal assembly. Where two or more buildings are provided above the horizontal assembly separating a Group S-2 ~~open or closed~~ parking ~~garage~~ or building below from the buildings above in accordance with the special provisions in Sections 509.2, 509.3 or 509.8, the buildings above the horizontal assembly shall be regarded as separate and distinct buildings from each other and shall comply with all other provisions of this code as applicable to each separate and distinct building.

Reason: Code proposal is strictly editorial with no intent to change the requirements under the Code.

Revision of the title to Section 509.9 is editorial to correlate with Sections 509.2 and 509.3 to which this section references because Sections 509.2 permit other occupancies (See Section 509.2(6) for listing of other occupancies) below the horizontal assembly.

The addition of the words "or building below" to the body of this section is editorial to correlate with Section 509.2 that lists under its Section 509.2(6) other occupancies besides a S-2 parking garage that are permitted below the horizontal assembly.

The deletion of "open or enclosed" is editorial because a parking garage under Sections 509.2 can be either opened or enclosed, and Section 509.3 spells out that its requirement is applicable to an enclosed garage under an open parking garage. Therefore, "open or enclosed" are not required in Section 509.9 because the referenced code sections provide the parking garage's open or enclosed criteria.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KLEIN-G2-509.9

G134–09/10
Table 601

Proponent: Jeff Hugo, CBO, National Fire Sprinkler Association

Revise table as follows:

TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (hours)

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A[d]	B	A[d]	B	HT	A[d]	B
Primary structural frame[g] (see Section 202)	3[a]	2[a]	1	0	1	0	HT	1	0
Bearing walls									
Exterior[f, g,]	3	2	1	0	2	2	2	1	0
Interior	3[a]	2[a]	1	0	1	0	1/HT	1	0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior[e]	0	0	0	0	0	0	See Section 602.4.6	0	0
Floor construction and secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and secondary members (see Section 202)	1½[b]	1[b, c]	1[b, c]	0[c]	1[b, c]	0	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
b. Except in Groups F-1, H, M and S-1 occupancies, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.
d. ~~An approved automatic sprinkler system in accordance with Section 903.3.1.1 shall be allowed to be substituted for 1-hour fire-resistance-rated construction, provided such system is not otherwise required by other provisions of the code or used for an allowable area increase in accordance with Section 506.3 or an allowable height increase in accordance with Section 504.2. The 1-hour substitution for the fire resistance of exterior walls shall not be permitted.~~ An approved automatic sprinkler system in accordance with Section 903.3.1.1 shall be allowed to be substituted for 1-hour fire resistive construction of all one and two story buildings. The 1-hour substitution for the fire resistance of exterior walls shall not be permitted.
e. Not less than the fire-resistance rating required by other sections of this code.
f. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
g. Not less than the fire-resistance rating as referenced in Section 704.10

Reason: Footnote d is contradictory to the ability to enlarge buildings by height and area with fire sprinklers and no fire statistics show that the requirements of this subsection to be beneficial to the structure, the firefighter's approach to the fire, and is cooled by the fire sprinklers regardless. This change is limited to one and two story buildings.

One and two story unlimited area buildings are subjected to the proposed eliminated portion of footnote d., " *provided such system is not otherwise required by other provisions of the code".* Fire sprinklers are very effective in controlling fires in such buildings.

Footnote c. will still apply to roof construction, including supporting beams and joists less than 20 feet, which was applicable even in the legacy codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HUGO-G1-TABLE 601.doc

G135–09/10
Table 601

Proponent: Catherine Heeb, City of Portland Bureau of Development Services

Revise table as follows:

TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A[d]	B	A[d]	B	HT	A[d]	B
Primary structural frame[g] (see Section 202)	3[a]	2[a]	1	0	1[h]	0[h]	HT	1	0
Bearing walls									
Exterior[f, g]	3	2	1	0	2	2	2	1	0
Interior	3[a]	2[a]	1	0	1	0	1/HT	1	0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior[e]	0	0	0	0	0	0	See Section 602.4.6	0	0
Floor construction and secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and secondary members (see Section 202)	1½[b]	1[b, c]	1[b, c]	0 c	1[b, c]	0	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
b. Except in Groups F-1, H, M and S-1 occupancies, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above

any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.

d. An approved automatic sprinkler system in accordance with Section 903.3.1.1 shall be allowed to be substituted for 1-hour fire-resistance-rated construction, provided such system is not otherwise required by other provisions of the code or used for an allowable area increase in accordance with Section 506.3 or an allowable height increase in accordance with Section 504.2. The 1-hour substitution for the fire resistance of exterior walls shall not be permitted.

e. Not less than the fire-resistance rating required by other sections of this code.

f. Not less than the fire-resistance rating based on fire separation distance (see Table 602).

g. Not less than the fire-resistance rating as referenced in Section 704.10

h. Where the exterior wall is not load bearing, the primary structural frame members that form the outermost perimeter bearing frame shall be protected as for exterior bearing walls.

Reason: The purpose of this added footnote is to clarify construction requirements in buildings of Type III construction that do not utilize bearing exterior walls. Traditionally, Type III buildings have been constructed with interior wood structure protected by exterior masonry bearing walls.

The current code language does not sufficiently address protection of exposed structural frame members in Type III construction where there is no exterior bearing wall, such as in curtain wall construction. This amendment would require protection of the outer perimeter of the structural frame in situations where this frame is not engaged in, or protected by, an exterior rated wall.

Protection of the outermost structural frame members provides an equivalent level of protection as construction that utilizes a rated exterior bearing wall.

Cost Impact: The code change proposal will increase the cost of construction.

Floor construction and secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and secondary members[h] (see Section 202)	1½[b]	1[b, c]	1[b, c]	0 c	1[b, c]	0	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

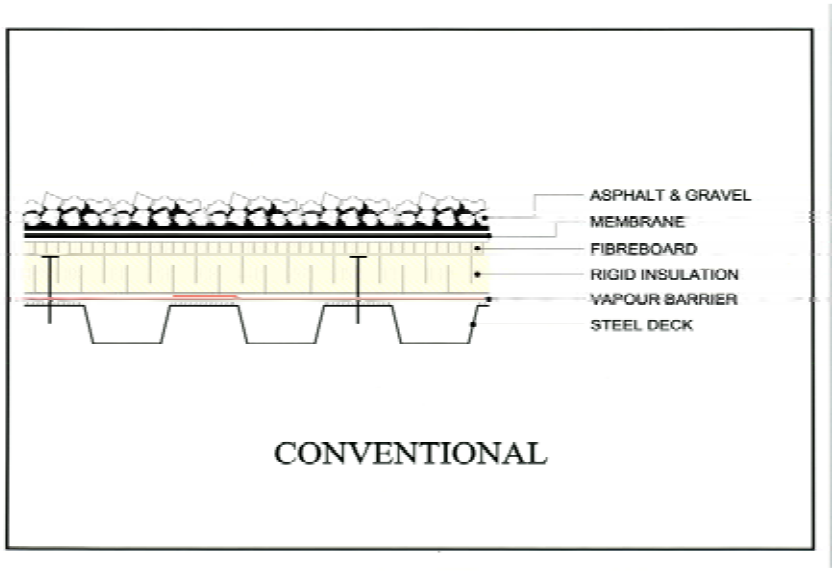
a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Groups F-1, H, M and S-1 occupancies, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.

d. An approved automatic sprinkler system in accordance with Section 903.3.1.1 shall be allowed to be substituted for 1-hour fire-resistance-rated construction, provided such system is not otherwise required by other provisions of the code or used for an allowable area increase in accordance with Section 506.3 or an allowable height increase in accordance with Section 504.2. The 1-hour substitution for the fire resistance of exterior walls shall not be permitted.
e. Not less than the fire-resistance rating required by other sections of this code.
f. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
g. Not less than the fire-resistance rating as referenced in Section 704.10
h. The requirements of this table for roof construction are not applicable to above deck components. For construction Types I and II, the materials used in above deck components shall meet the requirements of Section 603.1.

Reason: Table 601 contains footnote b which states, "Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members." This footnote is referenced for all Types (I through V) of roof construction where a rated assembly is required. In many cases this footnote is being interpreted as meaning that fire-retardant-treated wood is required whenever wood is used in a roof assembly that requires an hourly rating.
A typical roofing assembly contains the components shown below:



The roof deck is typically steel, concrete or wood. On top of the roof deck is a layer of insulation, in may cases a coverboard and them a waterproofing system. The waterproofing system may be a asphalt/gravel system as shown above, a single ply roof membrane, or for steeper slope applications shingles or tile. The current footnote b references structural members, components installed above the roof deck are not structural, they are supported by the structure.

Insulation suppliers to the roofing industry manufacture a nailable insulation product (see included Atlas Nailbase Datasheet). This product consists of foam plastic insulation with a layer of wood (OSB, Plywood, or fire-retardant-treated wood) laminated to it, thus combining two of the components shown above (insulation and fiberboard) into one product This product is installed on top of the roof deck and is used as the nailable substrate for various roofing materials such as shingles, shakes and tile.

In many instances designers feel that footnote b of Table 601 requires that fire-retardant-treated wood be used as the nailable component of this product when a rated assembly is required. While this product can be made with fire-retardant-treated wood as the nailable component this unnecessarily increases the cost of construction.

The proposed footnote h would provide clarifying language while maintaining important fire safety requirements. For example, this footnote is no way removes the hourly rating requirements of the roof assembly. Hourly ratings can be achieved with OSB as the nailable substrate on this product. It also retains the requirement that the product meet the requirements of Section 603 COMBUSTIBLE MATERIALS IN TYPE I AND II CONSTRUCTION.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G137–09/10
Table 602

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise table as follows:

TABLE 602
FIRE-RESISTANCE RATING REQUIREMENTS FOR
EXTERIOR WALLS BASED ON FIRE SEPARATION DISTANCE[a,e,i]

FIRE SEPARATION DISTANCE = x (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H[f]	OCCUPANCY GROUP F-1,M, S-1[g]	OCCUPANCY GROUP A, B, E, F-2, I, R[h], S-2[g], U[b,h]
X < 5[c]	All	3	2	1
5 ≤ X < 10	IA Others	3 2	2 1	1 1
10 ≤ X < 30	IA, IB, IIB, VB Others	2 1 1	1 0 1	1[d] 0 1[d]
X ≥ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.
b. For special requirements for Group U occupancies see Section 406.1.2
c. See Section 705.1.1 for party walls.
d. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.
e. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.
f. For special requirements for Group H Occupancies, see Section 415.3.
g. For special requirements for Group S Occupancies, see Section 412.4.1.
h. Group R-3, and Group U when used as accessory to Group R-3, shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet or more.
i. When work is exempt from a permit as listed in Section 105.2, Item1, there are no requirements for wall and opening protection based on location on property.

Reason: Footnote h: The addition of this footnote is necessary to be consistent with footnote "f" in Table 705.8 and Section 406.1.2 Item #2. In accordance with Table 705.8, when an R-3 occupancy has a fire separation distance of 5 feet or greater, unprotected openings are unlimited. Consequently if the entire exterior wall area can consist of unprotected windows, the current Table 602 requirement for one hour exterior walls at 5 feet or greater should be exempted for an R-3 occupancy. Similarly in Section 406.1.2 Item #2, the exterior wall of a Group U occupancy used for storage of pleasure-type motor vehicles is not required to have a fire-resistance rating when the fire separation distance is 5 feet or more. Therefore to be consistent, a Group U structure accessory to Group R-3 should also be granted this allowance in Table 602.

Footnote i: The beginning of Section 105.2 states" Exemptions from permit requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction." Addition of this footnote assures that small detached accessories such as tool sheds which are not over 120 square feet and are exempt from permit requirements do not become subject to requirements of Table 602.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MAIEL-G1-TABLE 602

G138–09/10
Table 602

Proponent: Joe Holland or Dave Bueche, Hoover Treated Wood Products

Revise table as follows:

TABLE 602
FIRE-RESISTANCE RATING REQUIREMENTS FOR ECTERIOR WALLS BASED ON FIRE SEPARATION DISTANCE[a, e]

FIRE SEPARATION DISTANCE = X (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H[f]	OCCUPANCY GROUP F-1, M S-1[g]	OCCUPANCY GROUP A, B, E, F-2, I, R, S-2[g], U[b]
X < 5[c]	All	3	2	1
5 ≤ X <10	IA	3	2	1
	Others	2	1	1
10 ≤ X 30	IA, IB	2	1	1[c]
	IIB, IIIB, VB	1	0	0
	Others	1	1	1[c]
X ≤ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.
b. For special requirements for Group U occupancies, see Section 406.1.2.
c. See Section 706.1.1 for party walls.
d. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.
e. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.
f. For special requirements for Group H occupancies, see Section 415.3.
g. For special requirements for Group S aircraft hangars, see Section 412.4.1.

Reason: The exterior wall fire resistance required in Table 601 is greater for Type IIIB than what is required for either Type IIB or VB. The interior fire resistance in Type IIIB construction is equivalent to Type IIB and Type VB and therefore should be allowed in the same category.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HOLLAND-BUECHE-G6-T602.doc

G139–09/10
602.3

Proponent: Katherine Bang, representing self.

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of solid, noncombustible materials and the interior building elements are of any material permitted by this code. ~~*Fire-retardant-treated wood* framing complying with Section 2303.2 shall be permitted within *exterior wall* assemblies of a 2-hour rating or less.~~

Exception: Ungrouted cells, fully enclosed within masonry construction, are permitted.

Reason: Type III construction was common in the past and referred almost exclusively to brick buildings. In recent years the brick has been replaced by concrete or CMU materials. In some parts of the country, the past building codes did not allow framed exterior wall construction for this type of building construction.

Table 503 allows significantly more floor area and height if a building is Type III construction. For instance, an apartment building can be 2 stories higher and 9000 SF larger if it is Type III-B construction in lieu of Type V-B construction.

The jurisdiction I work in has seen a large increase in Type III construction, but the exterior walls of these buildings are framed construction instead of concrete or CMU. The fire retardant diminishes the structural capacity of the wood and so there have been many appeals to not treat the wood. These appeal requests are routinely granted with only minimal additions to provide equivalent life safety.

The framed exterior walls have significant detailing problems at the intersection of the horizontal assemblies and the exterior walls. It is hard to maintain the fire rating of the exterior bearing wall with platform framing. Framed exterior walls should be categorized as Type II or Type V construction. This code change proposal is an effort to return to the original type of construction that was intended as Type III construction.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BANG-G1-602.3.DOC

G140–09/10
602.3, 602.4

Proponent: Jason Thompson, National Concrete Masonry Association (NCMA), representing Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. Fire-retardant-treated wood framing complying with Section 2303.2 shall be permitted within exterior wall assemblies ~~of~~ having not greater than a 2-hour fire-resistance rating ~~or less~~ where the exposed outer and inner faces of such walls are of noncombustible materials.

602.4 Type IV. Type IV construction (Heavy Timber, HT) is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid or laminated wood without concealed spaces. The details of Type IV construction shall comply with the provisions of this section. Fire-retardant-treated wood framing complying with Section 2303.2 shall be permitted within exterior wall assemblies ~~with~~ having not greater than a 2-hour fire-resistance rating ~~or less~~ where the exposed outer and inner faces of such walls are of noncombustible materials.

Reason: This code change adds to the provision for exterior walls using fire-retardant-treated wood framing in buildings of Types III and IV construction by requiring that the framing be covered on the outer and inner faces with noncombustible materials. This additional provision when fire-retardant-treated wood is used in exterior walls otherwise required to be constructed of noncombustible materials is taken from the 1997 ICBO Uniform Building Code (UBC) Section 503.4.3 Fire-Retardant-Treated Wood Framing. That section was the source for the justification in the IBC to allow fire-retardant-treated wood in these exterior wall assemblies where the fire-resistance rating did not exceed 2-hours.

A significant number of Type III construction buildings have taken advantage of this provision to allow the exterior wall to be framed of wood rather than constructed entirely of noncombustible materials, while also taking advantage of Section 1406.2.2. Section 1406.2.2 allows combustible exterior wall coverings to be installed on the exterior faces of these walls. That application does not meet the code intent for limiting the combustible materials in the exterior walls of Type III construction which is a basic fire safety component of that type of construction. Since the legacy code provision was used to justify the use of fire-retardant-treated wood, then the other requirements applicable thereto in that legacy code should also be incorporated into the IBC to achieve the intended level of fire safety.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THOMPSON-G5-602.3

G141–09/10
603.1

Proponent: Katherine Bang representing the City of Portland, Bureau of Development Services

Revise as follows:

603.1 Allowable Materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. Fire retardant wood shall be permitted in:
   - 1.1. Nonbearing partitions where the required fire-resistive reating is 2 hours or less.
   - 1.2. Nonbearing exterior walls where no fire rating is required.
   - 1.3. Exterior walls required to be fire-resistance rated where fire blocking is used in concealed spaces occurring at the intersection of the exterior wall and each floor and roof assembly.
   - 1.4. Roof construction, including girders, trusses, framing and decking.

Exception. In buildings of Type IA construction exceeding two stories above grade plane, fire-retardant-treated wood is not permitted in roof construction when the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).

2. through 25. (No change to current text)

Reason: This revision eliminates a conflict in the model code that is created by another proposed revision to Section 705.5. This revision is necessary if the other revision is to be adopted since the model building code does not allow combustible blocking in fire-resistive exterior walls of non-combustible construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: For the first 2 printings of the 2009 IBC, Item 1 of Section 603.1 was shown as Item 25.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BANG-G2-603.1.DOC

G142–09/10
Table 601, 603.1

Proponent: Joe Holland or Dave Bueche, Hoover Treated Wood Products

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:

1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
1.2. Nonbearing *exterior walls* where no fire rating is required.
1.3. Roof construction, including girders, trusses, framing and decking.
1.4. Floor construction where the required *fire-resistance rating* is 1-hour or less including girders, trusses, framing and sheathing.

Exception: In buildings of Type IA construction exceeding two stories above grade plane, fire-retardant-treated wood is not permitted in roof construction when the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).

2. through 25. (No change to current text)

TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (hours)

	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
BUILDING ELEMENT	A	B	A[d]	B	A[d]	B	HT	A[d]	B
Floor construction and secondary members (see Section 202)	2	2	1[c]	0[c]	1[c]	0	HT	1[c]	0
Roof construction and secondary members (see Section 202)	1 ½ [b]	1 [b,c]	1 [b,c]	0[c]	1 [b,c]	0	HT	1 [b,c]	0

c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.

(Portions of table and notes not shown remain unchanged)

Reason: Whether a material is combustible or noncombustible should be a secondary consideration in building construction. Of primary importance is how it will behave structurally and how it will perform in a fire. In some instances, the code currently requires noncombustible materials. The code requires the material be protected or no protection. Although FRTW and heavy timber are combustible materials they offer protection against fire: FRTW because it has been pressure treated to modify how it responds to fire. Both noncombustible materials and FRTW reduce fire spread. Heavy timber offers protection because of the required minimum sizes. In an exposed unprotected fire scenario wood can actually remain in place supporting design loads longer than some noncombustible materials.

In rated construction, both noncombustible materials and combustibles are tested using the same ASTM Standard, E119. A fire rating is not material specific. Therefore, the expectation is whether noncombustible or fire-retardant-treated wood, protected or unprotected, the response of the assembly to fire is equivalent

Cost Impact: The code change proposal will not increase the cost of construction.

Staff Note: In the first 2 editions of the 2009 IBC, Item 1 of Section 603.1 was shown as Item 25.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOLLAND-BUECHE-G5-603.1-2

G143–09/10
603.1

Proponent: Joe Holland and Dave Bueche, Hoover Treated Wood Products

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. Fire-retardant-treated wood shall be permitted in:
   - 1.1. Nonbearing partitions where the required fire-resistance rating is 2 hours or less.
   - 1.2. Nonbearing exterior walls where no fire rating is required.
   - 1.3. Roof construction, including girders, trusses, framing and decking.
   - 1.4. Blocking such as for handrails, millwork, cabinets and window and door frames.

   Exception: In buildings of Type IA construction exceeding two stories above grade plane, fire-retardant-treated wood is not permitted in roof construction when the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).

2. through 13. (No change to current text)
~~14. Blocking such as for handrails, millwork, cabinets and window and door frames.~~
15. through 25. (No change to current text)

Reason: The primary members of partitions in Type I and Type II construction must be noncombustible or fire-retardant-treated wood. To allow untreated wood in the partitions for blocking is inconsistent with Type I and Type II construction. In some cases it can be flush mounted exposed with the wallboard behind cabinets or millwork. It certainly is not prudent. Two of the three legacy codes did not allow.

Cost Impact: The code change proposal will increase the cost of construction.

Staff Note: In the first 2 editions of the 2009 IBC, Item 1 of Section 603.1 was shown as Item 25.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOLLAND-BUECHE-G4-603.1

G144–09/10
1202, 1203.2.2 (New)

Proponent: Joseph Lstiburek, Building Science Corporation, representing self

Add new text as follows:

1202.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AIR-IMPERMEABLE INSULATION. An insulation having an air permeance equal to or less than 0.02 l/s-m^2 at 75 pa pressure differential tested according to ASTM E 2178 or E 283.

1203.2.2 Unvented attic and unvented enclosed rafter assemblies. Unvented attic assemblies (spaces between the ceiling joists of the top story and the roof rafters) and unvented enclosed rafter assemblies (spaces between ceilings that are applied directly to the underside of roof framing members/rafters and the structural roof sheathing at the top of the roof framing members/rafters) shall be permitted where all of the following are met:

1. The unvented attic space is completely within the building thermal barrier.
2. No interior Class I vapor retarders are installed on the ceiling side (attic floor) of the unvented attic assembly or on the ceiling side of the unvented enclosed rafter assembly.
3. Where wood shingles or shakes are used, a minimum 1/4 inch (6 mm) vented air space separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In climate zones 5, 6, 7 and 8 as specified in the *International Energy Conservation Code*, any air-impermeable insulation shall be a Class II vapor retarder, or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. Either items 5.1, 5.2 or 5.3 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
   5.1. Air-impermeable insulation only. Insulation shall be applied in direct contact with the underside of the structural roof sheathing.
   5.2. Air-permeable insulation only. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing as specified in Table 1203.2.2 for condensation control.
   5.3. Air-impermeable and air-permeable insulation. The air-impermeable insulation shall be applied in direct contact with the underside of the structural roof sheathing as specified in Table 1203.2.2 for condensation control. The air-permeable insulation shall be installed directly under the air-impermeable insulation.
6. Where preformed insulation board is used as the air-impermeable insulation layer, it shall be sealed with tape, caulking, foam sealant or equivalent material at the inner most perimeter of each individual sheet interior surface to form a continuous layer.
7. This section does not apply in climate zones 5 or higher for special use structures or enclosures such as swimming pool enclosures, data processing centers, hospitals, or art galleries, where the structure or enclosure is humidified beyond 35 percent during the three coldest months.

TABLE 1203.2.2
INSULATION FOR CONDENSATION CONTROL

CLIMATE ZONE	MINIMUM RIGID BOARD ON AIR-IMPERMEABLE INSULATION R-VALUE[a, b]
2B and 3B - tile roof only	0 (none required)
1, 2A, 2B, 3A, 3B, 3C	R-5
4C	R-10
4A, 4B	R-15
5	R-20
6	R-25
7	R-30
8	R-35

a. Contributes to, but does not supersede, thermal resistance requirements for attic and roof assemblies.
b. Alternatively, sufficient rigid board or sheet insulation shall be installed directly above the structural roof sheathing to maintain the monthly average temperature of the underside of the structural roof sheathing above 45 degrees F (7 degrees C). For calculation purposes, an interior air temperature of 68 degrees F (20 degrees C) is assumed and the exterior air temperature is assumed to be the monthly average outside air temperature of the three coldest months.

Reason: Unvented roof assemblies - both attic and cathedral ceiling - are a proven technology. They give the designer significant flexibility in locating mechanical equipment and ductwork inside of conditioned spaces thereby saving energy. They significantly improve the air tightness of the building enclosure thereby saving energy. They reduce wind uplift forces and reduce the risk of wildfire damage. They eliminate the problems associated with wind driven rain entering roof vents during hurricanes. The language in this proposed section is modeled on the existing language in the IRC Section 806.4.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: LSTIBUREK-G1-1202 DEFINITION-Revised

G145–09/10
1203.2; IRC R806.2

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

PART I – IBC GENERAL

Revise as follows:

1203.2 Attic Spaces. Enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof framing members shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain and snow. Blocking and bridging shall be arranged so as not to interfere with the movement of air. A minimum of 1 inch of airspace shall be provided between the insulation and the roof sheathing. The net free ventilating area shall not be less than ~~1/300~~th 1/150th of the area of the space ventilated.

Exceptions:

1. The net free cross-ventilation area shall be permitted to be reduced to 1/300 provided that ~~with~~ at least 50 percent and not more than 80 percent of the required ventilating area is provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above the eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents.
2. The net free cross-ventilation area shall be permitted to be reduced to 1/300 when Class I or II vapor barrier is installed on the warm-in-winter side of the ceiling.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R806.2 Minimum area. The total net free ventilating area shall not be less than $^{1}/_{150}$ of the area of the space ventilated. ~~except that reduction of the total area~~

Exceptions:

1. The net free-cross ventilation area shall be permitted to be reduced to $^{1}/_{300}$ ~~is permitted~~ provided that at least 50 percent and not more than 80 percent of the required ventilating area is provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above the eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents.
2. ~~As an alternative,~~ The net free cross-ventilation area ~~may~~ shall be permitted to be reduced to $^{1}/_{300}$ when a Class I or II vapor barrier is installed on the warm-in-winter side of the ceiling.

Reason: IBC 1203.2. Current attic ventilation provisions do not address ventilation of low slopped or flat roof attics. It is appropriate to require more ventilation area (i.e. 1/150th) when 3' of vertical separation between the upper and lower vent areas is not possible. A reduction of required vent area (i.e. 1/300th) is appropriate when vertical separation of the vents is provided as natural convection provides additional air movement within the attic space. It is also appropriate to reduce the vent area when a vapor barrier is installed on the ceiling to reduce moisture transmission from the occupied space into the attic. This change also creates consistency with Section 806.2 of the 2009 IRC.

IRC R806.2. The current language found in IRC Section 806.2 includes two exceptions within the charging text. The proposal reformats the section to be consistent with the typical grammatical format found elsewhere in the codes. The change creates consistency with Section 1203.2 of the IBC.

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRANZ-G2-1203.2

G146–09/10
1203.2; IRC R806.1

Proponent: Ali M. Fattah, City of San Diego, San Diego Area Chapter ICC Code Committee

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

Revise as follows:

1203.2 Attic spaces. Where determined necessary by the building official due to atmospheric or climatic conditions, ~~Enclosed~~ enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof framing members shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain and snow. Blocking and bridging shall be arranged so as not to interfere with the movement of air. A minimum of 1 inch (25 mm) of airspace shall be provided between the insulation and the roof sheathing. The net free ventilating area shall not be less than 1/300 of the area of the space ventilated, with 50 percent of the required ventilating area provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents.

PART II – IRC BUILDING AND ENERGY

Revise as follows:

R806.1 Ventilation required. Where determined necessary by the building official due to atmospheric or climatic conditions, ~~Enclosed~~ enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow. Ventilation openings shall have a least dimension of $^{1}/_{16}$ inch (1.6 mm) minimum and ¼ inch (6.4 mm) maximum. Ventilation openings having a least dimension larger than ¼ inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, or similar material with openings having a least dimension of $^{1}/_{16}$ inch (1.6 mm) minimum and ¼ inch (6.4 mm) maximum. Openings in roof framing members shall conform to the requirements of Section R802.7.

Reason: The proposed code change deletes a current requirement. There are many conditions that can preclude providing attic ventilation where climactic conditions do not warrant attic ventilation, for example the installation of solar photovoltaics. Additionally, it is very impractical or not possible to ventilate occupied roof decks, low slope (flat) roofs or vaulted ceilings using rafters with drywall attached to directly to the underside of the solid combination rafter-ceiling joist. In many cases it is not possible to provide the 3 ft elevation difference between the high and low vents on low slope roofs and where low slope roofs include parapets and therefore no eave vents. The proposed change will not preclude applicants from providing attic ventilation to satisfy manufacturer's installation instructions for roof covering and therefore preserving the roof warranty. The language existed in the Uniform Building Code (Section 1505.3). That legacy building code was enforced in climates ranging from cold winter regions to hot desert regions in the southwest and had been in effect for more than 20 years. We are not aware of any moisture damage issues in attic spaces within jurisdictions that did not require attic ventilation, for example the City of San Diego and many surrounding jurisdictions.

This section can conflict with required one hour protection for projections such at eaves, as well as eave protection required by the International Wildland Urban interface Code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING AND ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FATTAH-G2.doc

G147–09/10
1207.1, 1207.4 (New); IRC AK101.1, AK 104 (New)

Proponent: Louis Mraw, State of New Jersey, Department of Community Affairs

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

1. Revise as follows:

1207.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent *dwelling units* or between *dwelling units* and adjacent public areas such as halls, *corridors*, *stairs* or service areas. Windows, doors, walls and roof/ceiling assemblies within buildings containing dwelling units that are exposed to aircraft noise shall provide air-borne sound insulation in accordance with Section 1207.4.

2. Add new section as follows:

1207.4 Aviation noise-resistant construction. Buildings subject to aircraft noise shall be constructed to provide noise level reduction according to the following:

1. Buildings exposed to a day-night average sound level of at least 65 dB but less than 70 dB shall be constructed to provide a 25 dB noise level reduction.
2. Buildings exposed to a day-night average sound level of at least 70 db but less than 75 dB shall be constructed to provide a 30 dB noise level reduction.
3. Buildings exposed to a day-night average sound level of at least 75 dB shall be constructed to provide a 35 dB noise level reduction.

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

AK101.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent *dwelling units* or between *dwelling units* and adjacent public areas such as halls, *corridors*, *stairs* or service areas. Windows, doors, walls and roof ceiling assemblies within buildings containing dwelling units that are exposed to aircraft noise shall provide air-borne sound insulation in accordance with Section AK 104.1.

2. Add new section as follows:

SECTION AK104
AVIATION NOISE-RESISTANT CONSTRUCTION

AK104.1 Aviation noise-resistant construction. Buildings subject to aircraft noise shall be constructed to provide noise level reduction according to the following:

1. Buildings exposed to a day-night average sound level of at least 65 dB but less than 70 dB shall be constructed to provide a 25 dB noise level reduction.
2. Buildings exposed to a day-night average sound level of at least 70 db but less than 75 dB shall be constructed to provide a 30 dB noise level reduction.
3. Buildings exposed to a day-night average sound level of at least 75 dB shall be constructed to provide a 35 dB noise level reduction.

Reason: The U.S. Department of Navy and the United State Air Force have established land use compatibility standards for exposure to aviation noise. Noise levels in these areas are expressed in terms of "Day-Night Average Sound Level", which is abbreviated by "DNL". DNL is the average measure of all aircraft flights occurring in a 24-hour period. The land use compatibility standards state that residential uses are discouraged in 65-69 dB DNL zones and strongly discouraged in 70-74 dB DNL zones. This proposed code change establishes Noise Level Reduction (NLR) criteria for homes exposed to this type of aviation noise.

Typically, noise level reduction has been based on a single-number rating system (STC ratings), however, the use of STC ratings is inappropriate for transportation noises such as aircraft as stated in ASTM E413 section 4.1. It is for this reason we have chosen to provide this performance based criteria.

Cost Impact: The code change proposal will not increase the cost of construction. The proposed code change will increase the cost of construction in area located in the vicinity of airports and military installations.

PART I – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MRAW-G1-1207.4

G148–09/10
1208.3

Proponent: Maureen Traxler, City of Seattle, WA, representing Washington Association of Building Officials Technical Code Development Committee

Revise as follows:

1208.3 Room area. Every dwelling unit shall have at least one room that shall have not less than 120 square feet (13.9 m^2) of net floor area. Other habitable rooms shall have a net floor area of not less than 70 square feet (6.5 m^2).

Exception: ~~Every kitchen~~ Kitchens in ~~a~~ one-and two-family ~~dwelling~~ dwellings ~~shall have not less than 50 square feet (4.64 m^2) of gross floor area~~.

Reason: Minimum room size is an amenity that, especially for kitchens, is not related to life safety or health. This proposal coordinates the IBC and IRC provisions for the minimum size of kitchens. While the IBC requires kitchens to be at least 50 square feet, the IRC has no minimum size. IRC Section R304.2 states:

"Other habitable rooms shall have a floor area of not less than 70 square feet (6.5 m2).
Exception: Kitchens."

IBC Section 1208.1 provides minimum maneuvering room in kitchens. It requires kitchens to have at least 3 feet of space between counter and appliances, and between counter fronts and walls.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAXLER-G2-1208.3

G149–09/10
1210.2

Proponent: Bruce D. Dimmig, representing the Arizona Building Officials

Revise as follows:

1210.2 Walls. Walls within 2 feet (610 mm) of service sinks, urinals and water closets shall have a smooth, hard, nonabsorbent surface, to a height of 4 feet (1219 mm) above the floor and except for structural elements, the materials used in such walls shall be of a type that is not adversely affected by moisture.

Exceptions:

1. *Dwelling units* and *sleeping units*.
2. Toilet rooms that are not accessible to the public and which have not more than one water closet.

Accessories such as grab bars, towel bars, paper dispensers and soap dishes, provided on or within walls, shall be installed and sealed to protect structural elements from moisture. For walls and partitions also see Section 2903.

Reason: The areas around service sinks are as susceptible to moisture as the urinals and water closets as splattering of water and other liquids is common place. Also, with the use of cleaning chemicals and other items that can and will be used at the service sinks makes the walls as subject to the effects experienced at the urinals and water closets.

Cost Impact: The code change proposal will have a minimal effect on the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DIMMIG-G1-1210.2

G150–09/10
1210.1.1 (New)

Proponent: Timothy Kyle Hantz, PE, General Services Administration, representing self

Add new text as follows:

1210.1.1 Diaper changing station. In assembly occupancies where a toilet room has two or more water closets, a diaper changing station shall be provided in the toilet room. Diaper changing stations shall comply with the work surface requirements of ICC A117.1.

Reason: IBC 101. 3 states that the intent of the code is to provide minimum standards for public health, safety and general welfare. I have noticed diaper changing stations in restaurants, trains, airports, convention centers, etc. It is hard to believe that in 2009, we still have to change our children's diapers on a toilet room floor. This is very unsanitary for the baby and the changer. This proposal would also help people who have trouble bending over, or getting on their hands and knees to change diapers.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: The Code Correlation Committee approved an editorial combining of Sections 1210 and 2903 of the 2009 IBC into a single section 1210 on Toilet and Bathroom requirements. This proposal, if approved would be located as Section 1210.1.1 of the new combined section.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HANTZ-G1-1211.1.DOC

G151–09/10
2703 (New)

Proponent: John England, MCO, England Enterprises Inc., representing Cities of Beaufort, Hardeeville SC

Add new section as follows:

SECTION 2703
EMERGENCY DISCONNECT OF POWER

2703.1 Emergency disconnect of power. All buildings shall be provided with a means of disconnecting electrical power from the building by emergency personnel without requiring entry into the building. Metering devices and disconnecting means by utility companies are not considered a means of disconnect. The building official or fire code official have the discretion of waiving this requirement with just cause.

2703.2 Emergency and standby power. Emergency and standby power generation systems shall have a means of disconnecting power by emergency personnel without requiring entry into the building.

Reason: Emergency (fire) personal have requested external disconnecting means on building for years.—the building, fire, or electrical code have not required it. Since fighting fires in building with electrical systems on is an ever growing danger to the fire department, they should have the option of cutting the power to the building. This can be done with disconnects or shut trip breakers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-G6-2703.doc

G152–09/10
3001.2, Chapter 35

Proponent: Victor D. Azzi, PhD, PE, Consulting Engineer, representing the Lift Manufacturers Product Section (LMPS), a division of the Material Handling Industry of America (MHIA)

1. Revise as follows:

3001.2 Referenced standards. Except as otherwise provided for in this code, the design, construction, installation, alteration, repair and maintenance of elevators and conveying systems and their components shall conform to ASME A17.l/CSA B44, ASME A90.l, ASME B20.1, ANSI MH29.1, ALI ALCTV, and ASCE 24 for construction in flood hazard areas established in Section 1612.3.

2. Add standard to Chapter 35 as follows:

ANSI
MH29.1-2003 Safety Requirements for Industrial Scissors Lifts

Reason: The proposed addition to Section 3001 is intended to add industrial scissors lifts, a common and industry-wide accepted vertical conveyance used in buildings since the early 1950's. This addition will help avoid the possibility of confusion by using the appropriate standard to define these types of lifting devises.

As one example of the confusion that currently exists, the Minnesota State Building Code follows the 2006 IBC A City of Minneapolis building inspector in March 2008 was inspecting a new installation of a scissor- type dock lift. The only referenced standard in IBC Chapter 30 (Elevators and Conveying Systems) that seemed to be applicable was ASME B20.1, so he applied that standard. The other referenced standards in IBC 3001.2 were elevators (A17.1), belt manlifts (A90.1), and automotive lifts (ALI ALCTV). The inspector rationalized that because the Minnesota state building code does not recognize industrial scissor lifts they are prohibited unless the manufacturer could show that they meet the intended safety requirements of the code he chose for the conveyance. The IBC is the minimum requirement for safety in that state. In order to gain approval, the manufacturer's scissors lift must meet or exceed the level of safety that was intended for a completely different devise - a conveyor as defined and regulated by ASME B20.1.

ANSI MH29.1 is a stand alone, nationally accepted ANSI standard. It is the only standard that applies to industrial scissors lifts in exactly the same way that ASME H20.I applies to conveyors, AI7.I applies to elevators, A90.I applies to belt manlifts, or ALI ALCTV applies to automotive lifts.

• Scissors lift in 3-sided pit at loading dock # I

• Scissors lift in 3-sided pit at loading dock # 2

• Scissors lift in front of loading dock

• Two scissors lifts at a loading dock

Cost Impact: This addition to the code will not increase the cost of construction

Analysis: A review of the standard proposed for inclusion in the code, ANSI-MH29.1, for compliance with ICC criteria for referenced standard given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: AZZI-G1-3001.2.doc

G153–09/10
3001.2.1 (New); IFC 607.4 (New); IPMC 606.1

Proponent: Philip M. Chandler representing New York State, Department of State, Office of Fire Prevention & Control.

THIS IS A 3 PART CODE CHANGE. ALL PARTS WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE AS 3 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE GENERAL CODE COMMITTEE.

PART I – IBC GENERAL

Add new text as follows:

3001.2 Referenced standards. Except as otherwise provided for in this code, the design, construction, installation, *alteration*, repair and maintenance of elevators and conveying systems and their components shall conform to ASME A17.1/CSA B44, ASME A90.1, ASME B20.1, ALI ALCTV, and ASCE 24 for construction in flood hazard areas established in Section 1612.3.

3001.2.1 Certificate of inspection. The most current certificate of inspection shall be on display at all times within the elevator or attached to the escalator or dumbwaiter, be available for public inspection in the office of the building *operator* or be posted in a publicly conspicuous location *approved* by the *building official*. The inspection and witnessing of tests required by ASME A17.1 shall be performed by an impartial, third-party inspector that meets the minimum qualifications as set forth in the referenced standard. The inspection and tests shall be performed at not less than the periodic intervals listed in ASME A17.1, Appendix N, except where otherwise specified by the authority having jurisdiction.

PART II – IFC

Add new text as follows:

607.4 Maintenance. Elevators, dumbwaiters and escalators shall be maintained in compliance with ASME A17.1. The most current certificate of inspection shall be on display at all times within the elevator or attached to the escalator or dumbwaiter, be available for public inspection in the office of the building *operator* or be posted in a publicly conspicuous location *approved* by the *code official*. The inspection and witnessing of tests required by ASME A17.1 shall be performed by an impartial, third-party inspector that meets the minimum qualifications as set forth in the referenced standard. The inspection and tests shall be performed at not less than the periodic intervals listed in ASME A17.1, Appendix N, except where otherwise specified by the authority having jurisdiction.

PART III – IPMC

Revise as follows:

606.1 General. Elevators, dumbwaiters and escalators shall be maintained in compliance with ASME A17.1. The most current certificate of inspection shall be on display at all times within the elevator or attached to the escalator or dumbwaiter, be available for public inspection in the office of the building *operator* or be posted in a publicly conspicuous location *approved* by the *code official*. The inspection and witnessing of tests required by ASME A17.1 shall be performed by an impartial, third-party inspector that meets the minimum qualifications as set forth in the referenced standard. The inspection and tests shall be performed at not less than the periodic intervals listed in ASME A17.1, Appendix N, except where otherwise specified by the authority having jurisdiction.

Reason: These three companion proposals will provide consistent provisions in the IBC, IFC and IPMC regarding elevator inspection and posting the appropriate certificate.

IBC Section 3001.2: As 3001.2 pertains to maintenance as well as to design, construction and installation, it is appropriate to use the same language found in IPMC here. Additionally, it is helpful to reiterate the qualifications needed by elevator inspectors and the importance of their impartiality.

IFC Section 607.4: Elevators, dumbwaiters and escalators have a significant impact on a building's overall fire safety. Accordingly, this new text will coordinate IFC requirements with those of the IBC and IPMC and at the same time, reiterate the qualifications needed by elevator inspectors and the importance of their impartiality.

IPMC Section 606.1: This eliminates much confusion surrounding the minimum qualifications of elevator inspectors explicit in the referenced standard and the need for impartiality implicit in the requirements for QEI-1certification. The need for impartiality is fundamental to the QEI process.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART III – IPMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CHANDLER-G1-3001.2.1.doc

G154–09/10
3002.3

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII)

Revise as follows:

3002.3 Emergency signs. An approved pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the exit stairways and not to use the elevators in case of fire. The sign shall ~~read: IN FIRE EMERGENCY, DO NOT USE ELEVATOR. USE EXIT STAIRS~~ comply with ASME A17.1/CSA B44.

Exceptions:

1. The emergency sign shall not be required for elevators that are part of an *accessible means of egress* complying with Section 1007.4.
2. The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008.

Reason: The message for these elevator signs is already addressed in the referenced standard:

ASME A17,1/CSA B44, Section 2.27.9 Elevator Corridor Call Station Pictograph. When the building code requires a sign be posted adjacent to hall call fixtures instructing occupants not to use the elevator in case of fire, the sign shown in Fig. 2.27.9 shall be provided. The sign shall include only the wording and graphics shown in Fig. 2.27.9. When the building code specifies a different design, 2.27.9 shall not apply.

(The Figure 2.27.9 uses the text “IN CASE OF FIRE ELEVATORS ARE OUT OF SERVICE. USE EXIT”.)

ASME A17,1/CSA B44 already provides the “standardized design” required by IBC Section 3002.3 but provides non-standardized text to accompany the pictograph. This is essentially a harmonization between the IBC requirement and the code referenced in 3001.2.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BLACK-G2-3002.3.doc

G155–09/10
3003.3 (New), 3007.3

Proponent: Dave Frable, U.S. General Services Administration

Revise as follows:

3003. 3 Hoistway lighting. When firefighters' emergency operation is active, the entire height of the hoistway shall be illuminated at not less than 1 foot-candle (11 lux) as measured from the top of the car of each elevator.

~~**3007.3 Hoistway lighting.** When firefighters' emergency operation is active, the entire height of the hoistway shall be illuminated at not less than 1 foot-candle (11 lux) as measured from the top of the car of each fire service access elevator.~~

(Renumber subsequent sections)

Reason: The intent of this code change is to provide illumination within elevator hoistways when firefighter's emergency operation has been enabled. It relocates the provisions currently only applicable to fire service access elevators applicable to high-rise buildings, to be a requirement for all elevator hoistways regardless of height or whether the elevator is designated for a specific use or not.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G3-3003.3

G156–09/10
3003.3 (New)

Proponent: Dave Frable, U.S. General Services Administration

Add new text as follows:

3003.3 Elevator identification. Each elevator shall be individually marked with an approved identification at each elevator landing and elevator control operating panel.

Reason: The intent of this code change is to provide a means for each elevator to be indentified consistently throughout the building.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G5-3003.4

G157–09/10
3007.1. 3007.1.1(New)

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII); Sean DeCrane, representing International Association of Fire Fighters (IAFF); Jack Murphy, representing Fire Safety Directors of Greater New York (FSDAGNY)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3007.1 General. Where required by Section 403.6.1, every floor of the building shall be served by ~~a~~ fire service access ~~elevator~~ elevators. Except as modified in ~~this section, the~~ Sections 3007.1 through 3007.7, fire service access ~~elevator~~ elevators shall be installed in accordance with this chapter and ASME A17.1/CSA B44.

3007.1.1. Ambulance stretcher. Each fire service access elevator shall be sized to accommodate a stretcher in conformance with Section 3002.4.

Reason: A fire service access elevator has to be large enough to accommodate firefighters and their equipment as they ascend to a fire floor and also be large enough to accommodate injured building occupants or persons with disabilities being evacuated from the building. This proposal simply correlates with the existing requirement in Section 3002.4 to provide a 3500+ lb elevator car in buildings four or more stories above/below grade plane that can accommodate a stretcher, ensuring that this car, which may be larger than the other elevators in the building, will also be the fire service access elevator.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BLACK-G6-3007.1.doc

G158–09/10
3007.2 (New), 3007.3 (New)

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3007.2 Automatic sprinkler system. The building shall be equipped throughout by an automatic sprinkler system in accordance with Section 903.3.1.1, except as otherwise permitted by Section 903.3.1.1.1 and as prohibited by Section 3007.2.1.

3007.2.1 Prohibited locations. Automatic sprinklers shall not be installed in elevator machine rooms, elevator machine spaces, and elevator hoistways of fire service access elevators.

3007.2.2 Sprinkler system monitoring. The sprinkler system shall have a sprinkler control valve supervisory switch and waterflow-initiating device provided for each floor that is monitored by the building's fire alarm system.

3007.3 Shunt trip. Means for elevator shutdown in accordance with Section 3006.5 shall not be installed on elevator systems used for fire service access elevators.

(Renumber subsequent sections)

Reason: 3007.2: The intent of this code change is to provide further clarification in meeting the original intent of Section 3007 regarding prohibiting the installation of automatic sprinklers in the associated elevator machine rooms and elevator machine spaces for fire service access elevators. . The subject proposed language is similar to the language in Section 3008.6 for occupant evacuation elevators.

3007.3: The intent of this code change is to provide further clarification in meeting the original intent of Section 3007 regarding prohibiting the installation of shunt trip for fire service access elevators. The subject proposed language is similar to the language in Section 3008.8 for occupant evacuation elevators.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Would this requirement take precedence over Sections 403.2 and 903.2.11.3 which allow certain portions of a high-rise building not to be provided with sprinkler protection?

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G9-3007.2

G159–09/10
3007.2 (New)

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3007.2 Phase I Emergency recall operation. An independent, three-position, key-operated "Fire Recall" switch shall be provided at the designated level for each fire service access elevator or for each group of fire service access elevators in accordance with the requirements in ASME A17.1/CSA B44. In addition, actuation of any building fire alarm initiating device shall initiate Phase I emergency recall operation on all fire service access elevators in accordance with the requirements in ASME A17.1/CSA B44. All other elevators shall remain in normal service unless Phase I emergency recall operation is manually initiated by a separate, required three-position key-operated "Fire Recall" switch or automatically initiated by the associated elevator lobby and elevator machine room smoke detectors.

(Renumber subsequent sections)

Reason: The intent of this code change is to provide further clarification in meeting the original intent regarding the design and operation of fire service access elevators. This code change will also ensure the subject elevators can be recalled quickly at the designated level by the responding firefighters.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G7-3007.2

G160–09/10
3007.2, 3007.2.1(New)

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing: California Fire Safety Advisory Council (CFSAC)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3007.2 Hoistway enclosures protection. The fire service access elevator hoistway shall be located in a shaft enclosure complying with Section 708.

3007.2.1 Structural integrity of hoistway enclosures. The fire service access elevator hoistway shaft enclosure shall comply with Section 403.2.3.

Reason: This proposed code change is a follow up to the Cal Chiefs Code Change G194-07/08 which was disapproved in Minneapolis.

That code change was disapproved mainly because it was based on a reference to the hose stream test in ASTM E119 for determining the structural integrity of the shaft enclosure. However, Code Change G65-07/08 by the Gypsum Association, which also addressed the issue of structural integrity of exit stairway and elevator hoistway shaft enclosures, was approved as modified in Minneapolis by Public Comment #2. That code change provided for another means for assessing the structural integrity of shaft enclosures, specifically for buildings known as super high-rise buildings (those greater than 420 ft in height). And it was supported by a NIST representative in response to one of the recommendations made in the NIST World Trade Center Report. Since it was approved for those conditions, it also seems appropriate that such structural integrity criteria should also be provided for the protection of fire service access elevator hoistways. These hoistways perform a very critical function protecting the responding fire fighters while the elevator assists them in gaining access to the fire floor in buildings generally more than 120 ft in height.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Does the reference to Section 403.2.3 in the proposal result in requiring 'hardening' of the hoistway shaft at the 120 foot threshold for fire service access elevators or the 420 foot threshold provided in Section 403.2.3?

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THORNBERRY-G3-3007.2

G161–09/10
3007.3 (New)

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII); Sean DeCrane, representing International Association of Fire Fighters (IAFF); Jack Murphy, representing Fire Safety Directors of Greater New York (FSDAGNY)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3007.3 Pressurization system. Hoistways for fire service access elevators and fire service access elevator lobbies required to be enclosed in accordance with 3007.4.2 shall be pressurized in accordance with Section 708.14.2.

(Renumber subsequent sections)

Reason: The Fire Service Access Elevators (FSAE) need to be protected from smoke entering either the hoistway directly or through the lobby or stair system that adjoins the FSAE. The current requirements for a Fire Service Access Elevator include elevator lobbies constructed as smoke barriers; however the Hazard Analysis done by the ASME Task Group on Use of Elevators by Firefighters determined that providing lobbies alone that are not pressurized is insufficient due to the likelihood that the lobby and stairwell doors would be open continuously to permit firefighting operations.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BLACK-G7-3007.3.doc

G162–09/10
3007.4 (New)

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3007.4 Water protection. An *approved* method to prevent water from infiltrating into the hoistway enclosure from the operation of the automatic sprinkler system outside the enclosed fire service access elevator lobby shall be provided.

(Renumber subsequent sections)

Reason: The intent of this code change is to provide performance language that will permit alternate design options to provide a means to prevent water from an operating sprinkler system from infiltrating into the hoistway enclosure. For example, such approved means could include: drains, sloping floor, etc. The subject proposed language is similar to the proposed language in Section 3008.10 for occupant evacuation elevators.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G10-3007.4

3007.4.2

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3007.4.2 Lobby enclosure. The fire service access elevator lobby shall be enclosed with a *smoke barrier* having a minimum 1-hour *fire-resistance rating*, except that lobby doorways shall comply with Section 3007.4.3.

Exception: Enclosed fire service access elevator lobbies are not required at the levels of exit discharge ~~street floor~~.

Reason: The intent of this code change is to only replace the undefined term “street floor” with the defined term “level of exit discharge”. The subject text is similar to the wording in the requirement in Section 3008.11.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G4-3007.4.2

G164–09/10
3007.5.1 (New)

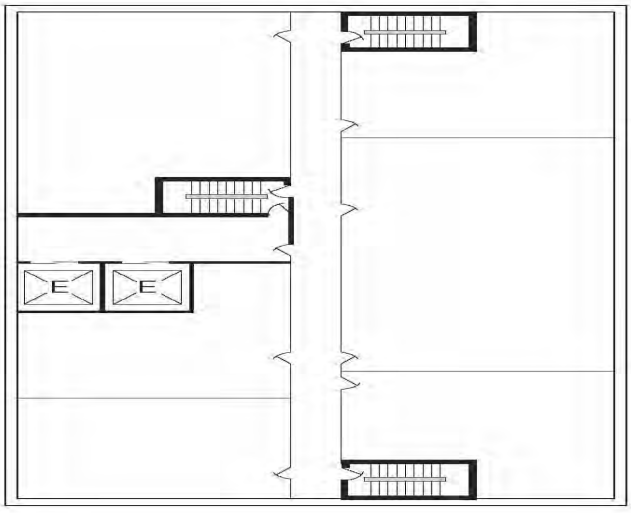
Proponent: Richard Bukowski, PE, FSFPE, Rolf Jensen & Associates, representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3007.5.1 Access. The *exit enclosure* containing the standpipe shall have access to the floor without passing through the fire service access elevator lobby.

Reason: Access from the exit enclosure containing the standpipe to the floor is necessary so that the fire department can advance their attack hose onto the fire floor without opening the door between the lobby and the floor which could permit smoke contamination of the lobby and cause recall of the elevator(s). This access to the floor could be direct or through an access corridor or vestibule between the elevator lobby and the exit enclosure as long as there is a smoke barrier enclosing the elevator lobby.



Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUKOWSKI-G1-3007.5.1.doc

G165–09/10
3007.7.1, 3008.15.1

Proponent: Brian Black BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII); Sean DeCrane, representing, International Association of Fire Fighters (IAFF); Jack Murphy, representing Fire Safety Directors Association of Greater New York (FSDAGNY)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3007.7.1 Protection of wiring or cables. Wires or cables that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to fire service access elevators shall be protected by construction having a minimum ~~1~~ 2-hour fire-resistance rating or shall be circuit integrity cable having a minimum ~~1~~ 2-hour fire resistance rating.

3008.15.1 Protection of wiring or cables. Wires or cables that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to fire service access elevators shall be protected by construction having a minimum ~~1~~ 2-hour fire-resistance rating or shall be circuit integrity cable having a minimum ~~1~~ 2-hour fire resistance rating.

Reason: RE: 3007.7.1: The safety of firefighters during their firefighting operations is dependent upon the life safety support systems listed in Section 3007 being maintained during the critical first 2 hours of their efforts. Locating, surrounding, confining and extinguishing the fire, as well as removing those whose lives are in jeopardy, will take time. If the fire is not under control by 2 hours into the effort, then it is probably time to evacuate. Providing the 2 hour protection will provide the necessary safety factor for firefighters to undertake the firefighting and rescue operations without increased concern for system failure. The 2-hour rating is consistent with the hoistway fire rating and fire pump feeder enclosure rating. This request has the full support of the firefighting community and is not unreasonable when it is considered that this will allow for more time to ensure the full evacuation of the building.

RE: 3008.15.1: The safety of building occupants evacuating a building is dependent upon the life safety support systems listed in Section 3008 being maintained during the critical hours of evacuation. The 2-hour rating is consistent with the hoistway fire rating and fire pump feeder enclosure rating. This request has the full support of the firefighting community and is not unreasonable when it is considered that this will allow for more time to ensure the full evacuation of a building.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BLACK-G8-10-3008.15.1.doc

G166–09/10
3007.7.1, 3008.15.1

Proponent: Brian Black BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII); Sean DeCrane, representing, International Association of Fire Fighters (IAFF); Jack Murphy, representing Fire Safety Directors Association of Greater New York (FSDAGNY)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3007.7.1 Protection of wiring or cables. Wires or cables that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to fire service access elevators shall be protected by construction having a minimum 1-hour fire-resistance rating or shall be circuit integrity cable having a minimum 1-hour fire resistance rating.

Exception: Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operation.

3008.15.1 Protection of wiring or cables. Wires or cables that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to fire service access elevators shall be protected by construction having a minimum 1-hour fire-resistance rating or shall be circuit integrity cable having a minimum 1-hour fire resistance rating.

Exception: Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operation.

Reason: The safety of building occupants evacuating a building is dependent upon the life safety support systems listed in Sections 3007 and 3008 being maintained during the critical hours of evacuation. Elevator landing fixtures that provide control signals such as hall call buttons and hall lanterns do not require a 1-hour fire resistance rating to ensure the viability of the system and protection of firefighters using the fire service access elevator during Phase II operation. The industry generally does not submit fixtures for testing to obtain a fire-resistance rating.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BLACK-G9-11-3007.7.1

3007.8 (New)

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3007.8 Fire service access elevator symbol. A pictorial symbol of a standardized design designating which elevators are fire service access elevators shall be installed on each side of the hoistway door frame on the portion of the frame at right angles to the fire service access elevator lobby. The fire service access elevator symbol shall be designed as shown in Figure 3007.8 and shall comply with the following:

1. The fire service access elevator symbol shall be a minimum of 3 inches (76 mm) in height.
2. The vertical center line of the fire service access elevator symbol shall be centered on the hoistway door frame. Each symbol shall not be less than 78 inches (1981 mm), and not more than 84 (2134 mm) inches above the finished floor at the threshold.

FIGURE 3007.8
FIRE SERVICE ACCESS ELEVATOR SYMBOL

Reason: The intent of this code change is to provide a means to designate which elevators in a building have been designated as fire service access elevators via a standardized pictorial symbol to be installed on each side of the door frame of each designated elevator. The subject symbol is based on the fire fighters hat referenced in ASME A17.1/CSA B44.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

3008.1, 3008.3 (New)

Proponent: Matthew Davy, P.E., Schirmer Engineering Corporation, representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3008.1 General. Where elevators are to be used for occupant self-evacuation during fires, all passenger elevators for general public use shall comply with this section. Where other elevators are used for occupant self-evacuation, they shall also comply with ~~this section~~.Sections 3008.1 through 3008.16.

3008.1.1 Alternative compliance. Where approved by the building official, occupant evacuation elevators shall comply with ASME A17.1/CSA B44 and shall be permitted to comply with standards alternative to Sections 3008.4 through 3008.16 provided such alternative standards are supported by an approved engineering analysis.

3008.2 Fire safety and evacuation plans. (No change to current text)

3008.3 Engineering analysis. An engineering analysis shall be conducted and approved for an occupant evacuation elevator.

3008.3.1 Analysis. The engineering analysis of the occupant evacuation elevator shall include a risk analysis, hazard analysis, or equivalent analysis. The analysis shall consider, as a minimum, the items indicated in Sections 3008.4 through 3008.16.

3008.3.2 Construction documents. The engineering analysis supporting the occupant evacuation elevators, their method of operation, systems supporting them, and methods of construction to be used shall accompany the submitted construction documents.

(Renumber subsequent sections)

Reason: An engineering analysis must be required for occupant evacuation elevator systems. These systems have many dynamic components and human interface aspects, which need to be reviewed, analyzed, and documented prior to acceptance by the code official or authority having jurisdiction. Occupant evacuation elevator systems are a life safety system that demands a rigorous analysis, such as a risk analysis or hazard analysis, for each building configuration and occupancy. The documentation requirement is consistent with the analysis for smoke control systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G169–09/10
3008.1.1 (New)

Proponent: Bill Ziegert, Smoke Guard, Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3008.1.1 Occupant evacuation elevators permitted. Occupant evacuation elevators shall be permitted only when the elevator code (ASME A17.1/CSA B44 or other) adopted by the jurisdiction contains specific requirements for the design, operation and maintenance of emergency evacuation operation (EEO).

Reason: Occupant Evacuation Elevators require many special operational / design requirements not found in the Building Code, and currently not included in any edition issued or under development of the ASME A17.1/CSA B44 Elevator Code. The proper operation and sequencing of the elevators to efficiently move occupants from the affected floors is the most important part of the occupant evacuation system and incorporation of this functionality currently allowed under the building code should not be allowed until the Elevator systems are designed with this additional functionality adequately addressed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ZIEGERT-G2-3008.1.1

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3008.1 General. Where elevators are to be used for occupant self-evacuation during fires, all passenger elevators for general public use shall comply with this section. Where other elevators are used for occupant self-evacuation, they shall also comply with this section. Also see Section 1003.7.

Reason: This code change provides a simple cross-reference to Section 1003.7 Elevators, Escalators, and Moving Walks in order to make sure the user of the code realizes that elevators are not allowed to be used as a component of a required means of egress from any other part of the building. Currently, this new technology utilizing elevators for occupant self-evacuation is still in its infancy. It needs to be further assessed by the voluntary use of occupant elevators for evacuation without reducing the current requirements for means of egress until such time as they have been proven to be safe, reliable, and effective. Therefore, this cross-reference reminder is important for the proper application of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THORNBERRY-G4-3008.1

3008.4 (New)

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3008.4 Phase I Emergency recall operation. An independent, three-position, key-operated "Fire Recall" switch shall be provided at the designated level for each occupant evacuation elevator in accordance with the requirements in ASME A17.1/CSA B44.

(Renumber subsequent sections)

Reason: The intent of this code change is to provide further clarification in meeting the original intent regarding the design and operation of fire service access elevators. This code change will also ensure the subject (as specific) elevators can be recalled quickly at the designated level by the responding firefighters.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G8-3008.4

G172–09/10
3008.7 (New)

Proponent: Matthew Davy, P.E., Schirmer Engineering Corporation, representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

3008.7 Activation. Occupant evacuation elevator systems shall be activated by any of the following:

1. The operation an automatic sprinkler system complying with Section 3008.6;
2. Smoke detectors required by another provision of the code; or required as an alternative standard complying with Section 3008.1.1.
3. Approved manual controls.

(Renumber subsequent sections)

Reason: The current occupant evacuation elevator requirements do not contain a means for system activation. This new section provides a minimum set of initiating devices to activate the automatic operation. An example of smoke detectors required by another section of this code includes smokeproof enclosures for the mechanical ventilation or stair pressurization alternative. An engineering analysis should be required for occupant evacuation elevators that includes a section on system activation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVY-G2-3008.7

G173–09/10
3008.9, 3008.9.1 (New)

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing: California Fire Safety Advisory Council (CFSAC)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3008.9 Hoistway enclosure protection. ~~The~~ Occupant evacuation elevator~~s~~ hoistways shall be located in ~~a hoistway~~ shaft enclosure~~(s)~~ complying with Section 708.

3008.9.1 Structural integrity of hoistway enclosures. Occupant evacuation elevator hoistway shaft enclosures shall comply with Section 403.2.3.

Reason: This code change is a follow up to Code Change G65-07/08 by the Gypsum Association which also addressed the issue of structural integrity of exit stairway and elevator hoistway shaft enclosures in super high-rise buildings (those greater than 420 ft in height). It was approved as revised by Public Comment #2 at the ICC Final Action Hearings held in Minneapolis, MN.

In our opinion, it follows that the structural integrity requirements for super high-rise building exit stairway and elevator hoistway shaft enclosures should also apply to elevator hoistway shaft enclosures provided for occupant evacuation elevators which are just as critical for life safety protection. Such new technology for evacuation of occupants should be provided with the highest level of fire protection that is reasonably possible in order to assure that the elevators will be available during a fire emergency to serve their intended purpose of evacuating the occupants. Certainly, the structural integrity of the elevator hoistway shaft enclosures should be required to have some reasonable degree of physical protection to assure that the hoistway shaft enclosures will remain in place when needed during a fire or other emergency.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THORNBERRY-G5-3008.9

3008.10

Proponent: Dave Frable, U.S. General Services Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3008.10 Water protection. ~~The occupant evacuation elevator hoistway shall be designed utilizing~~ An *approved* method to prevent water from infiltrating into the hoistway enclosure from the operation of the automatic sprinkler system ~~from infiltrating into the hoistway enclosure.~~ outside the enclosed occupant evacuation elevator lobby shall be provided.

Reason: The intent of this code change is to clarify the performance language in meeting the original intent of this section regarding providing a means to prevent water from an operating sprinkler system from infiltrating into the hoistway enclosure. The subject proposed language is similar to the proposed language in Section 3007.4 for fire service access elevators.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-G2-3008.10

G175–09/10
3008.10.1 (New)

Proponent: Gregory J. Cahanin, Cahanin Fire & Code Consulting, representing the Smoke Safety Council

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3008.10 Water protection. The occupant evacuation elevator hoistway shall be designed utilizing an approved method to prevent water from the operation of the automatic sprinkler system from infiltrating into the hoistway enclosure.

3008.10.1. Water Intrusion. For elevators serving four or more stories in buildings equipped throughout with an automatic sprinkler system, hoistways and equipment shall be protected from the effects of water intrusion from openings into the hoistway. Protection shall comply with one of the following;

1. A 1 ½ inch raised threshold in front of the elevator opening with a slope of 2 percent or less;
2. Automatic dams or barriers that prevent the intrusion of water into the elevator shaft and are approved by the building official; or
3. Drains or grates across the elevator hoistway opening capable of removing water generated by a minimum of four fire sprinklers for the building.

Reason: This is a revised proposal from last cycle which generated multiple discussions on the actual design of solutions indicating that there is a problem with water intrusion and there needs to be a definitive requirement in the code. Proposals by others also addressed this issue for the new classifications of elevators. The committee suggested an exception for buildings or elevators serving 3 or few levels and it is carried over with revised and more specific requirements.

Water intrusion into the elevator hoistway damages the electrical equipment that operates the elevator and potentially traps emergency personnel and occupants in the process of egressing.

This change recognizes three primary methods of protecting the opening. First, raising the threshold by 1.5 inches will direct the water to other lower areas of the floor. Setting the benchmark at 1.5 inches above the surrounding areas make a subtle rise in the floor possible while meeting the slope requirements found in Section 1010 while helping to direct water away from the opening.

Second, there are several commercially available automatic dams or barriers that can stop water intrusion. The qualifier that the AHJ must accept these systems that now have no definitive testing criteria allows for development of newer methods.

Third, the design of floor drains at the entrance to elevator hoistways is a viable method of controlling waterflow into buildings. The 4 sprinkler flow requirement is twice the expected flow based upon sprinkler operation data.

This change is submitted in three areas of Chapter 30-an overall general requirement or failing that then a requirement for newly established occupant evacuation elevators and fire service access elevators.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

3007.4.3, 3008.11.3

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3007.4.3 Lobby doorways. Other than the door to the hoistway, each doorway to a fire service access elevator lobby shall be provided with a ~~doorway that is protected with a~~ $^3/_4$-hour *fire door assembly* complying with Section 715.4. The *fire door assembly* shall also comply with the smoke and draft control door assembly requirements of Section 715.4.3.1 with the UL 1784 test conducted without the artificial bottom seal.

3008.11.3 Lobby doorways. Other than the door to the hoistway, each doorway to an occupant evacuation elevator lobby shall be provided with a ~~doorway that is protected with a~~ $^3/_4$-hour *fire door assembly* complying with Section 715.4. The fire door assembly shall also comply with the smoke and draft control assembly requirements of Section 715.4 3 1 with the UL 1784 test conducted without the artificial bottom seal.

Reason: The proposed new sentence to Section 3008.11.3 correlates with the lobby doorway requirements for fire service access elevators in Section 3007.4.3. The integrity and tenability of elevator lobbies used for occupant evacuation is just as critical as that provided for fire service access. The revision to the first sentence in both sections clarifies that the requirement for the rated doors applies to all doors into the lobby, except for the hoistway door. As currently written, the code could be interpreted to only require one door into the lobby to be a rated assembly, while any other door could be unrated.

Cost Impact: This code change proposal will increase the cost of construction.

3008.11.5, 1110.3

Proponent: Manny Muniz, California Deputy State Fire Marshal (Ret.), representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3008.11.5 Signage. An approved sign ~~indicating elevators are suitable for occupant self-evacuation~~ stating **PROTECTED ELEVATOR – USABLE IN EMERGENCIES** shall be posted on all floors adjacent to each elevator call station serving occupant evacuation elevators. Signage shall comply with visual character requirements in ICC A117.1 and include the International Symbol of Accessibility. Where exit sign illumination is required by Section 1011.2, the signs shall be illuminated.

1110.3 Other signs. Signage indicating special accessibility provisions shall be provided as shown:

1. through 6. (No change to current text)
7. At occupant evacuation elevators, signage shall be provided in accordance with Section 3008.11.5.

Reason: Exit signage should be consistent in all buildings that have protected elevators. 3008.11.5 requires such a sign but does not specify that wording for the sign. All required life safety signs that require words should clearly state the words, should be accessible in accordance with ICC A117.1, and should have illumination as required for exit signs. The proposed language is similar to 1007.9 for **AREA OF REFUGE** signs. The words **PROTECTED ELEVATOR – USABLE IN EMERGENCIES** is the same as recommended in the NFPA 101 Life Safety Code.

Cost Impact: The code change proposal will not increase the cost of construction.

707.5.1, 712.4, 3104.5

Proponent: Kaitlin McGillvray, Code Consultants Professional Engineers, PC

Revise as follows:

3104.5 Fire Barriers between pedestrian walkways and buildings. Walkways shall be separated from the interior of the building by not less than 2 hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. This protection shall extend vertically from a point 10 feet (3048 mm) above the walkway roof surface or the connected building roof line, whichever is lower, down to a point 10 feet (3048 mm) below the walkway and horizontally 10 feet (3048 mm) from each side of the pedestrian walkway. Openings within the l0-foot (3048 mm) horizontal extension of the protected walls beyond the walkway shall be equipped with devices providing a 3/4-hour fire protection rating in accordance with Section 715.

Exception: The walls separating the pedestrian walkway from a connected building and the openings within the 10 foot horizontal and vertical extension of the protected walls beyond the walkway are not required to have a fire-resistance rating by this section where any of the following conditions exist:

1. The distance between the connected buildings is more than 10 feet (3048 mm), the pedestrian walkway and the connected buildings, except for open parking garages, are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The wall is capable of resisting the passage of smoke or is constructed of tempered, wired, or laminated glass walls and doors and subject to the following:
   1.1. The wall or glass separating the interior of the building from the pedestrian walkway shall be protected by an automatic sprinkler system in accordance with Section 903.3.1.1 and the sprinkler system shall completely wet the entire surface of interior sides of the glass wall when actuated.
   1.2. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates.
   1.3. Obstructions shall not be installed between the sprinkler heads and the wall or glass.
2. The distance between the connected buildings is more than 10 feet (3048 mm) and both sidewalls of the pedestrian walkway are at least 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and toxic gases.
3. Buildings are on the same lot in accordance with Section 503.1.2.
4. Where exterior walls of connected buildings are required by Section 704 to have a fire-resistance rating greater than 2 hours, the walkway shall be equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

707.5.1 Supporting construction. The supporting construction for a *fire barrier* shall be protected to afford the required *fire-resistance rating* of the *fire barrier* supported. Hollow vertical spaces within a *fire barrier* shall be fireblocked in accordance with Section 717.2 at every floor level.

Exceptions:

1. The maximum required *fire-resistance rating* for assemblies supporting *fire barriers* separating tank storage as provided for in Section 415.6.2.1 shall be 2 hours, but not less than required by Table 601 for the building construction type.
2. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 708.12.
3. Supporting construction for 1-hour *fire barriers* required by Table 508.2.5 in buildings of Type IIB, IIIB and VB construction is not required to be fire-resistance rated unless required by other sections of this code.
4. Supporting construction for fire barriers required by Section 3104.5 is not required to be fire-resistance rated unless required by other sections of this code.

712.4 Continuity. Assemblies shall be continuous without openings, penetrations or joints except as permitted by this section and Section 708.2, 713.4, 714 and 1022.1. Skylights and other penetrations though a fire-resistance-rated roof deck or slab are permitted to be unprotected, provided that the structural integrity of the fire-resistance-rated roof assembly is maintained. Unprotected skylights shall not be permitted in roof assemblies required to be fire-resistance rated in accordance with Section 704.10. The supporting construction shall be protected to afford the required *fire-resistance rating* of the *horizontal assembly* supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the *horizontal assembly* is not required to be fire-resistance-rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by Table 508.2.5, provided the required *fire-resistance rating* does not exceed 1 hour.
2. Horizontal assemblies at the separations of *dwelling units* and *sleeping units* as required by Section 420.3.
3. Horizontal assemblies at *smoke barriers* construction in accordance with Section 710.
4. Supporting construction for horizontal assemblies required by Section 3104.5 is not required to be fire-resistance rated unless required by other sections of this code.

Reason: The additional wording in the exception is intended to be editorial in order to clarify the application of the exception to the base requirements of Section 3104.5. As determined during the 06/07 code change cycle, the intent of the Section 3104.5 exception is that application of any of the four listed design alternatives under the exception will apply to all of the base requirements. Therefore, the exceptions apply to the interior walls between the walkway and the connected buildings and the horizontal *and* vertical extensions of the connected buildings.

In conjunction with the required fire barriers between pedestrian walkways and buildings, Section 707.5.1 and Section 712.4 were modified. The exception added to Section 707.5.1 is intended to clarify the extent of the protection between the pedestrian walkway and the buildings. Fire barriers are intended to prevent the interior spread of fire; not to prevent the exterior spread of fire. Section 707.4 supports this intent by requiring exterior walls that serve as a part of a shaft or exit enclosure (required to be constructed as fire barriers) to comply with Section 705 for exterior walls and not Section 707 for fire barriers. By requiring a fire barrier between the pedestrian walkway and buildings, the supporting construction must also be protected to afford the required fire-resistance rating of the fire barrier supported. This would mean that the rated construction must be extended from the pedestrian walkway connection to grade, which is contradictory to the 10 foot extension required below the connection in the base requirement.

The exception added to Section 712.4 is also intended to clarify the extent of the protection between the pedestrian walkway and the buildings. Where pedestrian walkways are separated from the interior of the building by horizontal assemblies, the supporting construction must be protected to afford the required fire-resistance rating of the horizontal assembly supported. This would also mean that the rated construction must be extended from the pedestrian walkway connection to grade, which is contradictory to the 10 foot extension required below the connection in the base requirement.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCGILLVRAY-G1-3104.5.DOC

G179–09/10
3104.5. 3104.8, 3104.9 (New)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., The American Institute of Architects

1. Revise as follows:

3104.5 Fire barriers between pedestrian walkways and buildings. Walkways shall be separated from the interior of the building by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both. This protection shall extend vertically from a point 10 feet (3048 mm) above the walkway roof surface or the connected building roof line, whichever is lower, down to a point 10 feet (3048 mm) below the walkway and horizontally 10 feet (3048 mm) from each side of the *pedestrian walkway*. Openings within the l0-foot (3048 mm) horizontal extension of the protected walls beyond the walkway shall be equipped with devices providing a 3/4-hour *fire protection rating* in accordance with Section 715. Openings connecting the building to the pedestrian walkway shall not be considered openings for the purpose of determining allowable area of openings in Section 705.8, nor are openings connecting the building to the pedestrian walkway required to be protected except as required by this section.

Exception: The walls separating the *pedestrian walkway* from a connected building and the openings within the 10- foot (3048 mm) horizontal extension of the protected walls beyond the walkway are not required to have a *fire-resistance rating* by this section where any of the following conditions exist:

1. The distance between the connected buildings is more than 10 feet (3048 mm). The *pedestrian walkway* and connected buildings, except for *open parking garages*, are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1. The wall is capable of resisting the passage of smoke or is constructed of a tempered, wired or laminated glass wall and doors subject to the following:
   1.1. The wall or glass separating the interior of the building from the *pedestrian walkway* shall be protected by an *automatic sprinkler system* in accordance with Section 903.3.1.1 and the sprinkler system shall completely wet the entire surface of interior sides of the wall or glass when actuated;
   1.2. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates; and
   1.3. Obstructions shall not be installed between the sprinkler heads and the wall or glass.
2. The distance between the connected buildings is more than 10 feet (3048 mm) and both sidewalls of the *pedestrian walkway* are at least 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and *toxic* gases.
3. Buildings are on the same lot in accordance with Section 503.1.2.
4. Where *exterior walls* of connected buildings are required by Section 705 to have a *fire-resistance rating* greater than 2 hours, the walkway shall be equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1.

The previous exception shall apply to *pedestrian walkways* having a maximum height above grade of three *stories* or 40 feet (12 192 mm), or five *stories* or 55 feet (16 764 mm) where sprinklered.

3104.8 Width. The unobstructed width of *pedestrian walkways* shall not be less than 36 inches (914 mm). The total width <u>of each walkway</u> shall not exceed 30 feet (9144 mm).

2. Add new text as follows:

<u>3104.9 Multiple walkways and spacing.</u> <u>Pedestrian walkways located on multiple floors shall be permitted. For the purpose of determining wall and opening protection of multiple pedestrian walkways, where walkways are located adjacent to each other or adjacent and within one floor of each other, the requirements of Section 3104.5 shall apply to the walkway.</u>

> **<u>Exception:</u>** <u>Pedestrian walkways which are stacked directly over each other shall be permitted without protection specified in Section 3104.5</u>

Reason: Protection of openings in this section provides the necessary protection for separation from the building and the pedestrian walkway. No additional requirement for protection of these openings is necessary in Section 602. Nothing in the code prohibits the construction of more than one walkway between buildings. This change clarifies that the 30 foot width is for each walkway, not cumulatively. The new Section 3104.9 specifies that multiple walkways are to be stacked one above the other, or must be separated from each other as prescribed by Table 602

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3108.1 General. Towers shall be designed and constructed in accordance with the provisions of TIA-222. Towers shall be designed for seismic loads; exceptions related to seismic design listed in Section 2.7.3 of TIA-222 shall not apply.

Exception: Single free-standing poles used to support antennas not greater than 75 feet (22 860 mm), measured from the top of the pole to grade, shall not be required to be noncombustible.

Reason: Seismic design of Communications Towers has been required by the IBC up through the 2003 edition. For many years, the Legacy Code (UBC) required seismic design of these towers.

An exemption for seismic design of towers was developed within the 2009 IBC, via reference to Standard TIA 222 (the latest edition of TIA 222 is referred to as 222-G). Without the IBC's reference to Standard TIA 222, ASCE 7-05 requires seismic design of towers, TIA 222-G caries exemptions to seismic design in certain conditions.

The exemptions provided in TIA 222-G are flawed because of the following:

1) Requirements for Standards

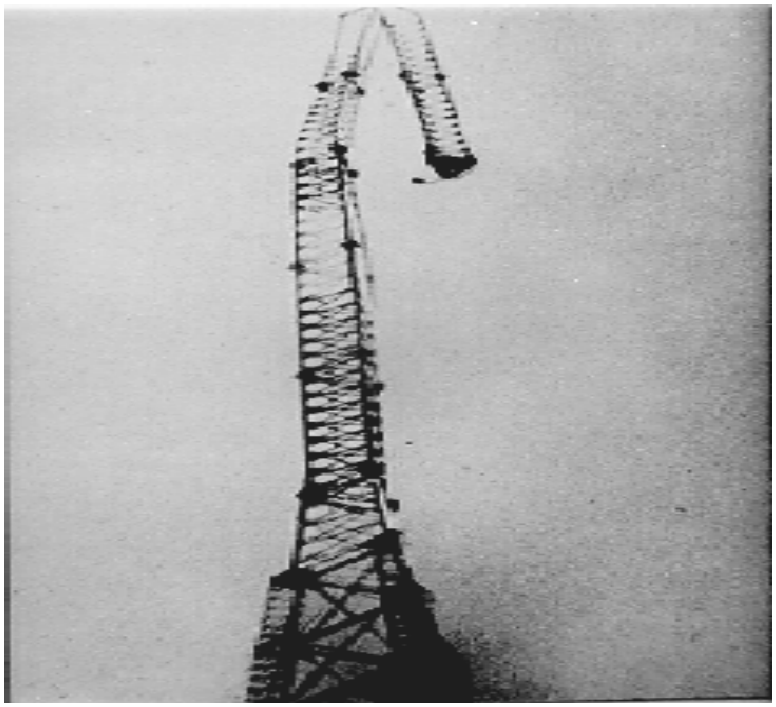
A Standard is required to provide the same basic level of public safety as the IBC. ASCE 7 Section 11.1.2 Scope, states that "Every structure, and portion thereof, including non-structural components, shall be designed and constructed to resist the effects of earthquake motions as prescribed by the seismic requirements of this standard. Certain nonbuilding structures, as described in Chapter 15, are also within the scope and shall be designed and constructed in accordance with the requirements of Chapter 15."

Chapter 15 gives specific requirements for design of communications towers. No exemptions are provided. TIA-222 is not listed as a referenced standard within the ICC Codes for seismic design, so seismic design requirements should be governed by ASCE 7 (222-F did not include a seismic design chapter)

TIA 222-G, because of exemptions to seismic design requirements, does not meet the minimum standard of care for design established by the IBC and ASCE 7.

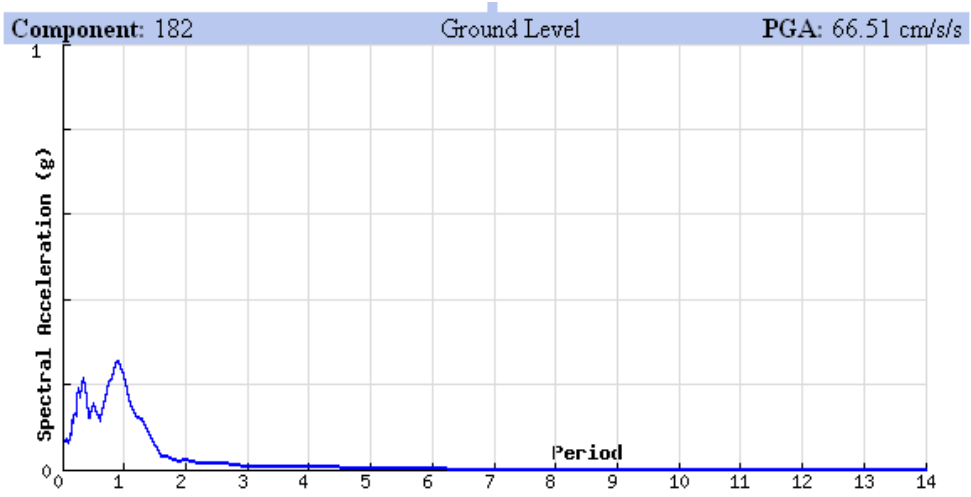
2) Historical Example

Areas that have been subjected to significant seismic ground motion recently have all affected towers that were designed to resist seismic forces Legacy Code. One must refer to historic examples to understand the effects of seismic forces on towers designed for wind only. One representative example is the KJR Radio Tower in Seattle, WA, that collapsed during the 1949 earthquake.



KJR Tower Collapse, 1949, Seattle, WA

It is instructive to look at the magnitude of earth motion at the tower location. While the 1949 earthquake was a significant earthquake, the KJR tower was located some distance away from the epicenter – about 48 miles. A ground motion record was recorded near the tower, at an army base on Marginal Way in Seattle:



The peak Spectral Acceleration was 0.13 g, as compared to a design level event of 1.05 g for Seattle.

TIA 222-G exempts seismic design of all towers located in areas where Ss is less than 1.0g. The ground motion that failed the KJR Radio Tower was equivalent to an Ss of 0.13g.

3) Analytical Example

TIA 222-G provides exemptions for seismic design for towers in areas where Ss < 1.0 and if the seismic base shear is less than ½ the wind base shear, regardless of seismicity.

Communications towers are typically flexible. Higher order dynamic effects usually dominate the structural fundamental response, usually necessitating some form of modal analysis. Because of the higher order modal effects, critical forces occur high up in the structure resulting in failures toward the top of the structure (as evinced with the KJR Radio tower failure).

Because of the higher order response of tower structures, exceptions based on base shear values are not warranted.

The following example using RISA Tower (provided by the City of Tacoma Building Department) elucidates some of the challenges associated with the existing code provision.

Assumptions:
Wind speed 85 mph, Exp B, Kzt=1.0
Essential Facility
Soil Class D

Analytical Results:

Site	Seismic Factor	Seismic Base Shear/ Wind Base Shear	Seismic Moment/ Wind Mom. (max)
Tacoma, WA	Ss=1.212 S1=0.418 Sds=0.822 Sd1=0.433	0.46	1.83
Site	Seismic Factors	Seismic Base Shear/ Wind Base Shear	Seismic Moment/ Wind Mom. (max)
Centralia, WA	Ss=1.000 S1=0.396 Sds=0.739 Sd1=0.424	0.44	1.65
Mid-western Oregon	Ss=0.600 S1=0.255 Sds=0.517 Sd1=0.321	0.33	1.16

For the tower located in Mid-western Oregon, having an Ss value of 0.6, (Ss<= 1.0), still produced seismic forces (in this case moments) 16% greater than wind loading. This maximum loading occurs near the top of the tower structure. The analysis also indicates that the ration between seismic base shear and wind base shear = 0.33, well below the exemption trigger of 0.50. However, seismic forces still produce higher forces than those developed from wind.

For a tower located in Centralia, WA (Ss=1.0), we see that seismic moments are approximately 65% greater than moments developed from wind forces.

Even in Tacoma, the seismic base shear/wind base shear < 0.50, which would have exempted this example tower from being designed for seismic forces (however, seismic forces generate moments that are 83% greater than moments resulting from wind forces).

Cost Impact: The code change proposal will not increase the cost of construction. The code change proposal will return cost of construction to levels commensurate with construction executed under designs compliant with the 2003 IBC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MOORE-HUSTON-G1-3108.1

G182–09/10
3109, Chapter 35

Proponent: Lorraine Ross, Intech Consulting Inc., representing Association of Pool and Spa Professionals

1. Revise as follows:

SECTION 3109
SWIMMING POOLS, SPAS AND AQUATIC RECREATIONAL FACILITIES
~~ENCLOSURES AND SAFETY DEVICES~~

3109.1 General. Swimming pools shall comply with the requirements of this section and other applicable sections of this code.

3109.1.1 Public swimming pools. Public swimming pools shall be designed and constructed in accordance with ANSI/NSPI -1.

3109.1.2 Public spas. Public spas shall be designed and constructed in accordance with ANSI/NSPI -2.

3109.1.3 Aquatic recreational facilities. Aquatic recreational facilities shall be designed and constructed in accordance with ANSI/IAF-9.

2. Add new definition as follows:

3109.2 Definitions. The following ~~word and term~~ words and terms shall, for the purposes of this section and used elsewhere in the code, have the meaning shown herein.

AQUATIC RECREATIONAL FACILITIES Facilities containing pools for free-form aquatic play and recreation such as waterparks, wave action pools; activity pools; catch pools; leisure rivers; vortex pools; interactive play attractions.

3. Revise as follows:

3109.3 Enclosures for public swimming pools. Public swimming pools shall be completely enclosed by a fence at least 4 feet (1290 mm) in height or a screen enclosure. Openings in the fence shall not *permit* the passage of a 4-inch-diameter (102 mm) sphere. The fence or screen enclosure shall be equipped with self-closing and self-latching gates.

3109.4 Enclosures for residential swimming pools. Residential swimming pools shall comply with Sections 3109.4.1 through 3109.4.3.

Exception: A swimming pool with a power safety cover or a spa with a safety cover comply with ASTM F 1346.

4. Add new standards to Chapter 35 as follows:

ANSI

ANSI/NSPI -1 2003	Public Pools Swimming Pools
ANSI/NSPI -2 1999	Public Spas
ANSI/IAF-9 2005	American National Standard for Aquatic Recreational Facilities

Reason: This code change proposal fills a gap in the International Building Code (IBC) regarding the design and construction of public swimming pools, public spas and aquatic recreational facilities by adding national consensus standards for these items. The ICC code development process recognizes the importance of credible construction and safety standards. Furthermore, these proposed standards were developed and are maintained through ANSI as required by ICC "Council Policy CP# 28-05 CODE DEVELOPMENT Section 3.6.3.2 The standard shall be developed and maintained through a consensus process such as ASTM or ANSI".

Revisions to Sections 3109.3 and 3109.4 clarify that these sections specifically address enclosures for swimming pools.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ANSI/NSPI-1, -2 and ANSI/IAF-9, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ROSS-G1-3109

G183–09/10
3202.2.1

Proponent: Katherine Bang, representing the City of Portland, Bureau of Development Services

Revise as follows:

3202.2.1. ~~Steps~~ Handrails. ~~Steps~~ Handrails shall not project more than 12 inches (305 mm). ~~and~~ Handrails shall be guarded by approved devices no less than 3 feet (914 mm) high~~,~~ or shall be located between columns or pilasters. The extension of handrails shall be in the same direction of the stair flights at stairways and the ramp runs at ramps.

Reason: The code already requires handrails, regardless of the number of steps, and the code also requires handrail extensions. If steps are permitted to project into the public right of way, it suggests that handrails would be permitted to extend 12" beyond that. I don't think it was the intention of the code to allow handrails to extend 24" into the public right of way so I have eliminated steps from this section and replaced it with handrails. The last sentence is the current language for handrail extensions in Section 1012.6.

Cost Impact: None - this is a clarification of code intent.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: BANG-G4-3202.2.1

G184–09/10
3302.1.1 (New) [IEBC [B] 1401.3.1 (New)]

Proponent: Randy Ohler, RA, Littlestown PA, representing City of Gaithersburg, MD.

Add new text as follows:

3302.1.1 (IEBC [B] 1401.3.1) Maintaining existing occupied areas while under construction. Separation between existing occupied and proposed work areas must be maintained during construction by means of temporary construction barriers. Areas under alteration or demolition are work zones. Work areas shall be separated from public occupied areas by a solid, noncombustible wall having a minimum one-hour fire resistance rating. In non-sprinklered buildings, the required separation shall be from floor to ceiling or from floor to the underside of the next deck above, floor or roof. In a sprinklered building, with an operational automatic sprinkler system in both the occupied space and the work zone, the barrier shall be a solid, limited combustible wall, at least 6 feet in height, with a limited combustible, non-solid dust/smoke barrier (such as fire retardant plastic sheeting) extending to the ceiling or from floor to the underside of the next deck above, floor or roof. In both cases, openings for workers to access construction areas shall be through self-closing gates, constructed of material similar or equal to the walls. Worker openings shall be posted with signage notifying occupants they are not permitted to enter the construction area. All required means of egress elements that serve the occupied area shall remain open, free from obstruction or construction related hazards, at the full required width, to a public way, in compliance with this code. Any altered or temporary egress route shall be approved by the building official prior to commencement of the construction activity.

Reason: Some jurisdictions do not adopt any code other than the single IBC and IRC. Current language in Section 3302.1 does not adequately define any specific requirements for safety, leaving it up to the building official to decide proper protection, but no specific concrete section for which to quote from when questioned by others. This new paragraph would help address the safety of persons within those jurisdictions, whom adopt the single code, subjected to any proposed construction activity while in an occupied building currently under construction. Construction activities can present additional fire and life safety risks that may include increased fuel loads, altered egress routes, hot work activities, and compromised fire suppression, detection and alarm systems. Fire potential during construction, alteration, or demolition operations is inherently high and can produce rapid fire spread and devastating results. Isolating the occupants from construction activities will allow additional time to escape from the consequences, and assist in compartmentalization of any fire or emergency event.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: OHLER-G1-3302.1.1

G185-09/10
IBC 3302.3 (New) [IEBC 1401.5 (New)], 3303.7 (New); IFC 1404.5

Proponent: Marshall Klein, PE, Marshall A. Klein & Associates, Inc., representing National Multi Housing Council (NMHC)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE IBC GENERAL CODE COMMITTEE.

PART I – IBC GENERAL

Add new text as follows:

3302.3 (IEBC [B] 1401.5) Fire safety during construction. Fire safety during construction shall comply with the applicable requirements of this code and the applicable provisions of Chapter 14 of the *International Fire Code*.

3303.7 Fire safety during demolition. Fire safety during demolition shall comply with the applicable requirements of this code and the applicable provisions of Chapter 14 of the *International Fire Code.*

PART II – IFC

Revise as follows:

IFC 1404.5 Fire watch. When required by the fire code official for building demolition, or building construction during working hours, that is hazardous in nature, qualified personnel shall be provided to serve as an on-site fire watch. Fire watch personnel shall be provided with at least one approved means for notification of the fire department and their sole duty shall be to perform constant patrols and watch for the occurrence of fire.

Reason: Intent of Part 1 of this code proposal is to correlate the IBC Section 3302, "Construction Safeguards", and the IFC requirements on fire safety during construction and demolition. IFC Chapter 14, "Fire Safety During Construction and Demolition" has all the fire safety requirements provided in one place for the fire safe operations during construction and demolition. The intent of Part II to IFC is to address the times when a fire watch is appropriate at a construction site during working hours and this code proposal will address such a need.

Cost Impact: The code change will not increase the cost of construction.

PART I – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KLEIN-G3 3302.3

G186–09/10
3306.10 (New), Chapter 35

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractor's National Association, Inc.

1. Add new text as follows:

3306.10 Occupant Protection During Construction. An indoor air quality (IAQ) management plan shall be developed and implemented for the construction and preoccupancy phases of the building as follows:

1. During construction, the recommended control measures of Chapter 3 of ANSI/SMACNA 008 shall be met or exceeded.
2. Stored on-site and installed absorptive materials shall be protected from moisture damage.
3. Temporary space conditioning equipment shall be installed during construction

2. Add new standard to Chapter 35 as follows:

SMACNA
ANSI/SMACNA 008-2008 IAQ Guidelines for Occupied Buildings Under Construction.

Reason: Currently there is insufficient guidance of how to address air quality in buildings that are under construction but partially or entirely occupied. This situation can occur both in existing buildings that are being renovated or new buildings where portions of the building that are completed are being occupied while construction continue on uncompleted portions.

Cost Impact: The code change proposal will increase the cost of construction. Minor costs may be incurred but if the movement of pollutants into occupied spaces is controlled well the savings in clean up costs and the benefit of full length equipment warranties to the owner will likely provide an overall cost savings.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/SMACNA 008, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-G1-3306.10 NEW

G187–09/10
3401.1 (IEBC [B] 301.1)

Proponent: Patrick Vandergriff, Vandergriff Code Consulting Services, representing Modular Building Institute

Revise as follows:

3401.1 (IEBC [B] 301.1) Scope. The provisions of this chapter shall control the alteration, repair, addition, ~~and~~ change of occupancy, and relocation of existing structures.

Exception: Existing bleachers, grandstands and folding and telescopic seating shall comply with ICC 300.

Reason: This recommended language picks up the code philosophy that the code applies to relocated structures and standardizes it throughout the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: VANDERGRIFF-G2-3401.1.doc

G188–09/10
3401.3 (IEBC [B] 301.1.1)

Proponent: Patrick Vandergriff, Vandergriff Code Consulting Services, representing Modular Building Institute

Revise as follows:

3401.3 (IEBC [B] 301.1.1) Compliance. Alterations, repairs, additions and changes of occupancy to, or relocation of, existing structures shall comply with the provisions for alterations, repairs, additions and changes of occupancy in the *International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Property Maintenance Code, International Private Sewage Disposal Code*, *International Residential Code* and NFPA 70.

Reason: This recommended language picks up the code philosophy that the code applies to relocated structures and standardizes it throughout the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: VANDERGRIFF-G5-3401.3.doc

G189–09/10
3401.3

Proponent: David Bonowitz, S.E., National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

Revise as follows:

3401.3 Compliance. Alterations, repairs, additions and changes of occupancy to existing structures shall comply with the provisions for alterations, repairs, additions and changes of occupancy, respectively, in the *International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Property Maintenance Code, International Private Sewage Disposal Code, International Residential Code* and NFPA 70. Where provisions of the other codes conflict with provisions of this Chapter, the provisions of this Chapter shall take precedence.

Reason: The proposal clarifies and confirms the intent of Section 3401.3.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

3401.4, 3401.4.3 (New), 3403.4.1, 3404.4.1, 3405.2.1, 3408.4; (IEBC [B] 301.2, 301.2.3 (New), 302.4.1, 303.4.1, 304.2.1, 307.4)

Proponent: David Bonowitz, David Bonowitz, S.E., National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Revise as follows:

3401.4 (IEBC [B] 301.2) Building materials and systems. Building materials and systems shall comply with the requirements of this section.

3401.4.1 (IEBC [B] 301.2.1) Existing materials. Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the building code official to be dangerous to life, health or safety. Where such conditions are determined to be dangerous to life, health or safety, they shall be mitigated or made safe.

3401.4.2 (IEBC [B] 301.2.2) New and replacement materials. Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for repairs and alterations, provided no hazard to life, health or property is created. Hazardous materials shall not be used where the code for new construction would not *permit* their use in buildings of similar occupancy, purpose and location.

3401.4.3 (IEBC [B] 301.2.3) Existing seismic force-resisting systems. Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0, and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.

2. Delete without substitution as follows:

~~**3403.4.1 (IEBC [B] 302.4.1)Seismic.** Seismic requirements for additions shall be in accordance with this section. Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.~~

~~**3404.4.1 (IEBC [B] 303.4.1) Seismic.** Seismic requirements for alterations shall be in accordance with this section. Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.~~

3. Revise as follows:

3405.2.1 (IEBC [B] 304.2.1) Evaluation. The building shall be evaluated by a *registered design professional*, and the evaluation findings shall be submitted to the code official. The evaluation shall establish whether the damaged building, if repaired to its predamage state, would comply with the provisions of this code for wind and earthquake loads. Evaluation for earthquake loads shall be required if the substantial structural damage was caused by or related to earthquake effects or if the building is in Seismic Design Category C, D, E or F.

Wind loads for this evaluation shall be those prescribed in Section 1609. Earthquake loads for this evaluation, if required, shall be permitted to be 75 percent of those prescribed in Section 1613. ~~Values of R, Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of an intermediate or special system.~~

3408.4 (IEBC [B] 307.4) Change of occupancy. When a change of occupancy results in a structure being reclassified to a higher occupancy category, the structure shall conform to the seismic requirements for a new structure of the higher occupancy category. ~~Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.~~

Exceptions:

1. Specific seismic detailing requirements of Section 1613 for a new structure shall not be required to be met where it can be shown that the level of performance and seismic safety is equivalent to that of a new structure. Such analysis shall consider the regularity, over strength, redundancy and ductility of the structure within the context of the existing and retrofit (if any) detailing provided.
2. When a change of use results in a structure being reclassified from Occupancy Category I or II to Occupancy Category III and the structure is located in a seismic map area where $S_{DS} < 0.33$, compliance with the seismic requirements of Section 1613 is not required.

Reason: This is an editorial change for clarity and simplicity. Currently the same provision appears in four separate locations. This proposal would simply replace those four occurrences with a single identical provision in an appropriate location at the top of the chapter. Specifically, the proposal does the following:

3401.4	Change the title and text of the section to suit the proposed new subsection 3401.4.3.
3401.4.3	Add this new subsection with text relocated from the other locations.
3403.4.1	Delete. New section 3401.4.3 will replace this provision.
3404.4.1	Delete. New section 3401.4.3 will replace this provision.
3405.2.1	Delete the sentence as shown. New section 3401.4.3 will replace this provision.
3408.4	Delete the sentence as shown. New section 3401.4.3 will replace this provision.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-GBONOWITZ-G9-3401.4.3.DOC

G191–09/10
3401.4.1 (IEBC [B] 301.2.1)

Proponent: David Bonowitz, S.E., National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3401.4.1 (IEBC [B] 301.2.1) Existing materials. Materials already in use in a building in conformance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the building code official to be ~~dangerous to life, health or safety~~ unsafe per Section 116. ~~Where such conditions are determined to be dangerous to life, health or safety, they shall be mitigated or made safe.~~

Reason: This proposal reflects the intent of approved proposal G203-07/08 and further improves the section by referencing a relevant section elsewhere.

The word "dangerous" should not be used, as it is a defined term in 2009 I-codes per G205-07/08, and its use here represents a substantive change contrary to the intent of this section. When this section was revised for 2009, the word "dangerous" was not used. Instead, the word "detrimental" was in proposal G203 because it was the already-approved term from approved with proposal S30-06/07. In the final editing process to assemble a variety of changes to Chapter 34 the word "dangerous," was substituted for 'detrimental', changing the meaning and scope of the provision.

The defined term that most closely matches the intent of the section (and probably what ICC intended with its substitution) is "unsafe" as used in section 116.

As for the last sentence, it also was not in the G203-07/08 proposal and should not have been added by ICC. While rational, it is not necessary because of the general requirement in section 116 for dealing with unsafe and dangerous conditions. Even if it is retained, it now uses the terms "dangerous" and "safe" improperly. The best correction is to simply delete the sentence.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The revision to Section 3401.4.1 (IEBC [B] 301.2.1) was Code Correlation Committee (CCC) Item CC08-IBC-27. The item was as follows:

3401.4.1 Existing materials. Materials already in use in a building in conformance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the code official to be ~~detrimental~~ dangerous to life, health or safety. Where such conditions are determined to be dangerous to life, health or safety, they shall be mitigated or made safe.

Reason: G205-07/08 makes changes to a 2006 section that has been revised by the reformatting of G203-07/08. This location is the best fit for the language. Note that G205-07/08 also adds a definition for dangerous to correlate with the IEBC as follows:

DANGEROUS. Any building or structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, partially collapsed, moved off its foundation, or lacks the support of ground necessary to support it.
2. There exists a significant risk of collapse, detachment, or dislodgment of any portion, member, appurtenance, or ornamentation of the building or structure under service loads.

CCC Committee Actions: Editorial and Approved

G192–09/10
3401.5 (New), 3405.1.1 (IEBC [B] 301.3 (New), 304.1.1)

Proponent: David Bonowitz, S.E., National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Add new text as follows:

3401.5 (IEBC [B] 301.3) Dangerous conditions. The building official shall have the authority to require the elimination of conditions deemed dangerous.

(Renumber subsequent sections in IBC)

2. Delete without substitution:

~~**3405.1.1 (IEBC 304.1.1) Dangerous conditions.** Regardless of the extent of structural or nonstructural damage, the building code official shall have the authority to require the elimination of conditions deemed dangerous.~~

Reason: This proposal relocates a provision from Section 3405.1.1 to Section 3401. This provision, dealing with the elimination of dangerous conditions, should be at the top of the chapter, as proposed, because it has broad applicability throughout Chapter 34, not just in the Repairs subsection.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

IBC 3402.1, 3405.2, 3405.2.1, 3405.2.2, 3405.2.3, 3405.3, 3405.4 (IEBC [B] 304.2, 304.2.1, 304.2.2, 304.2.3, 304.3, 304.4)

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Delete without substitution:

3402.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein.

~~**SUBSTANTIAL STRUCTURAL DAMAGE.** A condition where:~~

~~1. In any story, the vertical elements of the lateral force-resisting system have suffered damage such that the lateral load-carrying capacity of the structure in any horizontal direction has been reduced by more than 20 percent from its pre-damage condition; or~~
~~2. The capacity of any vertical gravity load-carrying component, or any group of such components, that supports more than 30 percent of the total area of the structure's floor(s) and roof(s) has been reduced more than 20 percent from its pre-damage condition and the remaining capacity of such affected elements, with respect to all dead and live loads, is less than 75 percent of that required by this code for new buildings of similar structure, purpose and location.~~

~~**3405.2 (IEBC [B] 304.2) Substantial structural damage to vertical elements of the lateral-force-resisting system.** A building that has sustained substantial structural damage to the vertical elements of its lateral-force-resisting system shall be evaluated and repaired in accordance with the applicable provisions of Sections 3405.2.1 through 3405.2.3.~~

~~**3405.2.1 (IEBC [B] 304.2.1) Evaluation.** The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the code official. The evaluation shall establish whether the damaged building, if repaired to its pre-damage state, would comply with the provisions of this code for wind and earthquake loads. Evaluation for earthquake loads shall be required if the substantial structural damage was caused by or related to earthquake effects or if the building is in Seismic Design Category C, D, E, or F.~~

~~Wind loads for this evaluation shall be those prescribed in Section 1609. Earthquake loads for this evaluation, if required, shall be permitted to be 75 percent of those prescribed in Section 1613. Values of R, Ω_0, and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of an intermediate or special system.~~

~~**3405.2.2 (IEBC [B] 304.2.2) Extent of repair for compliant buildings.** If the evaluation establishes compliance of the pre-damage building in accordance with Section 3405.2.1, then repairs shall be permitted that restore the building to its pre-damage state using materials and strengths that existed prior to the damage.~~

~~**3405.2.3 (IEBC [B] 304.2.3) Extent of repair for noncompliant buildings**. If the evaluation does not establish compliance of the pre-damage building in accordance with Section 3405.2.1, then the building shall be rehabilitated to comply with applicable provisions of this code for load combinations including wind or seismic loads. The wind loads for the repair shall be as required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be as required by the code in effect at the time of original construction or as required by this code, whichever are greater. Earthquake loads for this rehabilitation design shall be those required for the design of the pre-damage building, but not less than seventy-five percent of those prescribed in Section 1613. New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.~~

~~**3405.3 (IEBC [B] 304.3) Substantial structural damage to gravity load-carrying components**. Gravity load-carrying components that have sustained substantial structural damage shall be rehabilitated to comply with the applicable provisions of this code for dead and live loads. Snow loads shall be considered if the substantial structural damage was caused by or related to snow load effects. Existing gravity load-carrying structural elements shall be permitted to be designed for live loads approved prior to the damage. Nondamaged gravity load-carrying components that receive dead, live, or snow loads from rehabilitated components shall also be rehabilitated or shown to have the capacity to carry the design loads of the rehabilitation design. New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.~~

~~**3405.3.1 (IEBC [B] 304.3.1) Lateral force-resisting elements.** Regardless of the level of damage to vertical elements of the lateral force-resisting system, if substantial structural damage to gravity load-carrying components was caused primarily by wind or earthquake effects, then the building shall be evaluated in accordance with Section 3405.2.1 and, if noncompliant, rehabilitated in accordance with Section 3405.2.3.~~

~~**3405.4 (IEBC [B] 304.4) Less than substantial structural damage.** For damage less than substantial structural damage, repairs shall be allowed that restore the building to its pre-damage state using materials and strengths that existed prior to the damage. New structural members and connections used for this repair shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.~~

2. Add new text as follows:

3405.2 (IEBC [B] 304.2) Substantial damage. A building that has sustained substantial damage, as defined in Chapter 16, shall be brought into compliance with Chapter 16, except as modified as follows:

1. Existing gravity load-carrying structural elements shall be permitted to be designed for live loads approved prior to the damage.
2. The wind loads for the rehabilitation shall be as required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be as required by this code.
3. Earthquake loads for this rehabilitation design shall be those required for the design of the pre-damage building, but not less than seventy-five percent of those prescribed in Section 1613.
4. New structural members and connections required as part of the rehabilitation shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.

3405.3 (IEBC [B] 304.3) Less than substantial damage. For less than substantial damage, repairs shall be allowed that restore the building to its pre-damage state using materials and strengths that existed prior to the damage. New structural members and connections used for this repair shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.

3. Revise as follows:

3405.4 ~~3405.5~~ (IEBC [B] 304.4 ~~304.5~~) Flood hazard areas. For buildings and structures in flood hazard areas established in Section 1612.3, any repair that constitutes substantial improvement of the existing structure, as defined in Section 1612.2, shall comply with the flood design requirements for new construction, and all aspects of the existing structure shall be brought into compliance with the requirements for new construction for flood design.

For buildings and structures in flood hazard areas established in Section 1612.3, any repairs that do not constitute substantial improvement ~~or substantial damage~~ of the existing structure, as defined in Section 1612.2, are not required to comply with the flood design requirements for new construction.

Reason: This proposal is intended to reduce the dramatic and significant upgrade triggers that were introduced into Chapter 34 of the IBC during the last code cycle where none existed before. According to the *Handbook to the Uniform Building Code: An Illustrative Commentary,* upgrade triggers that add to the cost of repairs provide a disincentive to performing repairs and have been found to contribute to deterioration and net loss of existing building stock. Furthermore, requiring upgrades in order to repair a building adversely affects building owners, who must fund not only the repair but also the upgrade, which can cost many times the cost of repair-only. In a study of San Francisco's upgrade triggers, which are very similar to the language in G206 and to the language in the IEBC, the Structural Engineers Association of Northern California (SEAONC) concluded that "It is the opinion of the Study Group that these requirements probably encourage repair of damage without building permits and inspection controls to avoid the seismic trigger."

The specific wording of the upgrade triggers that were recently adopted into Chapter 34 has not really been tested in a high seismic zone; however, the City of Oakland, California adopted very similar upgrade triggers after the 1989 Loma Prieta earthquake. Although well intentioned, the Oakland upgrade triggers resulted in striking increases in the cost to repair (and upgrade) damaged buildings and had a number of unanticipated and unintended consequences: in a study of eight large buildings affected by the Oakland Earthquake Ordinance, costs to upgrade and repair averaged more than six times the cost of repair-only; engineers were unable to accurately determine "loss of structural capacity"; multi-year litigation ensued regarding two of the eight buildings studied; buildings were demolished (including a historic building); and the ordinance contributed to a major economic downturn, where damaged buildings remained vacant and unrepaired for more than a decade.

The current upgrade triggers relating to repairs in Chapter 34 are governed by the term "loss of structural capacity", but no commonly accepted definition of "loss of structural capacity" generally exists and can mean many different things to many different engineers. Linking upgrade requirements to an undefined term will necessarily increase the likelihood of disagreement between building owners, building officials, engineers, FEMA, and insurance companies; will result in difficulty in determining standard-of-care; and will dramatically increase structural engineering fees. In their study of San Francisco's upgrade triggers, which are similar to the language in Chapter 34, SEAONC concluded that "There is no consensus methodology to calculate loss of capacity. This uncertainty causes controversy and delays in critical post-earthquake situations. Experience in past earthquakes has shown that engineers can often get 'under' or 'over' any trigger set in this way as the situation demands."

There is also a lack of rationality in the current upgrade triggers. If upgrading costs only a small percentage of the repair-only scope, upgrading at a time when significant repairs are being performed makes economic sense. However, since there are no cut-offs, rational tests, or economic considerations for the additional upgrade costs, the upgrade triggers can result in wildly disproportionate upgrade costs when compared to repair-only, as shown in the Oakland Earthquake Damage Ordinance study.

Furthermore, there is no cause-and-effect relationship between the damage and the required seismic upgrades. The current language requires seismic upgrades of structures damaged by any and all causes if the substantial structural damage trigger is exceeded in moderate or high seismic zones, but this makes little if any sense. For example, assume that a building is significantly damaged by termites. Is it logical to require an engineering analysis, much less a seismic upgrade of the structure, in order to get a permit to repair the termite damage? Yet according to the current upgrade triggers, there is no necessary relationship between the cause of the damage and the requirement to seismically strengthen the damaged structure. The current structural upgrade triggers depart dramatically from the requirements to repair the electrical, mechanical, plumbing, accessibility, and fire protection systems. Given that damage to structures typically results from decay and deterioration, vehicle impact, and fires -- and typically not earthquake -- and given that fires kill many more people per year than earthquakes, the preoccupation of the current triggers with forcing seismic upgrades is completely unwarranted. In their study of upgrade triggers, SEAONC concluded, "Damage from fire is typically much different from earthquake damage and enforcement of the same repair standards seldom makes sense. Certainly fire damage is no indicator of basic seismic risk and there is no philosophical justification for triggering seismic upgrade on the same basis" and "Experience in San Francisco has shown these requirements often to be onerous and essentially unenforceable."

Even when considering earthquake hazards, the existing upgrade triggers fail the logic test: suppose that a large, design-level earthquake (the "big one") occurs in a major city. On the basis even of today's IBC design criteria, it is reasonable to expect that large numbers of buildings will experience significant damage as a result of the earthquake, even to buildings that conform or nearly conform to current code. Yet despite these damaged buildings all performing within the expectation of the current code, the proposed upgrade triggers would require further potentially massive and costly upgrades beyond the repairs already needed, because the proposed upgrade triggers do not permit any consideration of the intensity of the earthquake shaking responsible for the damage. Why would any engineer conclude that a city full of buildings that went through a major earthquake but protected life safety should be seismically upgraded? Why would any community want to mandate those upgrades? Why should the federal government, insurance companies, building owners, or taxpayers pay for those upgrades? Regarding this scenario, in their study of upgrade triggers, SEAONC concluded, "Requirements to upgrade such a large stock of buildings could put an undue economic burden on the private sector and delay regional recovery."

What this proposal does:

This proposal requires structural upgrades of existing structures only when the costs of repair-only are substantial; i.e. at least half the market value of the building. This brings the structural repair requirements into conformance with the provisions relating to repair of flood damage and helps ensure that the cost of the upgrades are not wildly disproportionate to the cost of repair-only. The proposal also helps ensure that trigger of wholesale structural upgrades is rare.

For copies of articles dealing with the problems with the Oakland Earthquake Ordinance or with the "substantial structural damage" trigger, please email me at gsearer@wje.com.

G194–09/10
3405.2, 3405.4 (IEBC [B] 304.2, 304.4)

Proponent: Gary J. Ehrlich, P.E., representing National Association of Home Builders

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3405.2 (IEBC [B] 304.2) Substantial structural damage to vertical elements of the lateral-force-resisting system. A building that has sustained substantial structural damage to the vertical elements of its lateral-force-resisting system shall be evaluated and repaired in accordance with the applicable provisions of Sections 3404.2.1 through 3404.2.3.

3405.2.1 (IEBC [B] 304.2.1) Evaluation. The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the building official. The evaluation shall establish whether the damaged building, if repaired to its pre-damage state, would comply with the provisions of this code for wind and earthquake loads. Evaluation for earthquake loads shall be required if the substantial structural damage was caused by or related to earthquake effects or if the building is in Seismic Design Category ~~C,~~ D, E, or F.

Wind loads for this evaluation shall be those prescribed in Section 1609. Earthquake loads for this evaluation, if required, shall be permitted to be seventy-five percent of those prescribed in Section 1613. Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0, and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, ~~an~~ intermediate or special system.

3405.2.2 (IEBC [B] 304.2.2) Extent of repair for compliant buildings. If the evaluation establishes compliance of the pre-damage building in accordance with Section 3404.2.1, then repairs shall be permitted that restore the building to its pre-damage state ~~using materials and strengths that existed prior to the damage.~~ , based on material properties and design strengths applicable at the time of original construction.

3405.2.3 (IEBC [B] 304.2.3) Extent of repair for noncompliant buildings. If the evaluation does not establish compliance of the pre-damage building in accordance with Section 3404.2.1, then the building shall be rehabilitated to comply with applicable provisions of this code for load combinations, including wind or seismic loads. The wind loads for the repair shall be as required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be as required ~~by the code in effect at the time of original construction or as required~~ by this code~~, whichever are greater~~. Earthquake loads for this rehabilitation design shall be those required for the design of the pre-damage building, but not less than seventy-five percent of those prescribed in Section 1613. New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.

3405.4 (IEBC [B] 304.4) Less than substantial structural damage. For damage less than substantial structural damage, repairs shall be allowed that restore the building to its pre-damage state ~~using materials and strengths that existed prior to the damage~~, based on material properties and design strengths applicable at the time of original construction. New structural members and connections used for this repair shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.

Reason: The purpose of this proposal is to clarify new language added to Chapter 34 for the evaluation of existing buildings. Despite concerns raised by NAHB and Gary Searer, as well as the IBC-Structural Committee, proposal G206-07/08 was approved at the Final Action Hearings in Minneapolis. We believe this language needs revising in order to be both enforceable by building officials and cost-effective to apply by engineers and building owners. The proposed changes are as follows:

1. Modify the seismic requirements of Section 3405.2.1. The current language can be taken to imply that only a lateral-force-resisting system which has been broken down into Ordinary, Detailed, Special and Intermediate classifications per ASCE 7 is permissible under these requirements. This would exclude light-frame shear walls, buckling-restrained braces, and a number of other systems. A similar issue with other language proposed for the IBC and the IEBC was fixed by public comments from the NCSEA Existing Building Committee. This proposal implements the change here.
2. The application of the seismic evaluation in Section 3405.2.1 is limited to SDC D through F. The original proposal includes SDC C, thus going beyond current FEMA requirements. The NCSEA EBC proposed this change as a public comment to address concerns raised by the IEBC code committee in Palm Springs in recommending the proposal for disapproval. However, they opted not to bring it forward in Minneapolis. The concerns have not gone away; in fact with the current economic climate they have gained in importance.
3. The language in Sections 3405.2 and 3405.4 is clarified. We have no idea what "using materials and strengths that existed prior to the damage" to repair a building means. However, designing a repair using the known material properties of the existing damaged element and using the codified design strengths at the time of construction makes sense from an economic standpoint. The proposed new language is consistent with similar requirements in Section 3404.2.3 for wind loads and Section 3404.3 for live loads.
4. The provision of Section 3405.2.3 specifying the wind loads to be used is revised. As building codes and design standards such as ASCE 7 are modified, some design requirements increase relative to previous editions, and some decrease. The reasons for these changes include improved wind speed modeling, new design provisions for low-rise buildings, better understanding of overall building performance, and new provisions to address specific concerns (such as overhangs, parapets, or rooftop equipment). If improved wind maps and more accurate design provisions give a reduction in wind loads under a new standard, it makes no sense to force a designer to use older provisions which may use obsolete science or implement conservative minimum design loads. This does not serve what should be the desire of all stakeholders to make the repair and rehabilitation of existing buildings economical for the owner, while at the same time doing what is needed to achieve life safety.

In summary, these changes will provide needed clarification for the building officials who must enforce this section, and enhance the ability of designers and building owners to provide cost-effective building repair and rehabilitation. In the current economic climate this is more critical than ever before. Furthermore, encouraging the repair and rehabilitation of existing structures rather than their demolition and replacement addresses "green building" concerns.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EHRLICH-G1-3405.2.1

G195–09/10
3405.2.3 (IEBC [B] 304.2.3)

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3405.2.3 (IEBC [B] 304.2.3) Extent of repair for noncompliant buildings. If the evaluation does not establish compliance of the pre-damage building in accordance with Section 3405.2.1, then the building shall be rehabilitated to comply with applicable provisions of this code for load combinations including wind or seismic loads. The wind loads for the repair shall be as required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be as required by the code in effect at the time of original construction or as required by this code, whichever are greater.

Where the damage was caused by earthquake and the Instrumental Intensity of the earthquake at the site of the building as determined using data from the United States Geological Survey was VII or greater, the seismic design forces for the repair shall be those required for the design of the pre-damage building. Where the damage was not caused by earthquake or if the damage caused by an earthquake with an Instrumental Intensity of less than VII at the site of the building, the seismic design forces for the rehabilitation shall be those required for the design of the pre-damage building, but not less than seventy-five percent of those prescribed in Section 1613.

~~Earthquake loads for this rehabilitation design shall be those required for the design of the pre-damage building, but not less than seventy-five percent of those prescribed in Section 1613.~~ New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.

Reason: This change is intended to make seismic upgrades of the lateral force resisting system after a large earthquake logical. Suppose that a large, design-level earthquake (the "big one") occurs in a major city. On the basis even of today's IBC design criteria, it is reasonable to expect that large numbers of buildings will experience significant damage as a result of the earthquake, even to buildings that conform or nearly conform to current code. Yet despite these damaged buildings all performing within the expectation of the current code, the proposed upgrade triggers would require further potentially massive and costly upgrades beyond the repairs already needed, because the proposed upgrade triggers do not permit any consideration of the intensity of the earthquake shaking responsible for the damage. Why would any engineer conclude that a city full of buildings that went through a major earthquake but protected life safety should be seismically upgraded? Why would any community want to mandate those upgrades? Why should the federal government, insurance companies, building owners, or taxpayers pay for those upgrades? Regarding this scenario, in their study of upgrade triggers, SEAONC concluded, "Requirements to upgrade such a large stock of buildings could put an undue economic burden on the private sector and delay regional recovery."

What this proposal does:
This proposal requires seismic upgrades of existing structures if the damage was not the result of earthquake activity or if the damage was caused by earthquake but was disproportionate to the intensity of the earthquake (i.e. significant structural damage when the Instrumental Intensity of the earthquake at the site was less than VII, as measured by the United States Geological Survey).

If an earthquake had a moderate or heavy damage potential at a particular site (Instrumental Intensity of VII or greater) and a structure at that site experienced substantial structural damage, this would not necessarily be unexpected even for a new building and seismic upgrade of the whole building to current code (or close to current code) would generally not be warranted. If, on the other hand, the Instrumental Intensity of say V or VI (very light or light potential damage) and significant structural damage occurred, then the structure may be overly susceptible to earthquake damage and strengthening is arguably prudent.

For copies of articles dealing with the problems with the Oakland Earthquake Ordinance or with the "substantial structural damage" trigger, please email me at gsearer@wje.com.

	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-G2-3405.2.3

G196–09/10
3405.5 (IEBC [B] 304.5)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3405.5 (IEBC [B] 304.5) Flood hazard areas. For buildings and structures in flood hazard areas established in Section 1612.3, any repair that constitutes substantial improvement of the *existing structure*, as defined in Section 1612.2, shall comply with the flood design requirements for new construction, and all aspects of the *existing structure* shall be brought into compliance with the requirements for new construction for flood design.

For buildings and structures in flood hazard areas established in Section 1612.3, any repairs that do not constitute substantial improvement ~~or substantial damage~~ of the *existing structure*, as defined in Section 1612.2, are not required to comply with the flood design requirements for new construction.

Reason: ICC added the words "or substantial damage" in the course of editing 2006 section 3403.1.2 per proposal G203-07/08. G203 split section 3403 into three sections, so the flood provision now occur three times, each slightly different. But the words "or substantial damage" need not be added. The Code Correlation Committee has removed the text from Sections 3403.2 and 3404.2.

- 3405.5. ICC should not have added the words "or substantial damage," which make no sense in this context. Repairs do not constitute damage.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The Code Correlation Committee editorially corrected Section 3405.5 of the IBC (304.5 IEBC) to read as follows:

3405.5 (IEBC [B] 304.5) Flood hazard areas. For buildings and structures in flood hazard areas established in Section 1612.3, any repair that constitutes substantial improvement of the *existing structure*, as defined in Section 1612.2, shall comply with the flood design requirements for new construction, and all aspects of the *existing structure* shall be brought into compliance with the requirements for new construction for flood design.

For buildings and structures in flood hazard areas established in Section 1612.3, any repairs that do not constitute substantial improvement or repair of substantial damage of the *existing structure*, as defined in Section 1612.2, are not required to comply with the flood design requirements for new construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: BONOWITZ-G2-3403.2.DOC

G197–09/10
3408.4 (IEBC [B] 307.4)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3408.4 (IEBC [B] 307.4) ~~Change of occupancy~~ Seismic (IEBC Structural). When a change of occupancy results in a structure being reclassified to a higher occupancy category, the structure shall conform to the seismic requirements for a new structure of the higher occupancy category. Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R,Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.

Exceptions:

1. Specific seismic detailing requirements of Section 1613 for a new structure shall not be required to be met where ~~it can be shown that the level of performance and seismic safety is~~ the seismic performance is shown to be equivalent to that of a new structure. ~~Such analysis~~ A demonstration of equivalence shall consider the regularity, overstrength, redundancy and ductility of the structure ~~within the context of the existing and retrofit (if any) detailing provided~~.
2. When a change of use results in a structure being reclassified from Occupancy Category I or II to Occupancy Category III and the structure is located in a seismic map area where $S_{DS} < 0.33$, compliance with the seismic requirements of Section 1613 is not required.

Reason: This proposal is editorial, for consistency. The Code Correlation Committee approved other editorial revisions to related provisions in Chapter 34 (Chapter 3 of the IEBC). This change to section 3408.4 has two elements:

1. The title change is an editorial revision proposed so that the name of the subsection is more appropriate and does not duplicate the name of the larger section.
2. The revision to the text of Exception 1 is an editorial clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: BONOWITZ-G1B-CHPT 34.doc

G198–09/10
3410.1 (IEBC [B] 309.1)

Proponent: Patrick Vandergriff, Vandergriff Code Consulting Services, representing Modular Building Institute

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE IBC GENERAL CODE COMMITTEE.

PART I – IBC GENERAL

Revise as follows:

3410.1 Conformance. Structures moved into or within the jurisdiction shall comply with the provisions of this code for new structures or Chapter 12 of the *International Existing Building Code*.

PART II – IEBC

Revise as follows:

[B] 309.1 Conformance. Structures moved into or within the jurisdiction shall comply with the *International Building Code* for new structures or with Chapter 12 of this code.

Reason: Several proposed code changes deal with the issues relative to modular construction in relation to the relocation of other structures or the use of temporary structures defined as tents, membrane structures and similar structures. The proposed language states compliance with the code and thereby requires compliance but allows for other language to be applied that may be specific to temporary and modular buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: These two code sections are typically linked such that changes to Sec. 3410.1 of the IBC would automatically change Sec. 309.1, but the nature of the proposed change, it was felt it would be clearer to show how each code would appear as the result of this proposal.

PART I – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IEBC

G199–09/10
3410.1(IEBC [B] 309.1), 3410.2 through 3410.8 (New)

Proponent: Patrick Vandergriff, Vandergriff Code Consulting Services, representing Modular Building Institute

1. Delete without substitution:

~~**3410.1 (IEBC [B] 309.1) Conformance.** Structures moved into or within the jurisdiction shall comply with the provisions of this code for new structures.~~

2. Add new text as follows:

3410.1 General. The relocation of any building to another location where the effects of wind, snow, flood or seismic provisions is greater than the percentage of increased loads allowed by this section relocated buildings shall comply with the requirements of Sections 3410.2 and Section 3410.8.

3410.2 Location on the lot. The building shall be located on the lot in accordance with the requirements of this code, or the *International Residential Code,* as applicable.

3410.3 Foundation. The foundation system of relocated buildings shall comply with Chapter 18, or the *International Residential Code* as applicable.

Exception: Foundations for modular structures are permitted to be of any materials allowed by the code and installed in accordance with either:

1. The manufacturers design requirements; or
2. An approved engineered design.

3410.3.1 Connection to the foundation. The connection of the relocated building to the foundation shall comply with Chapter 18, or the *International Residential Code,* as applicable.

3410.4 Wind loads. Buildings shall comply with Section 1609, or *International Residential Code* wind provisions, as applicable.

Exceptions:

1. Detached one- and two-family dwellings and Group U occupancies where wind loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than 5 percent.

3410.5 Seismic loads. Buildings shall comply with Section 1613, or *International Residential Code* seismic provisions, as applicable, to the new location.

Exceptions:

1. Structures in Seismic Design Categories A and B and detached one- and two-family dwellings in Seismic Design Categories A, B, and C where the seismic loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than 5 percent.

3410.6 Snow loads. Structures shall comply with Section 1608, or *International Residential Code* snow loads, as applicable, where snow loads at the new location are higher than those at the previous location.

Exception: Structural elements whose stress is not increased by more than 5 percent.

3410.7 Flood hazard areas. If relocated or moved into a *flood hazard area*, structures shall comply with Section 1612.

3410.8 Required inspection and repairs. The building official shall be authorized to inspect, or to require approved professionals to inspect at the expense of the owner, the various structural parts of a relocated building to verify that structural components and connections have not sustained structural damage. Any repairs required by the building official as a result of such inspection shall be made prior to the final approval.

Reason: This corresponds to several code change proposals establishing more clear definition and use issue with modular construction. This language provides the same language of the International Existing Building Code, Chapter 12 provisions dealing with the relocation of structures.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: This text is a copy of IEBC Chapter 12. If this proposal is approved, the Code Correlation Committee will decide if IEBC or IBC will control these provisions.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: VANDERGRIFF-G7-3410.1 NEW.doc

G200–09/10
3411.8.8 (IEBC [B] 310.8.8)

Proponent: Karen L. Braitmayer, FAIA, Studio Pacifica, Ltd, representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

Revise as follows:

3411.8.8 (IEBC [B] 310.8.8) Type A dwelling or sleeping units. Where more than 20 Group R-2 *dwelling* or sleeping units are being altered or added, the requirements for Section 1107 for Type A units apply only to the quantity of spaces being altered or added.

Reason: This proposal retains language that has been in the IBC since 2003. Loss of this language in the 2009 reduces the percentage of Type A housing stock required by IBC.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: The correlative text in the International Existing Building Code is in Sections 605.1.9 and 706.4.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BRAITMAYER-G1-3411.8.8

G201–09/10
3412.6.2.1(IEBC [B] 1301.6.2.1)

Proponent: Maureen Traxler representing City of Seattle, WA, Seattle Dept of Planning & Development

Revise as follows:

3412.6.2.1 (IEBC [B] 1301.6.2.1) Allowable area formula. The following formula shall be used in computing allowable area:

~~$A_a = (1 + I_f + I_s) \times A_t$~~

$A_a = \{A_t + [A_t \times I_f] + [A_t \times I_s]\}$ **(Equation 34-2) (IEBC Equation 13-3)**

where:

A_a = Allowable building area per story (square feet).
A_t = Tabular building area per story in accordance with Table 503 (square feet) of the *International Building Code*.
I_s = Area increase factor due to for sprinklers protection as calculated in accordance with (Section 506.3)
I_f = Area increase factor due to for frontage as calculated in accordance with (Section 506.2).

Reason: The purpose of the proposal is to coordinate the equations used to calculate area in the IEBC with the IBC. Both equations are intended to result in the same answer, and the definitions for the IEBC equation reference the IBC. However, the two codes use different characters, adding confusion.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAXLER-G1.1-1301.6.2.1

G202–09/10
3412.6.14, 3412.6.14.1 (IEBC [B] 1301.6.14, 1301.6.14.1)

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry, Inc. (NEII)

Revise as follows:

3412.6.14 (IEBC [B] 1301.6.14) Elevator control. Evaluate the passenger elevator equipment and controls that are available to the fire department to reach all occupied floors. Emergency recall and in-car operation of elevators ~~recall controls~~ shall be provided in accordance with the *International Fire Code*. Under the categories and occupancies in Table 3412.6.14, determine the appropriate value and enter that value into Table 3412.7 under Safety Parameter 3412.6.14, Elevator Control, for fire safety, means of egress and general safety. The values shall be zero for a single-story building.

TABLE 3412.6.14 (IEBC [B] TABLE 1301.6.14)
ELEVATOR CONTROL VALUES

ELEVATOR TRAVEL	CATAGORIES			
	a	b	c	d
Less than 25 feet of travel above or below the primary level of elevator access for emergency fire-fighting or rescue personnel	-2	0	0	+2
Travel of 25 feet or more above or below the primary level of elevator access for emergency fire-fighting or rescue personnel	-4	NP	0	+4

For SI: 1 foot = 304.8 mm.

3412.6.14.1 (IEBC [B] 1301.6.14.1) Categories. The categories for elevator controls are:

1. Category a — No elevator.
2. Category b—Any elevator without Phase I emergency recall operation and Phase II ~~recall~~ emergency in-car operation.
3. Category c — All elevators with Phase I emergency recall operation and Phase II ~~recall~~ emergency in-car operation as required by the *International Fire Code*.
4. Category d—All meet Category c; or Category b where permitted to be without Phase I emergency recall operation and Phase II emergency in-car operation ~~recall~~; and at least one elevator that complies with new construction requirements serves all occupied floors.

Reason: Correct terminology to correspond with Section 3003.2 and ASME A17.1/CSA B44.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: BLACK-G4-3412.6.14.doc

G203–09/10
3412.6.19 (IEBC [B] 1301.6.19)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., The American Institute of Architects

Revise as follows:

3412.6.19 (IEBC [B] 1301.6.19) Incidental accessory occupancy. Evaluate the protection of incidental accessory occupancies in accordance with Section 508.2.5. Do not include those occupancies where this code requires suppression throughout the buildings, including covered mall buildings, high-rise buildings, public garages and unlimited area buildings, or where Section 508.1 of the code allows the occupancies to be an accessory use, or mixed use separated or nonseparated. Assign the lowest score from Table 3412.6.19 for the building or floor area being evaluated and enter that value into Table 3412.7 under Safety Parameter 3412.6.19, Incidental Accessory Occupancy, for fire safety, *means of egress* and general safety. If there are no specific occupancy areas in the building or floor area being evaluated, the value shall be zero.

Reason: The application of the incidental accessory occupancy section of the code was not intended to be applied to accessory or mixed use conditions. This change will clarify that when considering a mixed use condition, Chapter 34 applies Section 3412.6 to such conditions, not Section 3412.6.19. Section 508.1 allows uses to be either considered an accessory use, mixed use or incidental accessory.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: COLLINS-G7-3412.6.19

G204–09/10
Appendix L (New); IRC Appendix L

Proponent: John England, MCO, England Enterprises Inc., representing Cities of Beaufort and Hardeeville, SC.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

Add new appendix as follows:

APPENDIX L
PERMIT FEES

(The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.)

L101.1 Schedule of permit fees. On buildings, structures, signs, pools, electrical, gas, mechanical and plumbing systems or alterations requiring a permit, a fee for each permit shall be paid as required, in accordance with Table L101.1.

TABLE L101.1
PERMIT FEE SCHEDULE

TOTAL VALUATION	FEE
$1 to $ 500	$50.00
$501 to $2,000	$50 for the first $500; plus $3 for each additional $ 100 or fraction thereof, to and including $2,000.
$2,001 to $40,000	$69 for the first $2,000; plus $11 for each additional $1,000 or fraction thereof, to and including $40,000
$40,001 to $100,000	$487 for the first $40,000; plus $9 for each additional $1,000 or fraction thereof, to and including $100,000
$100,001 to $500,000	$1,027 for the first $100,000; plus $7 for each additional $1,000 or fraction thereof, to and including $500,000
$500,001 to $1,000,000	$3,827 for the first $500,000; plus $5 for each additional $1,000 or fraction thereof, to and including $1,000,000
$1,000,001 to $5,000,000	$6,327 for the first $1,000,000; plus $3 for each additional $1,000 or fraction thereof, to and including $5,000,000
$5,000,001 and over	$18,327 for the first $ 5,000,000; plus $1 for each additional $1,000 or fraction thereof

L101.2 Plan review fees: One half of the require permit fee per Table L101.1, $75.00 minimum, shall be paid at time of submission of plans and specifications.

Exception: When no plan review is required by the building official, no fee shall be charged.

L101.3 Electrical, plumbing, mechanical, and gas permits fees. Electrical, plumbing, mechanical, and gas permit fees shall be based on Table L101.1.

Exception: Where the value of the electrical, plumbing, mechanical, and gas trades are included in the total construction cost as stated in Section 109.3, there shall be no additional charge for the permit.

L101.4 Re-inspection fees. $50.00 per trade per visit shall be charged to the contractor or homeowner. Re-inspection fees shall be paid in advance prior to the re-inspection. It shall be at the determination of the Building Official to waive re-inspection fees under certain condition.

L101.5 Building permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. If, in the opinion of the building official, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can show detailed estimates to meet the approval of the building official. Final building permit valuation shall be set by the building official. The BVD (Building Valuation Data) published every 6 months by ICC (International Code Council) shall be used in help determining the construction value.

L101.6 Work commencing before permit issuance. Any person who commences any work on a building, structure, electrical, gas, mechanical or plumbing system before obtaining the necessary permits the fees shall be doubled in accordance with Section 109.4

PART II – IRC BUILDING AND ENERGY

Add new appendix as follows:

APPENDIX L
PERMIT FEES

(The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.)

L101.1 Schedule of permit fees. On buildings, structures, signs, pools, electrical, gas, mechanical and plumbing systems or alterations requiring a permit, a fee for each permit shall be paid as required, in accordance with Table L101.1.

L101.2 Plan review fees:
One half of the require permit fee per Table L101.1, $75.00 minimum, shall be paid at time of submission of plans and specs.

Exception: When no plan review is required by the building official, no fee shall be charged.

L101.3 Electrical, plumbing, mechanical, and gas permits fees. Electrical, plumbing, mechanical, and gas permit fees shall be based on Table L101.1

Exception: Where the value of the electrical, plumbing, mechanical, and gas trades are included in the total construction cost as stated in sections R108.3, there shall be no additional charge for the permit.

L101.4 Re-inspection Fees. $50.00 per trade per visit shall be charged to the contractor or homeowner. Re-inspection fees shall be paid in advance prior to the re-inspection. It shall be at the determination of the Building Official to wave re-inspection fees under certain condition.

L101.5 Building permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. If, in the opinion of the building official, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can

show detailed estimates to meet the approval of the building official. Final building permit valuation shall be set by the building official. The BVD (Building Valuation Data) published every 6 months by ICC (International Code Council) shall be used in help determining the construction value.

L101.6 Work commencing before permit issuance. Any person who commences any work on a building, structure, electrical, gas, mechanical or plumbing system before obtaining the necessary permits the fees shall be doubled in accordance with Section R108.6.

TABLE L101.1
PERMIT FEE SCHEDULE

TOTAL VALUATION	FEE
$1 to $ 500	$50.00 ~~$24.00~~
$501 to $2,000	$50 ~~$24~~ for the first $500; plus $3 for each additional $ 100 or fraction thereof, to and including $2,000.
$2,001 to $40,000	$69 for the first $2,000; plus $11 for each additional $1,000 or fraction thereof, to and including $40,000
$40,001 to $100,000	$487 for the first $40,000; plus $9 for each additional $1,000 or fraction thereof, to and including $100,000
$100,001 to $500,000	$1,027 for the first $100,000; plus $7 for each additional $1,000 or fraction thereof, to and including $500,000
$500,001 to $1,000,000	$3,827 for the first $500,000; plus $5 for each additional $1,000 or fraction thereof, to and including $1,000,000
$1,000,001 to $5,000,000	$6,327 for the first $1,000,000; plus $3 for each additional $1,000 or fraction thereof, to and including $5,000,000
$5,000,001 and over	$18,327 for the first $ 5,000,000; plus $1 for each additional $1,000 or fraction thereof

Reason: Many new jurisdictions coming on line need some help in determining permit fees. The table was in the IRC and should also be in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC GENERAL

G205–09/10
Appendix L (New); Chapter 35

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers, representing American Society of Heating, Refrigeration, Heating & Air-Conditioning (ASHRAE)

Add new appendix as follows:

APPENDIX L
HIGH-PERFORMANCE GREEN BUILDINGS

The provisions in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION L101
GENERAL

L101.1 Scope. The provisions of this appendix are applicable to all buildings except those within the scope of the IRC and Group R-2, R-3 and R-4 buildings three stories or less in building height above grade plane.

L101.2 Intent. The intent of this appendix is to provide mandatory requirements for the construction, alteration and renovation of and addition to buildings within its scope. Such requirements are intended to conserve energy and natural resources and lessen, overall, the negative impact on the environment from buildings and the occupation and use of buildings.

L101.3 Requirements. The construction, alteration, and renovation of and addition to buildings shall comply with this code, ASHRAE/IES/USGBC 189.1, the *International Fire Code, International Wildland Urban Interface Code, International Zoning Code, International Mechanical Code, International Fuel Gas Code, International Plumbing Code, International Private Sewage Disposal code, International Property Maintenance Code, International Energy Conservation Code, International Existing Buildings Code* and NFPA 70.

SECTION L102 (Chapter 35)
REFERENCED STANDARDS

ASHRAE 189.1–200X	Standard for the Design of High-Performance, Green Buildings Except Low-Rise Residential Buildings

Reason: The purpose of this proposed change is to add a new appendix to the IBC.

The proposed appendix will reference ASHRAE/USGBC/IESNA Standard 189.1 for High-Performance Green Buildings Except Low-Rise Residential Buildings and this will provide jurisdictions with a newly-developed, consensus-based standard that can be used to develop local code requirements specific to green buildings or that could be applied to all buildings covered by the standard.

Green buildings are currently being designed and constructed nationwide using different programs guidelines, rating systems, and standards that are not develop using consensus-based methods. ASHRAE's standard was developed under the direction of ASHRAE members and in conjunction with representatives from other nationally-recognized organizations with experience and expertise in this field. This standard will provide a publicly-reviewed resource for local jurisdictions to use in the administration of green building construction. Several state and local jurisdictions already require, or are considering a requirement, that building projects within their jurisdiction be designed and constructed according to "green building" principles. In many cases, limited guidance is given as to the criteria to be used to determine if the building project meets the expectations. Standard 189.1 provides a publicly-reviewed resource for local jurisdictions to adopt and use in the administration of green building construction.

More information to come after the SPC 189.1 meeting on June 24, 2009.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 189.1, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FERGUSON-G1-APPENDIX L NEW

G206–09/10
Appendix L (New)

Proponent: Dwayne Garriss, Georgia State Fire Marshal's Office – Centers for Medicare and Medicaid Services Life Safety Administration

Add new appendix as follows:

APPENDIX L
CMS FORMS

The provisions contained in this appendix are not mandatory unless specifically adopted or referenced in an adopting ordinance.

SECTION L101
GENERAL

L101.1 Scope. The provisions of this appendix apply to all facilities where a provider or supplier has voluntarily applied for certification or accreditation in the Medicare/Medicaid program meeting the requirements of and approved by CMS as specified in 42 CFR. The survey forms in this appendix are used for all Life Safety Compliance surveys (initial and recertification) of facilities subject to Survey and Certification inspections for Medicare/Medicaid certification. This includes, but is not limited to, Skilled Nursing Facilities (SNFs), Nursing Facilities (NFs) whether freestanding, distinct parts, or dually certified, Intermediate Care Facilities for Mentally Retarded (ICFs/MR), Ambulatory Surgical Centers (ASC), inpatient Hospice facilities, Program for All inclusive Care for the Elderly (PACE) facilities, Critical Access Hospitals (CAH), Psychiatric and General Hospitals, including validation surveys of accredited facilities. These survey forms also apply to complaint investigations.

L101.2 Purpose. Certification is a recommendation made by the State survey agency on the compliance of providers and suppliers with the conditions of participation, requirements for Skilled Nursing Facilities (SNFs), Nursing Facilities (NFs) whether freestanding, distinct parts, or dually certified, Intermediate Care Facilities for Mentally Retarded (ICFs/MR), Ambulatory Surgical Centers (ASC), inpatient Hospice facilities, Program for All inclusive Care for the Elderly (PACE) facilities, Critical Access Hospitals (CAH), Psychiatric and General Hospitals. In order to safeguard the health, welfare and safety of individuals served within a facility, it is imperative that a facility not only attain substantial compliance in each area of identified deficiencies, but that it maintain/remain in continuous compliance. The provisions established in this appendix provided the minimum standards for new facilities which voluntarily seek certification or accreditation in the Medicare/Medicaid program. These minimum standards do exceed some of the minimum occupancy requirements established within the body of this Code which are necessary to meet the requirements of the Centers for Medicare and Medicaid Services as specified in 42 CFR.

SECTION L102
DEFINITIONS AND EQUIVALENCIES

L102.1 Definitions. For the purposes of this appendix chapter, the terms, phrases and words listed in this section and their derivatives shall have the indicated meanings.

ACCREDITED PROVIDER or SUPPLIER. A provider or supplier that has voluntarily applied for and has been accredited by a national accreditation program meeting the requirements of and approved by CMS in accordance with Section 488.5 or Section 488.6.

CMS. The Centers for Medicare & Medicaid Services. Formerly known as the Health Care Financing Administration (HCFA), which is the federal agency responsible for administering the Medicare and Medicaid programs.

L102.2 Construction type equivalencies. For the purposes of this appendix chapter, Table L102.2 shall be utilized for cross referencing the various construction types for use in the applicable CMS forms which are in the terms of the NFPA 220, entitled, "Standard on Types of Building Construction."

TABLE L102.2
CONVERSION TO NFPA 220 CONSTRUCTION TYPES USED ON CMS FORMS

Conversion Table to NFPA 220 Construction Types for CMS Forms										
NFPA 220	Type I 443	Type I 332	Type II 222	Type II 111	Type II 000	Type III 211	Type III 200	Type IV 2HH	Type V 111	Type V 000

9. Form CMS-2786Y entitled, "FIRE SAFETY SURVEY REPORT - 2000 LIFE SAFETY CODE Intermediate Care Facilities for the Mentally Retarded - SMALL FSES"

FIRE SAFETY SURVEY — 2000 LIFE SAFETY CODE

F-1 SIDE 1

Worksheet for Rating Residents

Complete one Worksheet for each resident.
Read Instruction Manual before filling out this form.
Base ratings on commonly observed examples of poor performance.

Resident's Name	Rater
Facility	Date

Write any explanatory remarks you may wish to make here:

Surveyor *(Signature)*	Title	Date
Surveyor ID		
Fire Authority Official *(Signature)*	Title	Date

COMPLETE OTHER SIDE FIRST

F-1 SIDE 2 Worksheet for Rating Residents

Read Instruction Manual before filling out this form.
Base ratings on commonly observed examples of poor performance.

F-1A Rating the Resident on the Risk Factors

Rating the resident on each of the factors below by checking the one circle in each risk factor that best describes the resident. For the first six factors, write the scores for the circles you checked in the appropriate score boxes in the far right column. For "response to fire drills," write the three checked scores in the large circles. Write the sum of the 3 scores in the large box on the right.

					SCORE BOXES
I. Risk of Resistance *(Check only one)*	Minimal Risk ○ score = 0	Risk of Mild Resistance ○ score = 6	Risk of Strong Resistance ○ score = 20		
II. Impaired Mobility *(Check only one)*	Self-Starting ○ score = 0	Slow ○ score = 3	Needs Limited Assistance ○ score = 6	Needs Full Assistance or Very Slow ○ score = 20	
III. Impaired Consciousness *(Check only one)*	No Significant Risk ○ score = 0	Partially Impaired ○ score = 6	Totally Impaired ○ score = 20		
IV. Need for Extra Help *(Check only one)*	Needs at Most One Staff ○ score = 0	Needs Limited Assistance from 2 Staff ○ score = 30	Needs Full Assistance from 2 Staff ○ score = 40		
V. Response to Instructions *(Check only one)*	Follows Instructions ○ score = 1	Requires Supervision ○ score = 3	Requires Considerable Attention/May Not Respond ○ score = 10		
VI. Waking Response to Alarm *(Check only one)*	Response Probable ○ score = 0	Response Not Probable ○ score = 6			
VII. Response to Fire Drills (Without Guidance or Advice from Staff)	Initiates and Completes Evacuation Promptly	Yes ○ score = 0	No ○ score = 8	○	
	Chooses and Completes Back-up Strategy	Yes ○ score = 0	No ○ score = 4	+ ○	
	Stays at Designated Location	Yes ○ score = 0	No ○ score = 6	+ ○	

SUM OF THESE THREE ITEMS

F-1B Finding the Resident's Overall Need For Assistance

Compare the numbers in the 7 score boxes you have filled in.
Take the one highest score from the score boxes and write it in this box:

	PART I - LSC REQUIREMENTS - Items in italics relate to the FSES							
	BUILDING CONSTRUCTION							
K11	If the building has a common wall with a nonconforming building, the common wall is a fire barrier having at least a two hour fire resistance rating constructed of materials as required for the addition. Communicating openings occur only in corridors and shall be protected by approved self-closing fire doors. 18.1.1.4.1, 18.1.1.4.2, 19.1.1.4.1, 19.1.1.4.2							
K12	2000 EXISTING Building construction type and height meets one of the following: 19.1.6.2, 19.1.6.3, 19.1.6.4, 19.3.5.1							
	1		I (443), I (332), II (222)	Any Height				
	2		II (111)	One story only (non-sprinklered).				
	3		II (111)	Not over three stories with complete automatic sprinkler system.				
	4		III (211)	Not over two stories with complete automatic sprinkler system.				
	5		V (111)					
	6		IV (2HH)					
	7		II (000)					
	8		III (200)	Not over one story with complete automatic sprinkler system.				
	9		V (000)					
	☐ Building contains fire treated wood. *Give a brief description, in REMARKS, of the construction, the number of stories, including basements, floors on which patients are located, location of smoke or fire barriers and dates of approval. Complete sketch or attach small floor plan of the building as appropriate.*

K12	2000 NEW Building construction type and height meets one of the following: 18.1.6.2, 18.1.6.3, 18.2.5.1							
	1		I (443), I (332), II (222)	Any height with complete automatic sprinkler system				
	2		II (111)	Not over three stories with complete automatic sprinkler system				
	3		III (211)	Not over one story with complete automatic sprinkler system.				
	4		V (111)					
	5		IV (2HH)					
	6		II (000)					
	7		III (200)	Not Permitted				
	8		V (000)					
	☐ Building contains fire treated wood. *Give a brief description, in REMARKS, of the construction, the number of stories, including basements, floors on which patients are located, location of smoke or fire barriers and dates of approval. Complete sketch or attach small floor plan of the building as appropriate.*							
K103	Interior walls and partitions in buildings of Type I or Type II construction shall be noncombustible or limited-combustible materials. 18.1.6.3, 19.1.6.3 (Indicate N/A for existing buildings using listed fire retardant treated wood studs within non-load bearing one-hour rated partitions.)							

Name of Facility | 2000 CODE

ID PREFIX		MET	NOT MET	N/A	REMARKS
	INTERIOR FINISH				
K14	2000 EXISTING Interior finish for corridors and exitways, including exposed interior surfaces of buildings such as fixed or movable walls, partitions, columns, and ceilings has a flame spread rating of Class A or Class B. 19.3.3.1, 19.3.3.2 *Indicate flame spread rating's*_____				
	2000 NEW Interior finish for corridors and exitways, including exposed interior surfaces of buildings such as fixed or movable walls, partitions, columns, and ceilings has a flame spread rating of Class A or Class B. Lower portion of corridor walls can be Class C. 18.3.3.1, 18.3.3.2 *Indicate flame spread rating's*_____				
K15	2000 EXISTING Interior finish for rooms and spaces not used for corridors or exitways, including exposed interior surfaces of buildings such as fixed or movable walls, partitions, columns, and ceilings has a flame spread rating of Class A or Class B. (In fully-sprinklered buildings, flame spread rating of Class A, Class B, or Class C may be continued in use within rooms separated in accordance with 19.3.6 from the access corridors.) 19.3.3.1, 19.3.3.2 *Indicate flame spread rating's*_____				
	2000 NEW Interior finish for rooms and spaces not used for corridors or exitways, including exposed interior surfaces of buildings such as fixed or movable walls, partitions, columns, and ceilings has a flame spread rating of Class A or Class B. (Rooms not over 4 persons in capacity may have a flame spread rating of Class A, Class B, or Class C). 18.3.3.1, 18.3.3.2. *Indicate flame spread rating's*_____				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K16	Newly installed interior floor finish complying with 10.2.7 shall be permitted in corridors and exits if Class I. 18.3.3.3, 19.3.3.3 (Indicate N/A for existing interior floor finish.) In smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.2, no interior floor finish requirements shall apply.				
	CORRIDOR WALLS AND DOORS				
K17	2000 EXISTING Corridors are separated from use areas by walls constructed with at least 1/2 hour fire resistance rating. In fully sprinklered smoke compartments, partitions are only required to resist the passage of smoke. In non-sprinklered buildings, walls properly extend above the ceiling. (Corridor walls may terminate at the underside of ceilings where specifically permitted by Code. Charting and clerical stations, waiting areas, dining rooms, and activity spaces may be open to corridor under certain conditions specified in the Code. Gift shops may be separated from corridors by non-fire rated walls if the gift shop is fully sprinklered.) 19.3.6.1, 19.3.6.2.1, 19.3.6.5 *If the walls have a fire resistance rating, give rating_____* *if the walls terminate at the underside of a ceiling, give a brief description in REMARKS, of the ceiling describing the ceiling throughout the floor area.*				
	2000 NEW Corridor walls shall form a barrier to limit the transfer of smoke. Such walls shall be permitted to terminate at the ceiling where the ceiling is constructed to limit the transfer of smoke. No fire resistance rating is required for the corridor walls. 18.3.6.1, 18.3.6.2, 18.3.6.5				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K18	2000 EXISTING Doors protecting corridor openings in other than required enclosures of vertical openings, exits, or hazardous areas shall be substantial doors, such as those constructed of 1¾ inch solid-bonded core wood, or capable of resisting fire for at least 20 minutes. Doors in fully sprinklered smoke compartments are only required to resist the passage of smoke. There is no impediment to the closing of the doors. Doors shall be provided with a means suitable for keeping the door closed. Dutch doors meeting 19.3.6.3.6 are permitted. 19.3.6.3 Roller latches are prohibited by CMS regulations in all health care facilities.				
	Show in REMARKS, details of doors, such as fire protection ratings, automatic closing devices, etc.				
	2000 New Doors protecting corridor openings shall be constructed to resist the passage of smoke. Doors shall be provided with positive latching hardware. Dutch doors meeting 18.3.6.3.6 are permitted. Roller latches shall be prohibited. 18.3.6.3				
	Show in REMARKS, details of doors, such as fire protection ratings, automatic closing devices, etc.				
K19	Vision panels in corridor walls or doors shall be fixed window assemblies in approved frames. (In fully sprinklered smoke compartments, there are no restrictions in the area and fire resistance of glass and frames.) 18.3.6.5, 18.3.6.3.1, 19.3.6.2.3, 19.3.6.3.8, 19.3.6.5				
K22	Access to exits shall be marked by approved, readily visible signs in all cases where the exit or way to reach exit is not readily apparent to the occupants. 7.10.1.4				
	VERTICAL OPENINGS				
K20	2000 EXISTING Stairways, elevator shafts, light and ventilation shafts, chutes, and other vertical openings between floors are enclosed with construction having a fire resistance rating of at least one hour. An atrium may be used in accordance with 8.2.5.6, 19.3.1.1				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	If all vertical openings are properly enclosed with construction providing at least a two hour fire resistance rating, also check this box. □				
	If enclosures are less than required, give a brief description and specific location in REMARKS.				
	2000 NEW Stairways, elevator shafts, light and ventilation shafts, chutes, and other vertical openings between floors are enclosed with construction having a fire resistance rating of at least two hours connecting four stories or more. (One hour for single story building and sprinklered buildings up to three stories in height.) 18.3.1.1. An atrium may be used in accordance with 8.2.2.3.5.				
	If enclosures are less than required, give a brief description and specific location in REMARKS.				
K21	Any door in an exit passageway, stairway enclosure, horizontal exit, smoke barrier or hazardous area enclosure shall be permitted to be held open only by devices arranged to automatically close all such doors by zone or throughout the facility upon activation of: □ (a) The required manual fire alarm system and □ (b) Local smoke detectors designed to detect smoke passing through the opening or a required smoke detection system and □ (c) The automatic sprinkler system, if installed 18.2.2.2.6, 19.2.2.2.6, 7.2.1.8.2				
	Describe method used in REMARKS				
K33	2000 EXISTING Exit components (such as stairways) are enclosed with construction having a fire resistance rating of at least one hour, are arranged to provide a continuous path of escape, and provide protection against fire or smoke from other parts of the building. 8.2.5.2, 19.3.1.1				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	If all vertical openings are properly enclosed with construction providing at least a two hour fire resistance rating, also check this box. ☐				
	If enclosures are less than required, give a brief description and specific location in REMARKS.				
	2000 NEW Exit components (such as stairways) in buildings four stories or more are enclosed with construction having a fire resistance rating of at least two hours, are arranged to provide a continuous path of escape, and provide a protection against fire and smoke from other parts of the building. In all buildings less than four stories, the enclosure is at least one hour. 8.2.5.4, 18.3.1.1				
	If enclosures are less than required, give a brief description and specific location in REMARKS.				
	SMOKE COMPARTMENTATION AND CONTROL				
K23	2000 EXISTING Smoke barriers shall be provided to form at least two smoke compartments on every sleeping room floor for more than 30 patients. 19.3.7.1, 19.3.7.2				
	2000 NEW Smoke barriers shall be provided to form at least two smoke compartments on every floor used by inpatients for sleeping or treatment, and on every floor with an occupant load of 50 or more persons, regardless of use. Smoke barriers shall also be provided on floors that are usable, but unoccupied. 18.3.7.1, 18.3.7.2				
K24	The smoke compartments shall not exceed 22,500 square feet and the travel distance to and from any point to reach a door in the required smoke barrier shall not exceed 200 feet. 18.3.7.1, 19.3.7.1				
	Detail in REMARKS zone dimensions including length of zones and dead end corridors.				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K25	2000 EXISTING Smoke barriers shall be constructed to provide at least a one-half hour fire resistance rating and constructed in accordance with 8.3. Smoke barriers shall be permitted to terminate at an atrium wall. Windows shall be protected by fire-rated glazing or by wired glass panels and steel frames. A minimum of two separate compartments shall be provided on each floor. Dampers shall not be required in duct penetrations of smoke barriers in fully ducted heating, ventilating, and air conditioning systems.19.3.7.3, 19.3.7.5, 19.1.6.3, 19.1.6.4				
	2000 NEW Smoke barriers shall be constructed to provide at least a one-hour fire resistance rating and constructed in accordance with 8.3. Smoke barriers shall be permitted to terminate at an atrium wall. Windows shall be protected by fire-rated glazing or by wired glass panels in approved frames. A minimum of two separate compartments shall be provided on each floor. Dampers shall not be required in duct penetrations of smoke barriers in fully ducted heating, ventilating, and air conditioning systems. 18.3.7.3, 18.3.7.5, 18.1.6.3				
K26	Space shall be provided on each side of smoke barriers to adequately accommodate those occupants served. 18.3.7.4, 19.3.7.4				
K27	2000 EXISTING Door openings in smoke barriers have at least a 20 minute fire protection rating or are at least 1¾ inch thick solid bonded core wood. Non-rated protective plates that do not exceed 48 inches from the bottom of the door are permitted. Horizontal sliding doors comply with 7.2.1.14. Doors shall be self-closing or automatic-closing in accordance with 19.2.2.2.6. Swinging doors are not required to swing with egress and positive latching is not required. 19.3.7.5, 19.3.7.6, 19.3.7.7				
	2000 NEW Door openings in smoke barriers have at least a 20 minute fire protection rating or are at least 1¾ inch thick solid bonded core wood. Non-rated protective plates that do not exceed 48 inches from the bottom of the door are permitted. Horizontal sliding doors comply with 7.2.1.14. Swinging doors shall be arranged so that each door swings in an opposite direction. Doors shall be self-closing and rabbets, bevels or astragals are required at the meeting edges. Positive latching is not required. 18.3.7.5, 18.3.7.6, 18.3.7.8				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K28	2000 EXISTING Door openings in smoke barriers shall provide a minimum clear width of 32 inches (81 cm) for swinging or horizontal doors. Vision panels are of fire-rated glazing or wired glass panels and steel frames. 19.3.7.5, 19.3.7.7				
	2000 NEW Door openings in smoke barriers are installed as swinging or horizontal doors shall provide a minimum clear width as follows: Provider Type / Swinging Doors / Horizontal Sliding Doors Hospitals and Nursing Facilities: 41.5 inches (105 cm) / 83 inches (211 cm) Psychiatric Hospitals and Limited Care Facilities: 32 inches (81 cm) / 64 inches (163 cm) Vision panels of fire-rated glazing or wired panels in approved frames are provided for each door. 18.3.7.5, 18.3.7.7				
K104	Penetrations of smoke barriers by ducts are protected in accordance with 8.3.6.				
	Describe any mechanical smoke control system in REMARKS.				
	HAZARDOUS AREA				
K29	2000 EXISTING One hour fire rated construction (with ¾ hour fire-rated doors) or an approved automatic fire extinguishing system in accordance with 8.4.1 and/or 19.3.5.4 protects hazardous areas. When the approved automatic fire extinguishing system option is used, the areas shall be separated from other spaces by smoke resisting partitions and doors. Doors shall be self-closing and non-rated or field-applied protective plates that do not exceed 48 inches from the bottom of the door are permitted. 19.3.2.1 Area / Automatic Sprinkler / Separation / N/A a. Boiler and Fuel-Fired Heater Rooms c. Laundries (greater than 100 sq feet) d. Repair Shops and Paint Shops e. Laboratories (if classified a Severe Hazard - see K31) f. Combustible Storage Rooms/Spaces (over 50 sq feet) g. Trash Collection Rooms i. Soiled Linen Rooms *Describe the floor and zone locations of hazardous areas that are deficient in REMARKS.*				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	2000 NEW Hazardous areas are protected in accordance with 8.4. The areas shall be enclosed with a one hour fire-rated barrier, with a ¾ hour fire-rated door, without windows (in accordance with 8.4). Doors shall be self-closing or automatic closing in accordance with 7.2.1.8. 18.3.2.1				

Area	Automatic Sprinkler	Separation	N/A
a. Boiler and Fuel-Fired Heater Rooms			
c. Laundries (greater than 100 sq feet)			
d. Repair, Maintenance and Paint Shops			
e. Laboratories (if classified a Severe Hazard - see K31)			
f. Combustible Storage Rooms/Spaces (over 50 and less than 100 sq feet)			
g. Trash Collection Rooms			
i. Soiled Linen Rooms			
m. Combustible Storage Rooms/Spaces (over 100 sq feet)			

Describe the floor and zone locations of hazardous areas that are deficient in REMARKS.

K30	Gift shops shall be protected as hazardous areas when used for storage or display of combustibles in quantities considered hazardous. Non-rated walls may separate gift shops that are not considered hazardous, have separate protected storage and that are completely sprinkled. Gift shops may be open to the corridor if they are not considered hazardous, have separate protected storage, are completely sprinklered and do not exceed 500 square °feet. 18.3.2.5, 19.3.2.5				

Area	Automatic Sprinkler	Separation	N/A
L. Gift Shop storing hazardous quantities of combustibles			

K211	2000 EXISTING Where Alcohol Based Hand Rub (ABHR) dispensers are installed: ❑ The corridor is at least 6 feet wide ❑ The maximum individual fluid dispenser capacity shall be 1.2 liters (2 liters in suites of rooms) ❑ The dispensers shall have a minimum spacing of 4 ft from each other ❑ Not more than 10 gallons are used in a single smoke compartment outside a storage cabinet. ❑ Dispensers are not installed over or adjacent to an ignition source. ❑ If the floor is carpeted, the building is fully sprinklered. 19.3.2.7, CFR 403.744, 418.100, 460.72, 482.41, 483.70, 483.623, 485.623				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K211	2000 NEW Where Alcohol Based Hand Rub (ABHR) dispensers are installed: ❑ The corridor is at least 6 feet wide ❑ The maximum individual fluid dispenser capacity shall be 1.2 liters (2 liters in suites of rooms) ❑ The dispensers shall have a minimum spacing of 4 ft from each other ❑ Not more than 10 gallons are used in a single smoke compartment outside a storage cabinet. ❑ Dispensers are not installed over or adjacent to an ignition source. ❑ If the floor is carpeted, the building is fully sprinklered. 18.3.2.7, CFR 403.744, 418.100, 460.72, 482.41, 483.70, 483.623, 485.623				
	EXIT AND EXIT ACCESS				
K32	Not less than two exits, remote from each other, are provided for each floor or fire section of the building. Only one of these two exits may be a horizontal exit. 18.2.4.1, 18.2.4.2, 19.2.4.1, 19.2.4.2				
	EXITS AND EGRESS				
K34	Stairways and smokeproof towers used as exits are in accordance with 7.2. 18.2.2.4, 19.2.2.3, 19.2.2.4				
K35	Capacity of exits in number of persons per unit of exit width is in accordance with 7.3. 18.2.3.1, 19.2.3.1				
K36	Travel distance (exit access) to exits are in accordance with 7.6. 18.2.6, 19.2.6				
K37	2000 EXISTING Existing dead-end corridors shall be permitted to be continued to be used if it is impractical and unfeasible to alter them so that exists are accessible in not less than two different directions from all points in aisles, passageways, and corridors. 19.2.5.10				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	2000 NEW Every exit and exit access shall be arranged so that no corridor, aisle or passageway has a pocket or dead-end exceeding 30 feet. 18.2.5.10				
K38	Exit access is so arranged that exits are readily accessible at all times in accordance with 7.1. 18.2.1, 19.2.1				
K39	2000 EXISTING Width of aisles or corridors (clear and unobstructed) serving as exit access shall be at least 4 feet. 19.2.3.3				
	2000 NEW Width of aisles or corridors (clear and unobstructed) serving as exit access in hospitals and nursing homes shall be at least 8 feet. In limited care facility and psychiatric hospitals, width of aisles or corridors shall be at least 6 feet. 18.2.3.3, 18.2.3.4				
K40	2000 EXISTING Exit access doors and exit doors used by health care occupants are of the swinging type and are at least 32 inches in clear width. 19.2.3.5				
	2000 NEW Exit access doors and exit doors used by health care occupants are of the swinging type, with openings of at least 41.5 inches wide. Doors in exit stairway enclosures shall be no less than 32 inches in clear width. In ICFs/MR, doors are at least 32 inches wide. 18.2.3.5				
K41	All sleeping rooms have a door leading to a corridor providing access to an exit or have a door leading directly to grade. One room may intervene in accordance with 18.2.5.1, 19.2.5.1, 18.2.5.9, 19.2.5.9 *If doors lead directly to grade from each room, check this box.* ☐				
K42	Any room or suite of rooms of more than 1,000 sq. ft. has at least 2 exit access doors remote from each other. 18.2.5.2, 19.2.5.2				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K43	Patient room doors are arranged such that the patients can open the door from inside without using a key.				
	Special door locking arrangements are permitted in facilities. 18.2.2.2.4, 18.2.2.2.5 *If door locking arrangement without delay egress is used indicate in REMARKS* 18.2.2.2.2, 19.2.2.2.2				
K44	Horizontal exits, if used, are in accordance with 7.2.4. 18.2.2.5, 19.2.2.5				
	ILLUMINATION AND EMERGENCY POWER				
K45	Illumination of means of egress, including exit discharge, is arranged so that failure of any single lighting fixture (bulb) will not leave the area in darkness. 18.2.8, 19.2.8, 7.8				
K46	Emergency lighting of at least 1½ hour duration is provided in accordance with 7.9. 18.2.9.1, 19.2.9.1.				
K47	2000 EXISTING Exit and directional signs are displayed in accordance with 7.10 with continuous illumination also served by the emergency lighting system. 19.2.10.1 (Indicate N/A in one story buildings with less than 30 occupants where the line of exit travel is obvious.)				
	2000 NEW Exit and directional signs are displayed with continuous illumination also served by the emergency lighting, system in accordance with 7.10. 18.2.10.1				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K105	2000 NEW (INDICATE N/A FOR EXISTING) Buildings equipped with or requiring the use of life support systems (electro-mechanical or inhalation anesthetics) have illumination of means of egress, emergency lighting equipment, exit, and directional signs supplied by the Life Safety Branch of the electrical system described in NFPA 99. 18.2.9.2., 18.2.10.2, 18.5.1.1, 18.5.1.2 (Indicate N/A if life support equipment is for emergency purposes only).				
K107	2000 NEW (INDICATE N/A FOR EXISTING) Required alarm and detection systems are provided with an alternative power supply in accordance with NFPA 72. 9.6.1, 18.3.4.1.3				
K108	2000 NEW (INDICATE N/A FOR EXISTING) Alarms, emergency communication systems, and illumination of generator set locations are in accordance with NFPA 70. 9.1.2				
	EMERGENCY PLAN AND FIRE DRILLS				
K48	There is a written plan for the protection of all patients and for their evacuation in the event of an emergency. 18.7.1.1, 19.7.1.1				
K50	Fire drills are held at unexpected times under varying conditions, at least quarterly on each shift. The staff is familiar with procedures and is aware that drills are part of established routine. Responsibility for planning and conducting drills is assigned only to competent persons who are qualified to exercise leadership. Where drills are conducted between 9:00 PM and 6:00 AM a coded announcement may be used instead of audible alarms. 18.7.1.2, 19.7.1.2				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	FIRE ALARM SYSTEMS				
K51	2000 EXISTING A fire alarm system with approved component, devices or equipment installed according to NFPA 72, National Fire Alarm Code to provide effective warning of fire in any part of the building. Activation of the complete fire alarm system shall be by manual fire alarm initiation, automatic detection or extinguishing system operation. Pull stations in patient sleeping areas, may be omitted provided that manual pull stations are within 200 ft of nurse's stations. Pull stations are located in the path of egress. Electronic or written records of tests shall be available. A reliable second source of power must be provided. Fire alarm systems shall be in accordance with NFPA72, and records of maintenance kept readily available. There shall be annunciation of the fire alarm system to an approved central station. 19.3.4, 9.6				
	2000 NEW A fire alarm system with approved component, devices or equipment installed according to NFPA 72, to provide effective warning of fire in any part of the building. Activation of the complete fire alarm system shall be by manual fire alarm initiation, automatic detection or extinguishing system operation. Pull stations are located in the path of egress. Electronic or written records of tests shall be available. A reliable second source of power must be provided. Fire alarm systems shall be maintained in accordance with NFPA72, and records of maintenance kept readily available. There shall be remote annunciation of the fire alarm system to an approved central station. 18.3.4, 9.6				
K52	A fire alarm system required for life safety shall be installed, tested, and maintained in accordance with NFPA 70 National Electrical Code and NFPA 72. The system shall have an approved maintenance and testing program complying with applicable requirement of NFPA 70 and 72. 9.6.1.4				
K155	Where a required fire alarm system is out of service for more than 4 hours in a 24-hour period, the authority having jurisdiction shall be notified, and the building shall be evacuated or an approved fire watch shall be provided for all parties left unprotected by the shutdown until the fire alarm system has been returned to service. 9.6.1.8				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K53	2000 EXISTING (INDICATE N/A FOR HOSPITAL AND FULLY SPRINKLERED NURSING HOMES) In an existing nursing home, not fully sprinklered, the resident sleeping rooms and public areas (dining rooms, activity rooms, resident meeting rooms, etc) are to be equipped with single station battery-operated smoke detectors. There will be a testing, maintenance and battery replacement program to ensure proper operation. CFR 483.70				
	2000 NEW (NURSING HOME AND EXISTING LIMITED CARE FACILITIES) An automatic smoke detection system is installed in all corridors. (As an alternative to the corridor smoke detection system on patient sleeping room floors, smoke detectors may be installed in each patient sleeping room and at smoke barrier or horizontal exit doors in the corridor.) Such detectors are electrically interconnected to the fire alarm system. 18.3.4.5.3				
K109	2000 EXISTING LIMITED CARE FACILITIES (INDICATE N/A FOR HOSPITALS OR NURSING HOMES) An automatic smoke detection system is installed in all corridors with detector spacing no further apart than 30 ft on center in accordance with NFPA 72. (As an alternative to the corridor smoke detection system on patient sleeping room floors, smoke detectors may be installed in each patient sleeping room and at smoke barrier or horizontal exit doors in the corridors.) Such detectors are electrically interconnected to the fire alarm system. 19.3.4.5.1 Smoke Detection System ❑ Corridors ❑ Rooms ❑ Bath				
K54	All required smoke detectors, including those activating door hold-open devices, are approved, maintained, inspected and tested in accordance with the manufacturer's specifications. 9.6.1.3				
	Give a brief description, in REMARKS of any smoke detection system which may be installed				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K55	2000 EXISTING Every patient sleeping room shall have an outside window or outside door. Except for newborn nurseries and rooms intended for occupancy for less than 24 hours. 19.3.8				
	2000 NEW Every patient sleeping room shall have an outside window or outside door. The allowable sill height shall not exceed 36 inches (91 cm) above the floor. Windows are not required for recovery rooms, newborn nurseries, emergency rooms, and similar rooms intended for occupancy for less than 24 hours. Window sill height for limited care facilities shall not exceed 44 inches (112 cm) above the floor. 18.3.8				
	AUTOMATIC SPRINKLER SYSTEMS				
K56	2000 EXISTING Where required by section 19.1.6, Health care facilities shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with section 9.7. Required sprinkler systems are equipped with water flow and tamper switches which are electrically interconnected to the building fire alarm. 19.3.5, NPFA 13				
	2000 NEW There is an automatic sprinkler system installed in accordance with NFPA13, Standard for the Installation of Sprinkler Systems, with approved components, device and equipment, to provide complete coverage of all portions of the facility. Systems are equipped with waterflow and tamper switches, which are connected to the fire alarm system. 18.3.5.				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K154	Where a required automatic sprinkler system is out of service for more than 4 hours in a 24-hour period, the authority having jurisdiction shall be notified, and the building shall be evacuated or an approved fire watch system be provided for all parties left unprotected by the shutdown until the sprinkler system has been returned to service. 9.7.6.1.				
	A. Date sprinkler system last checked and necessary maintenance provided. _____				
	B. Show who provided the service. _____				
	C. Note the source of water supply for the automatic sprinkler system. _____				
	(Provide, in REMARKS, information on coverage for any non-required or partial automatic sprinkler system.)				
K60	Initiation of the required fire alarm systems shall be by manual means in accordance with 9.6.2 and by means of any required sprinkler system waterflow alarms, detection devices, or detection systems. 18.3.4.2, 19.3.4.2, 9.6.2.1				
K61	Required automatic sprinkler systems shall have valves supervised so that at least a local alarm will sound when the valves are closed. 9.7.2.1, NFPA 72				
K62	Automatic sprinkler systems are continuously maintained in reliable operating condition and are inspected and tested periodically. 18.7.6, 19.7.6, 4.6.12, NFPA 13, NFPA 25, 9.7.5				
K63	Required automatic sprinkler systems have an adequate and reliable water supply which provides continuous and automatic pressure. 9.7.1.1, NFPA 13				
K64	Portable fire extinguishers shall be provided in all health care occupancies in accordance with 9.7.4.1, NFPA 10. 18.3.5.6, 19.3.5.6				

Name of Facility 2000 CODE

ID PREFIX		MET	NOT MET	N/A	REMARKS
	SMOKING REGULATIONS				
K66	Smoking regulations shall be adopted and shall include not less than the following provisions: 18.7.4, 19.7.4 ☐ (1) Smoking shall be prohibited in any room, ward, or compartment where flammable liquids, combustible gases, or oxygen is used or stored in any other hazardous location, and such area shall be posted with signs that read NO SMOKING or shall be posted with the international symbol for no smoking. ☐ (2) Smoking by patients classified as not responsible shall be prohibited, except when under direct supervision. ☐ (3) Ashtrays of noncombustible material and safe design shall be provided in all areas where smoking is permitted. ☐ (4) Metal containers with self-closing cover devices into which ashtrays can be emptied shall be readily available to all areas where smoking is permitted.				
	BUILDING SERVICE EQUIPMENT				
K67	Heating, ventilating, and air conditioning shall comply with 9.2 and shall be installed in accordance with the manufacturer's specifications. 18.5.2.1, 19.5.2.1, 9.2, NFPA 90A, 18.5.2.2, 19.5.2.2				
K68	Combustion and ventilation air for boiler, incinerator and heater rooms is taken from and discharged to the outside air. 18.5.2.2, 19.5.2.2.				
K69	Cooking facilities shall be protected in accordance with 9.2.3. 18.3.2.6, 19.3.2.6, NFPA 96				
K70	Portable space heating devices shall be prohibited in all health care occupancies. Except it shall be permitted to be used in non-sleeping staff and employee areas where the heating elements of such devices do not exceed 212°F (100°C). 18.7.8, 19.7.8

ID PREFIX		MET	NOT MET	N/A	REMARKS
K71	Rubbish Chutes, Incinerators and Laundry Chutes. 18.5.4, 19.5.4, 9.5, 8.4, NFPA 82				
	☐ (1) Any existing linen and trash chute, including pneumatic rubbish and linen systems, that opens directly onto any corridor shall be sealed by fire resistive construction to prevent further use or shall be provided with a fire door assembly having a fire protection rating of 1 hour. All new chutes shall comply with 9.5.				
	☐ (2) Any rubbish chute or linen chute, including pneumatic rubbish and linen systems, shall be provided with automatic extinguishing protection in accordance with 9.7.				
	☐ (3) Any trash chute shall discharge into a trash collection room used for no other purpose and protected in accordance with 8.4.				
	☐ (4) Existing flue-fed incinerators shall be sealed by fire resistive construction to prevent further use.				
K160	2000 EXISTING All existing elevators, having a travel distance of 25 ft or more above or below the level that best serves the needs of emergency personnel for fire fighting purposes, conform with Firefighter's Service Requirements of ASME/ ANSI A17.3, *Safety Code for Existing Elevators and Escalators.* 19.5.3, 9.4.3.2				
	ANSI A17.1 states 25 ft or more above or below the designated level and defines "designated level" as the main floor or other floor level that best serves the needs of emergency personnel for fire fighting purposes or rescue purposes identified by the building code or fire authority. Depending on floor slab thickness and heights this would generally apply to a three-story building, and almost certainly to a four-story building.				
	Includes firefighters service phase I key recall and smoke detector automatic recall, firefighters service phase II emergency in-car key operation, machine room smoke detectors, and elevator lobby smoke detectors. 19.5.3, 9.4.3.2				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K161	2000 EXISTING All existing escalators, dumbwaiters, and moving walks conform to the requirements of ASME/ ANSI A17.3, *Safety Code for Existing Elevators and Escalators*. 19.5.3, 9.4.2.2 Includes escalator emergency stop buttons and automatic skirt obstruction stop. For power dumbwaiters includes hoistway door locking to keep doors closed except for floor where car is being loaded or unloaded.				
	2000 NEW All elevators, escalators, and conveyors comply with ASME/ ANSI A17.1, *Safety Code for Elevators and Escalators* (Includes car emergency signaling, firefighters service phase I key and smoke detector automatic recall, firefighters service phase II emergency in-car operation, machine room smoke detectors, elevator lobby smoke detectors). 18.5.3, 9.4				
	FURNISHINGS AND DECORATIONS				
K72	Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency. No furnishings, decorations, or other objects shall obstruct exits, access thereto, egress there from, or visibility thereof shall be in accordance with 7.1.10				
K73	No furnishings or decorations of highly flammable character shall be used. 18.7.5.2, 18.7.5.3, 18.7.5.4, 19.7.5.2, 19.7.5.3, 19.7.5.4				
K74	Draperies, curtains, including cubicle curtains, and other loosely hanging fabrics and films serving as furnishings or decorations in health care occupancies shall be in accordance with provisions of 10.3.1 and NFPA 13 Standard for the Installation of Sprinkler Systems. Except shower curtains shall be in accordance with NFPA 701. ☐ Newly introduced upholstered furniture shall meet the criteria specified when tested in accordance with the methods cited in 10.3.2 (2) and 10.3.1. 18.3.5.3 and NFPA 13 ☐ Newly introduced mattresses shall meet the criteria specified when tested in accordance with the method cited in 10.3.2 (3) and 10.3.4. 18.7.5.3, 19.7.5.3 Newly introduced upholstered furniture and mattresses means purchased since March, 2003.				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K75	Soiled linen or trash collection receptacles shall not exceed 32 gal (121 L) in capacity. The average density of container capacity in a room or space shall not exceed .5 gal/ft² (20.4 L/m²). A capacity of 32 gal (121 L) shall not be exceeded within any 64-ft² (5.9-m²) area. Mobile soiled linen or trash collection receptacles with capacities greater than 32 gal (121 L) shall be located in a room protected as a hazardous area when not attended. 18.7.5.5, 19.7.5.5				
	LABORATORIES				
K31	Laboratories employing quantities of flammable, combustible, or hazardous materials that are considered a severe hazard shall be protected in accordance with NFPA 99. (Laboratories that are not considered to be severe hazard shall meet the provision of K29.) Laboratories in Health Care occupancies and medical and dental offices shall be in accordance with NFPA 99, Standard for Health Care Facilities 10.5.1.				
K136	Procedures for laboratory emergencies shall be developed. Such procedures shall include alarm actuation, evacuation, and equipment shutdown procedures, and provisions for control of emergencies that could occur in the laboratory, including specific detailed plans for control operations by an emergency control group within the organization or a public fire department in accordance with NFPA 99, 10.2.1.3.1, 18.3.2.2., 19.3.2.1				
K131	Emergency procedures shall be established for controlling chemical spills in accordance with NFPA 99. 10.2.1.3.2				
K132	Continuing safety education and supervision shall be provided, incidents shall be reviewed monthly, and procedures reviewed annually shall be in accordance with NFPA 99. 10.2.1.4.2				
K133	Fume hoods shall be in accordance with NFPA 99. 5.4.3, 5.6.2				
K134	Emergency Shower: Where the eyes or body of any person can be exposed to injurious corrosive materials, suitable fixed facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use. Fixed eye baths designed and installed to avoid injurious water pressure shall be in accordance with NFPA 99, 10.6.				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K135	Flammable and combustible liquids shall be used from and stored in approved containers in accordance with NFPA 30, Flammable and Combustible Liquids Code, and NFPA 45, Standard on Fire Protection for Laboratories Using Chemicals. Storage cabinets for flammable and combustible liquids shall be constructed in accordance with NFPA 30, Flammable and Combustible liquids Code NFPA 99, 4.3, 10.7.2.1.				
	MEDICAL GASES AND ANESTHETIZING AREAS				
K76	Medical gas storage and administration areas shall be protected in accordance with NFPA 99, Standard for Health Care Facilities. (a) Oxygen storage locations of greater than 3,000 cu.ft. are enclosed by a one-hour separation. (b) Locations for supply systems of greater than 3,000 cu.ft. are vented to the outside. NFPA 99, 4.3.1.1.2, 18.3.2.4, 19.3.2.4				
K77	Piped in medical gas systems comply with NFPA 99, Chapter 4.				
K78	Anesthetizing locations shall be protected in accordance with NFPA 99, Standard for Health Care Facilities. (a) Shutoff valves are located outside each anesthetizing location and arranged so that shutting off one room or location will not affect others. (b) Relative humidity is maintained equal to or great than 35% NFPA 99 4.3.1.2.3(n) and 5.4.1.1, 18.3.2.3, 19.3.2.3				
K140	(a) Master alarm panels are in two separate locations and have audible and visible signals. (b) There are high/low alarms for +/- 20% operating pressure. This section shall be in accordance with NFPA 99, 4.3.1.2.2 (c) Where a level 2 gas system is used, one alarm panel that complies with 4.3.1.2.2(b) 3 a, b, c and d and with 4.3.1.2.2(c) 2 and 5 shall be permitted. (4.4.1 exception No. 4).				
K141	Non-smoking and no smoking signs in areas where oxygen is used or stored shall be in accordance with 18.3.2.4, 19.3.2.4, NFPA 99, 8.6.4.2				
K142	All occupancies containing hyperbaric facilities shall comply with NFPA 99, Standard for Health Care Facilities, Chapter 19.				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K143	Transferring of oxygen shall be: (a) separated from any portion of a facility wherein patients are housed, examined, or treated by a separation of a fire barrier of 1-hour fire-resistive construction; and (b) the area that is mechanically ventilated, sprinklered, and has ceramic or concrete flooring; and (c) in an area that is posted with signs indicating that transferring is occurring, and that smoking in the immediate area is not permitted in accordance with NFPA 99 and Compressed Gas Association. 8.6.2.5.2				
	ELECTRICAL				
K106	The hospital and all nursing homes and hospices with life support equipment has a Type I Essential Electrical System powered by a generator with a transfer switch and separate power supply. The EES is in accordance with NFPA 99, 3.4.2.2, 3.4.2.1.4				
K144	Generators inspected weekly and exercised under load for 30 minutes per month and shall be in accordance with NFPA 99, 3.4.4.1, NFPA 110, 8.4.2				
K145	The Type I EES is divided into the critical branch, life safety branch and the emergency system and shall be in accordance with NFPA 99, 3.4.2.2.2				
K146	The nursing home/hospice with no life support equipment shall have an alternate source of power separate and independent from the normal source that will be effective for minimum of 1½ hour after loss of the normal source NFPA 99, 3.6.				
K147	Electrical wiring and equipment shall be in accordance with NFPA 70, National Electrical Code. 9.1.2				
K130	Miscellaneous List in the REMARKS sections, any items that are not listed previously, but are deficient. This information, along with the applicable Life Safety Code or NFPA standard citation, should be included on Form CMS-2567.				

Name of Facility	2000 CODE

PART IV RECOMMENDATION FOR WAIVER OF SPECIFIC LIFE SAFETY CODE PROVISIONS

For each item of the Life Safety code recommended for waiver, list the survey report form item number and state the reason for the conclusion that: (a) the specific provisions of the code, if rigidly applied, would result in unreasonable hardship on the facility, and (b) the waiver of such unmet provisions will not adversely affect the health and safety of the patients. If additional space is required, attach additional sheet(s).

According to the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0938-0242. The time required to complete this information collection is estimated to average 5 minutes per response, including the time to review instructions, search existing data resources, gather the data needed, and complete and review the information collection. If you have any comments concerning the accuracy of the time estimate(s) or suggestions for improving this form, please write to CMS, Attn: PRA Reports Clearance Officer, 7500 Security Boulevard, Baltimore, Maryland 21244-1850.

Name of Facility					2000 CODE
ID PREFIX		MET	NOT MET	N/A	REMARKS
	CORRIDOR WALLS AND DOORS				
K18	2000 EXISTING Doors protecting corridor openings in other than required enclosures of vertical openings, exits, or hazardous areas shall be substantial doors, such as those constructed of 1¾ inch solid-bonded core wood, or capable of resisting fire for at least 20 minutes. Doors in fully sprinklered smoke compartments are only required to resist the passage of smoke. There is no impediment to the closing of the doors. Doors shall be provided with a means suitable for keeping the door closed. Dutch doors meeting 19.3.6.3.6 are permitted. 19.3.6.3 Roller latches are prohibited by CMS regulations in all health care facilities.				
	Show in REMARKS, details of doors, such as fire protection ratings, automatic closing devices, etc.				
	2000 New Doors protecting corridor openings shall be constructed to resist the passage of smoke. Doors shall be provided with positive latching hardware. Dutch doors meeting 18.3.6.3.6 are permitted. Roller latches shall be prohibited. 18.3.6.3				
	Show in REMARKS, details of doors, such as fire protection ratings, automatic closing devices, etc.				
K22	Access to exits shall be marked by approved, readily visible signs in all cases where the exit or way to reach exit is not readily apparent to the occupants. 7.10.1.4				
	VERTICAL OPENINGS				
K20	2000 EXISTING Stairways, elevator shafts, light and ventilation shafts, chutes, and other vertical openings between floors are enclosed with construction having a fire resistance rating of at least one hour. An atrium may be used in accordance with 8.2.5.6, 19.3.1.1. *If all vertical openings are properly enclosed with construction providing at least a two hour fire resistance rating, also check this box.* ☐				

Name of Facility					2000 CODE
ID PREFIX		MET	NOT MET	N/A	REMARKS
	If enclosures are less than required, give a brief description and specific location in REMARKS.				
	2000 NEW Stairways, elevator shafts, light and ventilation shafts, chutes, and other vertical openings between floors are enclosed with construction having a fire resistance rating of at least two hours connecting four stories or more. (One hour for single story building and sprinklered buildings up to three stories in height.) 18.3.1.1. An atrium may be used in accordance with 8.2.2.3.5.				
	If enclosures are less than required, give a brief description and specific location in REMARKS.				
	SMOKE COMPARTMENTATION AND CONTROL				
K23	2000 EXISTING Smoke barriers shall be provided to form at least two smoke compartments on every sleeping room floor for more than 30 patients. 19.3.7.1, 19.3.7.2				
	2000 NEW Smoke barriers shall be provided to form at least two smoke compartments on every floor used by inpatients for sleeping or treatment, and on every floor with an occupant load of 50 or more persons, regardless of use. Smoke barriers shall also be provided on floors that are usable, but unoccupied. 18.3.7.1, 18.3.7.2				
K28	2000 EXISTING Door openings in smoke barriers shall provide a minimum clear width of 32 inches (81 cm) for swinging or horizontal doors. Vision panels are of fire-rated glazing or wired glass panels and steel frames. 19.3.7.5, 19.3.7.7				

ID PREFIX		MET	NO MET	N/A	REMARKS
	2000 NEW Door openings in smoke barriers are installed as swinging or horizontal doors shall provide a minimum clear width as follows: Provider Type / Swinging Doors / Horizontal Sliding Doors Hospitals and Nursing Facilities: 41.5 inches (105 cm) / 83 inches (211 cm) Psychiatric Hospitals and Limited Care Facilities: 32 inches (81 cm) / 64 inches (163 cm) Vision panels of fire-rated glazing or wired panels in approved frames are provided for each door. 18.3.7.5, 18.3.7.7				
	HAZARDOUS AREA				
K29	2000 EXISTING One hour fire rated construction (with ¾ hour fire-rated doors) or an approved automatic fire extinguishing system in accordance with 8.4.1 and/or 19.3.5.4 protects hazardous areas. When the approved automatic fire extinguishing system option is used, the areas shall be separated from other spaces by smoke resisting partitions and doors. Doors shall be self-closing and non-rated or field-applied protective plates that do not exceed 48 inches from the bottom of the door are permitted. 19.3.2.1 Area / Automatic Sprinkler / Separation / N/A a. Boiler and Fuel-Fired Heater Rooms c. Laundries (greater than 100 sq feet) d. Repair Shops and Paint Shops e. Laboratories (if classified a Severe Hazard - see K31) f. 	EXISTS AND EGRESS				
K38	Exit access is so arranged that exits are readily accessible at all times in accordance with 7.1. 18.2.1, 19.2.1				
K39	2000 EXISTING Width of aisles or corridors (clear and unobstructed) serving as exit access shall be at least 4 feet. 19.2.3.3				
	2000 NEW Width of aisles or corridors (clear and unobstructed) serving as exit access in hospitals and nursing homes shall be at least 8 feet. In limited care facility and psychiatric hospitals, width of aisles or corridors shall be at least 6 feet. 18.2.3.3, 18.2.3.4				
K40	2000 EXISTING Exit access doors and exit doors used by health care occupants are of the swinging type and are at least 32 inches in clear width. 19.2.3.5				
	2000 NEW Exit access doors and exit doors used by health care occupants are of the swinging type, with openings of at least 41.5 inches wide. Doors in exit stairway enclosures shall be no less than 32 inches in clear width. In ICFs/MR, doors are at least 32 inches wide. 18.2.3.5				

ID PREFIX		MET	NO MET	N/A	REMARKS
K43	Patient room doors are arranged such that the patients can open the door from inside without using a key. Special door locking arrangements are permitted in health facilities. 18.2.2.2.4, 18.2.2.2.5 *If door locking arrangement without delay egress is used indicate in REMARKS* 18.2.2.2.2, 19.2.2.2.2				
	ILLUMINATION AND EMERGENCY POWER				
K45	Illumination of means of egress, including exit discharge, is arranged so that failure of any single lighting fixture (bulb) will not leave the area in darkness. 18.2.8, 19.2.8, 7.8				
K47	2000 EXISTING Exit and directional signs are displayed in accordance with 7.10 with continuous illumination also served by the emergency lighting system. 19.2.10.1 (Indicate N/A in one story buildings with less than 30 occupants where the line of exit travel is obvious.)				
	2000 NEW Exit and directional signs are displayed with continuous illumination also served by the emergency lighting, system in accordance with 7.10. 18.2.10.1				
K105	2000 NEW (INDICATE N/A FOR EXISTING) Buildings equipped with or requiring the use of life support systems (electro-mechanical or inhalation anesthetics) have illumination of means of egress, emergency lighting equipment, exit, and directional signs supplied by the Life Safety Branch of the electrical system described in NFPA 99. 18.2.9.2., 18.2.10.2, 18.5.1.1, 18.5.1.2 (Indicate N/A if life support equipment is for emergency purposes only).				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	EMERGENCY PLAN AND FIRE DRILLS				
K48	There is a written plan for the protection of all patients and for their evacuation in the event of an emergency. 18.7.1.1, 19.7.1.1				
K50	Fire drills are held at unexpected times under varying conditions, at least quarterly on each shift. The staff is familiar with procedures and is aware that drills are part of established routine. Responsibility for planning and conducting drills is assigned only to competent persons who are qualified to exercise leadership. Where drills are conducted between 9:00 PM and 6:00 AM a coded announcement may be used instead of audible alarms. 18.7.1.2, 19.7.1.2				
	FIRE ALARM SYSTEMS				
K51	2000 EXISTING A fire alarm system with approved component, devices or equipment installed according to NFPA 72, National Fire Alarm Code to provide effective warning of fire in any part of the building. Activation of the complete fire alarm system shall be by manual fire alarm initiation, automatic detection or extinguishing system operation. Pull stations in patient sleeping areas, may be omitted provided that manual pull stations are within 200 ft of nurse's stations. Pull stations are located in the path of egress. Electronic or written records of tests shall be available. A reliable second source of power must be provided. Fire alarm systems shall be in accordance with NFPA 72, and records of maintenance kept readily available. There shall be annunciation of the fire alarm system to an approved central station. 19.3.4, 9.6				
	2000 NEW A fire alarm system with approved component, devices or equipment installed according to NFPA 72, to provide effective warning of fire in any part of the building. Activation of the complete fire alarm system shall be by manual fire alarm initiation, automatic detection or extinguishing system operation. Pull stations are located in the path of egress. Electronic or written records of tests shall be available. A reliable second source of power must be provided. Fire alarm systems shall be maintained in accordance with NFPA72, and records of maintenance kept readily available. There shall be remote annunciation of the fire alarm system to an approved central station. 18.3.4, 9.6				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K52	A fire alarm system required for life safety shall be installed, tested, and maintained in accordance with NFPA 70 National Electrical Code and NFPA 72. The system shall have an approved maintenance and testing program complying with applicable requirement of NFPA 70 and 72. 9.6.1.4				
K155	Where a required fires alarm system is out of service for more than 4 hours in a 24-hour period, the authority having jurisdiction shall be notified, and the building shall be evacuated or an approved fire watch shall be provided for all parties left unprotected by the shutdown until the fire alarm system has been returned to service. 9.6.1.8				
K53	2000 EXISTING (INDICATE N/A FOR HOSPITALS AND FULLY SPRINKLERED NURSING HOMES) In an existing nursing home, not fully sprinklered, the resident sleeping rooms and public areas (dining rooms, activity rooms, resident meeting rooms, etc) are to be equipped with single station battery-operated smoke detectors. There will be a testing, maintenance and battery replacement program to ensure proper operation. CFR 483.70				
	2000 NEW (NURSING HOME AND EXISTING LIMITED CARE FACILITIES) An automatic smoke detection system is installed in all corridors. (As an alternative to the corridor smoke detection system on patient sleeping room floors, smoke detectors may be installed in each patient sleeping room and at smoke barrier or horizontal exit doors in the corridor.) Such detectors are electrically interconnected to the fire alarm system. 18.3.4.5.3				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K109	2000 EXISTING LIMITED CARE FACILITIES (INDICATE N/A FOR HOSPITALS OR NURSING HOMES) An automatic smoke detection system is installed in all corridors, with detector spacing no further apart than 30 ft on center in accordance with NFPA 72. (As an alternative to the corridor smoke detection system on patient sleeping room floors, smoke detectors may be installed in each patient sleeping room and at smoke barrier or horizontal exit doors in the corridors.) Such detectors are electrically interconnected to the fire alarm system. 19.3.4.5.1 Smoke Detection System ❑ Corridors ❑ Rooms ❑ Bath				
	AUTOMATIC SPRINKLER SYSTEMS				
K56	2000 EXISTING Where required by section 19.1.6, Health care facilities shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with section 9.7. Required sprinkler systems are equipped with water flow and tamper switches which are electrically interconnected to the building fire alarm. 19.3.5, NPFA 13				
	2000 NEW When required by construction type, there is an automatic sprinkler system installed in accordance with NFPA13, Standard for the Installation of Sprinkler Systems, with approved components, device and equipment, to provide complete coverage of all portions of the facility. Systems are equipped with waterflow and tamper switches, which are connected to the fire alarm system. 18.3.5.				
	A. Date sprinkler system last checked and necessary maintenance provided. _____ B. Show who provided the service. _____				

ID PREFIX		MET	NOT MET	N/A	REMARKS
K154	Where a required automatic sprinkler system is out of service for more than 4 hours in a 24-hour period, the authority having jurisdiction shall be notified, and the building shall be evacuated or an approved fire watch system be provided for all parties left unprotected by the shutdown until the sprinkler system has been returned to service. 9.7.6.1				
K62	Automatic sprinkler systems are continuously maintained in reliable operating condition and are inspected and tested periodically. 18.7.6, 19.7.6, 4.6.12, NFPA 13, NFPA 25, 9.7.5				
K64	Portable fire extinguishers shall be provided in all health care occupancies in accordance with 9.7.4.1, NFPA 10. 18.3.5.6, 19.3.5.6				
	SMOKING REGULATIONS				
K66	Smoking regulations shall be adopted and shall include not less than the following provisions: 18.7.4, 19.7.4 ☐ (1) Smoking shall be prohibited in any room, ward, or compartment where flammable liquids, combustible gases, or oxygen is used or stored in any other hazardous location, and such area shall be posted with signs that read NO SMOKING or shall be posted with the international symbol for no smoking. ☐ (2) Smoking by patients classified as not responsible shall be prohibited, except when under direct supervision. ☐ (3) Ashtrays of noncombustible material and safe design shall be provided in all areas where smoking is permitted. ☐ (4) Metal containers with self-closing cover devices into which ashtrays can be emptied shall be readily available to all areas where smoking is permitted.				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	BUILDING SERVICE EQUIPMENT				
K70	Portable space heating devices shall be prohibited in all health care occupancies. Except it shall be permitted to be used in non-sleeping staff and employee areas where the heating elements of such devices do not exceed 212°F (100°C). 18.7.8, 19.7.8				
	FURNISHINGS AND DECORATIONS				
K72	Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency. No furnishings, decorations, or other objects shall obstruct exits, access thereto, egress there from, or visibility thereof shall be in accordance with 7.1.10				
K74	Draperies, curtains, including cubicle curtains, and other loosely hanging fabrics and films serving as furnishings or decorations in health care occupancies shall be in accordance with provisions of 10.3.1 and NFPA 13 Standard for the Installation of Sprinkler Systems. Except shower curtains shall be in accordance with NFPA 701. ☐ Newly introduced upholstered furniture shall meet the criteria specified when tested in accordance with the methods cited in 10.3.2 (2) and 10.3.1. 18.3.5.3 and NFPA 13				
	LABORATORIES				
K31	Laboratories employing quantities of flammable, combustible, or hazardous materials that are considered a severe hazard shall be protected in accordance with NFPA 99. (Laboratories that are not considered to be severe hazard shall meet the provision of K29.) Laboratories in Health Care occupancies and medical and dental offices shall be in accordance with NFPA 99, Standard for Health Care Facilities 10.5.1.				

ID PREFIX		MET	NO MET	N/A	REMARKS
K134	Emergency Shower: Where the eyes or body of any person can be exposed to injurious corrosive materials, suitable fixed facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use. Fixed eye baths designed and installed to avoid injurious water pressure shall be in accordance with NFPA 99, 10.6.				
K135	Flammable and combustible liquids shall be used from and stored in approved containers in accordance with NFPA 30, Flammable and Combustible Liquids Code, and NFPA 45, Standard on Fire Protection for Laboratories Using Chemicals. Storage cabinets for flammable and combustible liquids shall be constructed in accordance with NFPA 30, Flammable and Combustible liquids Code NFPA 99, 4.3, 10.7.2.1.				
	MEDICAL GASES AND ANESTHETIZING AREAS				
K76	Medical gas storage and administration areas shall be protected in accordance with NFPA 99, Standard for Health Care Facilities. (a) Oxygen storage locations of greater than 3,000 cu.ft. are enclosed by a one-hour separation. (b) Locations for supply systems of greater than 3,000 cu.ft. are vented to the outside. NFPA 99, 4.3.1.1.2, 18.3.2.4, 19.3.2.4				
K141	Non-smoking and no smoking signs in areas where oxygen is used or stored shall be in accordance with 18.3.2.4, 19.3.2.4, NFPA 99, 8.6.4.2				
K143	Transferring of oxygen shall be: (a) separated from any portion of a facility wherein patients are housed, examined, or treated by a separation of a fire barrier of 1-hour fire-resistive construction; and (b) the area that is mechanically ventilated, sprinklered, and has ceramic or concrete flooring; and (c) in an area that is posted with signs indicating that transferring is occurring, and that smoking in the immediate area is not permitted in accordance with NFPA 99 and Compressed Gas Association. 8.6.2.5.2				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	ELECTRICAL				
K144	Generators inspected weekly and exercised under load for 30 minutes per month and shall be in accordance with NFPA 99, 3.4.4.1, NFPA 110, 8.4.2.				
K146	The nursing home/hospice with no life support equipment shall have an alternate source of power separate and independent from the normal source that will be effective for minimum of 1½ hour after loss of the normal source NFPA 99, 3.6				
K130	Miscellaneous List in the REMARKS sections, any items that are not listed previously, but are deficient. This information, along with the applicable Life Safety Code or NFPA standard citation, should be included on Form CMS-2567.

OMB No. 0938-0242

ZONE _____ OF _____ ZONES

FIRE/SMOKE ZONE* EVALUATION WORKSHEET FOR HEALTH CARE FACILITIES

2000 LIFE SAFETY CODE

FACILITY	BUILDING
ZONE(S) EVALUATED	
PROVIDER/VENDOR NO.	DATE OF SURVEY

COMPLETE THIS WORKSHEET FOR EACH ZONE. WHERE CONDITIONS ARE THE SAME IN SEVERAL ZONES, ONE WORKSHEET CAN BE USED FOR THOSE ZONES.

Step 1: Determine Occupancy Risk Parameter Factors - Use Table 1.
A. For each Risk Parameter in Table 1, select and circle the appropriate risk factor value. Choose only one for each of the five Risk Parameters.

TABLE 1. OCCUPANCY RISK PARAMETER FACTORS

Risk Parameters	Risk Factors Values					
1. Patient Mobility *(M)*	Mobility Status	Mobile	Limited Mobility	Not Mobile	Not Movable	
	Risk Factor	1.0	1.6	3.2	4.5	
2. Patient Density *(D)*	No. of Patients	1–5	6–10	11–30	>30	
	Risk Factor	1.0	1.2	1.5	2.0	
3. Zone Location *(L)*	Floor	1st	2nd or 3rd	4th to 6th	7th and Above	Basements
	Risk Factor	1.1	1.2	1.4	1.6	1.6
4. Ratio of Patients to Attendants *(T)*	Patients / Attendant	1–2 / 1	3–5 / 1	6–10 / 1	>10 / 1	One or More / None
	Risk Factor	1.0	1.1	1.2	1.5	4.0
5. Patient Average Age *(A)*	Age	Under 65 Years and Over 1 year		65 Years and Over 1 Year and Younger		
	Risk Factor	1.0		1.2		

Step 2: Compute Occupancy Risk Factor (F) - Use Table 2.
A. Transfer the circled risk factor values from Table 1 to the corresponding blocks in Table 2.
B. Compute F by multiplying the risk factor values as indicated in Table 2.

TABLE 2. OCCUPANCY RISK FACTOR CALCULATION

	M		D		L		T		A		F
OCCUPANCY RISK		X		X		X		X		=	

Step 3: Compute Adjusted Building Status (R) - Use Table 2.
A. If building is classified as "NEW" use Table 3A. If building is classified as "Existing" use Table 3B.
B. Transfer the value of F from Table 2 to Table 3A or Table 3B as appropriate. Calculate R.
C. Transfer R to the block labeled R in Table 7 on page 4 of the work sheet.

TABLE 3A. (NEW BUILDINGS)

	F		R
1.0 X		=	

TABLE 3B. (EXISTING BUILDINGS)

	F		R
0.6 X		=	

*** FIRE/SMOKE ZONE is a space separated from all other spaces by floors, horizontal exits, or smoke barriers.**

SURVEYOR SIGNATURE	TITLE	DATE
FIRE AUTHORITY SIGNATURE	TITLE	DATE

Step 4: Determine Safety Parameter Values - Use Table 4.

A. Select and circle the safety value for each safety parameter in Table 4 that best describes the conditions in the zone. Choose only one value for each of the 13 parameters. If two or more appear to apply, choose the one with the lowest point value.

TABLE 4.

Safety Parameters	Safety Parameters Values						
1. Construction	Combustible Types III, IV, and V				NonCombustible Types I and II		
Floor or Zone	000	111	200	211 + 2HH	000	111	222, 322, 433
First	-2	0	-2	0	0	2	2
Second	-7	-2	-4	-2	-2	2	4
Third	-9	-7	-9	-7	-7	2	4
4th and Above	-13	-7	-13	-7	-9	-7	4
2. Interior Finish (Corridors and Exits)	Class C	Class B	Class A				
	-5(0)[f]	0(3)[f]	3				
3. Interior Finish (Rooms)	Class C	Class B	Class A				
	-3(1)[f]	1(3)[f]	3				
4. Corridor Partitions/Walls	None or Incomplete	<½ hour	≥½ to <1 hour	≥1 hour			
	-10(0)[a]	0	1(0)[a]	2(0)[a]			
5. Doors to Corridor	No Door	<20 min FPR	≥20 min FPR	≥20 min FPR and Auto Clos.			
	-10	0	1(0)[d]	2(0)[d]			
6. Zone Dimensions	Dead End			No Dead Ends >30 ft and Zone Length Is			
	>100 ft	>50 ft to 100 ft	30 ft to 50 ft	>150 ft	100 ft to 150 ft	<100 ft	
	-6(0)[b]	-4(0)[b]	-2(0)[b]	-2(0)[c]	0	1	
7. Vertical Openings	Open 4 or More Floors	Open 2 or 3 Floors	Enclosed with Indicated Fire Resist.				
			<1 hr	≥1 hr to <2 hr	≥2 hr		
	-14	-10	0	2(0)[a]	3(0)[a]		
8. Hazardous Areas	Double Deficiency		Single Deficiency		No Deficiencies		
	In Zone	Outside Zone	In Zone	In Adjacent Zone			
	-11	-5	-6	-2	0		
9. Smoke Control	No Control	Smoke Barrier Serves Zone	Mech. Assisted Systems by Zone				
	-5(0)[c]	0	3				
10. Emergency Movement Routes	<2 Routes	Multiple Routes					
		Deficient	W/O Horizontal Exit(s)	Horizontal Exit(s)	Direct Exit(s)		
	-8	-2	0	1	5		
11. Manual Fire Alarm	No Manual Fire Alarm		Manual Fire Alarm				
			W/O F.D. Conn.	W/F.D. Conn			
	-4		1	2			
12. Smoke Detection and Alarm	None	Corridor Only	Rooms Only	Corridor and Habit. Spaces	Total Spaces In Zone		
	0(3)[g]	2(3)[g]	3(3)[g]	4	5		
13. Automatic Sprinklers	None	Corridor and Habit. Space	Entire Building				
	0	8	10				

NOTE:
[a] Use (0) where parameter 5 is -10.
[b] Use (0) where parameter 10 is -8.
[c] Use (0) on floor with fewer than 31 patients (existing buildings only)
[d] Use (0) where parameter 4 is -10.

For SI units: 1 ft = 0.3048 m

[e] Use (0) where Parameter 1 is based on first floor zone or on an unprotected type of construction (columns marked "000" or "200")
[f] Use ( ) if the area of Class B or C interior finish in the corridor and exit or room is protected by automatic sprinklers and Parameter 13 is 0; use ( ) if the room with existing Class C interior finish is protected by automatic sprinklers, Parameter 4 is greater than or equal to 1, and Parameter 13 is 0.
[g] Use this value in addition to Parameter 13 if the entire zone is protected with quick-response automatic sprinklers.

Step 5: Compute Individual Safety Evaluations – Use Table 5.

A. Transfer each of the 13 circled Safety Parameter Values from Table 4 to every unshaded block in the line with the corresponding Safety Parameter in Table 5. For Safety Parameter 13 (Sprinklers) the value entered in the People Movement Safety column is recorded in Table 5 as ½ the corresponding value circled in Table 4.

B. Add the four columns, keeping in mind that any negative numbers deduct.

C. Transfer the resulting total values for S_1, S_2, S_3, S_4 to blocks labeled S_1, S_2, S_3, S_4 in Table 7 on page 4 of this sheet.

TABLE 5. INDIVIDUAL SAFETY EVALUATIONS

Safety Parameters	Containment Safety (S_1)	Extinguishment Safety (S_2)	People Movement Safety (S_3)	General Safety (S_4)
1. Construction				
2. Interior Finish (Corr. and Exit)				
3. Interior Finish (Rooms)				
4. Corridor Partitions/Walls				
5. Doors to Corridor				
6. Zone Dimensions				
7. Vertical Openings				
8. Hazardous Areas				
9. Smoke Control				
10. Emergency Movement Routes				
11. Manual Fire Alarm				
12. Smoke Detection and Alarm				
13. Automatic Sprinklers			÷ 2 =	
Total Value	S_1=	S_2=	S_3=	S_4=

TABLE 6.
MANDATORY SAFETY REQUIREMENTS (FOR USE IN HOSPITALS OR NURSING HOMES)

Zone Location	Containment (S_a)		Extinguishment (S_b)		People Movement (S_c)	
	New	Exist.	New	Exist.	New	Exist.
1st story	11	5	15(12)[a]	4	8(5)[a]	1
2nd or 3rd story[b]	15	9	17(14)[a]	6	10(7)[a]	3
4th story or higher	18	9	19(16)[a]	6	11(8)[a]	3

a. Use ( ) in zones that do not contain patient sleeping rooms.

b. For a 2nd story zone location in a sprinklered EXISTING facility, as an alternative to the mandatory safety requirement values set specified in the table, the following mandatory values *set* shall be permitted to be used: S_a=7, S_b=10, and S_c=7

Step 6: Determine Mandatory Safety Requirement Values - Use Table 6.

A. Using the classification of the building (i.e., New or Existing) and the floor where the zone is located circle the appropriate value in each of the three columns in Table 6.

B. Transfer the three circled values from Table 6 to the blocks marked S_a, S_b, and S_c in Table 7.

C. For each row check "Yes" if the value in the answer block is zero or greater. Check "No" if the value in the answer block is a negative number.

TABLE 7. ZONE FIRE SAFETY EQUIVALENCY EVALUATION								Yes	No
Containment Safety (S_1)	minus	Mandatory Containment (S_a)	≥ 0	S_1	−	S_a	= C		
Extinguishment Safety (S_2)	minus	Mandatory Extinguishment (S_b)	≥ 0	S_2	−	S_b	= E		
People Movement Safety (S_3)	minus	Mandatory People Movement (S_c)	≥ 0	S_3	−	S_c	= P		
General Safety (S_4)	minus	Occupancy Risk (R)	≥ 0	S_4	−	R	= G		

TABLE 8. FACILITY FIRE SAFETY REQUIREMENTS WORKSHEET				
Complete one copy of this worksheet for each facility. For each consideration, select and mark the appropriate column.		Met	Not Met	Not Applic.
A.	Building utilities conform to the requirements of Section 9.1.			
B.	In new facilities only, life-support systems, alarms, emergency communication systems, and illumination of generator set locations are powered as prescribed by 18.5.1.2 and 18.5.1.3.			
C.	Heating and air conditioning systems conform with the air conditioning, heating, and ventilating systems requirements within Section 9.2, except for enclosure of vertical openings, which have been considered in Safety Parameter 7 of Worksheet 4.7.6.			
D.	Fuel-burning space heaters and portable electrical space heaters are not used.			
E.	There are no flue-fed incinerators.			
F.	An evacuation plan is provided and fire drills conducted in accordance with 18.7.1/18.7.2 and 19.7.1/19.7.2.			
G.	Smoking regulations have been adopted and implemented in accordance with 18.7.4 and 19.7.4.			
H.	Draperies, upholstered furniture, mattresses, furnishings, and decoration combustibility is limited in accordance with 18.7.5 and 19.7.5.			
I.	Fire extinguishers are provided in accordance with the requirements of 18.3.5.4 and 19.3.5.6.			
J.	Exit signs are provided in accordance with the requirements of 18.2.10.1 and 19.2.10.			
K.	Emergency lighting is provided in accordance with 18.2.9.1 or 19.2.9.			
L.	Standpipes are provided in all new high rise buildings as required by 18.4.2.			

CONCLUSIONS

1. ☐ All of the checks in Table 7 are in the "Yes" column. The level of fire safety is at least equivalent to that prescribed by the *Life Safety Code*.*

2. ☐ One of more of the checks in Table 7 are in the "No" column. The level of fire safety is not shown by this system to be equivalent to that prescribed by the *Life Safety Code*.*

*The equivalency covered by this worksheet includes the majority of considerations covered by the *Life Safety Code*. There are a few considerations that are not evaluated by this method. These must be considered separately. These additional considerations are covered in Table 8, the "Facility Fire Safety Requirements Worksheet." One copy of this separate worksheet is to be completed for each facility.

☐ YES ☐ NO

A. ☐ The facility MEETS based upon:
1. ☐ Compliance with all provisions
2. ☐ Acceptance of a Plan of Correction
3. ☐ Recommended waivers
5. ☐ Performance Based Design

B. ☐ The facility DOES NOT MEET THE STANDARD.

	CONSTRUCTION					
K12	Buildings two or more stories in height and of Type II(000),III (200) V (000) construction are equipped throughout with a supervised approved automatic sprinkler system in accordance with section 9.7. 20.1.6.3, 21.1.6.3					
	Number of stories in the building _____					
K13	Construction Type _____					
	EXITS					
K32	At least two exits, located remote from each other are provided for each floor or fire section of the building. 20.2.4.1, 21.2.4.1					
K42	Rooms or suites of rooms of more than 2,500 sq. ft. have at least two exit access doors located remote from each other. 20.2.4.2, 21.2.4.2					
K37	Dead-end corridors do not exceed 50 ft. (Note: A common path of travel for the first 25 ft. is permitted.) 39.2.5.1, 39.2.5.2, 39.2.5.3					
K36	Travel distance between any room door required as exit access and an exit does not exceed 100 ft. The travel distance between any point in a room and an exit does not exceed 150 ft. (Note: In approved automatic sprinklered buildings, the travel distances may be increased by 50 ft.). 20.2.6.2, 21.2.6.2					
K112	At least 50 percent of the required exit capacity from upper floors discharges directly to the exterior of the building in accordance with section 7.7, 38.2.7, 39.2.7, 21.1.6.1, 20.1.6.1					
K113	Designated aisles, corridors, passageways, and exitways are provided with illumination in accordance with section 7.8. 20.2.8, 21.2.8					
K46	Emergency illumination is provided in accordance with section 7.9. 20.2.9.1, 21.2.9.1					
K47	Exits and ways of travel thereto are marked in accordance with section 7.10. 20.2.10, 21.2.10					
K43	Doors of patient treatment, diagnostic, or recovery rooms arranged to provide a clear width of not less than 32 inches and existing 34 inch door. 20.2.3.3, 21.2.3.3					
K40	Exit and exit access doors are at least 34 inches wide. 20.2.3.3, 21.2.3.3					

ID PREFIX		MET	NOT MET	N/A	REMARKS	2000 CODE
	LABORATORIES					
K31	Laboratories employing quantities of flammable, combustible, or hazardous materials that are considered a severe hazard shall be protected in accordance with NFPA 99. (Laboratories that are not considered to be a severe hazard shall meet the provision of K29.) Laboratories in health care occupancies and medical and dental offices shall be in accordance with NFPA 99, Standard for Health Care Facilities and NFPA101. Ventilating Systems shall comply with NFPA 101. 20.3.2.1, 21.3.2.1, 8.4.4, 9.2.4					
K136	Procedures for laboratory emergencies shall be developed. Such procedures shall include alarm actuation, evacuation, and equipment shutdown procedures, and provisions for control of emergencies that could occur in the laboratory, including specific detailed plans for control operations by an emergency control group within the organization or a public fire department in accordance with NFPA 99 and NFPA 101. 10.2.1.3.1, 20.3.2.1, 21.3.2.1					
K131	Emergency procedures established for controlling chemical spills shall be in accordance with NFPA 99. 10.2.1.3.2					
K132	Continuing safety education and supervision shall be provided, incidents shall be reviewed monthly, and procedures reviewed annually shall be in accordance with NFPA 99. 10.2.1.4.2					
K133	Fume hoods shall be in accordance with NFPA 99. 5.4.3, 5.6.2					
K134	Emergency Shower: Where the eyes or body of any person can be exposed to injurious corrosive materials, suitable fixed facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use. Fixed eye baths shall be designed and installed to avoid injurious water pressure shall be in accordance with NFPA 99. 10.6					
K135	Flammable and combustible liquids used from and stored in approved containers shall be in accordance with NFPA 30, Flammable and Combustible Liquids Code, and NFPA 45, Standard on Fire Protection for Laboratories Using Chemicals. Storage cabinets for flammable and combustible liquids shall be constructed in accordance with NFPA 30, Flammable and Combustible Liquids Code, NFPA 99. 4.3, 10.7.2.1					
K39	Corridors for exit access are at least 44 inches wide. 20.2.3.2, 21.2.3.2

	MEDICAL GASES, AND ANESTHETIZING AREAS					
K76	Medical gas storage and administration areas shall be protected in accordance with NFPA 99, Standards for Health Care Facilities, and NFPA 101. (a) Oxygen storage locations of greater than 3,000 cu. ft. are enclosed by a one hour separation. (b) Locations for supply systems of greater than 3,000 cu. ft. are vented to the outside. 4.3.1.1.2, 20.3.2.4, 21.3.2.4					
K77	Piped in medical gas systems comply with NFPA 99.					

ID PREFIX		MET	NOT MET	N/A	REMARKS	2000 CODE
K78	Anesthetizing locations shall be protected in accordance with NFPA 99, Standard for Health Care Facilities and NFPA 101. (a) Shutoff valves are located outside each anesthetizing location and arranged so that shutting off one room or location will not affect others. (b) Relative humidity is maintained equal to or greater than 35%. NFPA 99 4.3.1.2.3(n) and 5.4.1.1, 18.3.2.3, 19.3.2.3					
K140	(a) Master alarm panels are in two separate locations and have audible and visible signals. (b) There are high/low alarms for +/- 20% operating pressure. This section shall be in accordance with NFPA 99, 4.3.1.2.2 (c) Where a level 1 gas system is used, one alarm panel that complies with 4.3.1.2.2(b) 3 a, b, c and d and with 4.3.1.2.2(c) 2 and 5 shall be permitted. (4.4.1 exception No. 4).					
K141	Non-smoking and no smoking signs in areas where oxygen is used or stored shall be in accordance with NFPA 99. 8.6.4.2					
K142	All occupancies containing hyperbaric facilities shall comply with NFPA 99, Standard for Health Care Facilities, Chapter 19.					
K143	Transferring of oxygen shall be: ❑ (a) separated from any portion of a facility wherein patients are housed, examined, or treated by a separation of a fire barrier of one hour fire-resistive construction; and ❑ (b) the area that is mechanically ventilated, sprinklered, and has ceramic or concrete flooring; and ❑ (c) in an area that is posted with signs indicating that transferring is occurring, and that smoking in the immediate area is not permitted in accordance with NFPA 99 and Compressed Gas Association. 8.6.2.5.2					
	ELECTRICAL					
K106	The ASC with life support equipment has a Type I Essential Electrical System powered by a generator with a transfer switch and separate power supply. The EES is in accordance with NFPA 99. 3.4.2.2, 3.4.2.1.4					
K144	Generators are inspected weekly and exercised under load for 30 minutes per month and shall be in accordance with NFPA 99. 3.4.4.1, NFPA110, 8.4.2					

ID PREFIX		MET	NOT MET	N/A	REMARKS	2000 CODE
K145	The Type I EES is divided into the critical branch, life safety branch and the emergency system and shall be in accordance with NFPA 99. 3.4.2.2.2					
K146	The ASC with no life support equipment shall have an alternate source of power separate and independent from the normal source that will be effective for minimum of 11/2 hour after loss of normal source NFPA 99. 3.6					
K147	Electrical wiring and equipment shall be in accordance with NFPA 70, National Electrical Code 9.1.2, 20.5.1					
	INTERIOR FINISH					
K14	Interior finish on walls and ceilings of exits, enclosed corridors, and exit access furnishing shall be Class A or B (offices Class A, B, or C) 38.3.3.2, 39.3.3.2					
	FIRE ALARM SYSTEMS					
K51	A manual fire alarm system, not a pre-signal type, is provided to automatically warn the building occupants. Fire alarm system has initiation notification and control function. The fire alarm system is arranged to automatically transmit an alarm to summon the fire department. 20.3.4.1, 21.3.4.1					
	CORRIDOR SEPARATION					
K17	Corridors used as access to exit are separated from use areas by partitions with a fire resistance rating of at least one hour. Fire resistance rating not required if building fully sprinklered. Doors have at least one 20 minute fire protection rating and are equipped with a positive latch and closing device. Vision panels, if provided, in partitions or doors therein are not to exceed 20 inches and install at or below half distance from floor to room ceiling. 20.3.6.2, 38.3.6.1 (Indicate N/A for existing occupancies, open floor areas with available exits, corridors in a space occupied by a single tenant, and buildings provided with complete automatic sprinkler systems.)					
	OCCUPANCY SEPARATION					
K114	Ambulatory health care occupancies are separated from other tenants and occupancies by fire barriers with at least a 1 hour fire resistance rating. Doors in such barriers are solid bonded core wood of 1¾ inches or equivalent and are equipped with a positive latch and closing device. Vision panels, if provided in fire barriers or doors shall be of fixed fire window assemblies in accordance with 8.2.3.2.2.					

ID PREFIX		MET	NOT MET	N/A	REMARKS	2000 CODE
	SMOKE BARRIERS					
K115	Ambulatory health care facilities are divided into at least two smoke compartments with smoke barriers having at least 1 hour fire resistance rating. Doors in smoke barriers are equipped with positive latcher. Doors shall be constructed of not less than 1¾ inch thick solid bonded core wood or equivalent. Vision panels are provided and are of fixed wire glass limited to 1,296 sq. inch per panel. (Indicate N/A for facilities of less than 5,000 sq. ft. with an approved smoke detection system, and less than 10,000 sq. ft. with an approved supervicsed sprinkler system in accordance with 9.7.) 20.3.7.1, 20.3.7.2, 20.3.7.3, 21.3.7.1, 21.3.7.2, 21.3.7.2					
	PORTABLE FIRE EXTINGUISHERS					
K64	Portable fire extinguishers are provided. 20.3.5.2, 21.3.5.2					
	HIGH RISE BUILDINGS					
K116	Buildings over 75 ft. in height housing ambulatory health care facilities are provided with a complete approved automatic sprinkler system shall be in accordance with 11.8.					
	BUILDING SERVICES					
K117	Utilities shall comply with section 9.1 Electrical Wiring and Equipment and shall be in accordance with NFPA 70. National Electrical Code. Required Emergency Generators shall be tested and maintained in accordance with NFPA 110, Standard for Emergency and Standby Power Systems.					
K67	Heating, ventilating, and air-conditioning shall comply with the manufacturer's specifications and section 9.2. 20,5.2.1, 21.5.2.1					
K70	Portable space heating devices are prohibited except portable space heating devices shall be permitted to be used in non-sleeping staff and employee areas where the heating elements of such devices do not exceed 212°F (100°C). 20.7.8, 21.7.8					
K118	Elevators, dumbwaiters, and vertical conveyors shall comply with section 9.4. 20.5.3, 21.5.3					
K71	Rubbish chutes, incinerators, and laundry chutes shall comply with section 7.5. 20.5.4, 21.5.4					

ID PREFIX		MET	NOT MET	N/A	REMARKS	2000 CODE
	EMERGENCY PLAN, FIRE DRILLS					
K48	There is a written plan for the protection of all patients and for their evacuation in the event of an emergency. 20.7.1.1, 21.7.1.1					
K50	Fire drills are held at unexpected times under varying conditions, at least quarterly on each shift. The staff is familiar with procedures and is aware that drills are part of established routine. 20.7.1.2, 21.7.1.2					
	SMOKING REGULATIONS					
K66	Smoking regulations are adopted, and include the posting of "NO SMOKING" signs or shall be posted with the international symbol for no smoking in any room, ward, or compartment where flammable liquids, combustible gases or oxygen are used or stored, and in any other hazardous location. 20.7.4, 21.7.4					
	FURNISHINGS AND DECORATIONS					
K72	Draperies, curtains and other loosely hanging fabrics and films serving as furnishings, except curtains at shower, shall be in accordance with NFPA 701. 20.7.5.1, 21.7.5.1					
K73	Newly introduced upholstered furniture shall be in accordance with NFPA 260, 261 unless building is fully sprinklered. 20.7.5.2, 21.7.5.2 Newly introduced mattresses shall meet NFPA 267. 20.7.5.3, 21.7.5.3					
K74	Combustible decorations shall be flame retardant. 20.7.5.4, 21.7.5.4					
K75	Solid linen or trash collection receptacles shall not exceed 32 gallons (121L) in capacity.					
	Mobile soiled linen or trash collection receptacles with capacity greater than 32 gallons (121L) shall be located in a room protected as a hazardous area. 20.7.5.3, 21.7.5.5					
	MISCELLANEOUS					
K130	List in the REMARKS section, any items that are not listed previously, but are deficient. This information along with the applicable Life Safety Code or NFPA Standard citation, should be included on Form CMS-2567.					

RECOMMENDATION FOR WAIVER OF SPECIFIC LIFE SAFETY CODE PROVISIONS

For each item of the Life Safety Code recommended for waiver, list the survey report form item number and state the reason for the conclusion that: (a) the specific provision of the code, if rigidly applied, would result in unreasonable hardship on the facility, and (b) the waiver of such unmet provisions will not adversely affect the health and safety of the patients. (If additional space is required, use additional sheet.)

INSTRUCTIONS FOR COMPLETING THE FORM (CMS-2786V)
SMALL FACILITIES —16 BEDS OR LESS

1. **Complete a Worksheet for Rating Residents** (CMS-2786M) for each resident in the facility.

2. **Complete the first few pages of this form, a Worksheet for Calculating Evacuation Difficulty Score (Chapter 6 NFPA 101A, 2001 Edition).**
   Note: This is the ONLY method permitted to determine Level of Evacuation Difficulty in SMALL facilities.

3. **Transfer the E-Score** obtained in Scoresheet F2 C (Page 5) to the E-SCORE block on Page 1 of this form.

4. **Complete either Chapter 31 or 32** Requirements or the FSES/BC Appendix G - Rating the Building.

   A. **If completing Chapter 31 or 32** Requirements:

      1. PROMPT - Complete ONLY the PROMPT section of this form.
      2. SLOW - Complete both PROMPT and SLOW sections of this form.
      3. IMPRACTICAL - Complete all three sections of this form PROMPT, SLOW and IMPRACTICAL.

   B. **If completing the FSES/BC - Appendix G** - Rating The Building

      1. You **must** also complete the Chapter 31 or 32 requirements. An FSES building evaluation cannot be done without completing the usual survey form pages for these Chapters.
      2. You may use the FSES Health Care to evaluate the building (Form CMS-2786T), but if you choose to do so, you must also use the LSC Survey Report for Health Care Form CMS-2786R.

Worksheet for Calculating Evacuation Difficulty Score (E-Score)

F-2

BEFORE FILLING OUT THIS WORKSHEET:

- Please read the Instruction Manual.
- Make sure you have the completed "Worksheets for Rating Residents" (CMS-2786M) for each resident.
- Determine whether the requirements for using the Evacuation Difficulty Index have been satisfied by checking the one box to the left of each question below that shows whether the answer to the question is "YES" or "NO."

☐ Yes ☐ No 1. Has a protection plan been developed and written and have all staff members counted in the calculation of E-Scores been trained in its implementation?

☐ Yes ☐ No 2. Is the total available staff at any given time able to handle the individual evacuation needs of each resident who may be in the residence?

☐ Yes ☐ No 3. Can every staff member counted in the calculation of E-Scores meaningfully participate in the evacuation of every resident?

☐ Yes ☐ No 4. Are all staff members counted in the calculation of E-Scores required to remain in the residence with only the exceptions listed in the Instruction Manual?

☐ Yes ☐ No 5. Were at least twelve fire drills conducted during the year?

This worksheet is filled out for the staff "Shift"

From _____ To _____

(You must fill out this worksheet for the time of day, week, etc., when the ratings for the combination of staff and residents yields the highest E-Score. This period of time will usually be late at night. When it is not obvious which time period has the highest E-Score, complete a separate worksheet for all candidate time periods and use the one having the highest E-Score.)

F-2A Finding the Total Resident Score

1. List each resident's name in the scoresheet below. (Scoresheet F-2A)
2. For each resident, transfer the Evacuation Assistance Score (Part F-1B) from his/her Worksheet for Rating Residents (Step 1).
3. Add the Evacuation Assistance Score for all the residents and write the answer in the appropriate space at the bottom of Scoresheet F-2A.

Scoresheet F-2A RESIDENT SCORES					
Resident's Name	Evacuation Assistance Score	Resident's Name	Evacuation Assistance Score	Resident's Name	Evacuation Assistance Score
				Evacuation Assistance TOTAL	

F-2B Finding the Staff Shift Score

1. In Scoresheet F-2B (below), list the names of staff members who are required to remain in the group home during the time period (shift) specified on the front page of this worksheet.
2. Determine whether the effectiveness of the alarm system is rated as "assured" or "not assured" as explained in the Instruction Manual.
3. Using the appropriate "assured" or "not assured" column in the table below, find each staff member's Promptness of Response Score for the time period specified. Write each staff member's score in the appropriate space in Scoresheet F-2B.
4. Add the staff members' Promptness of Response Scores and write the total in the appropriate space in Scoresheet F-2B.

Scoresheet F-2B STAFF SCORES			
Staff's Name	Promptness of Response Score	Staff's Name	Promptness of Response Score
		Staff Shift TOTAL	

PROMPTNESS OF RESPONSE SCORES		
Staff Availability	Alarm Effectiveness	
	Assured	Not Assured
Standby or asleep	16	2
Immediately available	20	2
Immediately available & close by	20	10

NOTE: If the facility is a large residential facility, staff members may be responsible for assisting the residents in a fire/smoke zone, but may also have responsibilities for residents in other fire/smoke zones. See the glossary for Step 2 for the special procedure for assigning Promptness of Response Scores.

F-2C Finding the Home's Evacuation Difficulty Score

1. Rate the home on the factor below by checking the circle that best describes the home.

	Vertical Distance From Bedrooms to Exits		
	All BR on floor with direct exits	Any BR one floor from exit	Any BR two or more floors from exit
Small Facility	○ score = 0.8	○ score = 1.0	○ score = 1.2
Large Facility or Apartment	○ score = 1.0		

2. Write the score for the category you checked in the appropriate box in Scoresheet F-2C below.
3. Compute the E-Score as show in Scoresheet F-2C:
   a. Multiply the Resident Score Total by the score for Vertical Distance from Bedrooms to Exits.
   b. Divide the answer by the Staff Shift Score Total to find the Evacuation Difficulty Score (E-Score).

Scoresheet F-2C CALCULATION OF E-SCORE

Resident Score Total [ ] X Vertical Distance from Bedrooms to Exits [ ]

Staff Shift Score Total [ ] = ENTER THIS SCORE on COVER of THIS FORM — E-SCORE [ ]

4. Determine and record Level of Evacuation Difficulty appropriate to the Calculated E-Score; use Scoresheet F-2D.

Scoresheet F-2D

E-Score	Level of Evacuation Difficulty
≤ 1.5	Prompt
> 1.5 ≤ 5.0	Slow
> 5.0	Impractical

Level of Evacuation Difficulty [ ]

The adequacy of the water supply shall be documented to the authority having jurisdiction. 33.2.3.5.2. ❑ *Exception No. 1: Not Applicable.* ❑ *Exception No. 2: In slow and impractical evacuation capability facilities, an automatic sprinkler system in accordance with NFPA 13D, Standard for the Installation of Sprinkler Systems in One and Two Family Dwellings and Manufactured Homes, with a 30 minute water supply, shall be permitted. All habitable areas and closets shall be sprinklered. Automatic sprinklers shall not be required in bathrooms not exceeding 55 sq. ft., provided that such spaces are finished with lath and plaster or materials providing a 15 minute thermal barrier.* ❑ *Exception No. 3: Not Applicable.* ❑ *Exception No. 4: Not Applicable.* ❑ *Exception No. 5: In impractical evacuation capability facilities up to and including four stories in height, systems in accordance with NFPA 13R, Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height, shall be permitted. All habitable areas and closets shall be sprinklered. Automatic sprinklers shall not be required in bathrooms not exceeding 55 sq. ft., provided that such spaces are finished with lath and plaster or materials providing a 15 minute thermal barrier.* ❑ *Exception No. 6: Initiation of the fire alarm system shall not be required for existing installations in accordance with 33.2.3.5.5.*				

ID PREFIX		MET	NO MET	N/A	REMARKS
	2000 NEW Where an automatic sprinkler system is installed, for either total or partial building coverage, the system shall be in accordance with Section 9.7 and shall initiate the fire alarm system in accordance with 32.2.3.4.1. The adequacy of the water supply shall be documented to the authority having jurisdiction. 32.2.3.5.2. ❑ *Exception No. 1: Not Applicable.* ❑ *Exception No. 2: In slow and impractical evacuation capability facilities, an automatic sprinkler system in accordance with NFPA 13D, Standard for the Installation of Sprinkler Systems in One and Two Family Dwellings and Manufactured Homes, with a 30 minute water supply, shall be permitted. All habitable areas and closets shall be sprinklered. Facilities with more than eight residents shall be treated as two family dwellings with regard to water supply.* ❑ *Exception No. 3: Not Applicable.* ❑ *Exception No. 4: Not Applicable.* ❑ *Exception No. 5: In impractical evacuation capability facilities up to and including four stores in height, systems in accordance with NFPA 13R, Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stores in Height, shall be permitted. All habitable areas and closets shall be sprinklered.* ❑ *Exception No. 6: Initiation of the fire alarm system shall not be required for existing installations in accordance with 32.2.3.5.5.*				
	VERTICAL OPENINGS				
K20	Vertical openings shall be protected so as not to expose a primary means of escape. Vertical openings shall be considered protected if separated by smoke partitions in accordance with 8.2.4 that prevent the passage of smoke from one story to any primary means of escape on another story. Smoke partitions shall have a fire resistance rating of not less than a ½ hour. Any doors or openings to the vertical opening shall be capable of resisting fire for not less than 20 minutes. 32.2.3.1.1, 33.2.3.1.1 ❑ *Exception: Stairs shall be permitted to be open where complying with Exception No. 2 or Exception No. 3 to 32.2.2.4 and 33.2.2.4.* **Note: Make sure you have completed PROMPT and SLOW as well as this section.**				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	OPERATING FEATURES FOR ALL FACILITIES				
K46	Utilities shall comply with Section 9.1. 32.2.5.1, 33.2.5.1				
K147	The administration of every resident board and care facility shall have in effect and available to all supervisory personnel written copies of a plan for protecting all persons in the event of fire, for keeping persons in place, for evacuating persons to areas of refuge, and for evacuating person from the building when necessary. The plan shall include special staff response, including fire protection procedures needed to ensure the safety of any resident, and shall be amended or revised whenever any resident with unusual needs is admitted to the home. All employees shall be periodically instructed and kept informed with respect to their duties and responsibilities under the plan. Such instruction shall be reviewed by the staff not less than every 2 months. A copy of the plan shall be readily available at all times within the facility. 32.7.1, 33.7.1				
K148	Smoking regulations shall be adopted by the administration of board and care occupancies. 32.7.4.1, 33.7.4.1				
K149	Where smoking is permitted, noncombustible safety type ashtrays or receptacles shall be provided in convenient locations. 32.7.4.2, 33.7.4.2				
K150	New draperies, curtains, and other similar loosely hanging furnishings and decorations in board and care facilities shall be in accordance with provisions of 10.3.1. 32.7.5.1, 33.7.5.1				
K151	New upholstered furniture within board and care facilities shall be tested in accordance with the provisions of 10.3.2(1) and 10.3.3. ❑ *Exception: Upholstered furniture belonging to the resident in sleeping rooms, provided that a smoke alarm is installed in such rooms. Battery-powered single-station smoke alarms shall be permitted. 32.7.5.2, 33.7.5.2*				
K152	CFR-42-483.470(i) Evacuation Drills (1) The facility must hold evacuation drills at least quarterly for each shift of personnel and under varied conditions to – ❑ *(i) Ensure that all personnel on all shifts are trained to per form assigned tasks:* ❑ *(ii) Ensure that all personnel on all shifts are familiar with the use of the facility's emergency and disaster plans and procedures.*				

ID PREFIX		MET	NOT MET	N/A	REMARKS
	(2) The facility must – ❑ *(i) Actually evacuate clients during at least one drill each year on each shift;* ❑ *(ii) Make special provisions for the evacuation of clients with physical disabilities:* ❑ *(iii) File a report and evaluation on each drill:* ❑ *(iv) Investigate all problems with evacuation drills, including accidents and take corrective action: and* ❑ *(v) During fire drills, clients may be evacuated to a safe area in facilities certified under the Health Care Occupancies Chapter of the Life Safety Code.* (3) Facilities must meet the requirements of paragraphs (i) (1) and (2) of this section for any live-in and relief staff that they utilize.

INSTRUCTIONS FOR COMPLETING THE FORM (CMS-2786K)
LARGE FACILITIES — 17 BEDS OR MORE

1. **Determine the Level of Evacuation Capability** of the facility.
2. **Transfer the E-Score** obtained in Fig. 6.8 of page 1 of this form.
3. **Complete either LSC Chapter 32 for (new) or LSC Chapter 33 for (existing)** requirements of this form, or Fig. 7.5 — Rating the Building.

   A. **If completing Chapter 32 or 33** Requirements:

      1. PROMPT OR SLOW - Complete sections for PROMPT and SLOW
      2. Impractical - Complete a CMS-2786R (Health Care) or FSES/Health Care (Optional) — see page 13.

   B. **If completing the FSES/BC — Chapter 32 or 33** — Rating the Building

      1. You **MUST** also complete the Chapter 32 or 33 requirements. An FSES building evacuation cannot be done without completing the usual survey form pages for Chapter 32 or 33
      2. You may use the FSES/Health Care to evaluate the building (Form CMS-2786T Chapter 4 & Fig. 4.7), but if you choose to do so, you must use the LSC Survey Report for Health Care (CMS-2786R)

*Figures for FSES/HC are taken from NFPA 101 A 2001 Edition

Worksheet for Calculating Evacuation Difficulty Score (E-Score)

F-2

BEFORE FILLING OUT THIS WORKSHEET:

- Please read the Instruction Manual.
- Make sure you have the completed "Worksheets for Rating Residents" (figure 6.8) for each resident.
- Determine whether the requirements for using the Evacuation Difficulty Index have been satisfied by checking the one box to the left of each question below that shows whether the answer to the question is "YES" or "NO."

❑ YES ❑ NO 1. Has a protection plan been developed and written and have all staff members counted in the calculation of E-Scores been trained in its implementation?

❑ YES ❑ NO 2. Is the total available staff at any given time able to handle the individual evacuation needs of each resident who may be in the residence?

❑ YES ❑ NO 3. Can every staff member counted in the calculation of E-Scores meaningfully participate in the evacuation of every resident?

❑ YES ❑ NO 4. Are all staff members counted in the calculation of E-Scores required to remain in the residence with only the exceptions listed in the Instruction Manual?

❑ YES ❑ NO 5. Were at least twelve fire drills conducted during the year?

This worksheet is filled out for the staff "Shift"

From _____ To _____

(You must fill out this worksheet for the time of day, week, etc. when the ratings for the combination of staff and residents yields the highest E-Score. This period of time will usually be late at night. When it is not obvious which time period has the highest E-Score, complete a separate worksheet for all candidate time periods and use the one having the highest E-Score.)

EVALUATOR'S NAME_____ DATE _____

Zone _____

Write any explanatory remarks here:

Worksheet 6.8.2 Rating the Resident on the Risk Factors

Rate the resident on each of the factors below by checking the one circle for each risk factor that best describes the resident. For the first six factors, write the scores for the circles checked in the appropriate score boxes in the far right column. For "Response to Fire Drills," write the three checked scores in the large circles. Write the sum of the three scores in the large box on the right.

					Score Boxes
I. Risk of Resistance (Check only one)	Minimal Risk ○ score = 0	Risk of Mild Resistance ○ score = 6	Risk of Strong Resistance ○ score = 20		☐
II. Impaired Mobility (Check only one)	Self-Starting ○ score = 0	Slow ○ score = 3	Needs Limited Assistance ○ score = 6	Needs Full Assistance or Very Slow ○ score = 20	☐
III. Impaired Consciousness (Check only one)	No Significant Risk ○ score = 0	Partially Impaired ○ score = 6	Totally Impaired ○ score = 20		☐
IV. Need for Extra Help (Check only one)	Needs at Most One Staff ○ score = 0	Needs Limited Assistance from 2 Staff ○ score = 30	Needs Full Assistance from 2 Staff ○ score = 40		☐
V. Response to Instructions (Check only one)	Follows Instructions ○ score = 1	Requires Supervision ○ score = 3	Requires Considerable Attention/Might Not Respond ○ score = 10		☐
VI. Waking Response to Alarm (Check only one)	Response Probable ○ score = 0	Response Not Probable ○ score = 6			☐

VII. Response to Fire Drills (Without guidance or advice from staff)	Initiates and Completes Evacuation Promptly	Yes ○ score = 0	No ○ score = 8	○ +	
	Chooses and Completes Back-up Strategy	Yes ○ score = 0	No ○ score = 4	○ +	
	Remains at Designated Location	Yes ○ score = 0	No ○ score = 6	○ = Sum of These Three Scores	☐

Worksheet 6.8.3 Determining the Resident's Overall Need for Assistance

Compare the numbers in the seven score boxes filled in. Take the highest score from the score boxes (Worksheet 6.8.2.) and write it in the box at the right.

	☐ *Exception No. 1: Rooms or spaces, other than sleeping rooms, protected throughout by an approved automatic sprinkler system in accordance with 33.3.3.5.* ☐ *Exception No. 2: Prompt evacuation capability facilities in buildings not over two stories in height where not less than one required means of egress from each sleeping room provides a path of travel to the outside without traversing any corridor or other spaces exposed to unprotected vertical openings, living areas, and kitchens.* ☐ *Exception No. 3: Rooms or spaces, other than sleeping rooms, provided with a smoke detection and alarm system connected to activate the building evacuation alarm. Furnishings, finishes, and furniture, in combination with all other combustibles within the spaces, shall be of minimum quantity and arranged so that a fully developed fire is unlikely to occur.* Sleeping rooms shall be separated from corridors, living areas, and kitchens by walls complying with 33.3.3.6.3 through 33.3.3.6.6. Walls required by 33.3.3.6.1 or 33.3.3.6.2 shall have a fire resistance rating of not less than ½ hour. ☐ *Exception No. 1: In buildings protected throughout by an approved automatic sprinkler system in accordance with 33.3.3.5, walls shall be smoke partitions in accordance with 8.2.4. The provisions of 8.2.4.3.5 shall not apply.* ☐ *Exception No. 2: In buildings not more than two stories in height that are classified as prompt evacuation capability and that house not more than 30 residents, walls shall be smoke partitions in accordance with 8.2.4. The provisions of 8.2.4.3.5 shall not apply.* Doors in walls required by 33.3.3.6.1 or 33.3.3.6.2 shall have a fire protection rating of not less than 20 minutes. ☐ *Exception No. 1: Solid-bonded wood core doors of not less than 1¾ in. (4.4cm) thickness shall be permitted to continue to be used.* ☐ *Exception No. 2: In buildings protected throughout by an approved automatic sprinkler system in accordance with 33.3.3.5, doors that are nonrated shall be permitted to continue to be used.*					

ID PREFIX	LARGE FACILITY PROMPT AND SLOW EVACUATION CAPABILITIES	MET	NOT MET	N/A	REMARKS	LARGE PROMPT & SLOW
	☐ *Exception No. 3: Where automatic sprinkler protection is provided in the corridor with 31.3.5.2 through 31.3.5.4, doors shall not be required to have a fire protection rating but shall be in accordance with 8.2.4.3. The provisions of 8.2.4.3.5 shall not apply. Doors shall be equipped with latches for keeping the doors tightly closed.* Walls and doors required by 33.3.3.6.1 and 33.3.3.6.2 shall be constructed as smoke partitions in accordance with 8.2.4. The provisions of 8.2.4.3.5 shall not apply. No louvers, transfer grilles, operable transoms, or other air passages shall penetrate such walls or doors, except properly installed heating and utility installations. Doors in walls required by 33.3.3.6.1 and 33.3.3.6.2 shall be self-closing or automatic-closing in accordance with 7.2.1.8. Doors in walls separating sleeping rooms from corridors shall be automatic-closing in accordance with 7.2.1.8. ☐ *Exception No. 1: Doors to sleeping rooms that have occupant-control locks such that access is normally restricted to the occupants or staff personnel shall be permitted to be self-closing.* ☐ *Exception No. 2: In buildings protected throughout by an approved automatic sprinkler system installed in accordance with 33.3.3.5, doors, other than doors to hazardous areas, vertical openings, and exit enclosures, shall not be required to be self-closing or automatic-closing.* 33.3.3.6.6					
	2000 NEW Access shall be provided from every resident use area to not less than one means of egress that is separated from all sleeping rooms by walls complying with 32.3.3.6.3 through 32.3.3.6.6. Sleeping rooms shall be separated from corridors, living areas, and kitchens by walls complying with 32.3.3.6.3 through 32.3.3.6.6. Walls required by 32.3.3.6.1 or 32.3.3.6.2 shall have a fire resistance rating of not less than ½ hour. ☐ *Exception: In conversions (see 32.1.1.3), no fire resistance rating shall be required, but the wall shall be a smoke partition in accordance with 8.2.4. The provisions of 8.2.4.3.5 shall not apply.*					

ID PREFIX	LARGE FACILITY PROMPT AND SLOW EVACUATION CAPABILITIES	MET	NOT MET	N/A	REMARKS	LARGE PROMPT & SLOW
	Doors in walls required by 32.3.3.6.1 or 32.3.3.6.2 shall have a fire protection rating of not less than 20 minutes. □ *Exception: Doors in renovations and conversions (see 32.1.1.3) that are nonrated doors that resist the passage of smoke shall be permitted to continue to be used.* Doors to hazardous areas, vertical openings, exits, and exit passageways shall be self-closing or automatic-closing. 32.3.3.6.6					
K18	Doors in walls separating sleeping rooms from corridors shall have a fire protection rating of not less than 20 minutes. Doors shall be equipped with latches for keeping the doors tightly closed. □ *Exception No. 1: Existing 1¾ inch solid bonded wood core doors shall be permitted.* □ *Exception No. 2: Where walls are only required to resist the passage of smoke, doors without fire rating and which resist the passage of smoke are permitted.* □ *Exception No. 3: Where automatic sprinkler protection is provided in the corridor in accordance with 31.3.5.3 through 31.3.5.4, doors shall not be required to have a fire protection rating but shall be in accordance with 8.2.4.3. The provisions of 8.2.4.3.5 shall not apply. Doors shall be equipped with latches for keeping the doors tightly closed.* 32.3.3.6.4, 33.3.3.6.4					
	Walls and doors required by 32.3.3.6.1 and 32.3.3.6.2. shall be constructed as smoke partitions in accordance with 8.2.4. The provisions of 8.2.4.3.5 shall not apply. Example 7.5 Using the applicable mandatory safety requirement.* 32.3.1.2.2 See CMS-2786R					

Fire Safety Evaluation Worksheet for a Large Facility

Fig. 7.5

Facility Identification _____

Evaluator _____ Date _____

(Complete one worksheet for each large facility. This normally means a capacity for more than 16 residents.)

First complete Fig. 7.5.1. Continue with Fig. 7.5.2, 7.5.3, 7.5.4A, 7.5.4B, 7.5.5. Then return to this page to obtain the Equivalency Conclusions.

TURN TO NEXT PAGE

Part 2E. Equivalency Conclusions

Complete Fig. 7.5.1 through 7.5.5 before doing this part.

1. All of the checks in Fig. 7.5.5 are in the "YES" column. The level of fire safety is at least equivalent to that prescribed for large residentail facilities.*

2. One or more of the checks in Fig. 7.5.5 is in the "NO" column. The level of fire safety is not shown by this system to be equivalent to that prescribed by the Life Safety Code for large residential facilities.

*The equivalency covered by this worksheet includes the majority of considerations covered by the Life Safety Code. There are a few considerations that are not evaluated by this method. These must be considered separately. These additional considerations are covered in the "Facility Fire Safety Requirements Worksheet." One copy of this separate worksheet is to be completed for each facility.

Facility Fire Safety Requirements Worksheet

Considerations	Met	Not Met	Not Applicable
A. Utilities comply with provisions of 9.1.			
B. Heating, ventilating, and air conditioning equipment comply with provisions of 9.2.			
C. Elevators, dumbwaiters, and vertical conveyors comply with the provisions of 9.4.			
D. Rubbish chutes, incinerators, and laundry chutes comply with the provisions of 9.5.			
E. Complies with the applicable requirements of Sections 32.7 and/or 33.7.

INSTRUCTIONS FOR COMPLETING THIS FORM (CMS-2786X)
SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY

1. **FIRST** complete FORM CMS-2786Y *(Small Facility Survey Report)*

2. **NEXT** complete **THIS** form, to rate the suitability of the Apartment Building to House a Board and Care Occupancy.
   NOTE: The items on this form refer to the part of the building the Board and Care Occupancy (Apartment).

3. If using NFPA 101A Figure 7.7 — FSES/BC — Rating the Building, complete Part I of this form FIRST.
   NOTE: When using this form, you must also complete a CMS 2786Y.

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
	NOTE: You must complete a CMS-2786Y for each Apartment unit with a Board & Care Occupancy.					
	BUILDING CONSTRUCTION					
K12	Minimum Construction Requirements: (Based on highest story normally used by residents) PROMPT and SLOW One and Two Story ❑ Any construction type of one-hour or greater fire rating or, ❑ Type IV (2HH) or, ❑ Fully sheathed or, ❑ With automatic sprinkler system throughout, in accordance with Section 9.6 and 9.7. ❑ *Exception: One story any construction type and no more than 30 residents capable of prompt evacuation.* Three to Six Stories ❑ Type I, II or III construction of one-hour or greater fire rating or, ❑ Type IV construction with automatic sprinkler system throughout in accordance with Section 9.6 or 9.7. ❑ *Exception: Three or four story facilities of type V (000), sheathed and with automatic sprinkler system throughout, in accordance with Sections 9.6 and 9.7.* More than Six Stories ❑ Type I or II (222) construction or, ❑ Type II (111) construction or, ❑ Type III (211) construction or, ❑ Type IV (2HH) with automatic sprinkler system throughout in accordance with Sections 9.6 and 9.7. Minimum Construction Requirements: (Based on highest story normally used by residents) PROMPT and SLOW ❑ Type I or II (222) construction, beyond 75 feet in height with automatic sprinkler protection throughout in accordance with Section 9.6 and 9.7. ❑ Type II (111) construction, limited to three stories with automatic sprinkler protection throughout in accordance with Sections 9.6 and 9.7 ❑ Type II (000), III (211), IV (2HH), V (111) limited to one story with automatic sprinkler protection throughout in accordance with Section 9.6 and 9.7. 32.3.1.3, 33.3.1.3					

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
	HAZARDOUS AREAS (Outside B & C Units)					
K29	Where buildings are without suppression or detection *systems*, or have total automatic detection or partial sprinkler protection every hazardous area shall be separated by construction of one-hour fire rating. Openings shall be protected by smoke-actuated automatic or self-closing fire doors, with a ¾ hour fire rating or the area is equipped with an automatic sprinkler *system*. Hazardous areas include, but are not limited to: ❑ Boiler and heater rooms ❑ Laundries ❑ Repair shop ❑ Rooms or spaces used for storage of combustibles or equipment deemed hazardous by the authority having jurisdiction. Where buildings have an automatic extinguishment *system* installed in accordance with NFPA 13, areas may be smoke-resisting construction. 30.3.2, 31.3.2, 8.4					
K211	2000 EXISTING Where Alcohol Based Hand Rub (ABHR) dispensers are installed: ❑ The corridor is at least 6 feet wide ❑ The maximum individual fluid dispenser capacity shall be 1.2 liters (2 liters in suites of rooms) ❑ The dispensers shall have a minimum spacing of 4 ft from each other ❑ Not more than 10 gallons are used in a single smoke compartment outside a storage cabinet. ❑ Dispensers are not installed over or adjacent to an ignition source. ❑ If the floor is carpeted, the building is fully sprinklered. 19.3.2.7, CFR 483.470					

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
K211	2000 NEW Where Alcohol Based Hand Rub (ABHR) dispensers are installed: ❑ The corridor is at least 6 feet wide ❑ The maximum individual fluid dispenser capacity shall be 1.2 liters (2 liters in suites of rooms) ❑ The dispensers shall have a minimum spacing of 4 ft from each other ❑ Not more than 10 gallons are used in a single smoke compartment outside a storage cabinet. ❑ Dispensers are not installed over or adjacent to an ignition source. ❑ If the floor is carpeted, the building is fully sprinklered. 18.3.2.7, CFR 483.470					
	MANUAL FIRE ALARM					
K51	Apartment buildings with more than three stories or more than eleven units shall have a fire alarm system, not a presignal type, with occupant notification accomplished automatically and without delay in accordance with Section 9.6, 30.3.4, 31.3.4. An annunciator panel shall be provided. 31.3.4.3.2.					
K155	Where a required fire alarm system is out of service for more than 4 hours in a 24-hour period, the authority having jurisdiction shall be notified, and the building shall be evacuated or an approved fire watch shall be provided for all parties left unprotected by the shutdown untilt e fire alarm system has been returned to service. 9.6.1.8					
	SMOKE DETECTION AND ALARM (Outside B & C)					
K109	Every living unit within the apartment building regardless of number of stories, number of apartments, sprinkler system or other detection system shall have approved single or multiple station smoke detectors installed, powered by house electrical service. ❑ *Exception: Where the building is equipped with a total automatic smoke detection system throughout.* 30.3.5, 31.3.4.4					

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
	AUTOMATIC SPRINKLER (Outside B & C)					
K56	Where buildings are required to be protected throughout by an approved automatic sprinkler system and where a partial system is required, the system shall be in accordance with Section 9.7. 30.3.5					
K64	Portable fire extinguishers shall be provided in hazardous areas in accordance with Section 9.7.4.1 unless the building is provided with an appropriate supervised automatic sprinkler system. 30.3.5.7					
K154	Where a required automatic sprinkler system is out of service for more than 4 hours in a 24-hour period, the authority having jurisdiction shall be notified, and the building shall be evacuated or an approved fire watch system be provided for all parties left unprotected by the shutdown until the sprinkler system has been returned to service. 9.7.6.1					
	A. Date sprinkler system last checked and necessary maintenance provided. _____					
	B. Show who provided the service. _____					
	C. Note the source of the water supply for the automatic sprinkler system. _____					
	(Provide, in REMARKS, information on coverage for any non-required or partial automatic sprinkler system.)					
	SEPARATION OF B. C. UNIT AND ITS EXIT ROUTES					
K38	2000 EXISTING Exit access corridors shall be protected as follows: ❑ 1. Where buildings do not have an automatic sprinkler or detection system, corridor walls shall have one-hour fire rating. ❑ 2. Where buildings have a partial sprinkler or detection system, corridor walls shall have ¾ hour fire rating. ❑ 3. Where buildings have an automatic sprinkler system through, corridor walls shall have ½ hour fire ratings. 31.3.6					

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
	2000 New Exit access corridor walls shall consist of fire barriers in accordance with 8.2.3 that have no less than ½ hour fire resistance rating. Exception: In buildings protected throughout by an approved automatic sprinkler *system* in accordance with 29.3.5, no fire resistance rating shall be required, but the walls and all openings therein shall resist the passage of smoke. 30.3.6, 32.4.2, 31.3.6					
K18	Doors between apartments and corridors shall be self-closing and have a minimum 20 minute fire rating. 30.3.6.2, 31.3.6.2					
	EXIT SYSTEM					
K32	At least two acceptable exits, remote from each other, are provided for each floor or fire section. At least half of the required number of units of exit width shall lead directly to the street. ❑ Exception No. 1: A living unit with direct exit to street at ground level or an outside stairway or an enclosed stairway, of one hour fire rating, serving that unit only, *may* have a single exit. ❑ Exception No. 2: Where there are a maximum of four living units per floor with no more than 20 feet from each unit's entrance door to an exit, *may* have a single exit of a smokeproof tower or outside stair in accordance with 5.2.3. ❑ Exception No. 3: Where there is no more than three stories and living units are separated, vertically and horizontally by 3/4 hour fire rating, *may* have a single exit if the stairway is of one hour construction, serving as access with a maximum of 35 feet from each unit's entrance door to exit. 7.3, 30.2.4, 31.2.4, 32.3.2.4					
K35	Capacity of exits in number of persons per unit of exit width is in accordance with 7.3. 30.2.3.1, 31.2.3.1					
	EXIT ACCESS					
K36	Travel distance from the door of a room in a living unit to a corridor door and a living unit entrance door to the nearest exit are in accordance with Table A.31.1. 30.2.6.					

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
	INTERIOR FINISH					
K14	Interior finish on walls, ceilings and floors are in accordance with and shall apply to the parts of means of egress serving the apartments used as a residential board and care occupancy. 30.3.3, 31.3.3.					
	VERTICAL OPENINGS					
K20	Stairways, elevator shafts and other vertical openings are in accordance with 30.3.1, 29.3.1, 31.3.1					
	SMOKE CONTROL					
K24	Exit access corridors shall be provided with smoke barriers in accordance with Section 8.3. The maximum length of each smoke compartment shall be 200 feet. Smoke dampers are not required. ❑ *Exception No. 1: Where buildings have an automatic sprinkler system throughout.* ❑ *Exception No. 2: Where exit access is through an atrium 8.2.5.6.* ❑ *Exception No. 3: Where exterior exit access provides access to two exits 7.5.3.* ❑ *Exception No. 4: Buildings complying with 31.3.7, Exceptions 1,2, and 3.* ❑ *Exception No. 5: Buildings with exits maximum 50 feet apart.* ❑ *Exception No. 6: Where each dwelling unit has direct access to exterior at grade. 31.3.7, 33.4.3.3.*					
K44	Horizontal exits required to limit maximum gross area shall be as specified in 7.2.4.2. 31.2.2.5					
	SPECIAL FEATURES					
K126	Where buildings are greater than six stories with 1 total automatic fire detection system per N.F.P.A. 72E, but without an automatic sprinkler system, the interior exit access corridors shall be continuously pressurized at a minimum of 0.01 inches water, measured at any living unit door. 31.2.11, 7.2.3					

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
	BUILDING SERVICES EQUIPMENT					
K117	Utilities shall comply with provision of Section 9.1. 32.3.6.1, 33.3.6.1.					
K67	Heating, ventilating and air conditioning equipment shall comply with the provisions of Section 9.2. 32.3.6.2, 33.3.6.2					
K118	Elevators, dumbwaiters and vertical conveyors shall comply with the provisions of Section 9.4. 32.3.6.3, 32.3.6.3.2, 33.3.6.3					
K71	Rubbish chutes, incinerators and laundry chutes shall comply with the provisions of Section 9.5. 32.3.6.4, 33.3.6.4					
	OPERATING FEATURES					
K127	Every required automatic sprinkler *system*, fire detection and alarm system, smoke control *system*, exit lighting, fire door and other item of equipment required by this code shall be continuously maintained in proper operating condition. 4.6.12					
K72	No furnishings, decorations or other objects are placed to obstruct exits or visibility of exits. 7.5.2.2 32.7.5					
K73	No furnishings or decorations of an explosive or highly flammable character are used. 18.7.5.4, 19.7.5.4					
	EMERGENCY PLAN, FIRE DRILLS					
K48	There is a written plan for the protection of all persons and for their evacuation in the event of an emergency. All employees shall be instructed and reviewed as to their duties and responsibilities under the plan. 32.7.1, 33.7.1					

ID PREFIX	SUITABILITY OF AN APARTMENT BUILDING TO HOUSE A BOARD AND CARE OCCUPANCY	MET	NOT MET	N/A	REMARKS	APARTMENT HOUSE
K128	All residents capable of assisting in their evacuation shall be trained in the proper actions to take in the event of a fire. 32.7.2, 33.7.2					
K50	Fire exit drills shall be conducted twelve times per year, quarterly on each shift. Drills shall involve actual evacuation to a selected assembly point and provide experience in exiting through all exits. Exits not used in any fire drill shall not be credited in meeting the requirements of the code. 42 CFR 483.470 Subpart L					
K66	Where smoking is permitted, noncombustible safety-type ash trays or receptacles shall be provided in convenient locations. 32.7.4, 33.7.4					
	ILLUMINATION AND EMERGENCY POWER					
K45	Every public space, hallway, stairway and other means of egress shall have illumination in accordance with Section 7.8. 30.2.8, 31.2.8					
K46	Any apartment building with more than twelve living units or greater than three stories shall have emergency lighting in accordance with Section 7.8. ❑ *Exception: Where every living unit has a direct exit to the outside at grade level.*					
K47	Signs marking means of egress shall be in accordance with section 7.10 and provided in all apartment buildings requiring more than one exit. 30.2.10, 31.2.10					

FIRE SAFETY EVALUATION WORKSHEET FOR AN APARTMENT BUILDING WITH BOARD AND CARE OCCUPANCIES

G3

Building Identification _____

Evaluator_____Date _____

(Complete one worksheet for each apartment house containing one or more apartment units with a board and care occupancy.)

First complete Table 7.7. Continue with Fig. 7.7.1 through 7.7.5. Then return to this page to obtain the Equivalency Conclusions.

TURN TO NEXT PAGE

Part 3E. Equivalency Conclusions

Complete Tables 7.7.2 through 7.7.7 before doing this part.

1. ❑ All of the checks in Table 7.7.7 are in the "YES" column. The level of fire safety is at least equivalent to that prescribed for apartments.*

2. ❑ One or more of the checks in Table 7.7.7 is in the "NO" column. The level of fire safety is not shown by this system to be equivalent to that prescribed by the Life Safety Code for apartments.

*The equivalency covered by this worksheet includes the majority of considerations covered by the Life Safety Code. There are a few considerations that are not evaluated by this method. These must be considered separately. These additional considerations are covered in the "Facility Fire Safety Requirements Worksheet." One copy of this separate worksheet is to be completed for each facility.

FACILITY FIRE SAFETY REQUIREMENTS WORKSHEET

CONSIDERATIONS	MET	NOT MET	N/A
A. Utilities comply with provisions of 9.1			
B. Heating, ventilating, and air conditioning equipment comply with provisions of 9.2.			
C. Elevators, dumbwaiters, and vertical conveyors comply with the provisions of 9.4.			
D. Rubbish chutes, incinerators, and laundry chutes comply with the provisions of 9.5.			
E. Complies with the applicable requires of 32.7, 33.7 (Operating Features).			

Table G-3A
Worksheets for evaluating fire safety for an apartment building with board and care occupancies.

WORKSHEET 7.7.1 COVER SHEET

	0	2(0)[a]	4(0)[a]	6	8

6. Separation of Board & Care Home Unit and Its Exit Route from Other Spaces		Walls <30 min		Walls>30 min to <1 hr		Walls>1 hr	
	None or Incomplete	Doors <20 min w/o Closer	Doors≥20 min w/o Closer	Doors<20 min w/Closer	Doors≥20 min w/Closer	Doors<20 min w/Closer	Doors≥20 min w/Closer
	-6	-2	0(-2)[a]	1(-2)[a]	2(-2)[a]	1(-2)[a]	4(-2)[a]

7. Exit System (serving board & care home units)	<2 Standard Routes	Multiple Routes				
		Deficient	w/o Horiz.Exit	w/Horiz. Exit	Smokeproof Enclosure	Direct Exit
	-6	-2	0	2	2	4

8. Exit Access (serving board & care home units)	Max. Dead End Is		No Dead End >50 ft and				
	>100 ft	>50 ft or corridor common path>35 ft	>200 ft	>150 ft to ≤200 ft	>100 ft to ≤150 ft	>50 ft to ≤100 ft	<50 ft
	-6(0)[a]	-4(0)[a]	-2	-1	0	1	2

9. Interior Finish (egress routes serving board & care home units)	Flame-Spread Rating		
	>75 to ≤200	>25 to ≤75	≤25
	-3	-1	0

Table G-3A

WORKSHEET 7.7.2 *(continued)*

10. Vertical Openings	Open or Incomplete Enclosure			Enclosed[h]	
	Thru 5 or More Floors	3-4 Floors	2 Floors	<1 hr[f]	≥1hr[f]
	-10	-7	-2	0	10[g]

11. Smoke Control (serving floors having board & care home units)		Smoke	Mechanically Assisted Systems		
	None	Barriers	By Zone	By Unit	By Corridor
	0(2)[i]	2	3	3	4

NOTES:

[a] Use (-1X height in stories) if building is fully sheathed with plaster, gypsum board, or similar materials but not <-2 if parameter 5 is 8.

[b] Use ( ) if Parameter 1 is based on Type V(000), Type III(200), or Type II(000), if Note [a] does not apply, and if parameter 5 is ≤4.

[c] Use ( ) if Parameter 1 is based on Type V(000), Type III(200), or Type II(000).

[d] Use ( ) if Parameter 7 is -6.

[e] Use ( ) if Parameter 6 is based on "None or Incomplete," or "Walls or Doors are 1/2 hour walls /20 minute doors and Parameter 5 is <4.

[f] ≥30 min in existing building.

[g] Use ( ) if hazardous area is on exit route or in refuge area serving group home unit.

[h] Use 0 in 1 story building.

[i] Use (2) in 1-3 story buildings with <12 living units.

[j] Use ( ) if Parameter 5 is ≥6

[k] Use (0) if Parameter 5 is 8.

[l] Use ( ) where exceptions to 31.3.7 (NFPA *101*) apply.

For SI units: 1 ft = 0.348m.

Part 3B. Complete Individual Safety Evaluations – Use Worksheet 7.7.3

1. Transfer each of the 8 circled safety parameter values from Table G-3A to every unshaded block in the line with the corresponding safety parameter in Table G-3B. Where the block is indicated (-(2) enter only one half the value shown in Table G-3A.
2. Add the four columns, keeping in mind that any negative numbers deduct.

Transfer the resulting values for S_1, S_2, S_3 and S_4 to Table G-3D.

WORKSHEET 7.7.3 INDIVIDUAL INSERT SAFETY EVALUATIONS — APARTMENT BUILDINGS

Safety Parameters	Fire Control (S_1)	Egress Provided (S_2)	Refuge Provided (S_3)	General Fire Safety Provided (S_4)
1. Construction				
2. Hazardous Areas		÷ 2 =		
3. Manual Fire Alarm	÷ 2 =			
4. Smoke Detection and Alarm	÷ 2 =			
5. Automatic Sprinklers		÷ 2 =	÷ 2 = (See note)	
6. Separation of Living Units		÷ 2 =		
7. Exit system			÷ 2 =	
8. Exit Access				
9. Interior Finish				
10. Vertical Openings	÷ 2 =			
11. Smoke Control				
Total	S_1 =	S_2 =	S_3 =	S_4 =

NOTE: Use full value if Safety Parameter 1 is based on Type V (000), Type III (200), or Type II(000) construction. Divide by 2 (÷2) in all other cases.

Determine Mandatory Requirements — Use Figure 7.7.4

1. Using the level of requirement based on evacuation capability (see 21-1.3) to select the proper row of Figure 7.7.4. Circle the appropriate values.
2. Transfer the circled values from Table 7.74A to the blocks marked for Sa, Sb, Sc and Sd to Table G-3D.

WORKSHEET 7.7.4A MANDATORY REQUIREMENTS — SPRINKLERED AND NONSPRINKLERED APARTMENT BUILDINGS

		Control Requirements (Sa)		Egress Requirements (Sb)		Refuge Requirements (Sc)		General Fire Safety Requirements (Sd)	
Building Height	Level of Evacuation Difficulty	New	Exist.	New	Exist.	New	Exist.	New	Exist.
1 Story	Prompt/Slow	10	3	4.5	6	8	3	8	6
	Impractical	11	6	4.5	6	5	6	9	9
2–6 Stories	Prompt/Slow	10.5	4.5	6	7	9	5	9	8
	Impractical	14.5	6.5	6	7	9	7	13	10
>6 Stories	Prompt/Slow	12.5	11.5	6	7.5	7	8	11	10
	Impractical	14.5	13.5	6	7.5	9	10	13	14

WORKSHEET 7.7.4B MANDATORY REQUIREMENTS — NEW NONSPRINKLERED APARTMENT BUILDINGS MEETING EXCEPTION TO 30.3.5.2 (NFPA 101)

Building Height	Level of Evacuation Difficulty	Control Requirements (Sa)	Egress Requirements (Sb)	Refuge Requirements (Sc)	General Fire Safety Requirements (Sd)
1 Story	Prompt/Slow	5	10	5	11
2 Stories	Prompt/Slow	2.5	8	3	7
3–6 Stories	Prompt/Slow	6.5	11	7	13
>6 Stories	Prompt/Slow	8.5	11	9	15

WORKSHEET 7.7.4C MANDATORY REQUIREMENTS — NEW FACILITIES LOCATED IN EXISTING NONSPRINKLERED APARTMENT BUILDINGS

Building Height	Level of Evacuation Difficulty	Control Requirements (Sa)	Egress Requirements (Sb)	Refuge Requirements (Sc)	General Fire Safety Requirements (Sd)
1 Story	Prompt ≤30 residents	4	6	2	6
	Prompt >30 residents or slow	5	6	3	7
2 Stories	Prompt/Slow	4.5	7	3	7
3–6 Stories	Prompt/Slow	6.5	11	7	13

WORKSHEET 7.7.4D MANDATORY REQUIREMENTS — NEW FACILITIES LOCATED IN EXISTING NONSPRINKLERED APARTMENT BUILDINGS

Building Height	Level of Evacuation Difficulty	Control Requirements (Sa)	Egress Requirements (Sb)	Refuge Requirements (Sc)	General Fire Safety Requirements (Sd)
1 Story	Prompt/Slow/Impractical	9	4.5	3	7
2 Stories	Prompt/Slow	10.5	6	5	9
	Impractical	12.5	6	7	11
3–6 Stories	Prompt/Slow	10.5	6	9	9
	Impractical	14.5	6	9	13
>6 Stories	Prompt/Slow	12.5	6	7	11
	Impractical	14.5	6	9	13

(For use with NFPA 101A-2001/NFPA 101-2000, B & C Apts.)

WORKSHEET 7.7.5 EQUIVALENCY EVALUATION

1. Perform the indicated subtractions in Table G-2D. Enter the differences in the appropriate answer blocks.
2. For each row check "YES" if the value in the answer block is zero or greater. Check "NO" if the value in the answer block is a negative number.

					YES	NO
Control Provided (S_1)	minus	Required Control (S_a)	≥ 0	S_1 ☐ − S_a ☐ = ☐		
Egress Provided (S_2)	minus	Required Egress (S_b)	≥ 0	S_2 ☐ − S_b ☐ = ☐		
Refuge Provided (S_3)	minus	Required Refuge (S_c)	≥ 0	S_3 ☐ − S_c ☐ = ☐		
General Fire Safety (S_4)	minus	Required General Fire Safety (S_d)	≥ 0	S_4 ☐ − S_d ☐ = ☐		

WORKSHEET 7.7.6 FACILITY FIRE SAFETY REQUIREMENTS WORKSHEET

	CONSIDERATIONS	MET	NOT MET	N/A
A.	Utilities comply with the provisions of 32.3.6.1 and 33.3.6.1.			
B.	Heating, ventilating, and air conditioning equipment comply with the provisions of 32.3.6.2 and 33.3.6.2, except for enclosure of vertical openings, which have been considered in Safety Parameter 10 of Worksheet 7.7.2.			
C.	Elevators, dumbwaiters, and vertical conveyors comply with the provisions of 32.3.6.3 and 33.3.6.3.			
D.	Rubbish chutes, incinerators, and laundry chutes comply with the provisions of 32.3.6.4 and 33.3.6.5.			
E.	Complies with the applicable requirements of Sections 32.7 and 33.7.			

All references are to NFPA *101, Life Safety Code*

WORKSHEET 7.7.7 CONCLUSIONS

1. ☐ All of the checks in Worksheet 7.7.5 are in the "YES" column. The level of fire safety is at least equivalent to that prescribed by NFPA *101, Life Safety Code*, for apartments to house a board and care occupancy.*
2. ☐ One or more of the checks in Worksheet 7.7.5 are in the "NO" column. The level of fire safety is not shown by this system to be equivalent to that prescribed by NFPA *101* for apartments to house board and care occupancy.

*The equivalency covered by this worksheet includes the majority of considerations covered by NFPA *101, Life Safety Code*. There are some considerations that are not evaluated by this method. These must be considered separately. These additional considerations are covered in Worksheet 7.7.6, "Facility Fire Safety Requirements Worksheet." One copy of this worksheet is to be completed for each facility.

Fire Safety Evaluation Worksheet for a Small Facility

Facility Identification _____

Evaluator _____ Date _____

(Complete one worksheet for each individual residence or apartment used as a board and care home. A small facility normally means a capacity for 16 or fewer residents.)

First complete Worksheet 7.3.1. Continue with Worksheets 7.3.3, 7.3.4, 7.3.5 and 7.3.6. Then return to this page to obtain the Equivalency Conclusions.

TURN TO NEXT PAGE

Part 1E. Equivalency Conclusions.

Complete Worksheets 7.3.1 through 7.3.6 before doing this part.

1. ☐ All of the checks in Worksheet 7.3.7 are in the "YES" column. The level of fire safety is at least equivalent to that prescribed by the Life Safety Code.*

2. ☐ One or more of the checks in Worksheet 7.3.7 is in the "NO" column. The level of fire safety is not shown by this system to be equivalent to that prescribed for small dwelling units.

* The equivalency covered by this worksheet includes the majority of considerations covered by the Life Safety Code. There are a few considerations that are not evaluated by this method. These must be considered separately. These additional considerations are covered in the "Facility Fire Safety Requirements Worksheet." One copy of this separate worksheet is to be completed for each facility.

WORKSHEET 7.3.4 MANDATORY SAFETY REQUIREMENTS

Level of Evacuation Difficulty	Control Requirements (S_1)		Egress Requirements (S_2)		Refuge Requirements (S_3)		General Fire Safety Requirements (S_4)	
	New	Exist.	New	Exist.	New	Exist.	New	Exist.
Prompt	10(½)[a]	0	5(5)[a]	4	11(2½)[a]	2	7(2)[a]	1
Slow	10	2	9	7	11	4	11	7
Slow[b]		1		6		2		5
Impractical	10	8	10	9	11	9	12	10

[a] Use ( ) for small board and care facility conversion serving eight or fewer residents with an evacuation capability rating of "prompt."

[b] In existing buildings only, use these mandatory safety requirements if evacuation time is 8 minutes or less or if the evacuation capability score is 3 or less as determined by Chapter 6.

(For use with NFPA 101A-2001/NFPA 101-2000, B & C Small)

WORKSHEET 7.3.5 EQUIVALENCY EVALUATION

					YES	NO
Control Provided (S_1)	minus	Required Control (S_A)	$\geq$ 0	S_1 ☐ – S_A ☐ = ☐		
Egress Provided (S_2)	minus	Required Egress (S_B)	$\geq$ 0	S_2 ☐ – S_B ☐ = ☐		
Refuge Provided (S_3)	minus	Required Refuge (S_C)	$\geq$ 0	S_3 ☐ – S_C ☐ = ☐		
General Fire Safety (S_4)	minus	Required General Fire Safety (S_4)	$\geq$ 0	S_4 ☐ – S_4 ☐ = ☐		

WORKSHEET 7.3.6 FACILITY FIRE SAFETY REQUIREMENTS WORKSHEET

CONSIDERATIONS	MET	NOT MET
A. Complies with the applicable requirements of Sections 32.7 and 33.7. (NFPA *101*).		

WORKSHEET 7.3.7 CONCLUSIONS

1. ☐ All of the checks in Worksheet 7.3.5 are in the "YES" column. The level of fire safety is at least equivalent to that prescribed by NFPA *101, Life Safety Code.**

2. ☐ One or more of the checks in Worksheet 7.3.5 are in the "NO" column. The level of fire safety is not shown by this system to be equivalent to that prescribed by NFPA *101* for small dwelling units.

*The equivalency covered by this worksheet includes the majority of considerations covered by NFPA *101, Life Safety Code*. There are some considerations that are not evaluated by this method. These must be considered separately. These additional considerations are covered in Worksheet 7.3.6, "Facility Fire Safety Requirements Worksheet." One copy of this worksheet is to be completed for each facility.

* MANDATORY

Reason: The provisions established in this appendix will provided the minimum standards for new facilities which voluntarily seek certification or accreditation in the Medicare/Medicaid program. These minimum standards **do exceed** some of the minimum occupancy requirements established within the body of this Code **but are** necessary to meet the requirements of the Centers for Medicare and Medicaid Services as specified in 42 CFR.

It is absolutely absurd to have a new facility to be permitted and constructed in compliance with the body of the IBC and then be immediately cited as ineligible for certification or accreditation in the Medicare/Medicaid program because the body of the IBC did not take into account all the requirements of the Centers for Medicare and Medicaid Services as specified in 42 CFR. This will allow for those states and jurisdictions that adopt the International Codes to also adopt this appendix if desired to help deliver and administer the federal CMS programs utilizing the IBC. The construction type conversion Table 1 was placed in the appendix to assist code officials in all parts of the county in assessing the appropriate construction type for use in the CMS forms.

This appendix will allow states to adopt the additional requirements of the Centers for Medicare and Medicaid Services as specified in 42 CFR so that compliance with this appendix can allow for the certification recommendation to be made by the State survey agency on the compliance of providers and suppliers with the conditions of participation, requirements for Skilled Nursing Facilities (SNFs), Nursing Facilities (NFs) whether freestanding, distinct parts, or dually certified, Intermediate Care Facilities for Mentally Retarded (ICFs/MR), Ambulatory Surgical Centers (ASC), inpatient Hospice facilities, Program for All inclusive Care for the Elderly (PACE) facilities, Critical Access Hospitals (CAH), Psychiatric and General Hospitals.

No additional cost for those facilities desiring to seek voluntarily certification or accreditation in the Medicare/Medicaid program since they are already required to meet these minimum provisions and requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE

MEANS OF EGRESS

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some AIBC-E@ code change proposals are not included on this list, as they are being heard by other committees. Please consult the Cross Index of Proposed Changes.

E1–09/10
1001.4 (New) (IFC [B] 1001.4 (New))

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

Add new text as follows:

1001.4 Fire safety and evacuation plans: Fire safety and evacuation plans shall be provided for all occupancies and buildings where required by the *International Fire Code*. Such fire safety and evacuation plans shall comply with the applicable provisions of Sections 401.2 and 404 of the *International Fire Code*.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:

> Review the recommendations issued by NIST in its report entitled "Final Report on the Collapse of the World Trade Center Towers", issued September 2005, for applicability to the building environment as regulated by the I-Codes. To evaluate the necessity of developing code changes in response to the NIST report.

This proposal is similar to E3-07/08 last cycle. However, based on fire service input, it has been expanded to include the reference to Section 401.2 of the IFC which states:

> 401.2 Approval. Where required by this code, fire safety plans, emergency procedures and employee traing programs shall be approved by the fire code official.

This added reference identifies the scope of responsibility of the evaluation of the plans.

The purpose of this code change proposal is to provide consistent requirements for jurisdictions regarding requirements for fire safety and evacuation plans. We feel fire safety and evacuation plans are important issues that impact occupant egress during an emergency and therefore meets the intent of the IBC and needs to be addressed. In addition, many jurisdictions across the country currently have adopted the IBC, however many of these same jurisdictions have not adopted the IFC. This reference will ensure that at least the fire safety and evacuation plans of the IFC are adopted by reference. Enforcement of the provisions is not an issue based on the reference to Section 401.2. The provisions are clearly within the scope of the IFC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Heilstedt-E2-1001.4

E2–09/10
1002.1 (IFC [B] 1002.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

CORRIDOR. An enclosed exit access component that defines and provides a path of egress travel ~~to an exit~~.

Reason: The current definition of "CORRIDOR" is somewhat misleading. Obviously, there are two types of corridors: Fire-resistance rated and non-fire-resistance rated. Section 1018.6 states, "Fire-resistance-rated corridors shall be continuous from the point of entry to an exit…" This provision supports the philosophy that once a given level of protection is achieved, such level of protection shall not be reduced until arrival at the exit discharge. With the non-fire-resistance rated corridor, however, there is no inherent level of protection. It is not uncommon in building design for non-rated corridors to connect open office areas without leading to an exit. The proposed language will correlate with the definition of 'aisle" in declaring that unprotected exit access components provide a path of egress travel, but not necessarily directly to an exit. This proposal eliminates potential confusion created by the current definition and lets the technical requirements of Section 1018.6 stand on their own merit. Approval of this proposal will resolve a potential conflict in stated intent for commonly used corridor provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Keith-E2-1002.1-Corridor

E3–09/10
1002.1 (IFC [B] 1002.1)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT. That portion of a means of egress system ~~which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel~~ between the exit access and the exit discharge or public way. ~~Exits include exterior exit doors at the level of exit discharge, vertical exit enclosures, exit passageways, horizontal exits, exterior exit stairways, exterior exit ramps and horizontal exits.~~

Reason: The current definition of "EXIT" contains several technical inaccuracies. The definition of exit includes absolute, universal criteria for an exit that describe protection and fire resistance that isn't required on all exit components. Obviously, exterior exit stairways and exterior exit ramps are not interior spaces nor are they necessarily constructed with fire-resistance rated construction and opening protectives. This proposal also acknowledges that some exit components (i.e. an exterior exit door at the level of discharge) may lead directly to the public way.This change simplifies the definition by removing the absolutes and limiting it to describing what part an exit plays in the more general term and application of "means of egress."

The laundry list of "exterior exit doors at the level of exit discharge, vertical exit enclosures, exit passageways, horizontal exits, exterior exit stairways, and exterior exit ramps and horizontal exits" should also be removed, as they are not a definition, but a list of elements that the code includes as part of the "exit." Specific sections elsewhere in the code determine that the "components" are or are not acceptable as exits, such as the allowance for exit access on open stairways in exceptions 3 and 4 in Section 1016.1, which are permitted to be counted as exits from a floor by exceptions in Section 1021.1. This is already a convoluted procedure for determining what is an exit. Additional confusion caused by a list that is not inclusive is only an added burden to understanding exits. This list in the definition is at least incomplete or incorrect since it doesn't include the allowed exceptions. The proposed language will eliminate confusion and misunderstanding of what the code intends.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Collins-E5-1002.1

E4–09/10
1002.1 (IFC [B] 1002.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT. That portion of a means of egress system ~~which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel~~ between the exit access and the exit discharge or public way. Exit~~s~~ components include exterior exit doors at the level of exit discharge, ~~vertical~~ exit enclosures, exit passageways, horizontal exits, exterior exit stairways~~,~~ and exterior exit ramps ~~and horizontal exits~~.

Reason: The current definition of "EXIT" contains several technical inaccuracies. It contains some absolute information that is not necessarily applicable to all exit components. Obviously, exterior exit stairways and exterior exit ramps are not interior spaces nor are they necessarily constructed of fire-resistance rated construction and opening protectives. Accordingly, this specific language has been removed from the definition. This proposal also acknowledges that some exit components (i.e. an exterior exit door at the level of discharge) may lead directly to the public way. The term exit "component" was added to the definition of exit so as to be consistent with numerous other means of egress provisions. (Please see the definition of "EXIT ENCLOSURE" and "EXIT PASSAGEWAY.") Additionally, the title of Section 1022 was changed from "vertical exit enclosures" to "exit enclosures" in the 2009 Edition of the IBC. The term "vertical" has been removed from the proposed definition so as to be consistent with current terminology. The definition of "EXIT" is fundamental to proper means of egress system design. It is imperative that it be informative and precise. The proposed language will eliminate confusion and misunderstanding as to what the IBC intends.

Cost Impact: The code change proposal will not increase the cost of construction.

SECTION 1002 (IFC [B] 1002)
DEFINITIONS

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT. That portion of a means of egress system ~~which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel~~ between the exit access and the exit discharge. Exit~~s~~ components include exterior exit doors at the level of exit discharge, ~~vertical exit enclosures~~ interior exit stairways, interior exit ramps, exit passageways, horizontal exits, exterior exit stairways~~,~~ and exterior exit ramps ~~and horizontal exits~~.

EXIT ACCESS DOORWAY. A door or access point along the path of egress travel from an occupied room, area or space where the path of egress enters an intervening room, corridor, ~~unenclosed~~ exit access stair or ~~unenclosed~~ exit access ramp.

EXIT ACCESS RAMP. An interior ramp that is not a required interior exit ramp.

EXIT ACCESS STAIRWAY. An interior stairway that is not a required interior exit stairway.

~~**EXIT ENCLOSURE.** An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives, and provides for a protected path of egress travel in a vertical or horizontal direction to the exit discharge or the public way.~~

INTERIOR EXIT RAMP. An exit component that serves to meet one or more means of egress design requirements, such as required number of exits or exit access travel distance, and provides for a protected path of egress travel to the exit discharge or public way.

INTERIOR EXIT STAIRWAY. An exit component that serves to meet one or more means of egress design requirements, such as required number of exits or exit access travel distance, and provides for a protected path of egress travel to the exit discharge or public way.

SECTION 1009 (IFC [B] 1009)
STAIRWAYS

1009.1 (IFC [B] 1009.1)General. Stairways serving occupied portions of a building shall comply with the requirements of this section.

1009.2 (IFC [B] 1009.2) Interior exit stairways. Interior exit stairways shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1.

1009.2.1 (IFC [B] 1009.2.1) Where required. Interior exit stairways shall be included, as necessary, to meet one or more means of egress design requirements, such as required number of exits or exit access travel distance.

1009.2.2 (IFC [B] 1009.2.2) Enclosure. All interior exit stairways shall be enclosed in accordance with the provisions of Section 1022.

1009.3 (IFC [B] 1009.3) Exit access stairways. Floor openings between stories created by exit access stairways shall be enclosed.

Exceptions:

1. In other than Group I-2 and I-3 occupancies, exit access stairways that serve, or atmospherically communicate between, only two stories, are not required to be enclosed.
2. Exit access stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
3. In buildings with only Group B or M occupancies, exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13.
4. In other than Groups B and M occupancies, exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the floor opening does not connect more than four stories, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13.
5. Exit access stairways within an atrium complying with the provisions of Section 404 are not required to be enclosed.
6. Exit access stairways and ramps in open parking garages that serve only the parking garage are not required to be enclosed.
7. Stairways serving outdoor facilities where all portions of the means of egress are essentially open to the outside are not required to be enclosed.
8. Exit access stairways serving stages complying with Section 410.5.3.1 and 1015.6 are not required to be enclosed.
9. Stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.
10. In Group I-3 occupancies, exit access stairways constructed in accordance with Section 408.5 are not required to be enclosed.

1009.3.1 (IFC [B] 1009.3.1) Construction. Where required, enclosures for exit access stairways shall be constructed in accordance with this section. Exit access stairway enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.

1009.3.1.1 (IFC [B] 1009.3.1.1) Materials. Exit access stairway enclosures shall be of materials permitted by the building type of construction.

1009.3.1.2 (IFC [B] 1009.3.1.2) Fire-resistance rating. Exit access stairway enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more, and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit access stairway enclosures shall include any basements, but not any mezzanines. Exit access stairway enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

1009.3.1.3 (IFC [B] 1009.3.1.3) Continuity. Exit access stairway enclosures shall have continuity in accordance with Section 707.5 for fire barriers or Section 712.4 for horizontal assemblies as applicable.

1009.3.1.4 (IFC [B] 1009.3.1.4) Openings. Openings in an exit access stairway enclosure shall be protected in accordance with Section 715 as required for fire barriers. Doors shall be self- or automatic-closing by smoke detection in accordance with Section 715.4.8.3.

1009.3.1.4.1 (IFC [B] 1009.3.1.4.1) Prohibited openings. Openings other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.

1009.3.1.5 (IFC [B] 1009.3.1.5) Penetrations. Penetrations in an exit access stairway enclosure shall be protected in accordance with Section 713 as required for fire barriers.

1009.3.1.5.1 (IFC [B] 1009.3.1.5.1) Prohibited penetrations. Penetrations other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.

1009.3.1.6 (IFC [B] 1009.3.1.6) Joints. Joints in an exit access stairway enclosure shall comply with Section 714.

1009.3.1.7 (IFC [B] 1009.3.1.7) Ducts and air transfer openings. Penetrations of an exit access stairway enclosure by ducts and air transfer openings shall comply with Section 716.

1009.3.1.8 (IFC [B] 1009.3.1.8) Exterior walls. Where exterior walls serve as a part of an exit access stairway enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply.

1009.4 ~~1009.1~~ (IFC [B] 1009.4 ~~1009.1~~) Stairway width. *(No change to text)*

(Renumber subsequent sections)

SECTION 1010
RAMPS

1010.2 (IFC [B] 1010.2) Enclosure. All interior exit ramps shall be enclosed in accordance with the applicable provisions of Section 1022. Exit access ramps shall be enclosed in accordance with the provisions of Section 1009.3 for enclosure of stairways.

(Renumber subsequent sections)

~~1010.7~~ 1010.8 (IFC [B] ~~1010.7~~ 1010.8) Ramp construction. All ramps shall be built of materials consistent with the types permitted for the type of construction of the building, except that wood handrails shall be permitted for all types of construction. ~~Ramps used as an exit shall conform to the applicable requirements of Sections 1022.1 through 1022.6 for exit enclosures.~~

SECTION 1016 (IFC [B] 1016)
EXIT ACCESS TRAVEL DISTANCE

1016.1 (IFC [B] 1016.1) General ~~Travel distance limitations~~. Travel distance within the exit access portion of the means of egress system shall be in accordance with this section. ~~Exits shall be so located on each story such that the maximum length of exit access travel, measured from the most remote point within a story along the natural and unobstructed path of egress travel to an exterior exit door at the level of exit discharge, an entrance to a vertical exit enclosure, an exit passageway, a horizontal exit, an exterior exit stairway or an exterior exit ramp shall not exceed the distances given in Table 1016.1.~~

~~Exceptions:~~

1. ~~Travel distance in open parking garages is permitted to be measured to the closest riser of open exit stairways.~~
2. ~~In outdoor facilities with open exit access components and open exterior exit stairways or exit ramps, travel distance is permitted to be measured to the closest riser of an exit stairway or the closest slope of the exit ramp.~~
3. ~~In other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps when connecting a maximum of two stories. The two connected stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~
4. ~~In other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps in the first and second stories above grade plane in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories above grade plane shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~

~~5. Where applicable, travel distance on unenclosed exit access stairways or ramps and on connecting stories shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.~~

1016.2 (IFC [B] 1016.2) Limitations. Exit access travel distance shall not exceed the values given in Table 1016.2.

TABLE ~~1016.1~~ 1016.2 (IFC [B] TABLE ~~1016.1~~ 1016.2)
EXIT ACCESS TRAVEL DISTANCE[a]
(Portions of table not shown remain unchanged)

~~1016.2~~ 1016.2.1 (IFC [B] ~~1016.2~~ 1016.2.1) Exterior egress balcony increase. Exit access travel distances specified in ~~Section 1016.1~~ Table 1016.2 shall be increased up to an additional 100 feet (30 480 mm) provided the last portion of the exit access leading to the exit occurs on an exterior egress balcony constructed in accordance with Section 1019. The length of such balcony shall not be less than the amount of the increase taken.

1016.3 (IFC [B] 1016.3) Measurement. Exit access travel distance shall be measured from the most remote point within a story along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit.

Exceptions:

1. In open parking garages, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.
2. In outdoor facilities with open exit access components, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.

1016.3.1 (IFC [B] 1016.3.1) Exit access stairways and ramps. Travel distance on exit access stairways or ramps shall be included in the exit access travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stair and landings. The measurement along ramps shall be made on the walking surface in the center of the ramp and landings.

SECTION 1021(IFC [B] 1021)
NUMBER OF EXITS AND ~~CONTINUITY~~ EXIT CONFIGURATION

1021.1 (IFC [B] 1021.1) General. Each story and occupied roof shall have the minimum number of exits, or access to exits, as specified in this section. The required number of exits, or exit access stairways or ramps providing access to exits, from any story shall be maintained until arrival at grade or a public way. Exits or access to exits from any story shall be configured in accordance with this section. Each story above the second story of a building shall have a minimum of one interior or exterior exit stairway, or interior or exterior exit ramp. At each story above the second story that requires a minimum of three or more exits, or access to exits, a minimum of 50% of the required exits shall be interior or exterior exit stairways, or interior or exterior exit ramps.

Exceptions:

1. Interior exit stairways and interior exit ramps are not required in open parking garages where the means of egress serves only the open parking garage.
2. Interior exit stairways and interior exit ramps are not required in outdoor facilities where all portions of the means of egress are essentially open to the outside.

~~**1021.1 (IFC [B] 1021.1) Exits from stories.** All spaces within each story shall have access to the minimum number of approved independent exits as specified in Table 1021.1 based on the occupant load of the story. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories.~~

~~**Exceptions:**~~

~~1. As modified by Section 403.15 (Additional exit stairway).~~
~~2. As modified by Section 1021.2.~~
~~3. Exit access stairways and ramps that comply with Exception 3 or 4 of Section 1016.1 shall be permitted to provide the minimum number of approved independent exits required by Table 1021 on each story.~~
~~4. In Groups R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~

5. Within a story, rooms and spaces complying with Section 1015.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit.

The required number of exits from any story shall be maintained until arrival at grade or the public way.

TABLE 1021.1 (IFC [B] TABLE 1021.1)
MINIMUM NUMBER OF EXITS FOR OCCUPANT LOAD

OCCUPANT LOAD (persons per story)	MINIMUM NUMBER OF EXITS (per story)
1-500	2
501-1,000	3
More than 1,000	4

1021.1.2 (IFC [B] 1021.1.2) Parking structures. Parking structures shall not have less than two exits from each parking tier, except that only one exit is required where vehicles are mechanically parked. Unenclosed vehicle ramps shall not be considered as required exits unless pedestrian facilities are provided.

1021.1.3 (IFC [B] 1021.1.3) Helistops. The means of egress from helistops shall comply with the provisions of this chapter, provided that landing areas located on buildings or structures shall have two or more exits. For landing platforms or roof areas less than 60 feet (18 288 mm) long, or less than 2,000 square feet (186 m^2) in area, the second means of egress is permitted to be a fire escape, alternating tread device or ladder leading to the floor below.

1021.2 (IFC [B] 1021.2) Number of exits Single exits. Only one exit shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single exit in buildings otherwise required to have more than one exit if the areas served by the single exit do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single exit shall not be located more than one story below grade plane. Two exits, or exit access stairways or ramps providing access to exits, from any story or occupied roof shall be provided where one of the following conditions exists:

1. The occupant load exceeds one of the values in Table 1021.2.
2. The exit access travel distance exceeds that specified in Table 1021.2 as determined in accordance with the provisions of Section 1016.1.
3. Helistop landing areas located on buildings or structures shall be provided with two exits, or exit access stairways or ramps providing access to exits.

Exceptions:

1. Rooms, areas and spaces complying with Section 1015.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit.
2. Group R-3 occupancy buildings shall be permitted to have a one exit.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one exit,
4. Air traffic control towers shall be provided with the minimum number of exits specified in Section 412.3.
5. Individual dwelling units with a maximum occupant load of 20 in Group R-2 and R-3 occupancies shall be permitted to one exit.
6. Group R-3 and R-4 congregate residences shall be permitted to have one exit.

Where one exit, or exit access stairway or ramp providing access to exits at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with one exit shall not be located more than one story below grade plane.

TABLE 1021.2 (IFC [B] TABLE 1021.2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT

STORY	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER ~~FLOOR~~ STORY	~~AND~~ MAXIMUM EXIT ACCESS TRAVEL DISTANCE
First story or basement	A, B[b,d], E[c,e], F[b,d], M, U, S[b,d]	49 occupants ~~and~~	75 feet
	H-2, H-3	3 occupants ~~and~~	25 feet
	H-4, H-5, I, R	10 occupants ~~and~~	75 feet
	S	29 occupants ~~and~~	100 feet
Second story	B[b], F, M, S[a]	29 occupants ~~and~~	75 feet
	R-2	4 dwelling units ~~and~~	50 feet
Third story	R-2[a,c]	4 dwelling units ~~and~~	50 feet
Fourth story and above	NP	NA	NA

For SI: 1 foot = 3048.mm

NP – Not Permitted

NA – Not Applicable

~~a. For the required number of exits for parking structures, see Section 1021.1.2.~~

~~b. For the required number of exits for air traffic control towers, see Section 412.3.~~

~~c.~~ a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1026.

~~d.~~ b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.

~~e.~~ c. Day care occupancies shall have a maximum occupant load of 10.

1021.2.1 (IFC [B] 1021.2.1) Three or more exits. Three exits, or exit access stairways or ramps providing access to exits at other stories, shall be provided from any story or occupied roof with an occupant load of 501-1,000. Four exits, or exit access stairways or ramps providing access to exits at other stories, shall be provided from any story or occupied roof with an occupant load greater than 1,000.

1021.2.2 (IFC [B] 1021.2.2) Additional exits. In buildings over 420 feet in height, additional exits shall be provided in accordance with Section 403.5.2.

1021.3 (IFC [B] 1021.3) Exit configuration ~~continuity~~. Exits, or exit access stairways or ramps providing access to exits at other stories, shall be arranged in accordance with the provisions of Section 1015.2 through 1015.2.2. Exits shall be continuous from the point of entry into the exit to the exit discharge.

1021.3.1 (IFC [B] 1021.3.1) Access to exits at adjacent levels. Access to exits at other levels shall be by stairways or ramps. Where access to exits occurs from adjacent building levels, the horizontal and vertical exit access travel distance to the closest exit shall not exceed that specified in Section 1016.1. Access to exits at other levels shall be from an adjacent story.

Exception: Landing platforms or roof areas for helistops that are less than 60 feet (18 288 mm) long, or less than 2,000 square feet (186 m^2) in area, shall be permitted to access the second exit by a fire escape, alternating tread device or ladder leading to the story or level below.

1021.4 (IFC [B] 1021.4) Vehicular ramps. Vehicular ramps shall not be considered as an exit access ramp unless pedestrian facilities are provided.

~~**1021.4 (IFC [B] 1021.4) Exit door arrangement.** Exit door arrangement shall meet the requirements of Sections 1015.2 through 1015.2.2.~~

SECTION 1022 (IFC [B] 1022)
~~EXIT ENCLOSURES~~ INTERIOR EXIT STAIRWAYS AND RAMPS

1022.1 (IFC [B] 1022.1) General. Interior exit stairways and interior exit ramps serving as an exit component in a means of egress system shall comply with the requirements of this section. Interior exit stairways and ramps shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An interior exit stairway or ramp shall not be used for any purpose other than as a means of egress.

~~1022.1~~ **1022.2 (IFC [B] ~~1022.1~~ 1022.2) ~~Enclosures required~~ Construction.** Enclosures for interior exit stairways and ~~interior exit~~ ramps shall be ~~enclosed with~~ constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Interior exit stairway and ramp ~~Exit~~ enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit stairways or ramps ~~exit enclosure~~ shall include any basements, but not any mezzanines. Interior exit stairways and ramps ~~exit enclosures~~ shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. ~~Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.~~

~~Exceptions~~ **Exception:** Interior exit stairways and ramps in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.

1. ~~In all occupancies, other than Groups H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.~~
   - ~~1.1 The stairway is open to not more than one story above its level of exit discharge; or~~
   - ~~1.2 The stairway is open to not more than one story below its level of exit discharge.~~
2. ~~Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.~~
3. ~~Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.~~
4. ~~Stairways in open parking structures that serve only the parking structure are not required to be enclosed.~~
5. ~~Stairways in Group I-3 occupancies, as provided for in Section 408.3.8, are not required to be enclosed.~~
6. ~~Means of egress stairways as required by Sections 410.5.3 and 1015.6.1 are not required to be enclosed.~~
7. ~~Means of egress stairways from balconies, galleries and press boxes as provided for in Section 1028.5.1, are not required to be enclosed.~~

~~1022.2~~ **1022.3 (IFC [B] ~~1022.2~~ 1022.3) Termination.** ~~Exit enclosures~~ Interior exit stairways and ramps shall terminate at an exit discharge or a public way.

Exception: ~~An exit enclosures~~ Interior exit stairways and ramps shall be permitted to terminate at an exit passageway complying with Section 1023, provided the exit passageway terminates at an exit discharge or a public way.

~~1022.2.1~~ **1022.3.1 (IFC [B] ~~1022.2.1~~ 1022.3.1) Extension.** Where ~~an exit enclosures~~ interior exit stairways and ramps are ~~is~~ extended to an exit discharge or a public way by an exit passageway, the ~~exit enclosure~~ interior exit stairway and ramp shall be separated from the exit passageway by a fire barrier constructed in accordance with Section 707 or a horizontal assembly constructed in accordance with Section 712, or both. The fire-resistance rating shall be at least equal to that required for the ~~exit enclosure~~ interior exit stairway and ramp. A fire door assembly complying with Section 715.4 shall be installed in the fire barrier to provide a means of egress from the ~~exit enclosure~~ interior exit stairway and ramp to the exit passageway. Openings in the fire barrier other than the fire door assembly are prohibited. Penetrations of the fire barrier are prohibited.

Exception: Penetrations of the fire barrier in accordance with Section 1022.4 shall be permitted.

~~1022.3~~ **1022.4 (IFC [B] ~~1022.3~~ 1022.4) Openings and penetrations**. ~~Exit enclosure~~ Interior exit stairway and ramp opening protectives shall be in accordance with the requirements of Section 715.

Openings ~~in exit enclosures~~ interior exit stairways and ramps other than unprotected exterior openings shall be limited to those necessary for exit access to the enclosure from normally occupied spaces and for egress from the enclosure.

Elevators shall not open into ~~an exit enclosures~~ Interior exit stairways and ramps.

~~1022.4~~ **1022.5 (IFC [B] ~~1022.4~~ 1022.5) Penetrations.** Penetrations into and openings through ~~an exit enclosure~~ Interior exit stairways and ramps are prohibited except for required exit doors, equipment and ductwork necessary for independent ventilation or pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication systems and electrical raceway serving the ~~exit enclosure~~ interior exit stairway and ramp and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in

accordance with Section 713. There shall be no penetrations or communication openings, whether protected or not, between adjacent ~~exit enclosures~~ interior exit stairways and ramps.

~~1022.5~~ 1022.6 (IFC [B] ~~1022.5~~ 1022.6) Ventilation. Equipment and ductwork for ~~exit enclosure~~ interior exit stairway and ramp ventilation as permitted by Section 1022.4 shall comply with one of the following items:

1. Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the ~~exit enclosure~~ interior exit stairway and ramp by ductwork enclosed in construction as required for shafts.
2. Where such equipment and ductwork is located within the ~~exit enclosure~~ interior exit stairway and ramp, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or such air shall be conveyed through ducts enclosed in construction as required for shafts.
3. Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required for shafts.

In each case, openings into the fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by opening protectives in accordance with Section 715 for shaft enclosures.

The ~~Exit enclosure~~ interior exit stairway and ramp ventilation systems shall be independent of other building ventilation systems.

~~1022.6~~ 1022.7 (IFC [B] ~~1022.6~~ 1022.7) ~~Exit enclosure~~ Interior exit stairway and ramp exterior walls. Exterior walls of the ~~an exit enclosure~~ interior exit stairway and ramp shall comply with the requirements of Section 705 for exterior walls. Where nonrated walls or unprotected openings enclose the exterior of the stairway and the walls or openings are exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than ¾ hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the topmost landing of the stairway or to the roof line, whichever is lower.

~~1022.7~~ 1022.8 (IFC [B] ~~1022.7~~ 1022.8) Discharge identification. ~~A stairway in an exit enclosure An~~ interior exit stairway and ramp shall not continue below its level of exit discharge unless an approved barrier is provided at the level of exit discharge to prevent persons from unintentionally continuing into levels below. Directional exit signs shall be provided as specified in Section 1011.

~~1022.8~~ 1022.9 (IFC [B] ~~1022.8~~ 1022.9) Floor identification signs. A sign shall be provided at each floor landing in ~~exit enclosures~~ an interior exit stairway and ramp connecting more than three stories designating the floor level, the terminus of the top and bottom of the ~~exit enclosure~~ interior exit stairway and ramp and the identification of the stair or ramp. The signage shall also state the story of, and the direction to, the exit discharge and the availability of roof access from the ~~enclosure~~ interior exit stairway and ramp for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. Floor level identification signs in tactile characters complying with ICC A117.1 shall be located at each floor level landing adjacent to the door leading from the ~~enclosure~~ interior exit stairway and ramp into the corridor to identify the floor level.

~~1022.8.1~~ 1022.9.1 (IFC [B] ~~1022.8.1~~ 1022.9.1) Signage requirements. Stairway identification signs shall comply with all of the following requirements:

1. The signs shall be a minimum size of 18 inches (457 mm) by 12 inches (305 mm).
2. The letters designating the identification of the ~~stair enclosure~~ interior exit stairway and ramp shall be a minimum of 11/2 inches (38 mm) in height.
3. The number designating the floor level shall be a minimum of 5 inches (127 mm) in height and located in the center of the sign.
4. All other lettering and numbers shall be a minimum of 1 inch (25 mm) in height.
5. Characters and their background shall have a nonglare finish. Characters shall contrast with their background, with either light characters on a dark background or dark characters on a light background.
6. When signs required by Section 1022.8 are installed in ~~interior exit enclosures~~ the interior exit stairways and ramps of buildings subject to Section 1024, the signs shall be made of the same materials as required by Section 1024.4.

~~1022.9~~ 1022.10 (IFC [B] ~~1022.9~~ 1022.10) Smokeproof enclosures and pressurized stairways and ramps. In buildings required to comply with Section 403 or 405, each of the ~~exit enclosures~~ interior exit stairways and ramps

serving a story with a floor surface located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access or more than 30 feet (9144 mm) below the finished floor of a level of exit discharge serving such stories shall be a smokeproof enclosure or pressurized stairway or ramp in accordance with Section 909.20.

SECTION 403
HIGH-RISE BUILDINGS

403.2.3 Structural integrity of interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures. For high-rise buildings of occupancy category III or IV in accordance with Section 1604.5, and for all buildings that are more than 420 feet (128 000 mm) in building height, enclosures for interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures shall comply with Sections 403.2.3.1 through 403.2.3.4.

403.2.3.1 Wall assembly. The wall assemblies making up the enclosures for interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures shall meet or exceed Soft Body Impact Classification Level 2 as measured by the test method described in ASTM C 1629/C 1629M.

403.2.3.2 Wall assembly materials. The face of the wall assemblies making up the enclosures for interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures that are not exposed to the interior of the enclosures for interior exit stairways ~~exit enclosures~~ or elevator hoistway enclosure shall be constructed in accordance with one of the following methods:

1. The wall assembly shall incorporate not less than two layers of impact-resistant construction board each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C 1629/C 1629M.
2. The wall assembly shall incorporate not less than one layer of impact-resistant construction material that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C 1629/C 1629M.
3. The wall assembly incorporates multiple layers of any material, tested in tandem, that meet or exceed Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C 1629/C 1629M.

403.5.1 Remoteness of interior exit stairways ~~enclosures~~. ~~The~~ Required interior exit ~~stairway~~ stairways ~~enclosures~~ shall be separated by a distance not less than 30 feet (9144 mm) or not less than one-fourth of the length of the maximum overall diagonal dimension of the building or area to be served, whichever is less. The distance shall be measured in a straight line between the nearest points of the ~~exit stairway enclosures~~ interior exit stairways. In buildings with three or more interior exit stairway ~~enclosures~~, at least two of the interior exit stairway ~~enclosures~~ shall comply with this section. Interlocking or scissor stairs shall be counted as one interior exit stairway.

403.5.4 Smokeproof ~~exit~~ enclosures. Every required exit stairway serving floors more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access shall comply with Sections 909.20 and 1022.9.

SECTION 408
GROUP I-3

408.3.8 Interior exit stairway and ramp construction ~~enclosures~~. One ~~of the required~~ interior exit stairway or ramp ~~exit enclosures~~ in each building shall be permitted to have glazing installed in doors and interior walls at each landing level providing access to the ~~enclosure~~ interior exit stairway or ramp, provided that the following conditions are met:

1. The interior exit stairway or ramp ~~exit enclosures~~ shall not serve more than four floor levels.
2. Exit doors shall not be less than 3/4-hour fire door assemblies complying with Section 715.4
3. The total area of glazing at each floor level shall not exceed 5,000 square inches ($3m^2$) and individual panels of glazing shall not exceed 1,296 square inches ($0.84\ m^2$).
4. The glazing shall be protected on both sides by an automatic sprinkler system. The sprinkler system shall be designed to wet completely the entire surface of any glazing affected by fire when actuated.
5. The glazing shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler system operates.
6. Obstructions, such as curtain rods, drapery traverse rods, curtains, drapes or similar materials shall not be installed between the automatic sprinklers and the glazing.

SECTION 410
STAGES AND PLATFORMS

410.5.3.1 Stairway and ramp enclosure. Exit access stairways and ramps serving the stage are not required to be enclosed. Exit access stairways serving the lighting and access catwalks, galleries and gridirons are not required to be enclosed.

SECTION 705
EXTERIOR WALLS

705.2 Projections. Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall shall conform to the requirements of this section and Section 1406. Exterior egress balconies and exterior exit stairways and ramps shall also comply with Sections 1019 and 1026, respectively. Projections shall not extend beyond the distance determined by the following three methods, whichever results in the lesser projection:

1. A point one-third the distance from the exterior face of the wall to the lot line where protected openings or a combination of protected and unprotected openings are required in the exterior wall.
2. A point one-half the distance from the exterior face of the wall to the lot line where all openings in the exterior wall are permitted to be unprotected or the building is equipped throughout with an automatic sprinkler system installed under the provisions of Section 705.8.2.
3. More than 12 inches (305 mm) into areas where openings are prohibited.

Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section.

SECTION 707
FIRE BARRIERS

707.3.2 Interior exit stairway and ramp construction ~~enclosures~~. The fire-resistance rating of the fire barrier separating building areas from an interior exit stairway or ramp shall comply with Section 1022.1.

707.3.3 Enclosures for exit access stairways. The fire-resistance rating of the fire barrier separating building areas from an exit access stairway or ramp shall comply with Section 1009.3.1.2.

707.4 Exterior walls. Where exterior walls serve as a part of a required fire-resistance-rated shaft or stairway or ramp ~~exit~~ enclosure, or separation, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure or separation requirements shall not apply.

Exception: Exterior walls required to be fire-resistance rated in accordance with Section 1019 for exterior egress balconies, Section ~~1022.6~~ 1022.7 for interior exit stairways and ramps ~~enclosures~~ and Section 1026.6 for exterior exit stairways and ramps ~~and stairways~~.

707.5.1 Supporting construction. The supporting construction for fire barriers shall be protected to afford the required fire-resistance rating of the fire barrier supported. Hollow vertical spaces within a fire barrier shall be fireblocked in accordance with Section 717.2 at every floor level.

Exceptions:

1. The maximum required fire-resistance rating for assemblies supporting fire barriers separating tank storage as provided in Section 415.6.2.1 shall be 2 hours, but not less than required by Table 601 for the building construction type.
2. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 707.12.
3. Supporting construction for 1-hour fire barriers required by Table 508.2.5 in buildings of Type IIB, IIIB and VB construction is not required to be fire-resistance rated unless required by other sections of this code.
4. Interior exit stairway and ramp enclosures required by Section 1022.2 and exit access stairway and ramp enclosures required by Section 1009.3 shall be permitted to terminate at a top enclosure complying with Section 707.12.

707.6 Openings. Openings in a fire barrier shall be protected in accordance with Section 715. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15 m^2). Openings in enclosures for exit access stairways and ramps, interior

exit stairways and ramps ~~exit enclosures~~ and exit passageways shall also comply with Sections 1022.3 and 1023.5, respectively.

Exceptions:

1. Openings shall not be limited to 156 square feet (15 m^2) where adjoining floor areas are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door serving ~~an~~ enclosures for exit access stairways, exit access ramps, interior exit stairways and interior exit ramps ~~exit enclosures~~.
3. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective has been tested in accordance with ASTME 119 orUL263 and has a minimum fire-resistance rating not less than the fire-resistance rating of the wall.
4. Fire window assemblies permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of the length of the wall.
5. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door assembly in a fire barrier separating an enclosures for exit access stairways, exit access ramps, interior exit stairways and interior exit ramps ~~exit enclosures~~ from an exit passageway in accordance with Section 1022.2.1.

707.7.1 Prohibited penetrations. Penetrations into ~~an~~ enclosures for exit access stairways, exit access ramps, interior exit stairways, interior exit ramps ~~exit enclosures~~ or an exit passageway shall be allowed only when permitted by Section 1009.3.1.5, ~~1022.4~~ 1022.5 or 1023.6, respectively.

SECTION 708
SHAFT ENCLOSURES

708.1 General. The provisions of this section shall apply to shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Exit access stairways and exit access ramps shall be protected in accordance with the applicable provisions of Section 1009. Interior exit stairways and interior exit ramps shall be protected in accordance with the requirements of Section 1022. ~~Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.~~

708.2 Shaft enclosure required. Openings through a floor/ceiling assembly shall be protected by a shaft enclosure ~~complying with this section~~.

Exceptions:

1. A shaft enclosure is not required for openings totally within an individual residential dwelling unit and connecting four stories or less.
2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening ~~or stairway that is not a portion of the means of egress~~ protected according to Item 2.1 or 2.2.
   2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator ~~or stairway~~ and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
   2.2. Where the opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.3 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release therefrom.
3. A shaft enclosure is not required for penetrations by pipe, tube, conduit, wire, cable and vents protected in accordance with Section 713.4.
4. A shaft enclosure is not required for penetrations by ducts protected in accordance with Section 716.6. Grease ducts shall be protected in accordance with the International Mechanical Code.
5. In other than Group H occupancies, a shaft enclosure is not required for floor openings complying with the provisions for atriums in Section 404.

6. A shaft enclosure is not required for approved masonry chimneys where annular space is fireblocked at each floor level in accordance with Section 717.2.5.
7. In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following:
   7.1. Does not connect more than two stories.
   ~~7.2. Is not part of the required means of egress system.~~
   7.3. Is not concealed within the construction of a wall or a floor/ceiling assembly.
   7.4. Is not open to a corridor in Group I and R occupancies.
   7.5. Is not open to a corridor on nonsprinklered floors in any occupancy.
   7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.
   7.7. Is limited to the same smoke compartment.
8. A shaft enclosure is not required for automobile ramps in open and enclosed parking garages constructed in accordance with Sections 406.3 and 406.4, respectively.
9. A shaft enclosure is not required for floor openings between a mezzanine and the floor below.
10. A shaft enclosure is not required for joints protected by a fire-resistant joint system in accordance with Section 714.
~~11. A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 3 or 4 in Section 1016.1.~~
11~~12~~. Floor openings protected by floor fire doors in accordance with Section 712.8.
~~13. In Group I-3 occupancies, a shaft enclosure is not required for floor openings in accordance with Section 408.5.~~
12~~14~~. A shaft enclosure is not required for elevator hoistways in open or enclosed parking garages that serve only the parking garage.
13~~15~~. In open or enclosed parking garages a shaft enclosure is not required to enclose mechanical exhaust or supply duct systems when such duct system is contained within and serves only the parking garage.
14~~16~~. Where permitted by other sections of this code.

708.3 Construction. Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.

~~**708.3**~~ **708.4 Materials.** *(No change to text)*

~~**708.4**~~ **708.5 Fire-resistance rating.** *(No change to text)*

~~**708.5**~~ **708.6 Continuity.** *(No change to text)*

~~**708.6**~~ **708.7Exterior walls.** Where exterior walls serve as a part of a required shaft enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply.

Exception: Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section ~~1022.6~~ 1022.7 for interior exit stairways and ramps ~~exit enclosures~~ and Section 1026.6 for exterior exit stairways and ramps ~~and stairways~~.

(Renumber subsequent sections)

SECTION 709
FIRE PARTITIONS

709.5 Exterior walls. Where exterior walls serve as a part of a required fire-resistance-rated separation, such walls shall comply with the requirements of Section 705 for exterior walls, and the fire-resistance-rated separation requirements shall not apply.

Exception: Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section 1022.6 for interior exit stairways and ramps ~~exit enclosures~~ and Section 1026.6 for exterior exit stairways and ramps ~~and stairways~~.

SECTION 712
HORIZONTAL ASSEMBLIES

712.4 Continuity. Assemblies shall be continuous without openings, penetrations or joints except as permitted by this section and Sections 708.2, 713.4, 714, 1009.3 and 1022.1. Skylights and other penetrations through a fire-resistance-rated roof deck or slab are permitted to be unprotected, provided that the structural integrity of the fire-resistance-rated roof assembly is maintained. Unprotected skylights shall not be permitted in roof assemblies required to be fire-resistance rated in accordance with Section 704.10. The supporting construction shall be protected to afford the required fire-resistance rating of the horizontal assembly supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the horizontal assembly is not required to be fire-resistance-rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by Table 508.2.5, provided the required fire-resistance rating does not exceed 1 hour.
2. Horizontal assemblies at the separations of dwelling units and sleeping units as required by Section 420.3.
3. Horizontal assemblies at smoke barriers constructed in accordance with Section 710.

SECTION 715
OPENING PROTECTIVES

TABLE 715.4
FIRE DOOR AND FIRE SHUTTER FIRE PROTECTION RATINGS

TYPE OF ASSEMBLY	REQUIRED ASSEMBLY RATING (hours)	MINIMUM FIRE DOOR AND FIRE SHUTTER ASSEMBLY RATING (hours)
Fire barriers having a required fire-resistance rating of 1 hour: ~~Shaft, exit~~ Enclosures for shafts, exit access stairways, exit access ramps, interior exit stairways, interior exit ramps and exit passageway walls	1	1
Other fire barriers	1	3/4

(Portions of table not shown remain unchanged)

715.4.4 Doors in ~~exit enclosures~~ interior exit stairways and ramps and exit passageways. Fire door assemblies in interior exit stairways and ramps ~~exit enclosures~~ and exit passageways shall have a maximum transmitted temperature end point of not more than 450ºF (250ºC) above ambient at the end of 30 minutes of standard fire test exposure.

Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

715.4.6.1 Fire door labeling requirements. Fire doors shall be labeled showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or trademark of the third-party inspection agency, the fire protection rating and, where required for fire doors in interior exit stairways and ramps ~~exit enclosures~~ and exit passageways by Section 715.4.4, the maximum transmitted temperature end point. Smoke and draft control doors complying with UL 1784 shall be labeled as such and shall also comply with Section 715.4.6.3. Labels shall be approved and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.

715.4.7.2 ~~Exit and~~ Elevator, stairway and ramp protectives. Approved fire-protection-rated glazing used in fire door assemblies in elevator, stairways and ramps ~~exit~~ enclosures shall be so located as to furnish clear vision of the passageway or approach to the elevator, ~~ramp or~~ stairway or ramp.

SECTION 716
DUCT AND TRANSFER OPENINGS

716.5.2 Fire barriers. Ducts and air transfer openings of fire barriers shall be protected with approved fire dampers installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for stairways ramps ~~exit enclosures~~ and exit passageways except as permitted by Sections 1022.4 and 1023.6, respectively.

Exception: Fire dampers are not required at penetrations of fire barriers where any of the following apply:

1. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an approved smoke control system in accordance with Section 909 and where the use of a fire damper would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, are in areas of other than Group Hand are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

SECTION 803
WALL AND CEILING FINISHES

TABLE 803.9
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY[k]

GROUP	SPRINKLERED[l]			NONSPRINKLERED		
	Interior exit stairways, interior exit ramps ~~exit enclosures~~ and exit passageways [a, b]	Corridors and enclosure for exit access stairways and exit access ramps	Rooms and enclosed spaces[c]	Interior exit stairways, interior exit ramps ~~exit enclosures~~ and exit passageways [a, b]	Corridors and enclosure for exit access stairways and exit access ramps	Rooms and enclosed spaces[c]

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929m^2.

a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.11.1.

b. In other than Group I-3 occupancies ,~~exit enclosures of~~ in buildings less than three stories above grade plane ~~of other than Group I-3~~, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.

c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.

d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.

e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.

f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.

g. Class B material is required where the building exceeds two stories.

h. Class C interior finish materials shall be permitted in administrative spaces.

i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.

j. Class B materials shall be permitted as wainscotting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.

k. Finish materials as provided for in other sections of this code.

l. Applies when ~~the exit enclosures, exit passageways, corridors or rooms and enclosed spaces are~~ protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

SECTION 804
INTERIOR FLOOR FINISH

804.4 Interior floor finish requirements. In all occupancies, interior floor finish and floor covering materials for interior exit stairways and ramps ~~exit enclosures~~, exit passageways, corridors and rooms or spaces not separated from

corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux as specified in Section 804.4.1.

804.4.1 Minimum critical radiant flux. Interior floor finish and floor covering materials in enclosures for stairways and ramp ~~exit enclosures~~, exit passageways and corridors shall not be less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I-4, M, R-1, R-2 and S. In all areas, floor covering materials shall comply with the DOCFF-1 "pill test" (CPSC 16 CFR, Part 1630).

Exception: Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, Class II materials are permitted in any area where Class I materials are required, and materials complying with the DOC FF-1 "pill test" (CPSC 16 CFR, Part 1630) are permitted in any area where Class II Materials are required.

SECTION 1006 (IFC [B] 1006)
MEANS OF EGRESS ILLUMINATION

1006.3 (IFC [B] 1006.3) Illumination emergency power. The power supply for means of egress illumination shall normally be provided by the premises' electrical supply.

In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Aisles and unenclosed egress stairways in rooms and spaces that require two or more means of egress.
2. Corridors, interior exit stairways and ramps ~~exit enclosures~~ and exit passageways in buildings required to have two or more exits.
3. Exterior egress components at other than their levels of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.
4. Interior exit discharge elements, as permitted in Section 1027.1, in buildings required to have two or more exits.
5. Exterior landings as required by Section 1008.1.6 for exit discharge doorways in buildings required to have two or more exits.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

SECTION 1007 (IFC [B] 1007)
ACCESSIBLE MEANS OF EGRESS

1007.2 (IFC [B] 1007.2) Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
3. Interior exit access stairways between two stories complying with Sections 1007.3 and 1009.3.
~~3.~~4. Exterior exit stairways complying with Sections 1007.3 and 1026.
~~4.~~5. Elevators complying with Section 1007.4.
~~5.~~6. Platform lifts complying with Section 1007.5.
~~6.~~7. Horizontal exits complying with Section 1025.
~~7.~~8. Ramps complying with Section 1010.
~~8.~~9. Areas of refuge complying with Section 1007.6.

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.
2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.

1007.3 (IFC [B] 1007.3) Stairways. In order to be considered part of an accessible means of egress, ~~an exit access stairway as permitted by Section 1016.1 or exit~~ a stairway between stories shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit. Exit access stairways that connect levels in the same story are not permitted as part an accessible means of egress.

Exceptions:

1. ~~The area of refuge is not required at open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~
1. ~~2.~~ The clear width of 48 inches (1219 mm) between handrails is not required ~~at exit access stairways as permitted by Section 1016.1or exit stairways~~ in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
2. ~~3.~~ Areas of refuge are not required at ~~exit~~ stairways in buildings equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. ~~4.~~ The clear width of 48 inches (1219 mm) between handrails is not required for ~~exit~~ stairways accessed from a horizontal exit.
4. ~~5.~~ Areas of refuge are not required at ~~exit~~ stairways serving open parking garages.
5. ~~6.~~ Areas of refuge are not required for smoke protected seating areas complying with Section 1028.6.2.
6. ~~7.~~ The areas of refuge are not required in Group R-2 occupancies.

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway ~~within an exit enclosure~~ complying with Sections 1007.3 ~~and 1022~~ or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

~~Exceptions:~~

1. ~~A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.~~
2. ~~A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.~~

1007.6.2 (IFC [B] 1007.6.2) Separation. Each area of refuge shall be separated from the remainder of the story by a smoke barrier complying with Section 710 or a horizontal exit complying with Section 1025. Each area of refuge shall be designed to minimize the intrusion of smoke.

Exception: Areas of refuge located within an ~~exit~~ enclosure for exit access stairways or interior exit stairways.

1007.7.2 (IFC [B] 1007.7.2) Exterior ~~exit~~ stairway. Exterior ~~exit~~ stairways that are part of the means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) between handrails.

1007.8 (IFC [B] 1007.8) Two-way communication. A two-way communication system shall be provided at the elevator landing on each accessible floor that is one or more stories above or below the story of exit discharge complying with Sections 1007.8.1 and 1007.8.2.

Exceptions:

1. Two-way communication systems are not required at the elevator landing where the two-way communication system is provided within areas of refuge in accordance with Section 1007.6.3.
2. Two-way communication systems are not required on floors provided with ~~exit~~ ramps conforming to the provisions of Section 1010.

SECTION 1015 (IFC [B] 1015)
EXIT AND EXIT ACCESS DOORWAYS

1015.2.1 (IFC [B] 1015.2.1) Two exits or exit access doorways. Where two exits or exit access doorways are required from any portion of the exit access, the exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access doorways. Interlocking or scissor stairs shall be counted as one ~~exit~~ stairway.

Exceptions:

1. Where ~~exit enclosures~~ interior exit stairways are ~~provided as a portion of the required exit and are~~ interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1018, the required exit separation shall be measured along the shortest direct line of travel within the corridor.
2. Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

SECTION 1023 (IFC [B] 1023)
EXIT PASSAGEWAYS

1023.3 (IFC [B] 1023.3) Construction. Exit passageway enclosures shall have walls, floors and ceilings of not less than 1-hour fire-resistance rating, and not less than that required for any connecting ~~exit enclosure~~ interior exit stairway or ramp. Exit passageways shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

1023.5 (IFC [B] 1023.5) Openings and penetrations. Exit passageway opening protectives shall be in accordance with the requirements of Section 715.

Except as permitted in Section 402.4.6, openings in exit passageways other than exterior openings shall be limited to those necessary for exit access to the exit passageway from normally occupied spaces and for egress from the exit passageway.

Where an ~~exit enclosure~~ interior exit stairway or ramp is extended to an exit discharge or a public way by an exit passageway, the exit passageway shall also comply with Section 1022.2.1.

Elevators shall not open into an exit passageway.

SECTION 1024 (IFC [B] 1024)
LUMINOUS EGRESS PATH MARKINGS

1024.2 (IFC [B] 1024.2) Markings within exit components ~~enclosures~~. Egress path markings shall be provided in ~~exit enclosures, including vertical exit enclosures~~ interior exit stairways, interior exit ramps and exit passageways, in accordance with Sections 1024.2.1 through 1024.2.6.

1024.2.4 (IFC [B] 1024.2.4) Perimeter demarcation lines. Stair landings and other floor areas within ~~exit enclosures~~ interior exit stairways, interior exit ramps and exit passageways, with the exception of the sides of steps, shall be provided with solid and continuous demarcation lines on the floor or on the walls or a combination of both. The stripes shall be 1 to 2 inches (25mm to 51 mm) wide with interruptions not exceeding 4 inches (102 mm).

Exception: The minimum width of 1 inch (25 mm) shall not apply to outlining stripes listed in accordance with UL 1994.

1024.2.4.1 (IFC [B] 1024.2.4.1) Floor-mounted demarcation lines. Perimeter demarcation lines shall be placed within 4 inches (102 mm) of the wall and shall extend to within 2 inches (51 mm) of the markings on the leading edge of landings. The demarcation lines shall continue across the floor in front of all doors.

Exception: Demarcation lines shall not extend in front of exit discharge doors that lead out of an exit ~~enclosure~~ and through which occupants must travel to complete the exit path.

1024.2.4.2 (IFC [B] 1024.2.4.2) Wall-mounted demarcation lines. Perimeter demarcation lines shall be placed on the wall with the bottom edge of the stripe no more than 4 inches (102 mm) above the finished floor. At the top or bottom of the stairs, demarcation lines shall drop vertically to the floor within 2 inches (51 mm) of the step or landing edge. Demarcation lines on walls shall transition vertically to the floor and then extend across the floor where a line on the floor is the only practical method of outlining the path. Where the wall line is broken by a door, demarcation lines on walls shall continue across the face of the door or transition to the floor and extend across the floor in front of such door.

Exception: Demarcation lines shall not extend in front of exit discharge doors that lead out of an exit ~~enclosure~~ and through which occupants must travel to complete the exit path.

1024.2.6 (IFC [B] 1024.2.6) Doors within the exit path ~~from exit enclosures~~. Doors through which occupants ~~within an exit enclosure~~ must pass in order to complete the exit path shall be provided with markings complying with Sections 1024.2.6.1 through 1024.2.6.3.

1024.3 (IFC [B] 1024.3) Uniformity. Placement and dimensions of markings shall be consistent and uniform throughout the same ~~exit~~ enclosure.

1024.5 (IFC [B] 1024.5) Illumination. ~~Exit enclosures~~ Where photoluminescent exit path markings are installed shall be provided with the minimum means of egress illumination required by Section 1006 for at least 60 minutes prior to periods when the building is occupied.

SECTION 1025 (IFC [B] 1025)
HORIZONTAL EXIT

1025.4 (IFC [B] 1025.4) Capacity of refuge area. The refuge area of a horizontal exit shall be a space occupied by the same tenant or a public area and each such refuge area shall be adequate to accommodate the original occupant load of the refuge area plus the occupant load anticipated from the adjoining compartment. The anticipated occupant load from the adjoining compartment shall be based on the capacity of the horizontal exit doors entering the refuge area. The capacity of the refuge area shall be computed based on a net floor area allowance of 3 square feet (0.2787 m^2) for each occupant to be accommodated therein.

Exception: The net floor area allowable per occupant shall be as follows for the indicated occupancies:

1. Six square feet (0.6 m^2) per occupant for occupancies in Group I-3.
2. Fifteen square feet (1.4 m^2) per occupant for ambulatory occupancies in Group I-2.
3. Thirty square feet (2.8 m^2) per occupant for nonambulatory occupancies in Group I-2.

The refuge area into which a horizontal exit leads shall be provided with exits adequate to meet the occupant requirements of this chapter, but not including the added occupant load imposed by persons entering it through horizontal exits from other areas. At least one refuge area exit shall lead directly to the exterior or to an interior exit stairway or ramp ~~exit enclosure~~.

Exception: The adjoining compartment shall not be required to have a stairway or door leading directly outside, provided the refuge area into which a horizontal exit leads as stairways or doors leading directly outside and are so arranged that egress shall not require the occupants to return through the compartment from which egress originates.

SECTION 1026 (IFC [B] 1026)
EXTERIOR EXIT ~~RAMPS AND~~ STAIRWAYS AND RAMPS

1026.6 (IFC [B] 1026.6) Exterior ~~ramps and~~ stairway and ramp protection. Exterior exit ~~ramps and~~ stairways and ramps shall be separated from the interior of the building as required in Section 1022.1. Openings shall be limited to those necessary for egress from normally occupied spaces.

Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are no more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.

2. Separation from the interior of the building is not required where the exterior ~~ramp or~~ stairway or ramp is served by an exterior ramp or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior ~~ramp or~~ stairway or ramp located in a building or structure that is permitted to have unenclosed ~~interior~~ exit access stairways in accordance with Section 1009.3 ~~1022.1~~.
4. Separation from the interior of the building is not required for exterior ~~ramps or~~ stairways or ramps connected to open-ended corridors, provided that Items 4.1 through 4.4 are met:
   4.1 The building, including corridors, ~~ramps or~~ stairways or ramps, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
   4.2 The open-ended corridors comply with Section 1018.
   4.3 The open-ended corridors are connected on each end to an exterior exit ~~ramp or~~ stairway or ramp complying with Section 1026.
5. At any location in an open-ended corridor where a change of direction exceeding 45 degrees 0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior ~~ramp or~~ stairway or ramp shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

SECTION 1027 (IFC [B] 1027)
EXIT DISCHARGE

1027.1 (IFC [B] 1027.1) General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 below shall not exceed 50 percent of the number and capacity of the required exits.

Exceptions:

1. A maximum of 50 percent of the number and capacity of ~~the exit enclosures~~ interior exit stairways and ramps is permitted to egress through areas on the level of discharge provided all of the following are met:
   1.1 Such ~~exit~~ enclosures egress to a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the ~~exit~~ enclosure.
   1.2 The entire area of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the ~~exit~~ enclosure.
   1.3 The egress path from the ~~exit enclosure~~ interior exit stairway and ramp on the level of exit discharge is protected throughout by an approved automatic sprinkler system. All portions of the level of exit discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of ~~exits~~ interior exit stairways or ramps.
2. A maximum of 50 percent of the number and capacity of the ~~exit enclosures for~~ interior exit stairways and ramps is permitted to egress through a vestibule provided all of the following are met:
   2.1 The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the ~~exit~~ enclosure.
   2.2 The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3 The area is separated from the remainder of the level of exit discharge by construction providing protection at least the equivalent of approved wired glass in steel frames.
   2.4 The area is used only for means of egress and exits directly to the outside.
3. ~~Stairways in open parking garages complying with Section 1022.1, Exception 4, are permitted to egress through the open parking garage at their levels of exit discharge.~~
4. Horizontal exits complying with Section 1025 shall not be required to discharge directly to the exterior of the building.

SECTION 1028 (IFC [B] 1028)
ASSEMBLY

~~**1028.5.1 (IFC [B] 1028.5.1) Enclosure of openings.** Interior stairways and other vertical openings shall be enclosed in an exit enclosure in accordance with Section 1009, as provided in Section 1022.1, except that stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as~~

~~theaters, places of religious worship, auditoriums and sports facilities. At least one accessible means of egress is required from a balcony, gallery or press box level containing accessible seating locations in accordance with Section 1007.3 or 1007.4.~~

SECTION 1110
SIGNAGE

1110.3 Other signs. Signage indicating special accessibility provisions shall be provided as shown:

1. Each assembly area required to comply with Section 1108.2.7 shall provide a sign notifying patrons of the availability of assistive listening systems.

   Exception: Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.

2. At each door to an area of refuge, an exterior area for assisted rescue, an egress stairway, exit passageway and exit discharge, signage shall be provided in accordance with Section 1011.3.
3. At areas of refuge, signage shall be provided in accordance with Section 1007.11.
4. At exterior areas for assisted rescue, signage shall be provided in accordance with Section 1007.11.
5. At two-way communication systems, signage shall be provided in accordance with Section 1007.8.2.
6. Within ~~exit enclosures~~ interior exit stairways and ramps, signage shall be provided in accordance with Section 1022.8.

SECTION 2606
LIGHT-TRANSMITTING PLASTICS

2606.7 Light-diffusing systems. Unless the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, light-diffusing systems shall not be installed in the following occupancies and locations:

1. Group A with an occupant load of 1,000 or more.
2. Theaters with a stage and proscenium opening and an occupant load of 700 or more.
3. Group I-2.
4. Group I-3.
5. ~~Vertical exit enclosures~~ Interior exit stairways and ramps and exit passageways.

SECTION 3007
FIRE SERVICE ACCESS ELEVATOR

3007.4.1 Access. The fire service access elevator lobby shall have direct access to an ~~exit~~ enclosure for an interior exit stairway.

3007.5 Standpipe hose connection. A Class I standpipe hose connection in accordance with Section 905 shall be provided in the ~~exit enclosure~~ interior exit stairway and ramp having direct access from the fire service access elevator lobby.

SECTION 3008
OCCUPANT EVACUATION ELEVATORS

3008.11.1 Access. The occupant evacuation elevator lobby shall have direct access to an ~~exit enclosure~~ interior exit stairway or ramp.

PART II – IFC

SECTION 403
HIGH-RISE BUILDINGS

[F] 403.3.1.1 (IFC 914.3.1.1.1) Riser location. Sprinkler risers shall be placed in interior exit stairways and ramps ~~exit enclosures~~ that are remotely located in accordance with Section 1015.2.

SECTION 414
HAZARDOUS MATERIALS

[F] 414.7.2 (IFC 2705.4.4) Dispensing, use and handling. Where hazardous materials having a hazard ranking of 3 or 4 in accordance with NFPA 704 are transported through corridors ~~or exit enclosures~~, interior exit stairways or ramps or exit passageways there shall be an emergency telephone system, a local manual alarm station or an approved alarm-initiating device at not more than 150-foot (45 720 mm) intervals and at each exit and exit access doorway throughout the transport route. The signal shall be relayed to an approved central, proprietary or remote station service or constantly attended on-site location and shall also initiate a local audible alarm.

SECTION 415
GROUPS H-1, H-2, H-3, H-4 AND H-5

[F] 415.8.4.6.2 (IFC 1803.12.1.2) ~~Exit access~~ Corridors and interior exit stairways and ~~exit~~ ramps ~~enclosures~~. Emergency alarms for ~~exit access~~ corridors ~~and exit enclosures~~ interior exit stairways and ramps and exit passageways shall comply with Section 414.7.2.

SECTION 909
SMOKE CONTROL SYSTEMS

[F] 909.5 (IFC 909.5, IMC [F] 513.5) Smoke barrier construction. Smoke barriers shall comply with Section 710, and shall be constructed and sealed to limit leakage areas exclusive of protected openings. The maximum allowable leakage area shall be the aggregate area calculated using the following leakage area ratios:

1. Walls: $A/A_w = 0.00100$
2. Interior exit ~~enclosures~~ stairways and ramps and exit passageways: $A/A_w = 0.00035$
3. Enclosed exit access stairways and ramps and all other shafts: $A/A_w = 0.00150$
4. Floors and roofs: $A/A_F = 0.00050$

where:

A = Total leakage area, square feet (m^2).
A_F = Unit floor or roof area of barrier, square feet (m^2).
A_w = Unit wall area of barrier, square feet (m^2).

The leakage area ratios shown do not include openings due to doors, operable windows or similar gaps. These shall be included in calculating the total leakage area.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Unenclosed Interior Stairways". The scope of the activity is noted as:

Scope: The current code allows limited use of unenclosed exit stairs. During the previous code development cycles, numerous code changes have been submitted to clarify the intent and application of the code provisions relative to issues such as: exit versus exit access; travel distance measurements; contribution to the minimum number of required exits; etc. Due to the inter-relationship of code provisions, this requires a comprehensive analysis in order to clarify the code requirements.

Objectives:

A. The Unenclosed Interior Stairway Work Group will answer the following questions based on the current Means of Egress system that is composed of exit, exit access and exit discharge components:
   1. Can an unenclosed interior stairway qualify as an exit?
   2. If an un-enclosed interior stairway can qualify as an exit what is the entrance to the exit (where does the exit begin)?
   3. If an un-enclosed interior stairway can qualify as an exit where does the exit discharge begin (where does the exit end)?
   4. How is travel distance measured when an un-enclosed interior stairway is used as an element in a means of egress?
   5. Does the Minimum Number of Exits Section (1019.1 in the 2006 IBC) require entry to the required exits on each story?
B. The Unenclosed Interior Stairway Work Group will draft recommend code changes, as determined necessary, to effectively communicate the code requirements based on the answers to the above questions.

(Note that all references to stairs in this reason statement are inclusive of ramps)

Preface: Over that last several code development cycles, there have been numerous proposals intended to address the technical relationships between unenclosed interior stairways, travel distance and the required numbers and location of exits. Through these various proposals, it became evident that there was considerable confusion and disagreement as to what the IBC actually requires or implies. Although some minor changes were approved over time, cumulatively, they did little to resolve the underlying technical question being what part of the three part means of egress system is an unenclosed stair between stories. More specifically: Are stairs that are required to meet means of egress design requirements such as number of exits or exit access travel distance but allowed to be unenclosed an exit or an exit access? Are stairs that are not required for means of egress and supplemental but required to be enclosed do to the number of stories connected required to be protected as a shaft or as an exit enclosure? How should travel distance be measured when unenclosed stairs are part of the path of travel? Can required exits per floor be on an adjacent floor and accessed through an open stair?

At the hearings in Palm Springs the ICC Means of Egress Code Development Committee determined that proper attention could not be provided to the issues in that forum and referred the dilemma to the ICC Code Technology Committee. The CTC agreed that the issue should be researched and assigned a study group to investigate the matter and develop a code change proposal to resolve the issues.

This proposal is based on the following concepts:

All stairs within a building are elements of the means of egress system and must comply with chapter 10

Unenclosed stairways are not exits

All Exit Stairways, to qualify as an exit, must be enclosed with a fire rated enclosure consisting of exit stair shafts and passageways based on current exit enclosure provisions

All stairways that are permitted to be open or are not required stairways for egress purposes are Exit Access Stairways

Exit access stairways must be enclosed with fire rated enclosures based on shaft provisions or may be open in accordance exceptions based on the current exceptions;

Exit access travel distance is measured to an entrance to an exit

Exit access travel distance includes the travel distance on Exit access stairways

Entrances to exits on each story are not mandatory and access to exits on other stories is permissible within certain limitations

The code change in general: All of the current exceptions that will allow for an unenclosed opening to accommodate a stairway in chapter 7 and 10 are being relocated to proposed section 1009.3 including current exceptions to sections 708,1016, and 1022. Section 708 for shaft enclosures is being modified to only address floor openings that do not contain a stairway. All enclosure requirements for stairways, exit or exit access, will originate in section 1009. All fire rated enclosure requirements for exit stairs will remain in chapter 10 and exit access stair enclosure requirements will be placed in proposed section 1009.3 based on current section 708 construction requirements. Ramps will be treated the same as stairways. The new formalized concept of Exit Access Stairway is codified in proposed section 1009.3. New definitions are proposed for Exit Access Stairway(ramp) and Interior Exit Stairway(Ramp).

Specific section change explanations:

Modifications to current section 1002- The definition of Exit is proposed to be modified to remove the fire rated construction provisions from the definition because the construction requirements belong in the code text of section 1022. The definition should be focused on what the exit is, which is simply the component that is between the exit access and the exit discharge. The list of components that qualify as exits has been retained. Additionally “Exit Enclosure” is proposed to be replaced with new terms “Interior Exit Stairway” and “Interior Exit Ramp”. This concept is that the exit stairway or ramp in its entirety comprises the exit component, not just the enclosure. New definitions are proposed for Exit Access Ramp and Stairway to support the new concept of their use in proposed section 1009.3. The concept is that all interior stairways and ramps that are not formal exits, whether they are required means of egress components or not, are exit access components.

Modifications to current section 1009-In general, the concept with the changes to 1009 and companion changes to other sections is that 1009 is the point source for all requirements relating to interior stair code requirements including opening protection requirements. Figuratively speaking all stairs lead to section 1009. New sections 1009.1 through 1009.4 have been proposed for addition to current section 1009. 1009.1 establishes that all stairways serving occupied portions of a building must comply with section 1009, whether the stairs are required or not. 1009.2 establishes that exit stairs must lead out of the building directly or through an exit passageway or exit discharge component as is currently required. Section 1009.2.1 establishes the general requirement for when an exit stairway is required. Section 1009.2.2 directs the code user to section 1022 for detailed requirements for construction of the exit stairway including the current enclosure requirements. Proposed section 1009.3 is the new section established to regulate enclosure of exit access stairs. The base line is that all exit access stairs must be enclosed with exceptions to follow. All of the current exceptions in sections 708,1016, and 1022 have been moved to this section, as exceptions to the baseline requirement for enclosure because all open stairs are exit access stairs per this proposal. The exceptions either in text or concept are in 1009.3 with every attempt made to keep them as they are currently applied. New section 1009.3.1 and sub-sections are the construction requirements for enclosure of exit access stairs with the exit access stair would not qualify for one of the exceptions that would allow the stairway to be unenclosed. These requirements have been copied from section 708 Shaft enclosures because current code allows stairways that are not used as exits to meet shaft enclosure requirements of current section 708; current exit enclosure requirements of 1022 are only applicable to required exit stairs.

New section 1010.2-This section is proposed as simply a cross reference for ramps so that they are designed for enclosure no differently than stairways.

Modifications to current section 1016.1-The section is proposed for re-organization based on separation general provisions from specific design provisions. Exceptions 1 and 2 to 1016.1 were moved to proposed section 1016.3 do to conversion of existing section 1016.1 into a general section. Exceptions 3 and 4 to 1016.1 were deleted because the intended use of those exceptions is now captured in proposed modifications to current section 1021.1 and 1021.3.1.

Modifications to current section 1016.1- Exit access added for consistency and the table reference was changed to 1016.2 because this proposal includes changing the table number and reference section.

New section 1016.3- New section 1016.3 is proposed to separate the measurement requirements of exit access travel distance into a stand alone section for better clarity and order.

Modifications to current section 1021.1-Changed the section to a general section. The first sentence proposed replacement is a mix of language clean and addition of the proposed new terms “exit and exit access stairways or ramps”. The added second underlined text that proposes to require at least one exit stairway serving each story above the section is the relocation of the concept intended by current exceptions 3 and 4 to 1016.1 that have been proposed for deletion. Exceptions for open parking garages and outdoor facilities were relocated to this section. All of the specific provisions regarding required number of exits were moved from the proposed general section 1021.1 to a new section 1021.2.

Modifications to current section 1021.2-The bulk of this sections changes are to improve the format and flow of the section in keeping with moving specific requirements out of the beginning General section and laying out the requirements for number of exits and configuration in a more logical format. Proposed section 1021.3.1 has a provision that limits the access of exits on another floor to an adjacent level.
Modifications to current section 1022-The section title is proposed to be changed to the new term Interior Exit Stairways and Ramps. Some minor editorial changes have been made to the section and the new terms have been inserted into the text. The deleted last two sentences of 1022.1 (proposed 1022.2) were relocated to proposed section 1009.2.
New Section 410.5.3.1- Based on deletion of current exception #6 to 1022.1 the allowance for open stairs serving stages and support areas has been relocated to chapter 4 under the current stage exit provisions in chapter 4. This is cross referenced in proposed 1009.3 Exception #7.
New exception #3 to Section 706-Added cross-reference to top of shaft enclosure allowance in current section 707.12 to allow use for exit and exit access stair termination. This was done in conjunction with adding exit access stair enclosure requirements, modeled after shaft enclosure requirements, into section 1009.
Modifications to current section 708-Added the sentence in general section 708.1 that removes stair openings from regulation by section 708 and directs the code user to section 1009 for all stair opening protection requirements. As a companion to the intent of that change current exceptions numbers 2 (stair part), 7.2, 11 and 13 that address permissible unenclosed floor openings for stairs have been proposed for deletion and to be moved to section 1009.3: current #2 to proposed 1009.3 Exception #3; current #7.2 and #11 to proposed 1009.3 Exception #1; current #13 to proposed 1009.3 Exception #9. See below for a comparison of the suggested revisions between the Open Stairway study group recommendations and the Vertical Openings committee.
Proposed new section 708.3-Shaft enclosure construction provisions were moved out of the general section in 708.1 and into a new section titled Construction.
Modifications to current section 708.3-In current sections 1002 and 1022 the term “Exit Enclosure” is proposed to be replaced with new terms “Interior Exit Stairway” and “Interior Exit Ramp”. This change is companion to that change in term.
Modification to Sections following the main proposal are correlative items to match the proposed revisions to terminology and are not intended to change the scope of the code. Sections that were also reviewed for correlation, but are not proposed to be revised include 403, 408, 410, 414, 415, 705, 707, 708, 709, 712, 715, 716. 803, 804, 909, 1006, 1007, 1015, 1023, 1024, 1025, 1026, 1027, 1028, 1110, 2606, 3007, 3008.

Comparison of CTC proposals for open stairway and vertical openings:
This is a comparison between the overlapping portions of the proposals from the Vertical opening study group and the Open stairway study group. The text in the columns is to compare requirements that may be addressing the same type of provisions. The CTC committee did not feel that there were conflicts in these two proposals, however, in the interest of providing complete information to those participating in the code change process, this matrices should make reviewing for potential conflicts much easier. The first half is the exceptions currently in 708.2 and Section 1022 (exit access stairways). The 2nd half is the construction requirements.

Open Stairway Proposals	Vertical opening Proposals
	~~Section 708~~ Section 712
	~~Shaft Enclosures~~ Vertical Openings
For Stairways – **1009.3 Exit access stairways.** Floor openings between stories created by exit access stairways shall be enclosed. **Exceptions:** (See below) *For Ramps –* **1010.2 Enclosure.** All interior exit ramps shall be enclosed in accordance with the applicable provisions of Section 1022. Exit access ramps shall be enclosed in accordance with the applicable provisions of Section 1009.3. **708.1 General.** The provisions of this section shall apply to shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Exit access stairways and ramps shall be protected in accordance with the applicable provisions of Section 1009. Interior exit stairways and ramps shall be protected in accordance with the requirements of Section 1022. ~~Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.~~	**~~708.1~~ 712.1 General.** The provisions of this section shall apply to the vertical opening applications listed in Sections 712.1.1 through 712.1.18. ~~shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.~~
	~~**708.2 Shaft enclosure required.** Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this Section.~~ ~~**Exceptions:**~~
	712.1.1 Smoke compartments. Vertical openings contained entirely within a shaft enclosure complying with Section 709 shall be permitted.
1009.3 - 2. Exit access stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.	~~**708.2 -1.**~~ **712.1.2 Individual dwelling unit.** ~~A shaft enclosure is not required for~~ Unconcealed vertical openings totally within an individual residential dwelling unit and connecting four stories or less shall be permitted.
708.2 – 2. A shaft enclosure is not required in a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening ~~or stairway that is not a portion of the means of egress~~ protected according to Item 2.1 or 2.2;	~~**708.2 -2.**~~ **712.1.3 Escalator and Stairway Openings.** ~~A shaft enclosure is not required in~~ Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, ~~for~~ an escalator opening or stairway that is not a portion of the means of egress shall be protected according to Item ~~2.1 or 2.2~~ 712.1.3.1 or 712.1.3.2:
708.2 - 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator ~~or~~	~~**708.2 - 2.1.**~~ **712.1.3.1 Opening size.** Where the area of the ~~floor~~ vertical opening between stories does not exceed twice the horizontal projected

Open Stairway Proposals	Vertical opening Proposals
~~stairway~~ and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.	area of the escalator or stairway and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
	~~**708.2 - 2.2.**~~ **712.1.3.2 Automatic shutters**. Where the vertical opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.11 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release there from.
	~~**708.2 - 3.**~~ **712.1.4 Penetrations.** ~~A shaft enclosure is not required for p~~Penetrations by pipe, tube, conduit, wire, cable and vents shall be protected in accordance with Section ~~713.4~~ 712.4.
	~~**708.2 - 4.**~~ **712.1.5 Ducts.** ~~A shaft enclosure is not required for~~ Penetrations by ducts shall be protected in accordance with Section 716.6. Grease ducts shall be protected in accordance with the *International Mechanical Code*.
1009.3 - 4. Exit access stairways within an atrium complying with the provisions of Section 404 need not be enclosed.	~~**708.2 - 5.**~~ **712.1.6 Atriums.** In other than Group H occupancies, ~~a shaft enclosure is not required for floor openings complying with the provisions for~~ atriums ~~in~~ complying with Section 404 shall be permitted.
	~~**708.2 - 6.**~~ **712.1.7 Masonry chimney.** ~~A shaft enclosure is not required for a~~Approved masonry chimneys shall be permitted where the annular space is fireblocked at each floor level in accordance with Section 717.2.5.
1009.3 - 1. In other than Group I-2 and I-3 occupancies, exit access stairways that serve, or atmospherically communicate between, only two stories, need not be enclosed. **708.2 - 7.** In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following: 7.1. Does not connect more than two stories. ~~7.2. Is not part of the required means of egress system.~~ 7.3. Is not concealed within the construction of a wall or a floor/ceiling assembly. 7.4. Is not open to a corridor in Group I and R occupancies. 7.5. Is not open to a corridor on nonsprinklered floors in any occupancy. 7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures. 7.7. Is limited to the same smoke compartment.	~~**708.2 - 7.**~~ **712.1.8 Two story openings**. In other than Groups I-2 and I-3~~,~~ ~~a shaft enclosure is not required for~~ a floor opening that is not used as one of the applications listed in this section shall be permitted if it complies with all the items below ~~or an air transfer opening that complies with the following:~~ ~~7.1~~ 1. Does not connect more than two stories. ~~7.2~~ 2. Does not contain a stairway or ramp required by Chapter 10. ~~Is not part of the required means of egress system~~. 3 Does not penetrate a horizontal assembly that separates fire areas or smoke barriers that separate smoke compartments. ~~7.3~~ 4. Is not concealed within the construction of a wall or a floor/ceiling assembly. ~~7.4~~ 5. Is not open to a corridor in Group I and R occupancies. ~~7.5~~ 6. Is not open to a corridor on nonsprinklered floors ~~in any occupancy~~. ~~7.6~~ 7. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures. ~~7.7. Is limited to the same smoke compartment~~.
1009.3 ~~-~~ 5. Exit access stairways and ramps in open parking garages that serve only the parking garage are not required to be enclosed.	~~**708.2 - 8.**~~ **712.1.9 Parking garages**. ~~A shaft enclosure is not required for~~ Automobile ramps in open and enclosed parking garages shall be permitted where constructed in accordance with Sections 406.3 and 406.4, respectively.
	~~**708.2 - 9.**~~ **712.1.10 Mezzanine.** ~~A shaft enclosure is not required for~~ vertical ~~floor~~ openings between a mezzanine complying with Section 505 and the floor below shall be permitted. ~~and the floor below.~~
	~~**708.2 - 10.**~~ **712.1.11 Joints.** ~~A shaft enclosure is not required for~~ Joints shall be permitted where complying ~~protected by a fire-resistant joint system in accordance~~ with Section ~~714~~ 715.
1009.2 - 3. In buildings with only group B or M occupancies , exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. ~~**708.2 - 11.** A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 3 or 4 in Section 1016.1.~~	~~**708.2 - 11.**~~ **712.1.12 Unenclosed stairs and ramps.** A ~~shaft enclosure shall not be required for~~ vertical floor openings created by unenclosed stairs or ramps in accordance with Exception 3 or 4 in Section 1016.1 shall be permitted.
	~~**708.2 - 12.**~~ **712.1.13 Floor Fire Doors.** ~~Floor~~ Vertical openings shall be permitted where protected by floor fire doors in accordance with Section ~~712.8~~ 711.8.

Open Stairway Proposals	Vertical opening Proposals
1009.3 - 9. In Group I-3 occupancies, an exit access enclosure is not required for floor openings in accordance with Section 408.5. ~~**708.2 - 13.** In Group I-3 occupancies, a shaft enclosure is not required for floor openings in accordance with Section 408.5.~~	~~**708.2 - 13.**~~ **712. 1.14. Group I-3.** In Group I-3 occupancies, ~~a shaft enclosure is not required for floor~~ vertical openings shall be permitted in accordance with Section 408.5.
	~~**708.2 - 14.**~~ **712.1.15 Elevators in parking garages.** ~~A shaft enclosure is not required for e-~~vertical openings for elevator hoistways in open or enclosed parking garages that serve only the parking garage, and complying with 406.3 and 406.4 respectively, shall be permitted..
	~~**708.2 - 15.**~~ **712.1.16 Duct systems in parking garages.** Vertical openings for mechanical exhaust or supply duct systems in open or enclosed parking garages~~a shaft enclosure is not required to enclose mechanical exhaust or supply duct systems~~ complying with 406.3 and 406.4 respectively, shall be permitted to be unenclosed where ~~when~~ such duct system is contained within and serves only the parking garage.
	712.1.17 Nonfire-resistance-rated joints. Joints in or between floors without a required fire-resistance rating shall be permitted in accordance with section 711.4.1.
	~~**708.2 - 16.**~~ **712.1.18 Openings otherwise permitted.** Vertical openings shall be ~~Where~~ permitted where allowed by other sections of this code
1009.3 - 6. Stairways serving outdoor facilities where all portions of the means of egress are essentially open to the outside.	
1009.3 - 7. Exit access stairways serving stages shall comply with Section 410.5.3.1 and 1015.6.	
1009.3 - 8. Exit access stairways serving balconies, galleries and press boxes shall comply with Section 1028.5.1.	
	SECTION 713
	SHAFT ENCLOSURES
1009.3.1 Construction. Where required, enclosures for exit access stairways shall be constructed in accordance with this section. Exit access stairway enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.	**713.1 General.** The provisions of this section shall apply to shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 711, or both.
1009.3.1.1 Materials. Exit access stairway enclosures shall be of materials permitted by the building type of construction.	~~**708.3**~~ **713.2 Materials.** The shaft enclosure shall be of materials permitted by the building type of construction.
1009.3.1.2 Fire-resistance rating. Exit access stairway enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more, and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit access stairway enclosures shall include any basements, but not any mezzanines. Exit access stairway enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.	~~**708.4**~~ **713.3 Fire-resistance rating.** Shaft enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four *stories* or more, and not less than 1 hour where connecting less than four *stories*. The number of *stories* connected by the shaft enclosure shall include any basements but not any *mezzanines*. Shaft enclosures shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours. Shaft enclosures shall meet the requirements of Section 703.2.1.
1009.3.1.3 Continuity. Exit access stairway enclosures shall have continuity in accordance with Section 707.5 for fire barriers or Section 712.4 for horizontal assemblies as applicable.	~~**708.5**~~ **713.4 Continuity.** Shaft enclosures shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both, and shall have continuity in accordance with Section 707.5 for *fire barriers* or Section 712.4 for *horizontal assemblies* as applicable.
1009.3.1.8 Exterior walls. Where exterior walls serve as a part of an exit access stairway enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply. ~~**708.6**~~ **708.7Exterior walls.** Where exterior walls serve as a part of a required shaft enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply. **Exception:** Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section ~~1022.6~~ 1022.7 for enclosures for interior exit stairways and ramps ~~exit enclosures~~ and Section 1026.6 for exterior exit ramps and stairways.	~~**708.6**~~ **713.5 Exterior Walls.** Where exterior walls serve as a part of a required shaft enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply. **Exception:** Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section 1022.6 for exit enclosures and Section 1026.6 for exterior exit ramps and stairways.
1009.3.1.4 Openings. Openings in an exit access stairway enclosure shall be protected in accordance with Section 715 as required for fire	~~**708.7**~~ **713.6 Openings.** Openings in a shaft enclosure shall be protected in accordance with Section 715 as required for *fire barriers*. Doors shall be

Open Stairway Proposals	Vertical opening Proposals
barriers. Doors shall be self- or automatic-closing by smoke detection in accordance with Section 715.4.8.3.	self- or automatic closing by smoke detection in accordance with Section 715.4.8.3.
1009.3.1.4.1 Prohibited openings. Openings other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.	~~**708.7.1**~~ **713.6.1 Prohibited openings.** Openings other than those necessary for the purpose of the shaft shall not be permitted in shaft enclosures.
1009.3.1.5 Penetrations. Penetrations in a shaft enclosure shall be protected in accordance with Section 713 as required for fire barriers.	~~**708.8**~~ **713.7 Penetrations.** Penetrations in a shaft enclosure shall be protected in accordance with Section 713 as required for *fire barriers*.
1009.3.1.5.1 Prohibited penetrations. Penetrations other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.	~~**708.8.1**~~ **713.7.1 Prohibited penetrations.** Penetrations other than those necessary for the purpose of the shaft shall not be permitted in shaft enclosures.
1009.3.1.6 Joints. Joints in an exit access stairway enclosure shall comply with Section 714.	~~**708.9**~~ **713.8 Joints.** Joints in a shaft enclosure shall comply with Section 714.
1009.3.1.7 Ducts and air transfer openings. Penetrations of an exit access stairway enclosure by ducts and air transfer openings shall comply with Section 716.	~~**708.10**~~ **713.9 Duct and air transfer openings.** Penetrations of a shaft enclosure by ducts and air transfer openings shall comply with Section 716.
	~~**708.11**~~ **713.10 Enclosure at the bottom.** (No change to text)
706.5 Continuity. Fire barriers shall extend from the top of the floor/ceiling assembly below to the underside of the floor or roof slab or deck above and shall be securely attached thereto. Such fire barriers shall be continuous through concealed spaces, such as the space above a suspended ceiling. The supporting construction for fire barriers shall be protected to afford the required fire-resistance rating of the fire barrier supported, except for 1-hour fire-resistance-rated incidental use area separations as required by Table 508.2 in buildings of Type IIB, IIIB and VB construction. Hollow vertical spaces within a fire barrier shall be fireblocked in accordance with Section 717.2 at every floor level. **Exceptions:** 1. The maximum required fire-resistance rating for assemblies supporting fire barriers separating tank storage as provided in section 415.6.2.1 shall be 2 hours, but not less than required by Table 601 for the building construction type. 2. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 707.12. 3. Interior exit stairway and ramp enclosures required by Section 1009.2.2 and exit access stairway and ramp enclosures required by Section 1009.3 shall be permitted to terminate at a top enclosure complying with Section 707.12.	~~**708.12**~~ **713.11 Enclosure at top.** A shaft enclosure that does not extend to the underside of the roof sheathing, deck or slab of the building shall be enclosed at the top with construction of the same *fire-resistance rating* as the topmost floor penetrated by the shaft, but not less than the *fire-resistance rating* required for the shaft enclosure.
	~~**708.13**~~ **713.12 Refuse and laundry chutes** (No change to text and subsections)
	~~**708.14**~~ **713.13 Elevator, dumbwaiter and other hoistways.** (No change to text and subsections)

Cost Impact: The code change proposal will increase the cost of construction.

505.3, 505.4, 1002.1, 1006.3, 1011.1, 1015 (IFC [B] 1002.1, 1006.3, 1011.1, 1015)

Proponent: Anne VonWeller, Murray City, and Ron Clements, Chesterfield County Building Inspection Department, representing the Utah Chapter of the International Code Council

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

EXIT ACCESS ~~DOORWAY~~ POINT. A door or access point along the path of egress travel within the exit access from an occupied room, area or space where the path of egress enters an intervening room, corridor, unenclosed exit access stair or unenclosed exit access ramp.

SECTION 1015 (IFC [B] 1015.1)
EXITS AND EXIT ACCESS ~~DOORWAYS~~ POINTS FOR ROOMS AND SPACES

1015.1 (IFC [B] 1015.1) Number required ~~Exit or exit access doorways from spaces.~~ Two exits or exit access points ~~doorways~~ from any room or space shall be provided where one of the following conditions exists:

Exception: Group I-2 occupancies shall comply with Sections 1014.2.2 through 1014.2.7

1. The occupant load of the room or space exceeds one of the values in Table 1015.1.

   Exception: In Groups R-2 and R-3 occupancies, one exit or exit access point ~~means of egress~~ is permitted within and from individual dwelling units with a maximum occupant load of 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

2. The common path of egress travel exceeds one of the limitations of Section 1014.3.
3. Where required by Section 1015.3, 1015.4, 1015.5, 1015.6 or 1015.6.1.

Where a building contains mixed occupancies, each individual occupancy shall comply with the applicable requirements for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1.

TABLE 1015.1 (IFC [B] 1015.1)
ROOMS & SPACES WITH ONE EXIT OR EXIT ACCESS ~~DOORWAYS~~ POINT
(*Portions of table not shown remain unchanged)*

1015.1.1 (IFC [B] 1015.1.1) Additional ~~Three or more~~ exits or exit access ~~doorways~~ points. Three exits or exit access ~~doorways~~ points shall be provided from any room or space with an occupant load of 501 to 1,000. Four exits or exit access doorways shall be provided from any room or space with an occupant load greater than 1,000.

1015.2 (IFC [B] 1015.2) Availability ~~Exit or exit access doorways arrangement.~~ Required exits and exit access points shall be located in a manner that makes their availability obvious. Exits and exit access points shall be unobstructed at all times. Exit and exit access ~~doorways~~ points shall be arranged in accordance with Section~~s~~ 1015.3.~~1015.2.1 and 1015.2.2.~~

~~1015.2.1~~ 1015.3 (IFC [B] ~~1015.2.1~~ 1015.3) Arrangement ~~Two exits or exit access doorways.~~ Where two or more exits or exit access ~~doorways~~ points are required from any portion of the exit access, at least two of the exit doors or exit access ~~doorways~~ points shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access ~~doorways~~ points. For doors and doorways such distance shall be measured from the center of doors and openings. For unenclosed interior stairways and ramps such distance shall be measured from the center of the first stair riser or beginning of ramp slope. Interlocking or scissor stairs shall be counted as one exit or exit access point ~~stairway~~.

Exceptions:

1.~~2.~~ Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance ~~of the exit doors or exit access doorways~~ shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

2.~~1.~~ Where exit enclosures are provided ~~as a portion of the required exit~~ and such exit enclosures are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1018, the required ~~exit~~ separation distance shall be measured along the shortest direct line of egress travel within the corridor.

~~**1015.2.2 (IFC [B] 1015.2.2) Three or more exits or exit access doorways.** Where access to three or more exits is required, at least two exit doors or exit access doorways shall be arranged in accordance with the provisions of Section 1015.2.1.~~

~~**1015.3**~~ **1015.4 (IFC [B] ~~1015.3~~ 1015.4) Boiler, incinerator and furnace rooms.** Two exit access ~~doorways~~ points are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m^2) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422 000 KJ) input capacity. Where two exit access ~~doorways~~ points are required, one is permitted to be a fixed ladder or an alternating tread device. Exit access ~~doorways~~ points shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.

~~**1015.4**~~ **1015.5 (IFC [B] ~~1015.4~~ 1015.5) Refrigeration machinery rooms.** Machinery rooms larger than 1,000 square feet (93 m^2) shall have not less than two exits or exit access ~~doorways~~ points. Where two exit access ~~doorways~~ points are required, one such ~~doorways~~ points is permitted to be served by a fixed ladder or an alternating tread device. Exit access ~~doorways~~ points shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an exit or exit access ~~doorways~~ point. An increase in travel distance is permitted in accordance with Section 1016.1.

Doors shall swing in the direction of egress travel, regardless of the occupant load served. Doors shall be tight fitting and self-closing.

~~**1015.5**~~ **1015.6 (IFC [B] ~~1015.5~~ 1015.6) Refrigerated rooms or spaces.** Rooms or spaces having a floor area larger than 1,000 square feet (93m^2), containing a refrigerant evaporator and maintained at a temperature below 68°F (20°C), shall have access to not less than two exits or exit access ~~doorways~~ points.

Travel distance shall be determined as specified in Section 1016.1, but all portions of a refrigerated room or space shall be within 150 feet (45 720 mm) of an exit or exit access ~~doorways~~ points where such rooms are not protected by an approved automatic sprinkler system in accordance with Section 903.3.1.1. Egress is allowed through adjoining refrigerated rooms or spaces.

Exception: Where using refrigerants in quantities limited to the amounts based on the volume set forth in the International Mechanical Code.

~~**1015.6**~~ **1015.7 (IFC [B] ~~1015.6~~ 1015.7) Stage means of egress.** Where two ~~means of egress~~ exits or exit access points are required, based on the stage size or occupant load, one ~~means of egress~~ exit or exit access point shall be provided on each side of the stage.

~~**1015.6.1**~~ **1015.7.1 (IFC [B] ~~1015.6.1~~ 1015.7.1) Gallery, gridiron and catwalk means of egress.** The means of egress from lighting and access catwalks, galleries and gridirons shall meet the requirements for occupancies in Group F-2.

Exceptions:

1. A minimum width of 22 inches (559 mm) is permitted for lighting and access catwalks.
2. Spiral stairs are permitted in the means of egress.
3. Stairways required by this subsection need not be enclosed.
4. Stairways with a minimum width of 22 inches (559 mm), ladders, or spiral stairs are permitted in the means of egress.

5. A second ~~means of egress~~ exit or exit access point is not required from these areas where a means of escape to a floor or to a roof is provided. Ladders, alternating tread devices or spiral stairs are permitted in the means of escape.
6. Ladders are permitted in the means of egress.

SECTION 505
MEZZANINES

505.3 Egress. Each occupant of a mezzanine shall have access to at least two independent exits ~~means of egress~~ where the common path of egress travel exceeds the limitations of Section 1014.3. Where an unenclosed stairway provides a means of exit access from a mezzanine, the maximum travel distance includes the distance traveled on the stairway measured in the plane of the tread nosing. Accessible means of egress shall be provided in accordance with Section 1007.

Exception: A single exit or exit access point ~~means of egress~~ shall be permitted in accordance with Section 1015.1.

505.4 Openness. A mezzanine shall be open and unobstructed to the room in which such mezzanine is located except for walls not more than 42 inches (1067 mm) high, columns and posts.

Exceptions:

1. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the occupant load of the aggregate area of the enclosed space does not exceed 10.
2. A mezzanine having two or more exits or exit access points ~~means of egress~~ is not required to be open to the room in which the mezzanine is located if at least one exit or exit access point ~~of the means of egress~~ provides direct access to an exit from the mezzanine level.
3. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the aggregate floor area of the enclosed space does not exceed 10 percent of the mezzanine area.
4. In industrial facilities, mezzanines used for control equipment are permitted to be glazed on all sides.
5. In occupancies other than Groups H and I, that are no more than two stories above grade plane and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, a mezzanine having access to two or more exits ~~means of egress~~ shall not be required to be open to the room in which the mezzanine is located.

SECTION 1006
MEANS OF EGRESS ILLUMINATION

1006.3 (IFC [B] 1006.3) Illumination emergency power. The power supply for means of egress illumination shall normally be provided by the premises' electrical supply.

In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Aisles and unenclosed ~~egress~~ exit access stairways and ramps in rooms and spaces that require two or more exits or exit access points. ~~means of egress~~.
2. Corridors, exit enclosures and exit passageways in buildings required to have two or more exits.
3. Exterior egress components at other than their levels of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.
4. Interior exit discharge elements, as permitted in Section 1027.1, in buildings required to have two or more exits.
5. Exterior landings as required by Section 1008.1.6 for exit discharge doorways in buildings required to have two or more exits.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

SECTION 1011
EXIT SIGNS

1011.1 (IFC [B] 1011.1) Where required. Exits and exit access ~~doors~~ points shall be marked by an approved exit sign readily visible from any direction of egress travel. The path of egress travel to exits and within exits shall be marked by readily visible exit signs to clearly indicate the direction of egress travel in cases where the exit or the path of egress travel is not immediately visible to the occupants. Intervening means of egress doors within exits shall be marked by exit signs. Exit sign placement shall be such that no point in an exit access corridor or exit passageway is more than 100 feet (30 480mm) or the listed viewing distance for the sign, which ever is less, from the nearest visible exit sign.

Exception:

1. Exit signs are not required in rooms, spaces or areas which require only one exit or exit access point.
2. Main exterior exit doors or gates that are obviously and clearly identifiable as exits need not have exit signs where approved by the building official.
3. Exit signs are not required in occupancies in Group U and individual sleeping units or dwelling units in Group R-1, R-2 or R-3.
4. Exit signs are not required in dayrooms, sleeping rooms or dormitories in occupancies in Group I-3.
5. In occupancies in Groups A-4 and A-5, exit signs are not required on the seating side of vomitories or openings into seating areas where exit signs are provided in the concourse that are readily apparent from the vomitories. Egress lighting is provided to identify each vomitory or opening within the seating area in an emergency.

Reason:

Background

The 2009 edition added a definition for 'exit access doorway' to clarify that the provisions for exit access doorways applied to components where there is not always a doorway, such as the transition point along the path of egress to unenclosed interior stairways and ramps.

During the discussions of the CTC's Unenclosed Stairway Work Group it was recognized a more clear term was needed to describe the 'point' where requirements such as those for number, availability, and arrangement should be applied. 'Exit Access Point' was very clear and straight forward.

Most of the language in the above proposal was developed in the study group. However, it was determined 'exit access point' was beyond the scope of the specific study. There was a good deal of support for the concept and we were encouraged to bring it forward as a separate change.

The Changes

The one word change in the definition going from 'doorway' to 'point' is the focus of the change. The new term is carried throughout the change. Also, 'within the exit access' was added to make clear an 'exit access point' in only applicable in those portions of the means of egress.

The name of the section was expanded to assist users and avoid confusion with Section 1020.

'Means of egress' was changed to 'exit or exit access point' in several places because means of egress applies to all occupied portions of a building. The change occurs where a term refers to the number of required components which is more appropriate than the general term.

In 1015.3 we have made it clear exactly where to measure the required separation distance between egress components in the exit access. How many debates have been about "Do we measure to the center of the door? The closest edge? The furthest edge? We chose the center. This becomes more important to pin down when now using the concept of 'point'.

Changes to 505, 1006.3, and 1011.1 are for correlation with those in 1015.

Cost Impact: The code change proposal will not increase the cost of construction.

1002.1 (IFC [B] 1002.1)

Proponent: Edward A Hite, CML, representing self

Revise definition as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

PANIC HARDWARE. A ~~door latching~~ bar assembly incorporating a device that releases ~~the~~ a lock or latch upon the application of force in the direction of egress travel.

Reason:

1. Latching is only required with fire exit hardware and in areas such as corridors to control smoke.

2. Bars directly releasing locking mechanisms not necessarily attached to the bar, itself, should also be considered panic bars.
3. Currently, panic hardware would need to be a bar in order to meet the requirements of 1008.1.10.1, #3.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HITE-E1-1002-PANIC HARDWARE

E8–09/10
1002.1 (IFC [B] 1002.1); IRC R202

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Add new text as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

PROJECTED TREAD DEPTH. The full depth dimension of a tread with a nosing projection or the sum of the tread depth measured between adjacent nosings and the depth of the nosing projection.

NOSING PROJECTION. The additional depth of a tread in excess of the tread depth or the distance between the edges of adjacent treads overlapping horizontally.

RISER. The vertical component of a step or stair.

PART II – IRC BUILDING/ENERGY

Revise as follows:

SECTION R202
DEFINITIONS

RISER.

1. The vertical component of a *step* or *stair*
2. A water pipe that extends vertically one full story or more to convey water to branches or to a group of fixtures

Reason:
Part I -These definitions clarify the intent of the code.
Projected Tread Depth is currently incorrectly characterized as the tread depth in reference to measuring alternating tread devices. This definition will allow for the same terminology to apply to all vertical egress devices as it does to both stairs and ship ladders. Please see our related change to Alternating tread devices.
Nosing projection needs to be better understood by all that use the code. One of the most common misinterpretations akin to the measurement of tread depth is the concept of a nosing projection and how it is measured. This simple definition is long overdue.
Riser is currently listed in the IRC with a definition for a plumbing application. Please see our change to the IRC as well.
Part II-These definitions clarify the intent of the code.
Riser – I the 07/09 cycle the IRC committee pointed out that the term riser was confused with riser height and that further confusion was caused by the present definition of a plumbing application. The stair term is more commonly known and is therefore listed first. The existing definition remains unchanged.

Cost Impact: The code change will not increase the cost of construction.

1003.5 (IFC [B] 1003.5)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1003.5 (IFC [B] 1003.5) Elevation change. Where changes in elevation of less than 12 inches (305 mm) exist in the means of egress, sloped surfaces shall be used. Where the slope is greater than one unit vertical in 20 units horizontal (5-percent slope), ramps complying with Section 1010 shall be used. Where the difference in elevation is 6 inches (152 mm) or less, the ramp shall be equipped with either handrails or floor finish materials that contrast with adjacent floor finish materials.

Exceptions:

1. A single step with a maximum riser height of 7 inches (178 mm) is permitted for buildings with occupancies in Groups F, H, R-2, R-3, S and U at exterior doors not required to be accessible.
2. A stair with a single riser or with two risers and a tread is permitted at locations not required to be accessible by Chapter 11, provided that the risers and treads comply with Section 1009.3, the minimum depth of the tread is 13 inches (330 mm) and at least one handrail complying with Section 1012 is provided within 30 inches (762 mm) of the centerline of the normal path of egress travel on the stair.
3. A step is permitted in aisles serving seating that has a difference in elevation less than 12 inches (305 mm) at locations not required to be accessible by Chapter 11, provided that the risers and treads comply with Section 1025.11 and the aisle is provided with a handrail complying with Section 1025.13.

Throughout a story in a Group I-2 occupancy, any change in elevation in portions of the ~~exit access~~ means of egress that serve nonambulatory persons shall be by means of a ramp or sloped walkway.

Reason: The last paragraph was changed in Palms Springs (E13-07/08). The proponent argued that corridors should not be the only component of MOE mentioned in this section. It was argued that passageways should also be considered. Although the reasoning was sound, “exit access” was added to the Code language. Exit passageways are part of exit component of MOE not exit access. In order to capture all components of MOE, “exit access” is eliminated here and “means of egress” is added.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

SECTION 1004
OCCUPANT LOAD

1004.1 (IFC [B] 1004.1) Design occupant load. In determining means of egress requirements, the number of occupants for whom means of egress facilities shall be provided shall be determined in accordance with this section.

~~Where occupants from accessory areas egress through a primary space, the calculated occupant load for the primary space shall include the total occupant load of the primary space plus the number of occupants egressing through it from the accessory area.~~

1004.1.1 (IFC [B] 1004.1.1) Cumulative occupant loads. Where the path of egress travel includes intervening rooms, areas or spaces, cumulative occupant loads shall be determined in accordance with this section.

1004.1.1.1 (IFC [B] 1004.1.1.1) Intervening spaces. Where occupants egress from one room, area or space through another, the design occupant load shall be based on the cumulative occupant loads of all rooms, areas or spaces to that point along the path of egress travel.

~~1004.6~~ 1004.1.1.2 (IFC [B] ~~1004.6~~ 1004.1.1.2) ~~Mezzanine~~ Adjacent levels. The occupant load of a mezzanine or story ~~level~~ with egress ~~onto~~ through a room, ~~or~~ area or space on an adjacent level ~~below~~ shall be added to ~~that room or area's~~ the occupant load of that room, area or space. ~~and the capacity of the exits shall be designed for the total occupant load thus established.~~

~~1004.1.1~~ 1004.1.2 (IFC [B] ~~1004.1.1~~ 1004.1.2) Areas without fixed seating. *(No change to text)*

TABLE ~~1004.1.1~~ 1004.1.2 (IFC [B] ~~1004.1.1~~ 1004.1.2)
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT
(No change to table)

1004.2 (IFC [B] 1004.2) Increased occupant load. *(No change to text)*

1004.3 (IFC [B} 1004.3) Posting of occupant load. *(No change to text)*

~~**1004.4 (IFC [B] 1004.4) Exiting from multiple levels.** Where exits serve more than one floor, only the occupant load of each floor considered individually shall be used in computing the required capacity of the exits at that floor, provided that the exit capacity shall not decrease in the direction of egress travel.~~

~~**1004.5 (IFC [B] 1004.5) Egress convergence.** Where means of egress from floors above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the two floors.~~

~~1004.7~~ 1004.4 (IFC [B] ~~1004.7~~ 1004.4) Fixed seating. *(No change to text)*

~~1004.8~~ 1004.5 (IFC [B] ~~1004.8~~ 1004.5) Outdoor areas. *(No change to text)*

~~1004.9~~ 1004.6 (IFC [B] ~~1004.9~~ 1004.6) Multiple occupancies. *(No change to text)*

SECTION 1005
EGRESS WIDTH

1005.1 (IFC [B] 1005.1) Minimum required egress width. The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available ~~capacity~~ width to less than 50 percent of the required ~~capacity~~ width. The ~~maximum capacity~~ required width from any story of a building shall be maintained to the termination of the means of egress.

Exception: Means of egress complying with Section 1028.

1005.1.1 (IFC [B] 1005.1.1) Egress from multiple levels. Where exits serve more than one story, only the occupant load of each story considered individually shall be used in computing the required width of the exits at that story, provided that the exit width shall not decrease in the direction of egress travel.

1005.1.2 (IFC [B] 1005.1.2) Egress convergence. Where occupants from stories above and below converge at an intermediate level, the width of the exit from the point of convergence shall not be less than that based on the sum of the occupant loads of the two stories.

1005.2 (IFC [B] 1005.2) Door encroachment. *(No change to text)*

1005.3 (IFC [B] 1005.3) Door hardware encroachment. *(No change to text)*

Reason: This proposal is intended to repair certain fundamental means of egress provisions relating to the determination of occupant load and egress width. In Section 1004.1, cumulative occupant load provisions have been removed from general topic provisions and placed in a new Section 1004.1.1. In context, provisions for the determination of cumulative occupant loads on the same building level and adjacent building levels are stated in the same section. Adjacent level provisions are based on current Section 1004.6, mezzanine level requirements. It is felt that the scope of the provision needs to be expanded. This is due to the fact that Section 1021.1 permits access to exits from adjacent stories. Cumulative occupant load determination requirements prior to arrival at an exit should be the same regardless of whether the adjacent level is a mezzanine or story.

Sections 1004.4 and 1004.5 have been relocated in context in Section 1005. Each of those sections currently addresses determination of egress capacity, a width related provision. It is felt that it would best serve code users if all width related provisions were located in the same section.

Within Section 1005, the term “capacity” occurs numerous times. The term "capacity" is not defined in the IBC. Moreover, there is no context established for the term. In IBC context, the term capacity is most often confused with the term “width.” It is acknowledged that there are capacity based approaches to means of egress design. References to capacity in the IBC, however, do a disservice to code users who do not have benefit of experience with capacity based codes. The IBC needs to stand on its own technical merit and terminology.

Capacity represents the theoretical maximum occupant load that can be accommodated by a minimally sized means of egress component(s). Section 1005.1 clearly states that the required egress width is based on the occupant load served, or the prescribed component minimum, whichever is greater. This is reinforced in the charging statements of virtually every means of egress component section. Obviously, the minimum width of various means of egress components is based on anthropometrics. A 44-inch means of egress component assumes opposing traffic under typical usage conditions. It is acknowledged that it is highly likely that the occupant load served by a pair of 44-inch wide stairways will be less than 294. The theoretical capacity of the stairway is academic. The required width of each stairway is 44 inches. At that point that the occupant load increases beyond 294, the required width increases incrementally and the required width and the capacity now coincidentally align.

When two terms are used to describe the same condition, many code practitioners will attempt to infer differing requirements. This unnecessarily confuses code interpretation and application. In addition to this core correction of differing terminology, it is recommended that the ICC Means of Egress Code Development Committee direct the ICC technical staff to editorially covert these terms elsewhere in the IBC. This will greatly assist in the correct and consistent application of IBC egress width provisions.

Approval of this proposal will add clarity to the IBC by creating consistency in terminology in this fundamental area. Any one us may be familiar with the concept of capacity based means of egress design. Unfortunately, not all code users share in that level of experience. It is imperative that IBC requirements stand alone and assume no prior experience in another code system. After over a decade of publication, the 2012 Edition of the International Building Code should finally correlate this basic terminology and eliminate residual legacy provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Keith-E5-1004.1

E11–09/10
1004.1.1 (IFC [B] 1004.1.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1004.1.1 (IFC [B] 1004.1.1) Areas without fixed seating. The number of occupants shall be computed at the rate of one occupant per unit of area as prescribed in Table 1004.1.1. For areas without fixed seating, the occupant load shall not be less than that number determined by dividing the floor area under consideration by the occupant per unit of area factor assigned to the ~~occupancy~~ function of the space as set forth in Table 1004.1.1. Where an intended function ~~use~~ is not listed in Table 1004.1.1, the building official shall establish a function ~~use~~ based on a listed function ~~use~~ that most nearly resembles the intended function ~~use~~.

> **Exception:** Where approved by the building official, the actual number of occupants for whom each occupied space, floor or building is designed, although less than those determined by calculation, shall be permitted to be used in the determination of the design occupant load.

Reason: The title of the left hand column in Table 1004.1.1 was changed in the 2006 Edition of the IBC from “occupancy” to “function of space.” This change was appropriate in that the listed items are functions or uses within an area served by the means of egress system. The stated function may or may not coincide with the occupancy classification of the building. For instance, assembly functions such as conference rooms and break rooms are often contained within Group B (business area) occupancies. Unfortunately, the text that charges Table 1004.1.1 was not included in the approved change to the column title in Table 1004.1.1. This proposal corrects that oversight. Approval of this proposal will create editorial consistency and eliminate potential confusion caused by the differing terms applicable to the same provision.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

E12–09/10
1004.1.1, Table 1004.1.1 (IFC [B] 1004.1.1, Table 1004.1.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1004.1.1 (IFC [B] 1004.1.1) Areas without fixed seating. The number of occupants shall be computed at the rate of one occupant per unit of area as prescribed in Table 1004.1.1. For areas without fixed seating, the occupant load shall not be less than that number determined by dividing the floor area under consideration by the occupant load ~~per unit of area~~ factor assigned to the occupancy as set forth in Table 1004.1.1. Where an intended use is not listed in Table 1004.1.1, the building official shall establish a use based on a listed use that most nearly resembles the intended use.

Exception: Where approved by the building official, the actual number of occupants for whom each occupied space, floor or building is designed, although less than those determined by calculation, shall be permitted to be used in the determination of the design occupant load.

TABLE 1004.1.1 (IFC [B] 1004.1.1)
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR[a] ~~FLOOR AREA IN SQ. FT. PER OCCUPANT~~

(Portions of Table not shown, remain unchanged)

For SI: 1 square foot = 0.0929 m^2.

a. Floor area in sq. ft. per occupant.

Reason: Table 1004.1.1 represents the genesis for the design of a means of egress system. The determination of the occupant load is fundamental to the process. The right hand column represents a factor based on the function of the space that is multiplied by the area under consideration so as to determine the applicable occupant load of the space. The current column title heading, "floor area in sq. ft. per occupant," is somewhat cumbersome and actually states what the unit of measurement represents. The term "occupant load factor" is felt to be easier to use in conversation and more accurately describes the purpose of the tabular values. The term was chosen based on a term that is already recognized in Section 402.4.4.1. The legend in Equation 4-1 states that, "OLF = The occupant load factor (square feet per person). Floor area in sq. ft. per occupant and square feet per person are exactly the same thing. Perhaps a contemporary term such as "occupant density factor" would be more descriptive. Regardless, a functional term should identify this commonly used provision. The descriptive language in the current column title has been appropriately moved to a footnote indicating the unit of measurement. Approval of this proposal will simplify means of egress design by creating a descriptive, common use term while eliminating potential conflicts with other IBC provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

E13–09/10

Table 1004.1.1 (IFC [B] Table 1004.1.1)

Proponent: Jay Wallace, The Boeing Company

Revise as follows:

TABLE 1004.1.1 (IFC [B] TABLE 1004.1.1)
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	FLOOR AREA IN SQ. FT. PER OCCUPANT
~~Aircraft hangars~~	~~500 gross~~
Aircraft Related Uses	
Airport terminal	
Baggage claim	20 gross
Baggage handling	300 gross
Concourse	100 gross
Waiting areas	15 gross
Manufacturing	
Final assembly	500 gross
Sub-assembly fabrication	300 gross
Hangars	
Maintenance and repair	500 gross
Storage or painting	1,000 gross

(Portions of the table not shown remain unchanged.)

Reason: This proposal intends to provide more representative occupant density factors for aircraft manufacturing and storage facilities. Presently, other than for aircraft hangars, there are no industry specific occupant load factors. The recommended values are typical of industry practices. It should be noted that automation has greatly reduced the number of persons necessary to manufacture aircraft. The typically large area necessary for the manufacturing or storage of aircraft is also a factor in the determination of appropriate values. Assigning one occupant for each 32' x 32' area (1000 sf) in an aircraft storage or paint hanger is actually a conservative approach. This figure was selected to account for common usage in smaller facilities. The proposed fabrication occupant load factors also represent typical production practices. These factors become significant in means of egress design. The Boeing Company has a 4,500,000 square foot manufacturing facility. Using the current industrial area occupant load factor of 100 square feet per occupant, the design occupant load of this building is 45,000. It should be noted that The Boeing Company has only 160,000 employees worldwide. In fact, approximately 20,000 employees divided into three shifts work in this factory. The current calculated occupant load would result in a minimum of four exits having 750 feet of egress width. The proposed occupant load factor of 500 would result in a design occupant load of 9,000. Four exits would still be required, however, total egress width would now be a more realistic 150 total feet (50 x 3'-0" doors). Since the facility also contains sub-assembly fabrication operations, the occupant load would be greater than 9,000 resulting in more total egress width. Approval of this proposal will provide code users with occupant load factors representative of industry practices. Such characteristic values will provide for the safe egress of building occupants while not requiring excessive numbers of means of egress components.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wallace-E1-T1004.1.1

E14–09/10
Table 1004.1.1 (IFC [B] Table 1004.1.1)

Proponent: David S. Collins, FAIA, The Preview Group, Inc. representing The American Institute of Architects

Revise as follows:

Table 1004.1.1 (IFC [B] Table 1004.1.1)
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	FLOOR AREA IN SQ. FT. PER OCCUPANT
Assembly	
Gaming floors (keno, slots, etc.)	11 gross
Exhibit Gallery and Museum	30 net

(Portions of table not shown remain unchanged.)

Reason: Museums, such as fine arts and sciences, are unique in that determining the occupant load presents considerations that are not usual to calculating loads for other assembly spaces. Such facilities have need for high occupancy rooms, for gala openings etc., and museums have

dedicated spaces for such purposes. It is the actual gallery/exhibit spaces that defy use of the existing tables and it is only those spaces that this change addresses. To determine the occupant load of these spaces one must consider how exhibits are viewed.

What must be taken into consideration is the way exhibit in a museum is viewed. There has never been a museum gallery that has been filled to capacity, using even a 15 sf factor, simply because the display could not be seen by the vast majority of the people in the room at that load. Very few displays are actually viewed from close proximity. In fact, most art works are best viewed from distances and most people are not within 10 to 15 feet of the object being viewed. People do make close inspections but only after viewing the object from a distance and, when approaching a display common courtesy to others in the gallery call for "honoring a person's space" and no one moves toward the object until the other viewer has left the area. Consequently, a museum gallery will never be filled with its design capacity simply because of how the spaces are used.

The King Tut exhibit just left the Dallas Museum of Art and throughout its lengthy stay the galleries were never filled to design capacity. That exhibit included wall-mounted objects and free standing object within the room. The American Institute of Architects is confident that a 30sf/occupant load factor will more than suffice for a safe exiting calculation and we hope to have more data in the near future that will show that an occupant load of 50sf/occupant is satisfactory.

In the City of Cincinnati, Ohio has a number of large museum/assembly facilities that have utilized the factor of 1 occupant per 30 square feet. This includes the Museum Center, the Art Museum and the National Underground Freedom Center. Based on various efforts to rectify the problem with determining occupant loads in this building type, the City of Cincinnati has concluded that the 30 sf/occupant basis is rational and supportable.

In the over 100 year history of the Cincinnati Art Museum there has never been an event that saw the number of occupants that is required by the current code. The 30sf/occupant load factor was derived from calculations of the Museum Center's egress capacity. The structure was designed originally as a train terminal in the 1930's. Using the "smoke protected" concept within the code (because of the volume of the space), the City officials were comfortable with the way the building functioned with a multi-use, high volume traffic occupancy. Therefore, the 30sf factor has been used to design and manage many similar facilities in the Ohio region.

As a part of this change, Section 1004.3 would continue to require posting of occupant loads within an assembly use. The designer and user of the facility would continue to establish the appropriated anticipated occupant load. If the intended use is for other than as a gallery or museum, this should be taken into consideration in the design with an appropriate occupant load for the function.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Collins-E1-T1004.1.1

E15–09/10
Table 1004.1.1 (IFC [B] Table 1004.1.1)

Proponent: Sarah A. Rice, CBO, representing self

Revise as follows:

TABLE 1004.1.1 (IFC [B] TABLE 1004.1.1)
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	FLOOR AREA IN SQ. FT. PER OCCUPANT
Circulation space where primary function uses a net value Toilet rooms, stairways, corridors, elevators/escalators	100 gross

(Portions of Table not shown remain unchanged.)

Reason. When the majority of a story is intended to be occupied by a function where the occupant load is calculated using a "net" value, often the circulation or ancillary spaces are ignored. The occupant loads of these spaces often can make the difference between when 2 or 3 exits is required. The issue is NOT when a "gross" value is used to calculate occupant load, but when "net" is used.

The argument has been made that the people who might occupy these spaces are the same people who will be in the rooms adjoining these types of spaces and that they do not contribute an additional occupant load. But think of a college setting where all the rooms in a building are used for classrooms. To calculate the occupant load of the classroom Table 1004.1.1 says to use 20 net. But for anyone who has been in one of these buildings right when classes are changing, there are always students waiting in the hallways for the next class. Do you just ignore the occupant load generated by these people.

The IBC presently does not have any specific provision for non-simultaneous occupancy which is what is being done when these spaces are ignored. Unless people are strictly monitored, there will always be the potential for people to be in all parts of a building at the same time.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Rice-E4-Table 1004.1.1

E16–09/10

Table 1004.1.1 (IFC [B] Table 1004.1.1)

Proponent: Sarah A. Rice, CBO, representing self
Revise as follows:

TABLE 1004.1.1 (IFC [B] TABLE 1004.1.1)
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	FLOOR AREA IN SQ. FT. PER OCCUPANT
Covered mall building. Open air mall building	See Section 402.4.1

(Portions of Table not shown remain unchanged.)

Reason: Adds a line that directs the user to Chapter 4 when determining the occupant load of a covered mall building.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D

ICCFILENAME:Rice-E6-Table 1004.1.1

E17–09/10
1004.3 (IFC [B] 1004.3)

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise as follows:

1004.3 (IFC [B] 1004.3) Posting of occupant load. Every room or space that is an assembly occupancy shall have the maximum occupant load of the room or space posted in a conspicuous place no more than 12 feet (3.66 m) above the floor, near the main exit or exit access doorway from the room or space. Posted signs shall be of ~~an approved legible~~ permanent design with letters and numbers not less than 1 inch (25 mm) high on a contrasting background and shall be maintained by the owner or authorized agent.

Reason: The term "approved legible design" for a maximum occupant load sign is ambiguous and creates unnecessary conflicts in the field, usually around the time when a certificate of occupancy is ready to be issued. The revised language creates a clear standard that will reduce disagreements and potential waste. The proposed language is similar to the text found in Section 1008.1.9.3.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KRANZ-E1-1004.3.DOC

E18–09/10
1004.7 (IFC [B] 1004.7)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1004.7 (IFC [B] 1004.7) Fixed seating. For areas having fixed seats and aisles, the occupant load shall be determined by the number of fixed seats installed therein. The occupant load for areas in which fixed seating is not installed, such as waiting spaces ~~and wheelchair spaces~~, shall be determined in accordance with Section 1004.1.1 and added to the number of fixed seats.

The occupant load of wheelchair spaces and the associated companion seat shall be based on one occupant for each wheelchair space and one occupant for the associated companion seat provided in accordance with Section 1108.2.

For areas having fixed seating without dividing arms, the occupant load shall not be less than the number of seats based on one person for each 18 inches (457 mm)of seating length.

The occupant load of seating booths shall be based on one person for each 24 inches (610 mm) of booth seat length measured at the backrest of the seating booth.

Reason: A wheelchair space is required to have a minimum width of 33" and depth of 48" to be in compliance with ICC/ANSI A117.1. However, the minimum space required may be greater depending upon layout with the potential required size of a wheelchair space per ICC/ANSI A117.1 being 36" by 60". In addition, an unobstructed accessible route that is 36" wide is required to adjoin one side of the wheelchair space, so it requires at a minimum 33" by 36" and a maximum of 36" by 60" of additional space for each wheelchair space. Therefore, the minimum amount of space required for one wheelchair space is 19.25 square feet and the maximum amount of space required for one wheelchair space is 30 square feet. Since this wheelchair space is required to be "open" floor space, the floor area per occupant listed in Table 1004.1.1 is 5 square feet per occupant. This means that without this change 1004.7 would require between 4 and 6 occupants within a single wheelchair space and its adjacent accessible route. This is not how it is typically handled or enforced.

In addition, ICC/ANSI A117.1 allows the companion chairs to be movable, therefore the floor space needed for the movable chair would not have fixed seating. At a minimum, a companion chair will be 20" wide, so each companion chair and the respective accessible route for accessing the wheelchair space will take at least 20" by 84" of space, which is 11.67 square feet. This area would equate to at least 2 occupants per companion chair. A wheelchair space location with 8 wheelchair spaces and 8 companion chairs to be in compliance with Section 1108.2.2 would result in an occupant load of 16 per Section 1108.2.2. However, without this change the occupant load for this same space would be between 48 and 64 occupants even though Section 1108.2.2 requires 16. This many occupants would render this wheelchair seating area completely unusable by someone in a wheelchair. This proposal provides consistency between Sections 1004.7, 1108.2 and the approach that has historically been taken to occupant load within a wheelchair seating area.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-E2-1004.7

E19–09/10
1004.8 (IFC [B] 1004.8)

Proponent: Eirene Oliphant, MCP, Building Official, representing Leawood, KS

Revise as follows:

1004.8 (IFC [B] 1004.8) Outdoor areas. Yards, patios, courts and similar outdoor areas accessible to and usable by the building occupants shall be provided with means of egress as required by this chapter. The occupant load of such outdoor areas shall be assigned by the building official in accordance with the anticipated use. Where outdoor areas are to be used by persons in addition to the occupants of the building, and the area is confined by barriers, ~~and the path of egress travel from the outdoor areas passes through the building,~~ means of egress ~~requirements for the building~~ shall be provided from the area without passing through the building. ~~based on the sum of the occupant loads of the building plus the outdoor areas~~.

Exceptions:

1. For areas not confined by barriers, the path of egress travel from the outdoor areas are permitted to pass through the building. Means of egress requirements for the building shall be based on the sum of the occupant loads of the building plus the outdoor areas.

~~1~~2. Outdoor areas used exclusively for service of the building need only have one means of egress.

~~2~~3. Both outdoor areas associated with Group R-3 and individual dwelling units of Group R-2.

Reason: With the increasing number of outdoor patios associated with restaurants, specifically raised patios requiring guard assemblies, our jurisdiction has concerns with allowing occupants of the patio area re-entering the building in the event of a fire. Why are we sending people into the building where the fire is most likely occurring? If the patio is at grade and not confined by guards, the occupants can very easily escape in the event of a fire. However, if we allow them to pass through the restaurant or force them to jump over a guard, we are increasing the degree of hazard for which they will be exposed. Is not the purpose of the code to safeguard the general welfare of the public? How is allowing the public to enter a building which is on fire providing that?

Cost Impact: The code change will not increase the cost of construction.

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

PART I – MEANS OF EGRESS

1. Revise as follows:

1005.1 (IFC [B] 1005.1) Minimum required egress width. The *means of egress* width shall not be less than required by ~~this section~~ Table 1005.1. ~~The total width of *means of egress* in inches (mm) shall not be less than the total *occupant load* served by the *means of egress* multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components.~~ The minimum width shall not be less than specified elsewhere in this code. Multiple *means of egress* shall be sized such that the loss of any one *means of egress* shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any *story* of a building shall be maintained to the termination of the *means of egress*.

Exception: *Means of egress* complying with Section 1028.

2. Add new Table as follows:

TABLE 1005.1 (TABLE [B] 1005.1)
EGRESS WIDTH PER OCCUPANT SERVED

OCCUPANCY	WITHOUT SPRINKLER SYSTEM		WITH SPRINKLER SYSTEM[a]	
	Stairways (inches per occupant)	Other egress components (inches per occupant)	Stairways (inches per occupant)	Other egress components (inches per occupant)
Occupancies other than those listed below	0.3	0.2	0.2	0.15
Hazardous: H-1, H-2, H-3 and H-4	0.7	0.4	0.3	0.2
Institutional: I-2	NA	NA	0.3	0.2

For SI: 1 inch = 25.4 mm. NA = Not applicable.

a. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

3. Delete without substitution:

~~**3404.6 (IEBC [B] 303.6) Means of egress capacity factors.** Alterations to any existing building or structure shall not be subject to the egress width factors in Section 1005.1 of the International Building Code for new construction in determining the minimum egress widths or the minimum number of exits in an existing building or structure. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any alteration if, in the opinion of the code official, they do not constitute a distinct hazard to life.~~

4. Revise as follows:

3412.6.11(IEBC [B] 1301.6.11) Means of egress capacity and number. Evaluate the means of egress capacity and the number of exits available to the building occupants. In applying this section, the means of egress are required to conform to the following sections of this code: 1003.7, 1004, 1005.1, 1014.2, 1014.3, 1015.2, 1021, 1024.1, 1027.2, 1027.6, 1028.2, 1028.3, 1028.4 and 1029 ~~[except that the minimum width required by this section shall be determined solely by the width for the required capacity in accordance with Table 3412.6.11(1)].~~ The number of exits credited is the number that is available to each occupant of the area being evaluated. Existing fire escapes shall be accepted as a component in the means of egress when conforming to Section 3406.

Under the categories and occupancies in Table 3412.6.11~~(2)~~, determine the appropriate value and enter that value into Table 3412.7 under Safety Parameter 3412.6.11, Means of Egress Capacity, for means of egress and general safety.

5. Delete without substitution:

~~TABLE 3412.6.11(1) (IEBC [B] 1301.6.11(1))~~

~~a. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~

(Renumber subsequent sections)

Reason: This change will undo what happened as a result of code change E19-07/08. The major issue was the elimination of the added capacity in buildings when they are protected by a sprinkler system. The proponents indicated that they felt that circumstances arise where the evacuation of a building may be necessary in circumstances where there is no threat of a fire.

While this undoubtedly is true, there is no record, nor were any offered as part of the supporting information for this change for any event or series of events causing a loss of life due to this modification to the fundamental capacity of each element of the means of egress. On the contrary, the record of life loss in buildings which are protected by fire suppression is remarkable.

Events such as earthquakes, and tornados and even terrorist attacks are not events that can be planned for. Hurricanes and floods are typically fairly well understood and can be planned for allowing persons to leave in an orderly fashion. However, these events pose little immediate threat to building occupants. Even though the WTC was attacked by airplanes, the NIST report states:

During the last 20 minutes before each building collapsed, the evacuation rate in both buildings had slowed to about one-fifth the immediately prior evacuation rate. ***This suggests that for <u>those seeking and able to reach and use undamaged exits and stairways, the egress capacity (number and width of exits and stairways) was adequate to accommodate survivors</u>.***

In the same NIST report it states that the building design was modified such that it:

Reduced the number of required stairwells from 6 to 3, and the size of doors leading to the stairs from 44 inches to 36 inches;

These changes were due to the change to the 1968 Port Authority Code allowing the same changes to the width of the stairs just removed from the IBC. Even under the most dire of circumstances, the reduced width of the elements of the means of egress in the WTC allowed "those seeking and able to reach and use undamaged exits and stairways, the egress capacity (number and width of exits and stairways) was adequate to accommodate survivors."

The impact of this change on buildings and building design is enormous, and couldn't have happened at a worse time for the construction industry. Standard elements of the means of egress which were typically modified to allow the sprinkler increases are now restricted as follows:

Sprinklered Doors – 36" ..... 34" clear .... 226 capacity
Unsprinklered Doors – 36" .... 34" clear .... 179 capacity

Sprinklered Stairs – 44" .... 220 capacity
Unsprinklered Stairs – 44" .... 146 capacity

Speculative office buildings which would have a single corridor, or open space and two exit stairs would have been allowed to serve a total capacity of 440 occupants; based on 100 sf. per occupant, the building could be built 44,000 sf. in area with a fire suppression system based strictly on means of egress capacity. Using the same scenario under the current IBC, the maximum occupant load served by the same door and stairs would be limited to 292 occupants; which would serve a total building area of 29,200 sf.

The result of this change will likely be less fire suppression in such office buildings as well, resulting in the following scenarios:

Office building

2009 IBC		2006 IBC	
2 exits 29,200 sf. in area	3 exits 43,800 sf. in area	2 exits 44,000 sf. in area	3 exits 66,000 sf. in area
3 stories Type IIB No fire suppression	3 stories Type IIB No fire suppression	4 stories Type IIB Fire suppression	4 stories Type IIB Fire suppression
3 stories Type IIIB No fire suppression	3 stories Type IIIA No fire suppression	4 stories Type IIIB Fire suppression	4 stories Type IIIA Fire suppression
5 stories Type IV No fire suppression	5 stories Type IV No fire suppression	6 stories Type IV Fire suppression	6 stories Type IV Fire suppression
3 stories Type VA No fire suppression	NP	4 stories Type VA Fire suppression	NP

In every case, the reductions from what was allowed in 2006 are marginal compared to what is allowed without fire suppression.15,000 sf per floor of leasable space for Types IIB, IIB, IV and VA construction has been traded for fire suppression. These smaller buildings are less economically viable and will not be built, and yet we know that with the incentives for use of sprinklers they are a rational and safe way to build. Today, they would be required to add a third stair to achieve the same leasable building area or widen the two stairs, which would also reduce the leasable space.

I believe approving this code change will undo what is a very regressive position for the IBC. We are penalizing the users and designers by removing the one life safety system we know works virtually every time, causing undue economic pressure on development at a time when it can least afford it.

Fewer and fewer states are seeing the economic advantage of tri-annual adoption of the ICC codes for various reasons. This is an unfortunate trend that is likely to cause an undoing of the joint efforts by industry and code officials to assure as much as possible a uniform set of standards for construction in the United States. This change forges a stand that indicates a more balanced and rational approach to safety in buildings. It recognizes the overwhelming benefits of fire safety protection as part of the design and operation of buildings.

Cost: This code change will reduce the cost of construction.

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1005.1 (IFC [B] 1005.1) Minimum required egress width. The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.

~~Exception~~ Exceptions:

1. Means of egress complying with Section 1028.
2. For other than H and I-2 occupancies, the total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.2 inches (5.1 mm) per occupant for stairways and by 0.15 inches (3.8 mm) per occupant for other egress components in buildings that are provided with sprinkler protection in accordance with 903.3.1.1 or 903.3.1.2 and an emergency voice/alarm communication system in accordance with 907.5.2.2.

~~**3404.6 (IEBC [B] 303.6) Means of egress capacity factors.** Alterations to any existing building or structure shall not be subject to the egress width factors in Section 1005.1 of the International Building Code for new construction in determining the minimum egress widths or the minimum number of exits in an existing building or structure. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any alteration if, in the opinion of the code official, they do not constitute a distinct hazard to life.~~

3412.6.11(IEBC [B] 1301.6.11) Means of egress capacity and number. Evaluate the means of egress capacity and the number of exits available to the building occupants. In applying this section, the means of egress are required to conform to the following sections of this code: 1003.7, 1004, 1005.1, 1014.2, 1014.3, 1015.2, 1021, 1024.1, 1027.2, 1027.6, 1028.2, 1028.3, 1028.4 and 1029 ~~[except that the minimum width required by this section shall be determined solely by the width for the required capacity in accordance with Table 3412.6.11(1)].~~ The number of exits credited is the number that is available to each occupant of the area being evaluated. Existing fire escapes shall be accepted as a component in the means of egress when conforming to Section 3406.

Under the categories and occupancies in Table 3412.6.11~~(2)~~, determine the appropriate value and enter that value into Table 3412.7 under Safety Parameter 3412.6.11, Means of Egress Capacity, for means of egress and general safety.

2. Delete without substitution:

~~**TABLE 3412.6.11(1) (IEBC [B] 1301.6.11(1))**~~

~~a. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~

(Renumber subsequent sections)

Reason: The egress factors for sprinklered buildings were eliminated during the last cycle with no technical justification. The exception reinstates the egress factors for sprinklers buildings but also would require an emergency voice/alarm communication system (EVAC) to be provided.

The EVAC system provides the ability to communicate instructions to occupants that would facilitate evacuation or relocation that may be necessary in fire or other emergencies. This would also lead to more efficient use of the egress system.

The original submitter of this code change had also submitted a code change (E17-07/08) to reduce the occupant load in office buildings by changing the occupant load factor from 1/100 sq.ft. to 1/175 sq.ft. The change in occupant load factor was rejected even though that proposal had a scientific study published by NIST to back the proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC MEANS OF EGRESS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Grill-E1-1005.1

E22–09/10

1004.5, 1005.1 (IFC [B] 1004.5, 1005.1)

Proponent: Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International

Revise as follows:

~~**1005.1 (IFC [B] 1005.1) Minimum required egress width.** The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.~~

~~**Exception:** Means of egress complying with Section 1028.~~

1005.1 (IFC [B] 1005.1) General. The means of egress shall be sized in accordance with this section.

Exception: Means of egress complying with Section 1028.

1005.2 (IFC [B] 1005.2) Minimum width based on component. The width of egress components shall not be less than specified elsewhere in this code.

1005.3 (IFC [B] 1005.3) Capacity based on occupant load. The means of egress for any floor, room, or story shall be sized to accommodate the total occupant load, as determined by Section 1004, in accordance with the following:

1005.3.1 (IFC [B] 1005.3.1) Stairways. The capacity of means of egress stairways shall be calculated using a factor of 0.3 inches (7.62 mm) of width per person.

1005.3.2 (IFC [B] 1005.3.2) Other egress components. The capacity of means of egress components other than stairways shall be calculated using a factor of 0.2 inches (5.08 mm) of width per person.

1005.4 (IFC [B] 1005.4) Capacity based on egress path. The capacity of the means of egress required from any story of a building shall be maintained to the termination of the means of egress.

1005.5. (IFC [B] 1005.5) Distribution of egress capacity. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity.

1005.6 (IFC [B] 1005.6) Egress convergence. Where means of egress from floors above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the two floors.

(Renumber subsequent sections.)

Delete without substitution:

~~**1004.5 (IFC [B] 1004.5) Egress convergence.** Where means of egress from floors above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the two floors.~~

(Renumber subsequent sections.)

Reason: This proposal seeks to editorially reorganize and clarify the multiple requirements related to 'egress width' currently contained in a single paragraph in 10051, and to relocate a related provision from 1004.5 to a more logical location with other egress width/capacity provisions. No technical changes are intended by this change.

1005.1 creates a new charging paragraph.

1005.2 replaces the current second sentence of 1005.1, noting that minimum width requirements for means of egress components may be specified in other locations in the code.

1005.3 is consistent with the current egress width factors, but reorganizes the text to clarify that the total occupant load (which is determined in Section 1004) drives the capacity for which the egress width must be provided. The new text also clearly states that egress width/capacity is determined on a floor, room, and story basis.

1005.4 replaces the last sentence of current 1005.1, and notes that once a minimum capacity is required along a means of egress, it must be provided along the entire path of egress travel.

1005.5 is consistent with the current 4th sentence of 1005.1.
1005.6 relocates the provision for 'egress convergence' from 1004.5. This is really an issue of egress capacity/width, and should more appropriately be located here, instead of buried in a section on occupant load.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Perry-E1-1005.1

E23–09/10
1005.1 (IFC [B] 1005.1)

Proponent: Maureen Traxler representing Washington Association of Building Officials Technical Code Development Committee

Revise as follows:

1005.1 (IFC [B] 1005.1) Minimum required egress width. The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. <u>The width of exit access doorways shall not be less than the width required for doors in Section 1008.</u> Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.

Exception: Means of egress complying with Section 1028.

Reason: The IBC lacks a reasonable provision for minimum width of exit access doorways. The factors in Section 1005.1 only make sense when they are applied to situations where another code section sets forth a minimum width for an egress element, but a high number of occupants would use that element. For example, Section 1018.2 sets forth minimum corridor widths, but also states that the width shall not be less than allowed by Section 1005.1. Section 1018.2 establishes 44 inches as the minimum for most corridors, but if the corridor serves an occupant load of 300, Section 1005.1 would require 60 inches. However, the only section that addresses minimum widths for exit access doorways is 1005.1 which can produce some unacceptable results. For example, if a doorway from a space serves 50 people, Section 1005.1 says the minimum width is 10 inches.

Cost Impact: The code change proposal will not increase the cost of construction.

1005.2, 1005.2.1(New), 1005.2.2(New), 1005.2.3(New), 1005.3, 1017.1, 1018.2, 1018.3, 1023.2, 1027.5.1; (IFC [B] 1005.2, 1005.2.1(New), 1005.2.2(New), 1005.2.3(New), 1005.3, 1017.1, 1018.2, 1018.3, 1023.2, 1027.5.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

1. Revise as follows:

1005.2 (IFC [B] 1005.2) ~~Door~~ Encroachment. <u>Encroachments into the required means of egress width shall be in accordance with the provisions of this section.</u>

<u>1005.2.1 (IFC [B] 1005.2.1) Doors</u>. Doors, when fully opened, ~~and handrails~~ shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. ~~Other nonstructural projections such as trim and similar decorative features shall be permitted to project into the required width a maximum of 1½ inches (38 mm) on each side.~~

~~Exception~~ <u>Exceptions:</u>

1. Surface-mounted latch release hardware shall be exempt from inclusion in the 7- inch maximum (178 mm) encroachment where:
   1.1. The hardware is mounted to the side of the door facing away from the adjacent wall where the door is in the open position; and,
   1.2. The hardware is mounted not less than 34 inches (865mm) nor more than 48 inches (1220 mm) above the finished floor.
2. The restrictions on ~~a~~ door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 occupancies and dwelling units of Group R-3 occupancies.

2. Add new text as follows:

1005.2.2 (IFC [B] 1005.2.2) Other projections. Handrail projections shall be in accordance with the provisions of Section 1012.8. Other nonstructural projections such as trim and similar decorative features shall be permitted to project into the required width a maximum of 1½ inches (38 mm) on each side.

1005.2.3 (IFC [B] 1005.2.3) Protruding objects. Protruding objects shall comply with the applicable requirements of Section 1003.3.

3. Delete without substitution:

~~**1005.3 (IFC [B] 1005.3) Door hardware encroachment.** Surface-mounted latch release hardware shall be exempt from inclusion in the 7- inch maximum (178 mm) projection requirement of Section 1005.2 when:~~

~~1. The hardware is mounted to the side of the door facing the corridor width when the door is in the open position; and~~
~~2. The hardware is mounted not less than 34 inches (865mm) or more than 48 inches (1220 mm) above the finished floor.~~

4. Revise as follows:

1017.1 (IFC [B] 1017.1) General. Aisles serving as a portion of the exit access in the means of egress system shall comply with the requirements of this section. Aisles shall be provided from all occupied portions of the exit access which contain seats, tables, furnishings, displays and similar fixtures or equipment. Aisles serving assembly areas shall comply with Section 1028. Aisles serving reviewing stands, grandstands and bleachers shall also comply with Section 1028. The required width of aisles shall be unobstructed.

Exception: ~~Doors~~ Encroachments complying with Section 1005.2.

1018.2 (IFC [B] 1018.2) ~~Corridor~~ Width. The minimum ~~corridor~~ width of corridors shall be as determined in Section 1005.1, but not less than 44 inches (1118 mm).

Exceptions:

1. Twenty-four inches (610 mm)—For access to and utilization of electrical, mechanical or plumbing systems or equipment.
2. Thirty-six inches (914 mm)—With a required occupant capacity of less than 50.
3. Thirty-six inches (914mm)—Within a dwelling unit.
4. Seventy-two inches (1829 mm)—In Group E with a corridor having a required capacity of 100 or more.
5. Seventy-two inches (1829 mm)—In corridors and areas serving gurney traffic in occupancies where patients receive outpatient medical care, which causes the patient to be not capable of self-preservation.
6. Ninety-six inches (2438 mm)—In Group I-2 in areas where required for bed movement.

1018.3 (IFC [B] 1018.3) ~~Corridor~~ Obstruction. The required width of corridors shall be unobstructed.

Exception: ~~Doors~~ Encroachments complying with Section 1005.2.

1023.2 (IFC [B] 1023.2) Width. The minimum width of exit passageways shall be determined as specified in Section 1005.1 but such width shall not be less than 44 inches (1118 mm), except that exit passageways serving an occupant load of less than 50 shall not be less than 36 inches (914 mm) in width. The required width of exit passageways shall be unobstructed.

Exception: ~~Doors~~ Encroachments complying with Section 1005.2.

1027.5.1 (IFC [B] 1027.5.1) Width. The minimum width of egress courts shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm), except as specified herein. Egress courts serving Group R-3 and U occupancies shall not be less than 36 inches (914 mm) in width. The required width of egress courts shall be unobstructed to a height of 7 feet (2134 mm).

Exception: ~~Doors~~ Encroachments complying with Section 1005.2.

Where an egress court exceeds the minimum required width and the width of such egress court is then reduced along the path of exit travel, the reduction in width shall be gradual. The transition in width shall be affected by a guard not less than 36 inches (914 mm) in height and shall not create an angle of more than 30 degrees (0.52 rad) with respect to the axis of the egress court along the path of egress travel. In no case shall the width of the egress court be less than the required minimum.

Reason: This proposal is intended to clarify required width encroachment provisions. Current encroachment provisions have been reorganized into two categories: Doors and other projections. Minor editorial changes have been made in a few locations. For instance, the width determination requirements for corridors, exit passageways and egress courts have been correlated so as to contain identical charging language. It is not the intention of this proposal to change any current technical requirement. This format will coordinate with various means of egress component width provisions that generally reference Section 1005.2. Additionally, it provides a tie to Section 1003.3 that provides related requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

1005.2, 1005.4 (New), 1009.1, 1009.5, 1010.5.3, 1012.8, 1028.6 (IFC [B] 1005.2, 1005.4 (New), 1009.1, 1009.5, 1010.5.3, 1012.8, 1028.6)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

1. Revise as follows:

1005.1 (IFC [B] 1005.1) Minimum required egress width. The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.

Exception: Means of egress complying with Section 1028.

1005.2 (IFC [B] 1005.2) Door encroachment. Doors, when fully opened~~, and handrails~~ shall not reduce the required means of egress width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. ~~Other nonstructural projections such as trim and similar decorative features shall be permitted to project into the required width a maximum of 1 1/2 inches (38 mm) on each side.~~

Exception: The restrictions on a door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 and dwelling units of Group R-3.

1005.3 (IFC [B] 1005.3) Door Hardware encroachment. Surface-mounted latch release hardware shall be exempt from inclusion in the 7-inch (178 mm) maximum projection requirement of Section 1005.2 when:

1. The hardware is mounted to the side of the door facing the corridor width when the door is in the open position; and
2. The hardware is mounted not less than 34 inches (865 mm) or more than 48 inches (1220 mm) above the finished floor.

2. Add new text as follows:

1005.4 (IFC [B] 1005.4) Projections. Handrail projections into the required means of egress width of stairways and ramps at each handrail not exceeding 4.5 inches (114 mm) at or below the handrail height shall be permitted. Projections into the required means of egress width shall not be limited above the minimum headroom height required in Section 1003.2. Other nonstructural projections such as trim and similar decorative features shall be permitted to project into the required means of egress width a maximum of 1 1/2 inches (38 mm) on each side.

3. Revise as follows:

1009.1 (IFC [B] 1009.1) Stairway width. The width of stairways shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm). See Section 1007.3 for accessible means of egress stairways.

Exceptions:

1. Stairways serving an occupant load of less than 50 shall have a width of not less than 36 inches (914 mm).
2. Spiral stairways as provided for in Section 1009.9.
3. Aisle stairs complying with Section 1028.
4. Where an incline platform lift or stairway chairlift is installed on stairways serving occupancies in Group R-3, or within dwelling units in occupancies in Group R-2, a clear passage width not less than 20 inches (508 mm) shall be provided. If the seat and platform can be folded when not in use, the distance shall be measured from the folded position.
5. Projections into the required stairway width in accordance with Section 1005.4 shall be permitted.

1009.5 (IFC [B] 1009.5) Stairway landings. There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall not be less than the width of stairways they serve. Every landing shall have a minimum dimension measured in the direction of travel equal to the width of the stairway. Such dimension need not exceed 48 inches (1219 mm) where the stairway has a straight run. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. When wheelchair spaces are required on the stairway landing in accordance with Section 1007.6.1, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces.

~~Exception~~ Exceptions:

1. Aisle stairs complying with Section 1028.
2. Projections into the required landing width in accordance with Section 1005.4 shall be permitted.

1010.5 (IFC [B] 1010.5) Minimum dimensions. The minimum dimensions of means of egress ramps shall comply with Sections 1010.5.1 through 1010.5.3.

1010.5.1 (IFC [B] 1010.5.1) Width. The minimum width of a means of egress ramp shall not be less than that required for corridors by Section 1018.2. The clear width of a ramp between handrails, if provided, or other permissible projections shall be 36 inches (914 mm) minimum.

1010.5.2 (IFC [B] 1010.5.2) Headroom. The minimum headroom in all parts of the means of egress ramp shall not be less than 80 inches (2032 mm).

1010.5.3 (IFC [B] 1010.5.3) Restrictions. Means of egress ramps shall not reduce in width in the direction of egress travel. Projections into the required ramp and landing width are prohibited. Doors opening onto a landing shall not reduce the clear width to less than 42 inches (1067 mm).

Exception: Projections into the required means of egress width in accordance with Section 1005.4 shall be permitted.

4. Delete without substitution:

~~**1012.8 (IFC [B] 1012.8) Projections.** On ramps, the clear width between handrails shall be 36 inches (914 mm) minimum. Projections into the required width of stairways and ramps at each handrail shall not exceed 4.5 inches (114~~

~~mm) at or below the handrail height. Projections into the required width shall not be limited above the minimum headroom height required in Section 1009.2.~~

5. Revise as follows:

1028.6 (IFC [B] 1028.6) Width of means of egress for assembly. The clear width of aisles and other means of egress shall comply with Section 1028.6.1 where smoke-protected seating is not provided and with Section 1028.6.2 or 1028.6.3 where smoke-protected seating is provided. The clear width shall be measured to walls, edges of seating and tread edges ~~except for permitted projections~~.

Exception: Projections into the required aisle and other means of egress width in accordance with Section 1005.4 shall be permitted.

Reason: Handrail projections into the required means of egress width is more appropriately located in Section 1005. Also, handrails and other nonstructural projections should be relocated from door encroachment and clear width between handrails for ramps is already covered by Section 1010.5.1. Therefore, this proposal combines both the handrail projections and nonstructural projections into a new projections section under means of egress width and the duplicative clear ramp width requirement was eliminated. This proposal does not reduce the minimum ramp width requirements of Section 1010.5.1. It clarifies that handrails can project into the required means of egress width to the extent that it would not be in conflict with Section 1010.5.1. Changes to stairways and assembly aisles, where handrails are most commonly found, are revised for consistency.

Cost Impact: This code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-E3-1005.2

E26–09/10
1006.3, 1006.4 (IFC [B] 1006.3, 1006.4)

Proponent: Manny Muniz, California Deputy State Fire Marshal (Ret.), representing self

Revise as follows:

1006.3 (IFC [B] 1006.3) Illumination emergency power. The power supply for means of egress illumination shall normally be provided by the premises' electrical supply.

In the event of power supply failure, an emergency electrical system shall automatically illuminate the following areas:

1. Aisles and unenclosed egress stairways in rooms and spaces that require two or more means of egress.
2. Corridors, exit enclosures and exit passageways in buildings required to have two or more exits.

   Exception: When approved by the building official, approved luminous egress path marking listed and labeled in accordance with UL 1994 and installed in accordance with the manufacturer's instructions shall be permitted to be used.

3. Exterior egress components at other than their levels of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.
4. Interior exit discharge elements, as permitted in Section 1027.1, in buildings required to have two or more exits.
5. Exterior landings, as required by Section 1008.1.6, for exit discharge doorways in buildings required to have two or more exits.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

1006.4 (IFC [B] 1006.4) Performance of system. Emergency lighting facilities shall be arranged to provide initial illumination that is at least an average of 1 foot-candle (11 lux) and a minimum at any point of 0.1 foot-candle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 foot-candle (6

lux) average and a minimum at any point of 0.06 foot-candle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.

Exception: When luminous egress path marking listed and labeled in accordance with UL 1994 is approved for use, it shall be continuous except as interrupted by doorways, corridors or other such architectural features in order to provide a visible delineation along the path of travel.

Reason: Means of egress illumination is intended to allow people to visibly see the means of egress by providing 1 foot-candle at the walking surface of a continuous and unobstructed path of vertical and horizontal egress travel from any occupied portion of a building or structure to a public way. This typically is accomplished with emergency light units that have a battery back-up.
Full scale tests conducted by the National Research Council of Canada and Public Works and Government Services Canada in 2006 by Dr. G. Proulx, Dr. N. Bénichou, Dr. J.K. Hum and Dr. K.N. Restivo at a 13 story office building in downtown Ottawa, Canada indicate that there may be a better and more cost-effective way to help people get out of a building.

"Comparative studies found that photoluminescent material could provide an acceptable alternative to conventional emergency lighting. Findings also indicated that the material provided a high level of performance when installed in stairwells. It was also found that low-level lighting wayguidance systems performed better than conventional emergency lighting. Studies with smoke concluded that the continuity of information of photoluminescent lines ensured an uninterrupted visual reinforcement, which provided a significant advantage over conventional emergency lighting, which became obscured by the smoke. Other advantages of the material were its easy installation in new or existing buildings, its cost-effectiveness and its low maintenance."

"This study's findings show the interesting potential of photoluminescent signage to assist occupant evacuation. Such signage, properly installed, can address certain deficiencies in the traditional approach of emergency lighting associated with power failure or smokelogging of high-mounted luminaires. In order to obtain the expected outcome though, it is essential to properly install the signs, material and wayguidance components. Setting up a PLM wayfinding system appears as a cost-effective addition to, or even a potential replacement for, traditional electrical emergency lighting, since it does not consume energy, requires no wiring, minimum maintenance, and is completely reliable provided it is installed in locations where sufficient activation is ensured from normal illumination maintained on the evacuation route. The occupants' behaviour, their speed of movement and their subjective appraisal of the material are all in concordance to indicate that PLM signs and safety wayguidance system could be a worthwhile addition improving occupant fire safety in office buildings."

403.5.5 of the 2009 IBC and 4604.23 of the 2009 IFC already require such non-electrical luminous egress path marking systems in all new and existing buildings of Groups A, B, E, I, M and R-1 having occupied floors located more than 75 feet above the lowest level of fire department vehicle access. A key reason the ICC voting membership voted to require non-electrical luminous egress path marking systems was to insure that the egress path was visible under normal, emergency and total blackout lighting conditions so as to not rely on battery or generator backup systems that sometimes fail during an emergency.

Given that 1003.6 of the 2009 IBC and IFC already requires that "Obstructions shall not be placed in the required width of a means of egress except projections permitted by this chapter.", the only thing that needs to be visible is the path of egress travel.

This will allow the building official to approve systems on a case by case basis as deemed appropriate as long as the luminous egress path marking system has been tested for such use in accordance with UL 1994.

A copy of this study, "Evaluation of the Effectiveness of Different Photoluminescent Stairwell Installations for the Evacuation of Office Building Occupants" has been submitted to ICC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Muniz-E1-1006.3

E27–09/10
1006.3 (IFC [B] 1006.3)

Proponent: Alex Boesenberg representing National Electrical Manufacturers Association

Revise as follows:

1006.3 (IFC [B] 1006.3) Illumination emergency power. The power supply for means of egress illumination shall normally be provided by the premises' electrical supply.

In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Aisles and unenclosed egress stairways in rooms and spaces that require two or more means of egress.
2. Corridors, exit enclosures and exit passageways in buildings required to have two or more exits.
3. Exterior egress components at other than their levels of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.
4. Interior exit discharge elements, as permitted in Section 1027.1, in buildings required to have two or more exits.
5. Exterior landings as required by Section 1008.1.6 for exit discharge doorways in buildings required to have two or more exits.

6. Electrical rooms containing panelboards, distribution boards, switchboards, control centers and similar equipment rated 200 amperes or above.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

Reason: This proposal will add electrical rooms to those spaces and areas requiring emergency lighting. Electrical rooms and areas containing the equipment described pose a unique hazard for anyone in this area. Panelboards, distribution boards, switchboards, control centers, etc. are capable of releasing tremendous amounts of energy under fault conditions, including extremely elevated temperatures, pressure waves, sound waves, molten metal, and flying objects. Compounding the hazard is that such an event often leaves the electrical room or area, and anyone in the vicinity, in complete darkness. Anyone working on or near the equipment in such a circumstance may be suffering from burns, vision loss, hearing loss, injury from flying objects, and disorientation. It is imperative that there be sufficient light so any injured person can locate and access a means to escape the area and seek help or, in a worst case scenario, allow rescue workers to quickly locate and evacuate injured persons from the area.

There are numerous cases of such catastrophic failures that leave the room or area in total darkness. Many of these instances have been documented by security cameras and can be viewed on public sites such as You-tube. The small expense of providing a minimal level of lighting can easily save a life or minimize injury. The requirement can be met by the installation of inexpensive unit lighting with integral backup power, or through the building's emergency power supply if so equipped.

Cost Impact: This proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOESENBERG-E1-1006.3

E28–09/10
1006.3, 1006.4 (IFC [F] 1006.3, 1006.4)

Proponent: Gene Boecker, Code Consultants, Inc., representing Code Consultants, Inc.

Revise as follows:

1006.3 (IFC [B] 1006.3) ~~Illumination~~ Emergency power. The power supply for *means of egress* illumination shall normally be provided by the premises' electrical supply.

In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. *Aisles* and unenclosed egress *stairways* in rooms and spaces that require two or more *means of egress*.
2. *Corridors*, *exit enclosures* and *exit passageways* in buildings required to have two or more *exits*.
3. Exterior egress components at other than their *levels of exit discharge* until *exit discharge* is accomplished for buildings required to have two or more *exits*.
4. Interior *exit discharge* elements, as permitted in Section 1027.1, in buildings required to have two or more *exits*.
5. Exterior landings as required by Section 1008.1.6 for *exit discharge* doorways in buildings required to have two or more *exits*.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

~~1006.4~~ 1006.3.1 (IFC [B] ~~1006.4~~ 1006.3.1) ~~Performance of system~~ Illumination level. Emergency lighting facilities shall be arranged to provide initial illumination that is at least an average of 1 foot-candle (11 lux) and a minimum at any point of 0.1 foot-candle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 foot-candle (6 lux) average and a minimum at any point of 0.06 foot-candle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.

Reason: The proposed code change eliminates confusion between Section 1006.2 and 1006.4. Section 1006.2 states that the lighting must be at least 1 foot candle when Section 1006.4 states an average. As currently written, Sections 1006.2 and 1006.4 have the same hierarchy in the Section. This leads to confusion as to which is applicable. Although the terms used in 1006.4 say "emergency lighting" it is often misunderstood as being applicable whenever a facility is subject to emergency lighting and not the specific characteristics of the lights during the emergency lighting scenario.

By making the provisions in [current] Section 1006.4 subordinate to the emergency lighting section, it clarifies the fact that the averaging method for determining compliance is only applicable to those systems with emergency power requirements; and, that the minimums in Section 1006.2 apply to "normal" lighting conditions.

The suggested change to the heading/title of Section 1006.3 makes it easier to grasp what the subject matter is; and, since the entire Section (1006) is about "illumination" it reduces redundancy in wording.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Boecker-E1-1006.2_1006.4

E29–09/10
1006.4 (IFC [B] 1006.4)

Proponent: Ken Brouillette, representing City of Puyallup Washington

Revise as follows:

1006.4 (IFC [B] 1006.4) Performance of system. Emergency lighting facilities shall be arranged to provide initial illumination that is at least an average of 1 foot-candle (11 lux) and a minimum at any point of 0.1 foot-candle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 foot-candle (6 lux) average and a minimum at any point of 0.06 foot-candle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40:1 shall not be exceeded.

Exception: In a single story building equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 the emergency lighting facilities shall be permitted to be arranged to provide initial illumination that is at least an average of 0.5 foot-candle (5 lux) and a minimum at any point of 0.1 foot-candle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.3 foot-candle (3 lux) average and a minimum at any point of 0.06 foot-candle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40:1 shall not be exceeded.

Reason: Fire sprinkler tests have indicated that the level of smoke during evacuation is substantially decreased following the activation of an approved automatic fire sprinkler system. I have conducted many illumination tests in my jurisdiction and had to upgrade the emergency lighting facilities to comply with the current code language. This reduction will allow for adequate emergency lighting for evacuating.

Cost Impact: The code change proposal will not increase the cost of construction.

E30–09/10
1007 (IFC [B] 1007)

Proponent: Rick Lupton, City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.1 (IFC [B] 1007.1) Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress are required by Section 1015.1 or 1021.1 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress are not required in alterations to existing buildings.
2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section ~~1007.3~~ 1007.6, ~~1007.4~~ 1007.7 or ~~1007.5~~ 1007.8.
3. In assembly areas with sloped or stepped aisles, one accessible means of egress is permitted where the common path of travel is accessible and meets the requirements in Section 1028.8.

1007.1.1 (IFC [B] 1007.1.1) Elevators required. In buildings where a required accessible floor is four or more stories above or below a level of exit discharge, at least one required accessible means of egress shall be an elevator complying with Section 1007.7.

Exceptions:

1. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, an elevator shall not be required as an accessible means of egress on floors provided with a horizontal exit and located at or above the levels of exit discharge.
2. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, an elevator shall not be required as an accessible means of egress on floors provided with a ramp conforming to the provisions of Section 1010.

1007.2 (IFC [B] 1007.2) Continuity and components. Each required accessible means of egress shall be continuous to a public way and the components shall ~~consist of one or more of the following components:~~ comply with Sections 1007.3 through 1007.14

~~1. Accessible routes complying with Section 1104.~~
~~2. Interior exit stairways complying with Sections 1007.3 and 1022.~~
~~3. Exterior exit stairways complying with Sections 1007.3 and 1026.~~
~~4. Elevators complying with Section 1007.4.~~
~~5. Platform lifts complying with Section 1007.5.~~
~~6. Horizontal exits complying with Section 1025.~~
~~7. Ramps complying with Section 1010.~~
~~8. Areas of refuge complying with Section 1007.6.~~

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section ~~1007.7~~ 1007.10.
2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section ~~1007.6~~ 1007.9 or an exterior area for assisted rescue in accordance with Section ~~1007.7~~ 1007.10.

~~**1007.2.1 (IFC [B] 1007.2.1) Elevators required.** In buildings where a required accessible floor is four or more stories above or below a level of exit discharge, at least one required accessible means of egress shall be an elevator complying with Section 1007.4.~~

~~**Exceptions:**~~

~~1. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a horizontal exit and located at or above the levels of exit discharge.~~
~~2. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a ramp conforming to the provisions of Section 1010.~~

1007.3 (IFC [B] 1007.3) Accessible route of travel. An accessible route of travel shall be in accordance with Section 1104 and ICC A117.1.

1007.4 (IFC [B] 1007.4) Ramps. A ramp shall be in accordance with Section 1010.

1007.5 (IFC [B] 1007.5) Horizontal exits. A horizontal exit shall be in accordance with Section 1025.

~~1007.3~~ 1007.6 (IFC [B] ~~1007.3~~ 1007.6) Stairways. In order to be considered part of an accessible means of egress, an exit access stairway as permitted by Section 1016.1 or exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section ~~1007.6~~ 1007.9 or a horizontal exit.

Exceptions:

1. The area of refuge is not required at open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
2. The clear width of 48 inches (1219 mm) between handrails is not required at exit access stairways as permitted by Section 1016.1or exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Areas of refuge are not required at exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
5. Areas of refuge are not required at exit stairways serving open parking garages.
6. Areas of refuge are not required for smoke protected seating areas complying with Section 1028.6.2.
7. The areas of refuge are not required in Group R-2 occupancies.

~~1007.4~~ **1007.7 (IFC [B] ~~1007.4~~ 1007.7) Elevators.** In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Chapter 27 and 3003. The elevator shall be accessed from either an area of refuge complying with Section ~~1007.6~~ 1007.9 or a horizontal exit.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge or horizontal exit in open parking garages.
2. Elevators are not required to be accessed from an area of refuge or horizontal exit in buildings and facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Elevators not required to be located in a shaft in accordance with Section 708.2 are not required to be accessed from an area of refuge or horizontal exit.
4. Elevators are not required to be accessed from an area of refuge or horizontal exit for smoke protected seating areas complying with Section 1028.6.2.

~~1007.5~~ **1007.8 (IFC [B] ~~1007.5~~ 1007.8) Platform lifts.** Platform (wheelchair) lifts shall not serve as part of an accessible means of egress, except where allowed as part of a required accessible route in Section 1109.7~~, Items 1 through 9~~. Standby power shall be provided in accordance with Chapter 27 for platform lifts permitted to serve as part of a means of egress.

Exception: A platform lift shall not be permitted as a component of an accessible means of egress at locations where existing site constraints make use of a ramp or elevator infeasible.

~~1007.5.1~~ **1007.8.1 (IFC [B] ~~1007.5.1~~ 1007.8.1) Openness.** Platform lifts on an accessible means of egress shall not be installed in a fully enclosed hoistway.

~~1007.6~~ **1007.9 (IFC [B] ~~1007.6~~ 1007.9) Areas of refuge.** Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway within an exit enclosure complying with Sections ~~1007.3~~ 1007.6 and 1022 or an elevator complying with Section ~~1007.4~~ 1007.7. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.
2. A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

~~1007.6.1~~ **1007.9.1 (IFC [B] ~~1007.6.1~~ 1007.9.1) Size.** Each area of refuge shall be sized to accommodate one wheelchair space of 30 inches by 48 inches (762 mm by1219 mm) for each 200 occupants or portion thereof, based

on the occupant load of the area of refuge and areas served by the area of refuge. Such wheelchair spaces shall not reduce the required means of egress width. Access to any of the required wheelchair spaces in an area of refuge shall not be obstructed by more than one adjoining wheelchair space.

~~1007.6.2~~ 1007.9.2 (IFC [B] ~~1007.6.2~~ 1007.9.2) Separation. Each area of refuge shall be separated from the remainder of the story by a smoke barrier complying with Section 710 or a horizontal exit complying with Section 1025. Each area of refuge shall be designed to minimize the intrusion of smoke.

Exception: Areas of refuge located within an exit enclosure.

~~1007.6.3~~ 1007.9.3 (IFC [B] ~~1007.6.3~~ 1007.9.3) Two-way communication. Areas of refuge shall be provided with a two-way communication system complying with Sections ~~1007.8.1~~ 1007.11.1 and ~~1007.8.2~~ 1007.11.2.

~~1007.7~~ 1007.10 (IFC [B] ~~1007.7~~ 1007.10) Exterior area for assisted rescue. ~~The~~ An exterior area for assisted rescue shall ~~must~~ be open to the outside air and meet the requirements of Section ~~1007.6.1~~ 1007.9.1. Separation walls shall comply with the requirements of Section 705 for exterior walls. Where walls or openings are between the area for assisted rescue and the interior of the building, the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than ¾ hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower.

~~1007.7.1~~ 1007.10.1 (IFC [B] ~~1007.7.1~~ 1007.10.1) Openness. The exterior area for assisted rescue shall be at least 50 percent open, and the open area above the guards shall be so distributed as to minimize the accumulation of smoke or toxic gases.

~~1007.7.2~~ 1007.10.2 (IFC [B] ~~1007.7.2~~ 1007.10.2) Exterior exit stairway. Exterior exit stairways that are part of the means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) between handrails.

~~1007.8~~ 1007.11 (IFC [B] ~~1007.8~~ 1007.11) Two-way communication. A two-way communication system shall be provided at the elevator landing on each accessible floor that is one or more stories above or below the story of exit discharge complying with Sections ~~1007.8.1~~ 1007.11.1 and ~~1007.8.2~~ 1007.11.2.

Exceptions:

1. Two-way communication systems are not required at the elevator landing where the two-way communication system is provided within areas of refuge in accordance with Section ~~1007.6.3~~ 1007.9.3.
2. Two-way communication systems are not required on floors provided with exit ramps conforming to the provisions of Section 1010.

~~1007.8.1~~ 1007.11.1 (IFC [B] ~~1007.8.1~~ 1007.11.1) System requirements. Two-way communication systems shall provide communication between each required location and the fire command center or a central control point location approved by the fire department. Where the central control point is not constantly attended, a two-way communication system shall have a timed automatic telephone dial-out capability to a monitoring location or 911. The two-way communication system shall include both audible and visible signals.

~~1007.8.2~~ 1007.11.2 (IFC [B] ~~1007.8.2~~ 1007.11.2) Directions. Directions for the use of the two-way communication system, instructions for summoning assistance via the two-way communication system and written identification of the location shall be posted adjacent to the two-way communication system.

~~1007.9~~ 1007.12 (IFC [B] ~~1007.9~~ 1007.12) Signage. Signage indicating special accessibility provisions shall be provided as shown:

1. Each door providing access to an area of refuge from an adjacent floor area shall be identified by a sign stating: AREA OF REFUGE.
2. Each door providing access to an exterior area for assisted rescue shall be identified by a sign stating: EXTERIOR AREA FOR ASSISTED RESCUE.

Signage shall comply with the ICC A117.1 requirements for visual characters and include the International Symbol of Accessibility. Where exit sign illumination is required by Section 1011.2, the signs shall be illuminated. Additionally,

tactile signage complying with ICC A117.1 shall be located at each door to an area of refuge and exterior area for assisted rescue in accordance with Section 1011.3.

~~1007.10~~ 1007.13 (IFC [B] ~~1007.10~~ 1007.13) Directional signage. Direction signage indicating the location of the other means of egress and which are accessible means of egress shall be provided at the following:

1. At exits serving a required accessible space but not providing an approved accessible means of egress.
2. At elevator landings.
3. Within areas of refuge.

~~1007.11~~ 1007.14 (IFC [B] ~~1007.11~~ 1007.14) Instructions. In areas of refuge and exterior areas for assisted rescue, instructions on the use of the area under emergency conditions shall be posted. The instructions shall include all of the following:

1. Persons able to use the exit stairway do so as soon as possible, unless they are assisting others.
2. Information on planned availability of assistance in the use of stairs or supervised operation of elevators and how to summon such assistance.
3. Directions for use of the two-way communications system where provided.

Reason: This proposal primarily reorganizes the section for purposes of clarity and contains no substantive changes.

Section 1007.1.1 is relocated from the subsection on continuity and components. Because section 1007.1 specifies how many accessible means of egress (AMOE) are required, it is appropriate that the requirement for an elevator, in some buildings, be included here as well. The exceptions have been modified to reflect that the exceptions apply only to the AMOE and that elevators may still be required by other sections of the code.

The laundry list of cross-references in Section 1007.2 has been omitted in favor of a reference to the series of sections detailing component and general requirements.

Section 1007.3 is added and because Section 1104 covers only location, the cross-reference to ICC A117.1 for accessible route requirements has been added.

Section 1007.4 is added for consistent treatment of accepted components.

Section 1007.5 is added for consistent treatment of accepted components.

Currently, item 10 of where platform lifts are allowed is specifically omitted in allowable locations within an AMOE. This proposal adds an exception that states the condition where a platform lift can be used as part of an accessible route of travel but not an AMOE. Adding the exception highlights the distinction.

Except for renumbering and updating references, the remainder of Section 1007 is unchanged.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Lupton-E1B-AMOE Clarity

E31–09/10
1007.1 (IFC [B] 1007.1)

Proponent: Maureen Traxler representing City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.1 (IFC [B] 1007.1) Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress are required by Section 1015.1 or 1021.1 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress are not required in alterations to existing buildings.
2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3, 1007.4 or 1007.5.
3. In assembly areas with sloped or stepped aisles, one accessible means of egress is permitted where the common path of travel is accessible and meets the requirements in Section 1028.8.
4. In parking garages, accessible means of egress are not required to serve parking areas that do not contain accessible parking spaces or other accessible elements.

Reason: This proposal fills a gap in the current regulations. Currently, the code can be read to require all portions of all buildings to have an accessible means of egress, regardless of whether an accessible route of travel is required to a particular space. This proposal clarifies that areas in parking garages that do not have accessible parking spaces do not need to be provided with an accessible means of egress.

A requirement to provide an accessible means of egress to all portions of a parking garage would practically dictate that all multi-level parking garages be designed with level plates connected by vehicle ramps, in order to provide a complying accessible means of egress to all portions of the garage. This is often not an efficient design for parking garages. It would be very difficult for many continuously-ramped garages to comply, since the slope of any portion of the garage would be limited to 5% (1 vertical to 20 horizontal), in order to avoid providing handrails and landings every 30 inches of rise (see IBC 1010.4, 1010.8, and definition of "ramp" in IBC 1002).We do not believe the intent behind the code is to dictate the design of garages in this way. This proposal maintains the requirement for an accessible means of egress for the areas in a garage with accessible parking, but allows the rest of the garage to be designed as necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAXLER-E2-1007.1

E32–09/10
1007.1.1 (New) [IFC [B] 1007.1.1(New)]

Proponent: Rick Lupton, City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.1 (IFC [B] 1007.1) Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress are required by Section 1015.1 or 1021.1 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress are not required in alterations to existing buildings.
2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3, 1007.4 or 1007.5.
3. In assembly areas with sloped or stepped aisles, one accessible means of egress is permitted where the common path of travel is accessible and meets the requirements in Section 1028.8.

1007.1.1 (IFC [B] 1007.1.1) Separation of accessible means of egress. When two accessible means of egress are required, they shall be located as far apart as practical.

Reason: This proposal is intended to address a gap in the code. Currently, there is no specific code language that would prevent two accessible means of egress (AMOE) from being located immediately adjoining. Yet complying with Section 1015.2.1 would place an undue burden on the designer because there are times that an elevator is required as an AMOE and the measure between the elevator and a stair would likely control rather than the measure between stairs as intended for conventional design. According to ICC staff the intent is that two accessible means of egress be separated, but that flexibility is necessary to accommodate types and possible locations of AMOE. While this proposal does not detail exactly how far apart the two AMOE are required to be, it does state the intent yet allows the building official flexibility where necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

1007.1.1(New), 1007.6 (IFC [B] 1007.1.1(New), 1007.6)

Proponent: Proponent: Rick Lupton, City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.1 (IFC [B] 1007.1) Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than

one means of egress are required by Section 1015.1 or 1021.1 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress are not required in alterations to existing buildings.
2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3, 1007.4 or 1007.5.
3. In assembly areas with sloped or stepped aisles, one accessible means of egress is permitted where the common path of travel is accessible and meets the requirements in Section 1028.8.

1007.1.1 (IFC [B] 1007.1.1) Travel distance. The maximum travel distance from any accessible space to an accessible exterior exit door, horizontal exit, exit stairway, elevator, area of refuge, or exterior area for assistedrescue shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1.

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. ~~The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1.~~ Every required area of refuge shall have direct access to a stairway within an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.1.7 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.
2. Smokeproof enclosure is not required for an elevator lobby used as an area of refuge not required to be enclosed.

Reason: This proposal relocates the travel distance provision from the area of refuge section to Section 1007.1 and applies the requirement to exits, areas of refuge or exterior areas for assisted rescue. Under the 2009 IBC areas of refuge are not required in sprinkled buildings and as a result no travel distance limitations would apply in those circumstances. As proposed, the same travel distance limitations that apply for conventional means of egress would apply to accessible means of egress (AMOE), except that the dimension may be less for the AMOE because the measurement terminates at an area of refuge or exterior area for assisted rescue. For a larger building, this may mean additional AMOE.

Cost Impact: The code change proposal will increase the cost of construction.

E34–09/10
1007.2.1 (New), 1007.6 (IFC [B] 1007.2.1 (New), 1007.6)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1007.2 (IFC [B] 1007.2) Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
3. Exterior exit stairways complying with Sections 1007.3 and 1026.
4. Elevators complying with Section 1007.4.
5. Platform lifts complying with Section 1007.5.
6. Horizontal exits complying with Section 1025.
7. Ramps complying with Section 1010.
8. Areas of refuge complying with Section 1007.6.

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.
2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.

1007.2.1 (IFC [B] 1007.2.1) Travel distance limitations. Each required accessible means of egress component shall be so located on each story such that the maximum length of accessible exit access travel, measured from the most remote point of an accessible space to an accessible means of egress exit component, shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1.

(Renumber subsequent sections)

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. ~~The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1.~~ Every required area of refuge shall have direct access to a stairway in an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.
2. A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

Reason: Currently, any building that provides accessible means of egress without the use of an area of refuge has no limit to the travel distance required by the accessible means of egress system. Travel distance limits are only found in Section 1007.6. The general means of egress requires a limit to travel distance as part of a holistic approach to the exit system to address the occupant flow rates through exit components and travel speeds along its path. There is limited information on how people with disabilities impact these flow rates and travel speeds, but persons with mobility impairments typically move at a slower rate than able bodied people. The exit system for persons with a disability should be within the same travel distance limits as that provided others within the building. Therefore, this proposal moves the travel distance limitation requirement from that pertaining to only an area of refuge and applies it to the continuity of the overall accessible means of egress where it belongs.

Cost Impact: This code change proposal will increase the cost of construction.

E35–09/10
1007.2 (IFC [B] 1007.2)

Proponent: Anne VonWeller, Murray City, representing the Utah Chapter of the International Code Council

Revise as follows:

1007.2 (IFC [B] 1007.2) Continuity and components. Each required means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3, 1009 and 1022.
3. Interior exit ramps complying with Sections 1010 and 1022.
4. Unenclosed exit access stairways complying with 1007.3, 1009 and Exception 3 or 4 of Section 1016.1.
5. Unenclosed exit access ramps complying with 1010 and Exception 3 or 4 of Section 1016.1.
~~3~~ 6. Exterior exit stairways complying with Sections 1007.3, 1009 and1026.
7. Exterior exit ramps complying with 1010 and 1026.
~~4~~ 8. Elevators complying with 1007.4

~~5~~ 9. Platform lifts complying with Section 1007.5
~~6.~~10. Horizontal exits complying with Section 1025.
~~7.~~ ~~Ramps complying with Section 1010.~~
~~8~~ 11. Areas of refuge complying with Section 1007.6

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.
2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.

Reason: In the 2009 Edition a distinction has been made between 'exit' stairways and ramps and 'exit access' stairways and ramps. In the past all of the exceptions for unenclosed stairways and ramps occurred in Section 1022.1. Now some of those exceptions are located in 1022.1 and some in 1016.1. This change is offered to lead user to the new location for the two exceptions relocated to 1016.1 and to provide consistence with changes made to the 2009 edition of the IBC regarding unenclosed exit access stairways and ramps. It also clarifies the base requirements contained in 1009 apply to the stairways in this section 1007.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Vonweller-E4-1007.2

E36–09/10
1007.2 (IFC [B] 1007.2)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1007.2 Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
3. Interior exit access stairways complying with Section 1007.3 and Section 1016.1, Exception 3 and 4.
~~3.~~4. Exterior exit stairways complying with Sections 1007.3 and 1026.
~~4.~~5. Elevators complying with Section 1007.4.
~~5.~~6. Platform lifts complying with Section 1007.5.
~~6.~~7. Horizontal exits complying with Section 1025.
~~7.~~8. Ramps complying with Section 1010.
~~8.~~9. Areas of refuge complying with Section 1007.6.

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.
2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.

Reason: Exit access stairways as permitted by Section 1016.1 are not listed as a component of an accessible means of egress. Therefore their use should be included here to avoid conflict with Section 1007.3.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-E10-1007.2

1007.2, 1007.7, 1007.7.1, 1007.7.2 (IFC [B] 1007.2, 1007.7, 1007.7.1, 1007.7.2)

Proponent: Ron Clements, Chesterfield County Virginia Building Inspection Department, representing Chesterfield County Virginia Building Inspection Department

Revise as follows:

1007.2 Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
3. Exterior exit stairways complying with Sections 1007.3 and 1026 and serving levels other than the level of exit discharge.
4. Elevators complying with Section 1007.4.
5. Platform lifts complying with Section 1007.5.
6. Horizontal exits complying with Section 1025.
7. Ramps complying with Section 1010.
8. Areas of refuge complying with Section 1007.6.
9. Exterior area for assisted rescue complying with Section 1007.7 serving exits at the level of exit discharge.

~~Exceptions:~~

1. ~~Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.~~
2. ~~Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.~~

1007.7 (IFC [B] 1007.7) Exterior area for assisted rescue. The exterior area for assisted rescue ~~must be open to the outside air and~~ shall be an area provided on the exterior landing serving an exit door on an accessible route. The exterior area of assisted rescue shall meet the size and access requirements of Section 1007.6.1.

1007.7.1 (IFC 1007.7.1) Seperation. ~~Separation walls shall comply with the requirements of Section 705 for exterior walls. Where walls or openings are between the area for assisted rescue and the interior of the building, the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour.~~ Exterior walls separating the exterior area of assisted rescue from the interior of the building shall have a minimum fire resistance rating of 1 hour, rated for exposure to fire from the inside. The fire resistance rated exterior wall construction shall extend horizontally 10 feet (3048mm) beyond the landing on either side of the landing or equivalent fire resistance rated construction is permitted to extend out perpendicular to the exterior wall 4 feet(1220 mm) minimum on the side of the landing. The fire resistance rated construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. Openings within such fire resistance rated exterior walls shall be protected in accordance with Section 715 ~~by opening protectives having a fire protection rating of not less than 3/4 hour~~. ~~This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower.~~

~~1007.7.1~~ 1007.7.2 (IFC [B] ~~1007.7.1~~ 1007.7.2) Openness. The exterior area for assisted rescue shall be at least 50 percent open, and the open area ~~above the guards~~ shall be so distributed as to minimize the accumulation of smoke or toxic gases.

~~1007.7.2~~ 1007.7.3 (IFC [B] ~~1007.7.2~~ 1007.7.3) Exterior ~~exit~~ stairway. Exterior ~~exit~~ stairways that are part of the means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) between handrails.

Reason: The intent of this proposal is to clarify where the exterior are for assisted rescue is intended to be utilized and provide better code language for the requirements.

Section 1007.2. The addition language to item 3 is to indicate that the provisions for exterior exit stairways are for stairways from upper floors or basements, not the couple of steps somewhere along the path of exit discharge. If an area of refuge inside a building can be a component of an

accessible means of egress, the exterior area of assisted rescue should also be one of that list, thus the addition of item 9. The exceptions are no longer needed with the revisions to the list.

Section 1007.7 - The first text strike-through removed redundant language regarding openness to the exterior. The requirement for openness is provided in detail in Section 1007.7.1 therefore the statement is redundant in the first sentence of 1007.7. The added text to the first sentence clearly states that the exterior area for assisted rescue is an area on an exterior landing serving an exit door on an accessible route. This clarifies that the area is on an exterior landing, that it is served by an exit door therefore this is part of the exit discharge and that it is on an accessible route, which guarantees that there is an accessible route to get to the exterior area for assisted rescue. The current language is ambiguous about exactly how the exterior area for assisted rescue fits into the overall means of egress system.

The rest of the paragraph is split into a new section for clarity – Section 1007.7.1. The second text strike-through removes confusing text that states "building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating". That language suggests that some portion of the separation wall is non rated but the wall beyond the non rated portion is to be rated? It is very confusing text that is corrected in the following new text proposed. The new text attempts to capture the basic technical requirements of the current Section with two technical changes. The first was the added text that allows the rated construction to extend out perpendicular from the building on the end of the landing. This is a method that we have used to protect exterior areas for assisted rescue adjacent to, and within 10 feet of, loading dock doors to avoid having to provide a ¾ hour protected opening at the loading dock door. The 4 foot minimum dimension is based on the 4 foot protection required for similar types of exposure protection specified in Sections 706.5 Exception #2 and 3, and 706.5.1 exception #1. The second technical change is the requirement for the rating to be for inside exposure. This is based on the current method for prescribing exterior wall fire ratings in Section 705.5. Inside exposure is specified in this case since the protection intended is from a fire inside the building. The last change to Section 1007.7 is to refer opening protection of the fire rated construction to Section 715. Section 715 has the complete opening protection provisions necessary to properly protect the openings. Having the opening protection specification in Section 1007.7 without all of the supporting Sections provided in Section 715 is technically inaccurate. Table 715.4 requires ¾ hour protection in exterior walls so no amendment to the table is required and additionally the current text could be mis-applied to allow ¾ hour opening protection when the wall had a higher fire rating for another purpose, which would not occur with a direct reference to Section 715. This revision clarifies the original intent for the use of the exterior area of assisted rescue as a protected area serving an exit at the level of exit discharge where there is not be an accessible route to the public way.

Section 1007.7.1 (new Section 1007.7.2) has the text "above the guards" removed because the text accomplishes the performance requirement intended without that text. Additionally an exterior area for assisted rescue could be constructed without a guardrail in some circumstances such as a grade level landing that connects to the public way with a stair in the exit discharge. Lastly "guard" is not a defined term.

Section 1007.7.2 (new Section 1007.7.3) uses the term exterior "exit" stair. Exterior exit stairs are regulated by Section 1026 and are an exit component. The exterior stair serving an exterior area for assisted rescue is typically an exit discharge component. If a true Section 1026 exit stair is used to serve an exterior area for assisted rescue per 1007.2 exception #2 removal of the work "exit" would not pose a problem because the more generic term "exterior stair" could be applied to an exit stair. Based on these points "exit" is proposed to be deleted from 1007.7.2.

Cost Impact: This will reduce the cost of construction by reducing the confusion associated with interpreting the current exterior area for assisted rescue provisions.

1007.2, 1007.7, 1007.7.1 (New), 1007.7.2 (IFC [B] 1007.2, 1007.7, 1007.7.1 (New), 1007.7.2)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1007.2 (IFC [B] 1007.2) Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
3. Exterior exit stairways complying with Sections 1007.3 and 1026.
4. Elevators complying with Section 1007.4.
5. Platform lifts complying with Section 1007.5.
6. Horizontal exits complying with Section 1025.
7. Ramps complying with Section 1010.
8. Areas of refuge complying with Section 1007.6.
9. Exterior area for assisted rescue complying with 1007.7

~~Exceptions:~~

1. ~~Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.~~
2. ~~Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.~~

1007.7 (IFC [B] 1007.7) Exterior area for assisted rescue. Exterior areas for assisted rescue shall be accessed by an accessible route from the area served shall be permitted in accordance with Section 1007.7.1 or 1007.7.2.

1007.7.1 (IFC [B] 1007.7.1) Level of exit discharge. Where the exit discharge does not include an accessible route from an exit located on a level of exit discharge to a public way, an exterior area of assisted rescue shall be provided on the exterior landing in accordance with Sections 1007.7.3 through 1007.7.6.

1007.7.2 (IFC [B] 1007.7.2) Stories above level of exit discharge. Where exit access from the area served is outdoor open air, an exterior area of assisted rescue is permitted as an alternative to an area of refuge. Every required exterior area of assisted recue shall have direct access to an interior exit stairway, exterior stairway, or elevator serving as an accessible means of egress component. The exterior area of assisted rescue shall comply with Section 1007.7.3 through 1007.7.6 and shall be provided with a two-way communication system complying with Sections 1007.8.1 and 1007.8.2.

1007.7.3 (IFC [B] 1007.7.3) Size. Each exterior area for assisted rescue shall be sized to accommodate wheelchair spaces in accordance with Section 1007.6.1. ~~The exterior area for assisted rescue must be open to the outside air and meet the requirements of Section 1007.6.1.~~

1007.7.4 (IFC [B] 1007.7.4) Separation. Separation walls shall comply with the requirements of Section 705 for exterior walls. Where walls or openings are between the area for assisted rescue and the interior of the building, the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower.

~~1007.7.1~~ 1007.7.5 (IFC [B] ~~1007.7.1~~ 1007.7.5) Openness. The exterior area for assisted rescue shall be open to the outside air. The sides other than the separation walls shall be at least 50 percent open, and the open area above ~~the~~ guards shall be ~~so~~ distributed so as to minimize the accumulation of smoke or toxic gases.

~~1007.7.2~~ 1007.7.6 (IFC [B] ~~1007.7.2~~ 1007.7.6) ~~Exterior exit~~ Stairway. ~~Exterior exit~~ Stairways that are part of the means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) between handrails.

> **Exception:** The clear width of 48 inches (1219 mm) between handrails is not required at stairways serving buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: An exterior area of assisted rescue is a component of an accessible means of egress, like other components listed. It is not an exception to a component of an accessible means of egress – it is a viable alternative to an interior area of refuge. This proposal clarifies how an exterior area of assisted rescue can serve as a component and still maintain the provisions relating to other components. With proper separation, communication and signage an exterior area of assisted rescue should not be limited to an exit discharge or an exterior exit stair. A stair complying with Section 1022 allows for an exterior stair, but it also allows for an enclosed exit stair to serve an exterior area of assisted rescue and Section 1107.4 would allow an elevator to also serve it. This option needs clarification on it use and this proposal provides that clarification.

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-E6-1007.2

E39–09/10
1007.2.1, 1007.8 (IFC [B] 1007.2.1, 1007.8)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1007.2.1 (IFC [B] 1007.2.1) Elevators required. In buildings where a required accessible floor is four or more stories above or below a level of exit discharge, at least one required accessible means of egress shall be an elevator complying with Section 1007.4.

Exceptions:

1. ~~In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a horizontal exit and located at or above the levels of exit discharge.~~ The elevator shall not be required on floors provided with a horizontal exit and located at or above the levels of exit discharge provided:
   1.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2; and,
   1.2. The horizontal exit provides a minimum of two distinct exits or, in addition to the horizontal exit, a second accessible means of egress is provided.
2. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with an exit ramp conforming to the provisions of Section 1010 and at least one additional accessible means of egress.

1007.8 (IFC [B] 1007.8) Two-way communication. A two-way communication system shall be provided at the elevator landing on each accessible floor that is one or more stories above or below the story of exit discharge complying with Sections 1007.8.1 and 1007.8.2.

Exceptions:

1. Two-way communication systems are not required at the elevator landing where the two-way communication system is provided within areas of refuge in accordance with Section 1007.6.3.
2. Two-way communication systems are not required at the elevator landing on floors provided with an exit ramp~~s~~ conforming to the provisions of Section 1010 and at least one additional accessible means of egress.

Reason: The existing exceptions assume that the horizontal exit and the ramp are always available and accessible. This cannot be guaranteed as the hazard may be blocking access to the ramp or horizontal exit. At most, only two accessible means of egress are required to be provided. The exception reduces that down to one. If the one remaining horizontal exit or ramp is not available, there is no accessible means of egress provided. The restated exceptions assume a higher probability that at least one option will be available. The same reasoning applies to the communication system.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Weihle-E2-1007.2.1

E40–09/10

1007.2.1 (IFC [B] 1007.2.1)

Proponent: Rick Lupton, City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.2.1 (IFC [B] 1007.2.1) Elevators required. In buildings where a required *accessible* floor is four or more stories above or below a *level of exit discharge*, at least one required *accessible means of egress* shall be an elevator complying with Section 1007.4.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a ramp conforming to the provisions of Section 1010.
3. Where rooms, spaces or floor levels are not required to be accessible or where stories are not required to be connected by an accessible route in accordance with Chapter 11, an elevator is not required to serve as part of an accessible means of egress.

Reason: Where spaces like a mechanical penthouse are not required to be accessible, then Section 1007.1 clearly does not require an accessible means of egress. But there are many locations within a building that might be required to contain accessible elements and yet are not required to be

wheelchair accessible. The 2006 IBC Commentary – Volume I explains that many of these exceptions are because of the economic impracticality in installing an elevator to serve such locations. And the ADA Title III frankly refers to this as "the elevator exemption". These locations are clearly intended to be exempted from installing an elevator as impractical, whether the intended purpose is for an accessible route or an accessible means of egress.

Examples of where a room, space or floor level would not require an accessible route abound, even spaces located 4 stories or more above or below the level of exit discharge. For example, the 2000 square foot mezzanine executive office of a five story building does not require elevator access and so, should not require an elevator as part of the accessible means of egress.

If a parking garage constructed six stories below grade serves a retail store having accessible entries at the 1st story only, then Section 1106.6 would require all the accessible parking spaces to be located at only the 1st story to provide shortest accessible route possible and none of the remaining parking garage levels would require an accessible route because they contain no accessible parking. As such, an elevator should not be a required part of an accessible means of egress.

The 2nd story of a multistory Type B penthouse dwelling unit in a high-rise apartment building is not required to be accessible if the conditions of Section 1107.7.2 are met, so an elevator should not be required as a part of the accessible means of egress within the dwelling unit.

This proposal adds exception 3 to clarify that when no accessible route is provided, then an elevator need not be provided solely for purposes of the accessible means of egress, consistent with explanations contained in the 2006 IBC Commentary under Section 1007.1.

Cost Impact: The code change proposal will not increase the cost of construction.

1007.3, 1007.6 (IFC [B] 1007.3, 1007.6)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1007.3 (IFC [B] 1007.3) Exit Stairways. In order to be considered part of an accessible means of egress, an ~~exit access stairway as permitted by Section 1016.1 or~~ exit stairway in compliance with Sections 1022 and 1026 shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. ~~The area of refuge is not required at open exit access or exit stairways as permitted by Section 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~
1. The clear width of 48 inches (1219 mm) between handrails is not required at exit access stairways as permitted in Section 1016.1 or exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Areas of refuge are not required at exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
4. Areas of refuge are not required at exit stairways serving open parking garages.
5. Areas of refuge are not required for smoke protected seating areas complying with Section 1028.6.2.
6. The area of refuge are not required in Group R-2 occupancies.

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to an exit stairway ~~in an exit enclosure~~ complying with Section~~s~~ 1007.3 ~~and 1022~~ or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

Exceptions:

1. An exit stairway serving an area of refuge is not required to be enclosed where permitted in Sections ~~1016.1 and~~ 1022~~.1~~ and 1026.

2. A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

Reason: Exit access stairways as permitted by Section 1016.1 are not listed as a component of an accessible means of egress. Therefore, either their use should be stricken from 1007.3 to avoid confusion or added as a component. This proposal deletes reference to exit access stairs consistent with the limited components since the location of exit access stairs can be wide ranging making it difficult for first responders to locate potential people waiting to be evacuated, especially in facilities where an area of refuge with two-way communication is not required or provided. Section 1007.3 exception #1 is redundant with exception #3 when the reference to exit access stairs is removed, therefore this proposal eliminates exception #1 rather than a more complex modification.

Cost Impact: This proposal will increase the cost of construction.

ICCFILENAME:Roether-E4-1007.2

E42–09/10
1007.3 (IFC [B] 1007.3)

Reason: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1007.3 (IFC [B] 1007.3) Stairways. In order to be considered part of an accessible means of egress, an exit access stairway as permitted by Section 1016.1 or exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

~~1. The area of refuge is not required at open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

~~2~~ 1. The clear width of 48 inches (1219 mm) between handrails is not required at exit access stairways as permitted by Section 1016.1 or exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

~~3~~ 2. Areas of refuge are not required ~~at exit stairways~~ in buildings equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

~~4~~ 3. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.

~~5~~ 4. Areas of refuge are not required at exit stairways serving open parking garages.

~~6~~ 5. Areas of refuge are not required for smoke protected seating areas complying with Section 1028.6.2.

~~7~~ 6. The areas of refuge are not required in Group R-2 occupancies.

Reason: Combining exceptions 1 and 3 is effectively an editorial change which does not affect the application of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

1007.3, 1007.4, 1007.6.2 (IFC [B] 1007.3, 1007.4, 1007.6.2)

Proponent: Rick Lupton, City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.3 (IFC [B] 1007.3) Stairways. In order to be considered part of an accessible means of egress, exit access stairway as permitted by Section 1016.1 or exit stairway shall have a clear width of 48 inches (1219 mm) minimum

between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

~~1. The area of refuge is not required at open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2~~

~~2.~~ 1. The clear width of 48 inches (1219 mm) between handrails is not required at exit access stairways as permitted by Section 1016.1 or exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

~~3. Areas of refuge are not required at exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

~~4.~~ 2. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.

~~5.~~ 3. Areas of refuge are not required at exit stairways serving open parking garages.

~~6.~~ 4. Areas of refuge are not required for smoke protected seating areas complying with Section 1028.6.2.

~~7.~~ 5. The areas of refuge are not required in Group R-2 occupancies.

1007.4 (IFC [B] 1007.4) Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Chapter 27 and 3003. The elevator shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge or horizontal exit in open parking garages.

~~2. Elevators are not required to be accessed from an area of refuge or horizontal exit in buildings and facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

~~3.~~ 2. Elevators not required to be located in a shaft in accordance with Section 708.2 are not required to be accessed from an area of refuge or horizontal exit.

~~4.~~ 3. Elevators are not required to be accessed from an area of refuge or horizontal exit for smoke protected seating areas complying with Section 1028.6.2.

1007.6.2 (IFC [B] 1007.6.2) Separation. Each area of refuge shall be separated from the remainder of the story by a smoke barrier complying with Section 710 or a horizontal exit complying with Section 1025. Each area of refuge shall be designed to minimize the intrusion of smoke.

~~Exception~~ Exceptions:

1. Areas of refuge located in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 shall not be required to be separated from the remainder of the story.
2. Areas of refuge located within an exit enclosure.

Reason: This proposal primarily regards areas of refuge in sprinkled buildings. The 2009 code excepts areas of refuge for stairs and elevators in fully sprinkled buildings. In this proposal the separation requirements are excepted where a building is fully sprinkled, but the wheelchair space and communication features of an area of refuge are maintained. The change is based on sprinklers substituting only for protection and time. Wheelchair spaces and communication are still needed and desired in order for assisted rescue, even in sprinkled buildings. As a result, an area of refuge becomes a space where a person in a wheelchair can get assistance. However, by not requiring the separation from the rest of the building, including logically the design for smoke intrusion, sprinklers are credited yet other necessary features are maintained. The proposal will not cause any conflict with the current definition of area of refuge –refer Section 1002. However, the proposal will add some cost to construction over current code requirements. The change is accomplished by deleting exceptions to Sections 1007.3 and 1007.4 and an exception is added to Section 1007.6.2, detailing separation requirements for areas of refuge.

Cost Impact: The code change proposal will increase the cost of construction.

E44–09/10
1007.3, 1007.4 (IFC [B] 1007.3, 1007.4)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1007.3 (IFC [B] 1007.3) Stairways. In order to be considered part of an accessible means of egress, an exit access stairway as permitted by Section 1016.1 or exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from ~~either~~ an area of refuge complying with Section 1007.6 ~~or a horizontal exit~~.

Exceptions:

1. The area of refuge is not required at open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
2. The clear width of 48 inches (1219 mm) between handrails is not required at exit access or exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Areas of refuge are not required at exit stairways in buildings equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. ~~The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.~~
5. ~~4.~~ Areas of refuge are not required at exit stairways serving open parking garages.
6. ~~5.~~ Areas of refuge are no required for smoke protected seating areas complying with Section 1028.6.2.
7. ~~7~~ 6. ~~The~~ areas of refuge are not required in Group R-2 occupancies.

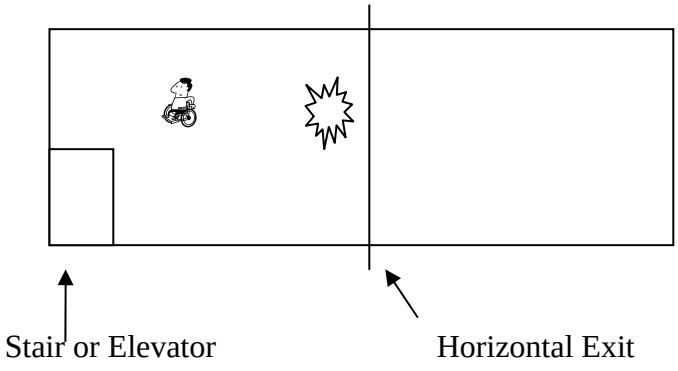
1007.4 (IFC [B] 1007.4) Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Sections 2702 and 3003. The elevator shall be accessed from ~~either~~ an area of refuge complying with Section 1007.6 ~~or a horizontal exit~~.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge ~~or horizontal exit~~ in open parking garages.
2. Elevators are not required to be accessed from an area of refuge ~~or horizontal exit~~ in buildings ~~and facilities~~ equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Elevators not required to be located in a shaft in accordance with Section 707.2 are not required to be accessed from an area of refuge ~~or horizontal exit~~.
4. Elevators are not required to be accessed from an area of refuge ~~or horizontal exit~~ for smoke protected seating areas complying with Section 1025.6.2.

Reason: The concept of “accessed from a horizontal exit” is flawed in that it assumes everyone passes through the horizontal exit. This is only true for half of the occupants of the floor (assuming the horizontal exit splits the floor in two). The stair or elevator cannot be accessed from a horizontal exit when the person and the stair or elevator are on the same side of the horizontal exit.

The criteria for accessible stairs and elevators must be maintained without regard to the horizontal exit. The horizontal exit cannot be used to eliminate the area of refuge or the width of the stair for those occupants that are already on the stair/elevator side of the horizontal exit. Each portion of the floor on either side of the horizontal exit requires two accessible means of egress per Section 1007.1; the stair/elevator (1) and the horizontal exit (2). The area of refuge and width of the stair must be maintained in order to provide a second exit in the event the hazard blocks access to the horizontal exit.



Cost Impact: The code change proposal will increase the cost of construction.

E45–09/10
1007.3, 1007.4 (IFC [B] 1007.3, 1007.4)

Proponent: Rick Lupton, City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.3 (IFC [B] 1007.3) Stairways. In order to be considered part of an accessible means of egress, an exit access stairway as permitted by Section 1016.1 or exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. The area of refuge is not required at open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
2. The clear width of 48 inches (1219 mm) between handrails is not required at exit access stairways as permitted by Section 1016.1or exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Areas of refuge are not required at exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
5. Areas of refuge are not required at exit stairways serving open parking garages.
6. Areas of refuge are not required for smoke protected seating areas complying with Section 1028.6.2.
7. ~~The areas~~ Areas of refuge are not required ~~in~~ within Group R-2 or R-3 ~~occupancies~~ dwelling or sleeping units.

1007.4 (IFC [B] 1007.4) Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Chapter 27 and 3003. The elevator shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge or horizontal exit in open parking garages.
2. Elevators are not required to be accessed from an area of refuge or horizontal exit in buildings and facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

3. Elevators not required to be located in a shaft in accordance with Section 708.2 are not required to be accessed from an area of refuge or horizontal exit.
4. Elevators are not required to be accessed from an area of refuge or horizontal exit for smoke protected seating areas complying with Section 1028.6.2.
5. Private residence elevators are not required to be accessed from an area of refuge or horizontal exit within individual dwelling units and sleeping units of Group R-2 or R-3 occupancy.

Reason: This proposal is intended to clarify exception 7 of Section 1007.3. It is my understanding that this exception is intended to apply within individual units of a Group R-2 occupancy and not the common stairs and elevators used by all occupants of a Group R-2 occupancy. It follows, logically, that the exception should also apply to Group R-3 units and to elevators within individual units. IRC townhouses, for example, should not require areas of refuge. Common stairs and elevators can still use the sprinkler exception to areas of refuge.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Lupton-E1C-1007 AOR in R2

E46–09/10
1007.6, 1007.6.2 (IFC [B] 1007.6, 1007.6.2)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

1007.6 Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway within an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke ~~barrier~~ partition.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and Section 1022.1.
2. A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

1007.6.2 Separation. Each area of refuge shall be separated from the remainder of the story by a smoke ~~barrier~~ partition having a fire-resistance rating of not less than 1 hour complying with Section ~~710~~ 711 or a horizontal exit complying with Section 1025. Each area of refuge shall be designed to minimize the intrusion of smoke.

Exception: Areas of refuge located within an exit enclosure.

Reason: The continuity of smoke barriers is required by Section 710.4 to extend from outside wall to outside wall. Smoke partitions are not required to extend from outside wall to outside wall. I do not believe the code intended areas of refuge related to elevators to be separated with smoke barriers.

Cost Impact: This will decrease the cost of construction.

Analysis: There is a code change proposal on the docket of the Fire Safety Committee to Section 710 that is proposing to revise continuity of fire barrier requirements around areas of refuge.
