1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway within an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. ~~Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smoke-proof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier~~.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.
2. A smoke-proof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

Reason: Areas of refuge required to serve an elevator or stair enclosure must be separated from the remainder of the building by a smoke barrier or a horizontal exit per Section 1007.6.2. As written above, this sentence would never apply as all areas of refuge are formed by either a smoke barrier or horizontal exit.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRANZ-E4-1007.6.DOC

E48–09/10
1007.6.1 (IFC [B] 1007.6.1)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1007.6.1 (IFC [B] 1007.6.1) Size. Each area of refuge shall be sized to accommodate one wheelchair space of 30 inches by 48 inches (762 mm by1219 mm) for each 200 occupants or portion thereof, based on the occupant load of the area of refuge and areas served by the area of refuge. Such wheelchair spaces shall not reduce the required means of egress width. Access to any of the required wheelchair spaces in an area of refuge shall not be obstructed by more than one adjoining wheelchair space. Wheelchair spaces shall be clear of any door swing. A turning space complying with ICC A117.1 shall be provided within the area of refuge.

Reason: A turning space is necessary in order to avoid entrapment inside the area of refuge and to ensure minimal maneuverability within the area of refuge. Without the turning space requirement the area of refuge could be no more than a 3' by 4' room. While it seems apparent that the door into the stairway should not overlap the wheelchair space the 2nd sentence of Section 1007.6.1 does not guarantee that.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E5-1007.6.1

E49–09/10
1007.6.2 (IFC [B] 1007.6.2)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1007.6.2 ~~Separation~~ Construction. At a minimum, Each area of refuge shall ~~be separated from the remainder of the story by a smoke barrier complying with Section 709 or a horizontal exit complying with Section 1025~~ provide an equivalent level of protection as the enclosure serving the area of refuge. Each area of refuge shall be designed to minimize the intrusion of smoke.

~~**Exception:** Areas of refuge located within an exit enclosure.~~

Reason: When an area of refuge is required, the rating for the construction should match the stairway or elevator shaft construction. Since smoke barrier requirments do not include criteria for 2 hour construction, the appropriate construction is a fire barrier, so only referencing Section 709 is inadequate. The fire or hazard location might block access through a horizontal exit, therefore, the area of refuge should always be required.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E6-1007.6.2

E50–09/10
1007.8, 1007.8.2, 1007.8.3 (New), 1007.9, 1007.10 (IFC [B] 1007.8, 1007.8.2, 1007.8.3 (New), 1007.9, 1007.10)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1007.8 (IFC [B] 1007.8) Two-way communication. A two-way communication system shall be provided at the elevator landing on each accessible floor that is one or more stories above or below the story of exit discharge complying with Sections 1007.8.1 and 1007.8.2. Signage for the two-way communication system shall be provided in accordance with Section 1007.8.3.

Exceptions:

1. Two-way communication systems are not required at the elevator landing where the two-way communication system is provided within areas of refuge in accordance with Section 1007.6.3.
2. Two-way communication systems are not required on floors provided with exit ramps conforming to the provisions of Section 1010.

1007.8.1 (IFC [B] 1007.8.1) System requirements. Two-way communication systems shall provide communication between each required location and the fire command center or a central control point location approved by the fire department. Where the central control point is not constantly attended, a two way communication system shall have a timed automatic telephone dial-out capability to a monitoring location or 911. The two-way communication system shall include both audible and visible signals.

1007.8.2 (IFC [B] 1007.8.2) System Directions. Directions for the use of the two-way communication system, instructions for summoning assistance via the two-way communication system and written identification of the location shall be posted adjacent to the two-way communication system. Signage shall comply with ICC A117.1 requirements for visual characters.

1007.8.3 (IFC [B] 1007.8.3) System signage. Directional signage indicating the location of the nearest two-way communication system shall be provided at the following:

1. Exit access and exit stairways not providing a two-way communication system.
2. Elevator landings, other than levels of exit discharge, not providing a two-way communication system.

1007.9 (IFC [B] 1007.9) Signage. Signage indicating special accessibility provisions shall be provided as shown:

1. Each door providing access to an area of refuge from an adjacent floor area shall be identified by a sign stating: AREA OF REFUGE.
2. Each door providing access to an exterior area for assisted rescue shall be identified by a sign stating: EXTERIOR AREA FOR ASSISTED RESCUE.
3. Each stairway serving as part of an accessible means of egress but not accessed by an area of refuge shall be identified by a sign stating: AREA FOR ASSISTED RESCUE.
4. Each elevator landing providing a two-way communication system shall provide a sign at the two-way communication system stating: CALL STATION FOR ASSISTED RESCUE.

Signage shall comply with the ICC A117.1 requirements for visual characters and include the International Symbol of Accessibility. Where exit sign illumination is required by Section 1011.2, the signs shall be illuminated. Additionally, tactile signage complying with ICC A117.1 shall be located at each door to an area of refuge and exterior area for assisted rescue in accordance with Section 1011.3.

1007.10 (IFC [B] 1007.10) Directional signage. Directional signage indicating the location of the ~~other means of egress and which are~~ accessible means of egress shall be provided at the following:

1. At exits serving a required accessible space but not providing an approved accessible means of egress.
2. At elevator landings.
3. ~~Within areas of refuge~~ At exit access and exit stairways not providing an approved accessible means of egress.

Reason: Signage is a critical component to an effective accessible means of egress system. Directional signage to a two-way communication system may be the most important component in the egress system as this communication system is the only element provided to obtain assisted rescue.

Exception 2 at Section 1007.8 is amended because there is no assurance that if only one ramp is provided that it will not be blocked by the hazard.

When an area of refuge or other approved accessible means of egress is provided, directional signage at other noncompliant routes must be provided to direct individuals to the compliant route.

Cost Impact: The code change proposal will increase the cost of construction.

E51–09/10
1008.1.2 (IFC [B] 1008.1.2)

Proponent: Gaius G. Nelson, Architect, Nelson•Tremain Partnership, representing self

Revise as follows:

1008.1.2 (IFC [B] 1008.1.2) Door swing. Egress doors shall be of the pivoted or side-hinged swinging type.

Exceptions:

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within sleeping rooms or suites of sleeping rooms in Group I-2.
4. ~~5~~. Doors within or serving a single dwelling unit in Groups R-2 and R-3.
5. ~~6~~. In other than Group H occupancies, revolving doors complying with Section 1008.1.4.1.
6. ~~7~~. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.4.3 are permitted in a means of egress.
7. ~~8~~. Power-operated doors in accordance with Section 1008.1.4.2.
8. ~~9~~. Doors serving a bathroom within an individual sleeping unit in Group R-1.
9. ~~9~~. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a means of egress from spaces with an occupant load of 10 or less.

Doors shall swing in the direction of egress travel where serving an occupant load of 50 or more persons or a Group H occupancy.

Reason: Sliding doors are more easily operated by the disabled and present less of an obstacle than swinging doors when moving from one room to another. The NFPA 101 Life Safety Code allows sliding doors in areas serving an occupant load of fewer than 10. Refer to Chapter 18, New Health Care Occupancies.

Many state and local jurisdictions (eg. MN, WI, TX, MO, KS, IL) allow sliding doors in these occupancies.
Residents within I-2 occupancies have long term tenure, and are familiar with their living environment.
I-2 buildings are already constructed to high life safety standards.

Cost Impact: The cost of construction is potentially reduced because sliding doors allow for more useable floor space. The door approach clearances are reduced, and the door swing space is eliminated.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

E52–09/10
1008.1.2 (IFC [B] 1008.1.2)

Proponent: Gaius G. Nelson, Architect, Nelson•Tremain Partnership, representing self

Revise as follows:

1008.1.2 (IFC [B] 1008.1.2) Door swing. Egress doors shall be of the pivoted or side-hinged swinging type.

Exceptions:

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single dwelling unit in Groups R-2, ~~and~~ R-3, and I-1.
5. In other than Group H occupancies, revolving doors complying with Section 1008.1.4.1.
6. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.4.3 are permitted in a means of egress.
7. Power-operated doors in accordance with Section 1008.1.4.2.
8. Doors serving a bathroom within an individual sleeping unit in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a means of egress from spaces with an occupant load of 10 or less.

Doors shall swing in the direction of egress travel where serving an occupant load of 50 or more persons or a Group H occupancy.

Reason: Sliding doors are more easily operated by the disabled and present less of an obstacle than swinging doors when moving from one room to another. The NFPA 101 Life Safety Code allows sliding doors in areas serving an occupant load of fewer than 10. Refer to Chapter 18, New Health Care Occupancies.

Many state and local jurisdictions (e.g., MN, WI, TX, MO, KS, IL) allow sliding doors in these occupancies.
Residents within I-1 occupancies have long term tenure, and are familiar with their living environment.
I-1 buildings are already constructed to high life safety standards.

Cost Impact: The cost of construction is potentially reduced because sliding doors allow for more useable floor space. The door approach clearances are reduced, and the door swing space is eliminated.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Nelson-E1-1008.1.2

E53–09/10
1008.1.2 (IFC [B] 1008.1.2)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1008.1.2 (IFC [B] 1008.1.2) Door swing. Egress doors shall be side-hinged swinging.

Exceptions:

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single dwelling unit in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1008.1.4.1.
6. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.4.3 are permitted in a means of egress.
7. Power-operated doors in accordance with Section 1008.1.4.2.
8. Doors serving a bathroom within an individual sleeping unit in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a means of egress from spaces with an occupant load of 10 or less.

Doors shall swing in the direction of egress travel where serving a room or area containing an occupant load of 50 or more persons or a Group H occupancy.

Reason: The current wording of the second paragraph of Section 1008.1.2 can result in an incorrect interpretation of the intent of this section. The present wording can be interpreted to mean that the *door* itself must serve a tributary occupant load of 50 or more. However, the 2006 IBC Commentary for this code section located on page 10-40, clearly specifies that a side-hinged door must swing in the direction of egress travel where the required occupant capacity *of the room* is 50 or more. The 2006 IBC Commentary goes on to give the example of a room with 99 occupants and two exit doors where each door would individually serve less than 50, but the intent is that both doors must swing in the direction of egress. Because of this published conclusion of the intent of this paragraph, the current wording would benefit from the proposed change so that it would no longer be subject to an incorrect interpretation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Maiel-E4-1008.1.2

E54–09/10
1008.1.4.3 (IFC [B] 1008.1.4.3)

Proponent: Gregory J. Cahanin, Cahanin Fire & Code Consulting Representing the Smoke Safety Council

Revise as follows:

1008.1.4.3 (IFC [B] 1008.1.4.3) Horizontal or vertical ~~sliding~~ doors. In other than Group H occupancies, horizontal or vertical ~~sliding~~ doors permitted to be a component of a *means of egress* in accordance with Exception 6 to Section 1008.1.2 shall comply with all of the following criteria:

1. The doors shall be power operated and shall be capable of being operated manually in the event of power failure.
2. The doors shall be openable by a simple method from both sides without special knowledge or effort.
3. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door in motion and 15 pounds (67 N) to close the door or open it to the minimum required width.
4. The door shall be openable with a force not to exceed 15 pounds (67 N) when a force of 250 pounds (1100 N) is applied perpendicular to the door adjacent to the operating device.
5. The door assembly shall comply with the applicable *fire protection rating* and, where rated, shall be self-closing or automatic closing by smoke detection in accordance with Section 715.4.8.3, shall be installed in accordance with NFPA 80 and shall comply with Section 715.
6. The door assembly shall have an integrated standby power supply.
7. The door assembly power supply shall be electrically supervised.
8. The door shall open to the minimum required width within 10 seconds after activation of the operating device.

Reason: Doors other than side-swinging doors have had special classifications for some time- turnstiles, revolving doors, and horizontal sliding doors suitable for egress are the most common. Horizontal sliding door classifications for egress were first developed more than 2 decades ago for Won Door's then unique bi-fold door and wall system. Since that time there have been multiple manufacturers whose opening protectives are not side swinging, but meet the same performance and safety requirements for horizontal sliding doors while have a different orientation. This change is

recognition of any door system orientation that meets the specific operational requirements that have been successfully in place for horizontal doors is acceptable. Further, it does not matter if the door slides, folds, or rolls up- only that it perform successfully for safe egress. There is no change in the testing or operational requirements- only a clarification of orientation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Cahanin-E1-1008.1.4.3

E55–09/10
1008.1.4.3 (IFC [B] 1008.1.4.3)

Proponent: John W. Park, John Park consulting representing Won-Door Corporation.

Revise as follows:

1008.1.4.3 (IFC [B] 1008.1.4.3) Horizontal sliding doors. In other than Group H occupancies, horizontal sliding doors permitted to be a component of a means of egress in accordance with Exception 6 to Section 1008.1.2 shall comply with all of the following:

1. The doors shall be power operated and shall be capable of being operated manually in the event of power failure.
2. The doors shall be openable by a simple method from both sides without special knowledge or effort.
3. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door in motion and 15 pounds (67 N) to close the door or open it to the minimum required width.
4. The door shall be openable with a force not to exceed 15 pounds (67 N) when a force of 250 pounds (1100 N) is applied perpendicular to the door adjacent to the operating device.
5. The door assembly shall comply with the applicable fire protection rating and, where rated, the door assembly shall comply with all of the following:
   - 5.1 Be self-closing or automatic closing by smoke detection in accordance with Section 715.4.8.3,
   - 5.2 The door assembly shall be installed in accordance with NFPA 80, ~~and~~
   - 5.3 The door assembly shall comply with Section 715, and
   - 5.4 Electronic controls for horizontal sliding doors that include closing and signaling functions shall be tested and listed in accordance with UL 864.
6. The door assembly shall have an integrated standby power supply.
7. The door assembly power supply shall be electrically supervised.
8. The door shall open to the minimum required width within 10 seconds after activation of the operating device.

Reason: Self closing or automatic closing devices referenced need to work seamlessly with fire alarm systems, including providing feedback signals to achieve joint control with the fire control center. UL 864, *Standard for Control Units and Accessories for Fire Alarm Systems* is a nationally recognized standard that provides appropriate tests and guidelines to assure compatibility. It further deals with critical functions such as alarm verification, endurance, life safety networks, notification, power supplies, resets, risk of electrical shock, risk of fire, standby power sources, storage batteries, dual power source systems, supervisory signals, and trouble signals. Since the closing device essentially releases the door from its open to closed position on receipt of a signal from the fire alarm system, they should be evaluated to the 864 standard under the “Releasing Device” category. Holding said closing devices to nationally recognized standards ensures consistency and compatibility for these types of products.

Separating the requirements for compliance with section 715 as well as being installed in accordance with NFPA 80 breaks out the separate requirements and makes for better understanding.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Park-E1-1008.1.4.3

E56–09/10
1008.1.4.4, Chapter 35 (IFC [B] 1008.1.4.4, Chapter 45)

Proponent: Kurt Roeper, representing Ingersoll Rand

1. Revise as follows:

1008.1.4.4 Access Controlled Egress Doors. The entrance doors in a means of egress in buildings with an occupancy in Groups A, B, E, I-2, M, R-1,or R-2 and entrance doors to tenant spaces in occupancies in groups A, B, E, I-2, M, R-1,or R-2 are permitted to be equipped with an approved entrance and egress access control system, listed in accordance with ANSI / UL 294, which shall be installed in accordance with all of the following criteria;

1. A sensor shall be provided on the egress side arranged to detect an occupant approaching the doors. The doors shall be arranged to unlock by a signal from or loss of power to the sensor.
2. Loss of power to that part of the access control system which locks the doors shall automatically unlock the doors.
3. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016mmto 1219 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads "PUSH TO EXIT." When operated, the manual unlocking device shall result in direct interruption of power to the lock—independent of the access control system electronics—and the doors shall remain unlocked for a minimum of 30 seconds.
4. Activation of the building fire alarm system, if provided, shall automatically unlock the doors, and the doors shall remain unlocked until the fire alarm system has been reset.
5. Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically unlock the doors. The doors shall remain unlocked until the fire alarm system has been reset.
6. Entrance doors in buildings with an occupancy in Group A, B, E or M shall not be secured from the egress side during periods that the building is open to the general public.

2. Add new standard to Chapter 35 (IFC [B] Chapter 45) as follows:

UL – Underwriters Laboratories, Inc.
ANSI / UL 294-1999 – Access Control System Units with revisions through 2009

Reason: The increasing technological complexity of wired and wireless access control systems necessitates a baseline level of system performance and reliability be established via testing and listing to a nationally recognized standard. This proposal does not remove the AHJ's right to approve such systems, but supplements their evaluation by requiring listing to a nationally recognized standard. The existing requirements of the code do not provide any foundation from which an AHJ can assess electronic systems and communication devices used in access / egress control systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, UL 294, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME:Roepe-E1-1008.1.4.4

E57–09/10
1008.1.5, 1008.1.7(IFC [B] 1008.1.5, 1008.1.7)

Proponent: Julie Ruth, PE, JRuth Code Consulting, representing American Architectural Manufacturers Association

1. Revise as follows:

1008.1.5 (IFC [B] 1008.1.5) Floor elevation. There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope). Thresholds at doorways shall not exceed ¾ inch (19.1 mm) in height for sliding doors serving dwelling units or ½ inch (12.7 mm) for other doors. Floor level changes greater than ¼ inch (6.4 mm) at the required exit door, including those due to raised thresholds, shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).

Exceptions:

1. Doors serving individual dwelling units in Groups R-2 and R-3 where the following apply:
   1.1. A level floor or landing on each side of a door is not required for a door ~~is permitted to open~~ at the top step of an interior flight of stairs, provided the door does not swing over the top step.
   1.2. Screen doors and storm doors are permitted to swing over stairs or landings.

2. Exterior doors as provided for in Section 1003.5, Exception 1, and Section 1020.2, which are not on an accessible route.
3. In Group R-3 occupancies, and dwelling units in Group R-2 occupancies, where the following apply:
   3.1. Are not required to be Accessible units, Type A units or Type B units,
   3.2. The exterior floor or landing at an exterior doorway ~~shall~~ is not ~~be~~ more than 7 ¾ inches (197 mm) below the top of the threshold, ~~provided~~ and
   3.3. The exterior door, other than an exterior storm or screen door, does not swing over the landing.

Thresholds at doorways shall not exceed ¾ inch (19.1 mm) in height above the interior finished floor for sliding doors serving dwelling units or ½ inch (12.7 mm) for other doors. If the top of the threshold at these doors is more than ¼ inch (6.4 mm) above the interior finished floor the threshold or floor shall be beveled with a slope towards the interior not greater than one unit vertical in two units horizontal (50 percent slope).

4. Variations in elevation due to differences in finish materials, but not more than ½ inch (12.7 mm).
5. Exterior decks, patios or balconies that are part of Type B dwelling units, have impervious surfaces and meet the following:
   5.1. ~~that~~ Are not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the dwelling unit,
   5.2. Are not more than 4 ½ inches below the top of the threshold of any side swinging doors between the exterior deck, patio or balcony and the adjacent interior space, and
   5.3. Are not more than 4 ¾ inches below the top of the threshold of any sliding doors between the exterior deck, patio or balcony and the adjacent interior space.

Thresholds at doorways shall not exceed ¾ inch (19.1 mm) in height above the interior finished floor for sliding doors serving dwelling units or ½ inch (12.7 mm) for other doors. If the top of the threshold at these doors is more than ¼ inch (6.4 mm) above the interior finished floor the threshold or floor shall be beveled with a slope towards the interior not greater than one unit vertical in two units horizontal (50 percent slope).

2. Delete without substitution:

~~**1008.1.7 Thresholds.** Thresholds at doorways shall not exceed ¾ inch (19.1 mm) in height for sliding doors serving dwelling units or ½ inch (12.7 mm) for other doors. Raised thresholds and floor level changes greater than ¼ inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).~~

~~**Exception:** The threshold height shall be limited to 7 ¾ inches (197 mm) where the occupancy is Group R-2 or R-3, the door is an exterior door that is not a component of the required means of egress; the door, other than an exterior storm or screen door does not swing over the landing or step; and the doorway is not on an accessible route as required by Chapter 11 and is not part of an Accessible unit, Type A unit or Type B unit.~~

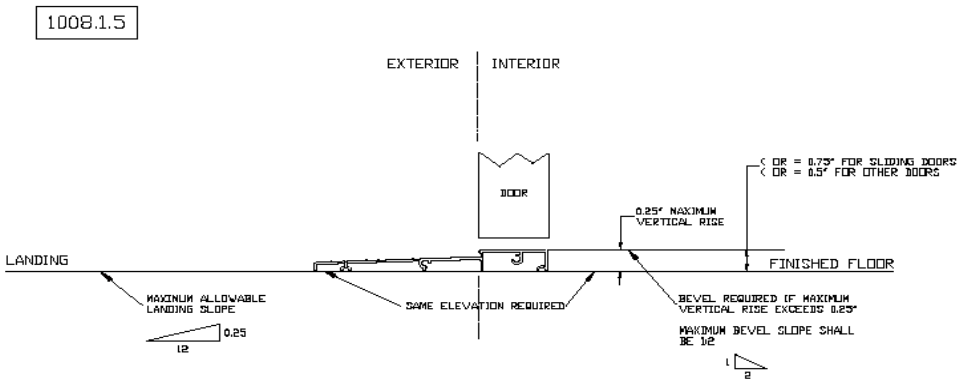
(Renumber subsequent sections)

Reason: This proposal seeks to clarify the requirements of the International Building Code with regards to floor elevations and thresholds at and adjacent to exterior doorways, by combining the requirements that are currently in two sections into one section. The 2009 IBC deals with floor elevations at doorways separately from thresholds, as did the previous editions of the IBC. This has resulted in confusion.

The primary concern with regards to egress through a door is the changes in elevation that occurs as the building occupant passes from one space on one side of the door to another space on the other side. This proposal seeks to address that transition in one section.

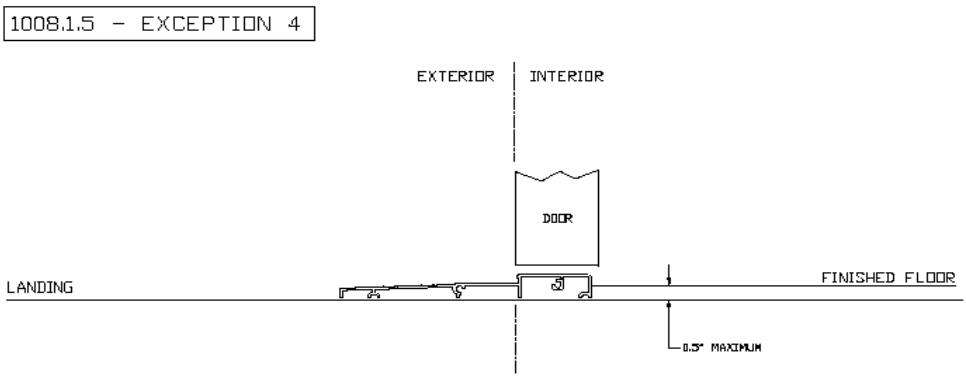
When the wind blows across the surface of an exterior wall a phenomenal known as pressure differentiation occurs between the surface of that wall and the wall cavity. The exact nature of the differentiation, both with regards to whether or not it is positive or negative, and its magnitude, will depend upon the surface of the exterior wall itself, openings that occur between the wall cavity and the exterior surface, the direction the wind is blowing and the speed of the wind. If the pressure in the wall cavity is less than the pressure on the exterior surface, then exterior air will be drawn into the wall cavity. If the exterior air is laden with moisture, then that moisture will be drawn into the cavity as well.

The exact nature of this pressure differentiation, and particularly its potential magnitude, is a subject that AAMA and its members have been studying for decades. AAMA/WDMA/CSA 101/I.S.2/A440 requires exterior wall fenestrations to be tested for water infiltration at a difference in pressure between the interior side of the wall and the exterior side of the wall of either 15 or 20% of structural design pressure, with a cap of 12 psf. In areas where the exterior design wind speed is 90 mph (the majority of the U.S.), the resultant design wind pressure on the exterior surface of the wall of a building under 60 feet in height can be as great as +/- 37 psf, with resultant design pressure differential for water infiltration as high as 7.4 psf. This translates into 1.42 inches of water when measured using a manometer. A threshold height of 1/2 inch or 3/4 inch, as is currently required by Section 1008.1.7 in combination with Section 1008.1.5 and as illustrated in the sketch below, is not adequate to resist this.



Moreover, extreme wind events that have occurred within the U.S. over the past decade appear to indicate that while the design wind pressure calculated using the three second gust model of ASCE 7 - 98 and later editions appear to be adequate for determining required structural load capacity (at least for fenestration) such may not be the case with regards to the pressure differential assumed between the interior and exterior side of the wall for water infiltration. In other words, we know that 3/4 inch is inadequate to resist water penetration through the wall for the majority of the country. What we don't yet know is what the appropriate number should be. AAMA is currently engaged in further research on this topic.

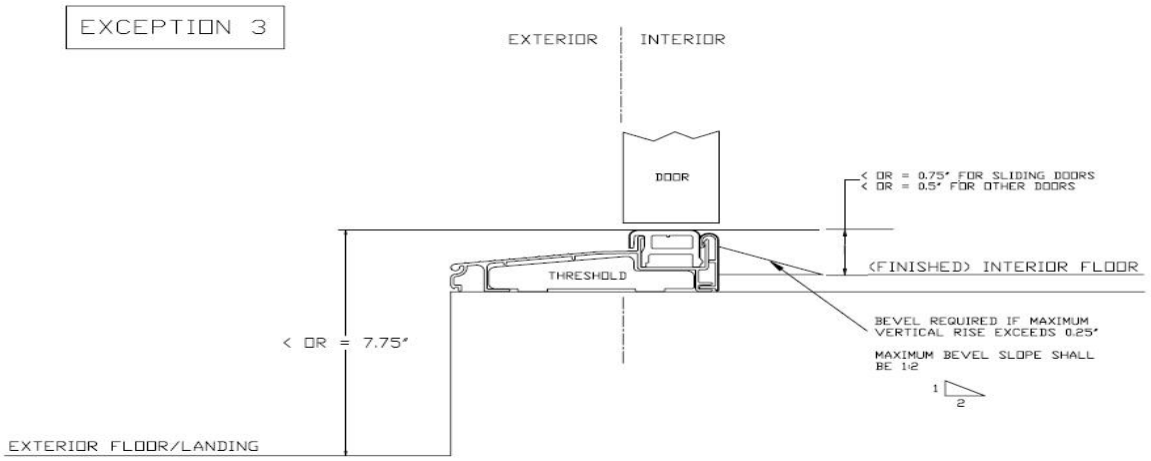
Even though a difference in floor elevation due to floor finish materials is permitted by exception 4 to Section 1008.1.5, the threshold height is still limited to ½ inch for swinging doors or ¾ inch for sliding doors, by Section 1008.1.7. As shown in the sketch below, this slight difference in floor elevation is not adequate to address the water pressure differentiation that could be experienced at the sill of these exterior doors.



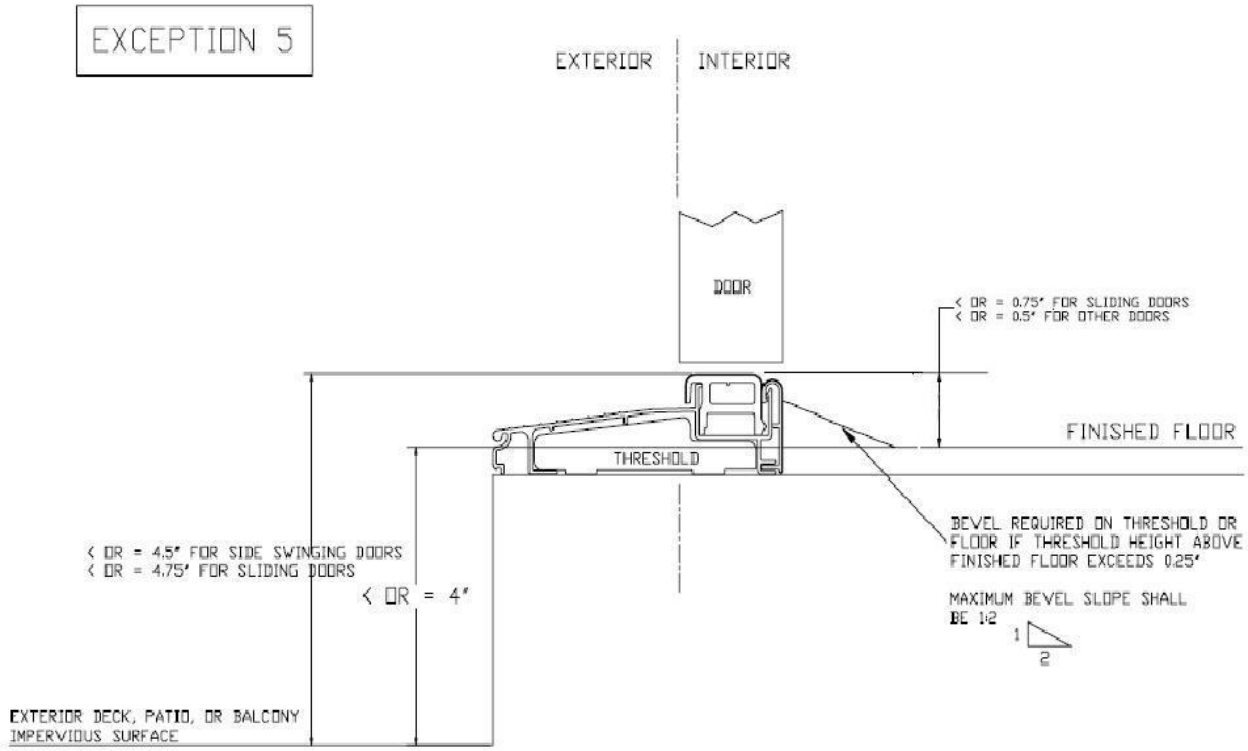
Currently the IBC and IRC permits thresholds greater than 3/4 inch in height for exterior doors that are not required egress doors, do not swing over a landing and are not part of an Accessible unit, Type A or Type B unit, or in a doorway that is on an accessible route, as required by Chapter 11 of the IBC. Such thresholds are permitted by the exception to Section 1008.1.7 to be up to 7 3/4 inches in height.

The intent of the exception to Section 1008.1.7, when it was proposed by the fenestration industry in the first years of the IBC, was to permit thresholds up to 7 3/4 inches in height to be incorporated into the 7 3/4 inches step down in height that is permitted at the door by Exception 3 to Section 1008.1.5. A tie between these two sections, however, does not currently exist. As a result, there has been confusion about the proper use of this exception. By bringing the requirements for threshold height into Section 1008.1.5 the tie between threshold height and floor elevations on either side of the door is more firmly established.

This proposal also addresses concerns that have been expressed that the current exception does not appropriately limit the height of the threshold above the interior floor, by repeating the current provisions on Section 1008.1.5 in Exception 3. The result is shown in the sketch below.



Finally, this proposal addresses the same concern regarding potential water infiltration of Type B dwelling units by bringing revising Exception 5 similarly to Exception 3. The revisions proposed to Exception 3 and Exception 5 to Section 1008.1.5 would permit thresholds higher than 1/2 inch or 3/4 inch to be used, provided the extra height is incorporated into the height difference between the interior and exterior floors that is already permitted by these exceptions, and the current height of threshold above the interior floor surface requirements are maintained. The sketch below illustrates the provisions of proposed Exception 5.



It is our hope that this proposal will address the concerns of ADA advocates who might be opposed to the current exception to Section 1008.1.7, permit our industry to provide thresholds that have a higher potential to resist water infiltration, even under extreme weather conditions, at least for those exterior doorways included within the scope of Exceptions 3 and 5 to Section 1008.1.5, and clarify the intent of the IBC with regards to door thresholds. We urge the committee's approval of this code change proposal.

Cost Impact: This code change proposal will not increase the cost of construction.

E58–09/10
1008.1.7 (IFC [B] 1008.1.7); IRC R311.3.1

Proponent: Julie Ruth, JRuth Code Consulting, representing AAMA

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1008.1.7 (IFC [B] 1008.1.7) Thresholds. Thresholds at doorways shall not exceed 3/4 inch (19.1 mm) in height *above the finished floor or landing* for sliding doors serving dwelling units or 1/2 inch (12.7 mm) *above the finished floor or landing* for other doors. Raised thresholds and floor level changes greater than 1/4 inch (6.4mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).

Exception: The threshold height shall be limited to 73/4 inches (197 mm) where the occupancy is Group R-2 or R-3; the door is an exterior door that is not a component of the required means of egress; the door, other than an exterior storm or screen door, does not swing over the landing or step; and the doorway is not on an accessible route as required by Chapter 11 and is not part of an Accessible unit, Type A unit or Type B unit.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.3.1 Floor elevations at the required egress door. Landings or finished floors at the required egress door shall not be more than 1.5 inches (38 mm) lower than the top of the threshold.

Exception: The ~~exterior~~ landing or floor on the exterior side shall not be more than 7 3/4 inches (197 mm) below the top of the threshold provided the door does not swing over the landing or floor.

When exterior landings or floors serving the required egress door are not at grade, they shall be provided with access to grade by means of a ramp in accordance with Section R311.8 or a stairway in accordance with Section R311.7.

Reason:
PART I –This proposal clarifies that threshold height is to be measured to the finished floor or landing, and not the top of the subfloor or other surface.
PART II - This proposal clarifies that threshold height is to be measured to the finished floor or landing, and not the top of the subfloor or other surface, and that it is the exterior floor or landing that is permitted to be up to 7 ¾ inches below the top of the threshold, when other criteria are met. As the code currently reads, it could be misconstrued to mean the exterior landing or ANY floor shall not be more than 7 ¾ inches below the top of the threshold. This is not the intent of this exception. The proposal seeks to clarify that.

Cost Impact: The code change will not increase the cost of construction.

PART I – IBC MEANS OF EGRESS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RUTH-E1-1008.1.7.DOC

E59–09/10
1008.1.7 (IFC [B] 1008.1.7)

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

Revise as follows:

1008.1.7 (IFC [B] 1008.1.7) Thresholds. Thresholds at doorways shall not exceed 3/4 inch (19.1 mm) in height for sliding doors serving dwelling units or 1/2 inch (12.7 mm) for other doors. Raised thresholds and floor level changes greater than 1/4 inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).

~~**Exception:** The threshold height shall be limited to 7 3/4 inches (197 mm) where the occupancy is Group R-2 or R-3; the door is an exterior door that is not a component of the required means of egress; the door, other than an exterior storm or screen door, does not swing over the landing or step; and the doorway is not on an accessible route as required by Chapter 11 and is not part of an Accessible unit, Type A unit or Type B unit.~~

Exception: In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to 7-3/4 inches (197mm) in height if all of the following apply:

1. The door is not part of the required means of egress.
2. The door is not part of an accessible route as required by Chapter 11.
3. The door is not part of an Accessible unit, Type A unit or Type B unit.

Reason: This proposal clarifies the exception in this section of the code for ease of understanding and enforcement. This revision is intended to essentially an editorial reformatting of the technical requirements of the code. WDMA members have received numerous questions from code officials and project owners regarding this section of the IBC. This proposal removes the reference to exterior storm and screen doors because this is addressed in 1008.1.5, Exception 1.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1008.1.9.3 (IFC [B] 1008.1.9.3); IPMC 304.18.1; IRC R311.2, R311.2.1 (New)

Proponent: John Morgan, City of Frontenac, Missouri, representing Missouri Association of Building Officials and Inspectors

THIS IS A 3 PART CODE CHANGE. PARTS I AND II WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. PART III WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1008.1.9.3 (IFC [B] 1008.1.9.3) Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   2.1. The locking device is readily distinguishable as locked;
   2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   2.3. The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.

4. ~~Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.~~ All side-hinged doors providing access to individual dwelling units or sleeping units of Group R occupancies shall be equipped with a deadbolt lock designed to be readily openable from the side which egress is to be made without the need for keys, special knowledge or effort and shall have a lock throw of not less than 1 inch (25mm).
   Exception: Dead bolts shall not be required on doors leading from dwelling units to attached garages, where secured exterior garage doors are provided.
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.

PART II – IPMC

Revise as follows:

304.18.1 Doors. All side-hinged doors providing access to a dwelling unit, rooming unit or housekeeping unit that is rented, leased or let shall be equipped with a deadbolt lock designed to be readily openable from the side from which egress is to be made without the need for keys, special knowledge or effort and shall have a lock throw of not less than 1 inch. Such deadbolt locks shall be installed according to the manufacturer's specifications and maintained in good working order. For the purpose of this section, a sliding bolt shall not be considered an acceptable deadbolt lock.

> **Exception:** Dead bolts shall not be required on doors leading from dwelling units to attached garages, where secured exterior garage doors are provided.

PART III – IRC BUILDING/ENERGY

Add new text as follows:

R311.2 Egress door. At least one egress door shall be provided for each *dwelling* unit. The egress door shall be side-hinged, and shall provide a minimum clear width of 32 inches (813 mm) when measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). The minimum clear height of the door opening shall not be less than 78 inches (1981 mm) in height measured from the top of the threshold to the bottom of the stop. Other doors shall not be required to comply with these minimum dimensions. ~~Egress doors shall be readily openable from inside the *dwelling* without the use of a key or special knowledge or effort.~~

R311.2.1 Door locks and latches. All side-hinged doors providing access to a dwelling unit shall be equipped with a deadbolt lock designed to be readily openable from the side which egress is to be made without the need for keys, special knowledge or effort and shall have a lock throw of not less than 1 inch (25mm).

> **Exception:** Dead bolts shall not be required on doors leading from dwelling units to attached garages, where secured exterior garage doors are provided.

Reason:
Part I & III-The purpose of this change is to coordinate the requirements for deadbolts between the IPMC, IBC and IRC. Currently section 304.18.1 of the IPMC requires deadbolts to be installed on doors providing access to a dwelling unit, rooming unit, or housekeeping unit that is rented, leased or let. It is not reasonable to require a minimum level of security to a renter, but not provide that same security to a person who owns the property.

Furthermore, at the time of construction it is not reasonable to know the intentions of the owner to possibly lease, rent or let the unit. This can lead to additional steps to obtain compliance when it is learned that a unit is to be a rental. Originally in the IPMC it states all doors providing access, and we a proposing a change to the IPMC to address the need to allow certain style doors such as glass sliding doors and doors leading to secured garages to be exempt from this requirement as we are recommending in this change. The IPMC does require all doors, windows and hatchways to have security devices, therefore sliding doors would have to have some type of locking device.
Part II- The purpose of the change is to coordinate the requirements for deadbolts between the IPMC, IRC and IBC. The current language hinders the coordination of the codes through the installation of deadbolts on differing types of doors. This section will clarify on which doors deadbolts are required and where they are exempt, (i.e. sliding glass doors, and doors between a residence and an attached garage, which are required by 304.18 to have some type of security device).

Cost Impact: Part I & III-The code change proposal will have minimal increase to cost of construction.

Cost Impact: Part II- The code change proposal will not increase the cost of construction.

PART I – IBC MEANS OF EGRESS

	Assembly:	ASF	AMF	DF

PART II – IPMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART III – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Morgan-E1-1008.1.9.3

E61–09/10
1008.1.9.3 (IFC [B] 1008.1.9.3)

Proponent: Jim McClintic, Sandy City, representing the Utah Chapter

Revise as follows:

1008.1.9.3 (IEBC [B] 1008.1.9.3) Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   2.1. The locking device is readily distinguishable as locked;
   2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   2.3. The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool <u>and complying with the height requirements outlined in Section 1008.1.9.2.</u>
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.

Reason: This additional language will clarify hardware height requirements in these locations and help eliminate the confusion when this section of the code is being enforced.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Mcclintic-E1-1008.1.9.3

E62–09/10
1008.1.9.3 (IFC [B] 1008.1.9.3)

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise as follows:

1008.1.9.3 (IFC [B] 1008.1.9.3) Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   2.1. The locking device is readily distinguishable as locked;
   2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   2.3. The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.
6. Doors serving outdoor areas specified in Section 1004.8 having an occupant load of 300 or less are permitted to be equipped with key-operated locking devices from the egress side provided:
   6.1. The locking device is readily distinguishable as locked;
   6.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background;
   6.3. A two-way communication system complying with Sections 1007.8.1 and 1007.8.2 shall be provided on the egress side.
   6.4 The use of the key-operated locking device is revocable by the building official.

Reason: Egress from confined outdoor areas, as required by Section 1004.8, is necessary. Unfortunately, many building owners are reluctant to leave required egress doors from these areas unlocked for security reasons, which places the public at risk. Fire Code officials, who conduct maintenance inspections, and building owners are at odds on this issue. It makes sense to recognize that this conflict exists and place safeguards in the code to eliminate the conflict. The two-way communication system will allow an occupant to call for help if the egress is accidently locked while the outdoor area is occupied. This new text is similar to exception #2 of Section 1008.1.9.3 as it relates to an allowance to lock egress doors under certain conditions.

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRANZ-E2-1008.1.9.3.DOC

E63–09/10
1008.1.9.3 (IFC [B] 1008.1.9.3)

Proponent: Tom Lariviere, Chairman, representing Joint Fire Service Review Committee

Revise as follows:

1008.1.9.3 (IFC [B] 1008.1.9.3) Locks and latches. Approved locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   2.1 The locking device is readily distinguishable as locked;
   2.2 A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   2.3 The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.

4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.
6. In Group I-2 occupancies housing clients where the means of egress needs to be secured for the safety of the clients provided all the following requirements are met:
   - 6.1 The facility is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1,
   - 6.2 The doors unlock upon actuation of the automatic sprinkler system,
   - 6.3 The doors unlock upon activation of the automatic smoke detection system,
   - 6.4 The doors unlock upon loss of power controlling the lock or lock mechanism,
   - 6.5 The door locks shall have the capability of being unlocked by a signal from an approved location,
   - 6.6 Emergency lighting is provided at the door, and
   - 6.7 The facility is constantly staffed.

Reason: The new language addresses the problem faced by providers of patients suffering from Alzheimer's or Dementia wandering out of facilities and endangering their persons. Cognitive impairments caused by these diseases and other forms of dementia, render the residents of this type of facility unable to make the most appropriate decisions for their safety and welfare. This proposal would allow for door locking arrangements without delayed egress locks that are currently approved in health care type occupancies.

These patients can be very quick and mobile. The delayed egress lock poses a very challenging situation for staff when providing care for these patients who seek wandering or "exit seeking" associated with their disease.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A concern would be how this proposal will coordiante with Section 1008.1.9.6 Special locking arrangements in Group I-2.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Lariviere-E1-1008.1.9.3

E64–09/10
1008.1.9.4 (IFC [B] 1008.1.9.4)

Proponent: Gene Boecker, AIA, Code Consultants, Inc., representing Code Consultants, Inc.

Revise as follows:

1008.1.9.4 (IFC [B] 1008.1.9.4) Bolt locks. Manually operated flush bolts or surface bolts are not permitted.

Exceptions:

1. On doors not required for egress in individual dwelling units or sleeping units.
2. Where a pair of doors serves a storage or equipment room, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf.
3. Where a pair of doors serves an *occupant load* of less than 50 persons in a Group B, F or S occupancy, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf. The inactive leaf shall contain no doorknobs, panic bars or similar operating hardware.
4. Where a pair of doors serves a Group B, F or S occupancy, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf provided such inactive leaf is not needed to meet egress width requirements and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1. The inactive leaf shall contain no doorknobs, panic bars or similar operating hardware.
5. Where a pair of doors serves patient care rooms in Group I-2 occupancies, self-latching edge or surface-mounted bolts are permitted on the inactive leaf provided that the inactive leaf is not needed to meet egress width requirements and the inactive leaf contains no doorknobs, panic bars or similar operating hardware.
6. Where pairs of doors are installed in accordance with Section 1008.1.9.3, item 2, the inactive leaf shall be permitted to be equipped with manually operated surface or flush bolts provided the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and the inactive leaf is not required for means of egress width.

Reason: This recognizes one of the current practices in the construction industry. Whether we choose to admit it or not, the standard manner in which the doors are installed in compliance with item #2 for Section 1008.1.9.3 is that the active leaf has the readily distinguishable lock and sign

while the inactive leaf is simply held in place by flush (edge) bolts. It is the flush bolt that keeps the inactive leaf secure so that the active leaf can be locked when the building is not occupied.

Although it could be easy to simply recognize this condition and include it alone, the exception adds the requirement for sprinkler protection as an added measure of safety. It also differentiates this exception from exception #3 which limits the occupant load to less than 50 and does not address sprinkler protection.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Boecker-E2-1008.1.9.4

E65–09/10
1008.1.9.8 (IFC [B] 1008.1.9.8)

Proponent: Edward A. Hite, CML, representing self

Revise as follows:

1008.1.9.8 (IFC [B] 1008.1.9.8) Electromagnetically locked egress doors. Doors in the means of egress ~~that are not otherwise required to have panic hardware~~ in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, M, R-1 or R-2 shall be permitted to be electromagnetically locked if equipped with listed hardware that incorporates a built-in switch and meet the requirements below:

1. The listed hardware that is affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.
2. The listed hardware is capable of being operated with one hand.
3. Operation of the listed hardware releases ~~to~~ the electromagnetic lock and unlocks the door immediately.
4. Loss of power to the listed hardware automatically unlocks the door.

Reason: Bars tested and listed to release electromagnetic locks include both panic bars and fire exit hardware. When power is removed from a listed electromagnetic lock, it will release in less than ½ second. Bars with switches directly release that power. The number of people going through the door has no bearing on this.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HITE-E2-1008.1.9.8

E66–09/10
1008.1.9.10 (IFC [B] 1008.1.9.10)

Proponent: Tom Lariviere, Chairman, representing Joint Fire Service Review Committee

Revise as follows:

1008.1.9.10 (IFC [B] 1008.1.9.10) Stairway doors. Interior stairway means of egress doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. Stairway discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.5.3.
3. ~~In stairways serving not more than four stories,~~ Stairway doors are permitted to be locked from the stairway side ~~opposite the egress side, provided they are openable from the egress side and~~ when the stairway serves no more than four stories and the doors are capable of being unlocked simultaneously without unlatching upon a signal from the fire command center, if present, or a signal by emergency personnel from a single location inside the main entrance to the building.

4. Stairway doors are permitted to be locked from the stairway side when the stairways serves no more than two stories and the stairway discharge door leads directly to the exit discharge and a key box is provided in accordance with Section 506 of the International Fire Code.

Reason: Many buildings are concerned with security and reentry into the building from the stairways. As a result, building owners and managers desire to lock the stairwell doors to prohibit entry onto the floor from the stairwell. This practice of locking the stairwell doors increases the building security.

This proposal will provide an additional exception for buildings not more than two stories in height. This new exception will allow for the prohibition of reentry from the stairwell as long as a key box is provided for fire department use. The fire department could access the key box and unlock the stairwell doors for fire use.

The current requirements are allow for the locking of these doors, but only is an electric override is provided within the building for fire department use. The current requirement is overly restrictive for stairways serving only two stories, and this exception will provide another option for building owners and managers.

Item 4 is added to provide the allowance for doors to be locked when the building serves no more than 2 stories. Item 3 is revised without changing the intent. This revision is to simplify the wording and clarify the section. This wording is similar to the current wording in Section 403.5.3.

Cost Impact: This code change proposal will decrease the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Lariviere-E3-1008.1.9.10

E67–09/10
1009.1 (IFC [B] 1009.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1009.1 (IFC [B] 1009.1) General. Stairways serving occupied portions of a building shall comply with the requirements of this section.

~~**1009.1**~~ **1009.2 (IFC [B] ~~1009.1~~ 1009.2) ~~Stairway~~ Width.** The width of stairways shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm). See Section 1007.3 for accessible means of egress stairways.

Exceptions:

1. Stairways serving an occupant load of less than 50 shall have a width of not less than 36 inches (914 mm).
2. Spiral stairways as provided for in Section 1009.9.
3. Aisle stairs complying with Section 1028.
4. Where an incline platform lift or stairway chairlift is installed on stairways serving occupancies in Group R-3, or within dwelling units in occupancies in Group R-2, a clear passage width not less than 20 inches (508 mm) shall be provided. If the seat and platform can be folded when not in use, the distance shall be measured from the folded position.

(Renumber subsequent sections)

Reason: Presently, Section 1009 has no general charging provisions. It is essential that all means of egress components have legal charging statements so as to establish the applicability of given prescriptive technical requirements. This is especially true with stairways. Often, there are stairs or stairways in a building in excess of those minimally required to support a given means of egress design. This proposal establishes that the applicable technical provisions of Section 1009 apply to all stairways serving occupied portions of the building, regardless of whether or not they are a required means of egress component. Approval of this proposal will increase consistency in the application of very important stairway provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Keith-E7-1009.1

E68–09/10
1009.1 (IFC [B] 1009.1)

Proponent: Catherine Heeb, representing City of Portland Bureau of Development Services

Revise as follows:

1009.1 (IFC [B] 1009.1) Stairway width. The width of stairways shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm). See Section 1007.3 for accessible means of egress stairways.

Exceptions:

1. Stairways serving an occupant load of less than 50 shall have a width of not less than 36 inches (914 mm).
2. Spiral stairways as provided for in Section 1009.9.
3. Aisle stairs complying with Section 1028.
4. Where an incline platform lift or stairway chairlift is installed on stairways serving occupancies in Group R-3, or within dwelling units in occupancies in Group R-2, a clear passage width not less than 20 inches (508 mm) shall be provided. If the seat and platform can be folded when not in use, the distance shall be measured from the folded position.
5. Stairways in Group E serving an occupant load of 100 or more shall have a width of not less than 60 inches (1525 mm).

Reason: The code currently and historically has required 6' corridors in group E occupancies where the occupant load is over 100 (2009 IBC 1018.2, exception 4). The prior Uniform Building Code required a 5' minimum width on the stair (1997 UBC, section 1007.3.5) as well.

As written, a 44" stair in an E occupancy could accommodate 146 occupants, and a 5' stair would not be needed until it served 200 occupants. The code acknowledges that stairs require greater egress width than other means of egress components by requiring 0.3" of width per occupant stair as compared to 0.2" for other portions of the means of egress. Given the population served, the presence of other distractions, and the possibility of staff occupying landings to guide students during an evacuation, the 5' stair width is needed to alleviate congestion and improve egress on staircases in large E occupancies.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Heeb-E1-1009.1

E69–09/10
1009.1, 1009.12, 1013.2 (IFC [B] 1009.1, 1009.12, 1013.2)

Proponent: John Jensen, representing Chevron Products Company

Revise as follows:

1009.1 (IFC [B] 1009.1) Stairway width. The width of stairways shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm). See Section 1007.3 for accessible means of egress stairways.

Exceptions:

1. Stairways serving an occupant load of less than 50 shall have a width of not less than 36 inches (914 mm).
2. Spiral stairways as provided for in Section 1009.9.
3. Aisle stairs complying with Section 1028.
4. Where an incline platform lift or stairway chairlift is installed on stairways serving occupancies in Group R-3, or within dwelling units in occupancies in Group R-2, a clear passage width not less than 20 inches (508 mm) shall be provided. If the seat and platform can be folded when not in use, the distance shall be measured from the folded position.
5. Stairways serving industrial applications and construction site trailers shall have a width of not less than 30 inches.

1009.12 (IFC [B] 1009.12) Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. Handrails for aisle stairs are not required where permitted by Section 1028.13.
2. Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.
3. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
5. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails.
6. Stairways serving industrial applications and construction site trailers are permitted to have handrails on only the open side of the stairway.

1013.2 (IFC [B] 1013.2) Height. Required guards shall be not less than 42 inches (1067 mm) high, measured vertically above the adjacent walking surfaces, adjacent fixed seating or the line connecting the leading edges of the treads.

Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
3. For stairways serving industrial applications and construction site trailers, where the top of guard also serves as a handrail, the top of the guard shall be permitted be at the height specified for handrails in Section 1012.2.

~~3~~4. The height in assembly seating areas shall be in accordance with Section 1028.14.

~~4~~5. Along alternating tread devices and ship ladders, guards whose top rail also serves as a handrail, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread nosing.

Reason: The purpose of this proposal is to provide allowances for stairs serving industrial applications and construction site trailers where access is limited. Section 1009.1 - A stairway with a minimum width of 30 inches meets the requirements for industrial stair width per Cal OSHA (Section 3234(d)). Section 1009.12 - A stairway with a handrail on only the open side of exposed stairways meets the requirements for industrial stairs per Cal OSHA (Section 3234 (g)). Section 1013.2 - A guardrail on stairways with a vertical height that of handrails meets the requirements for industrial stairs per Cal OSHA (Section 3214 (b), 3234 (g)(3)).

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: JENSEN-E1-1013.2

E70–09/10

1009.4.1 (IFC [B] 1009.4.1); IRC R311.7.4

Proponent: Tim Pate, City and County of Broomfield, representing the Colorado Chapter ICC Code Change Committee

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS. PART II WILL BE HEARD BYTHE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1009.4.1 (IFC [B] 1009.4.1) Dimension Reference Surfaces. For the purpose of this section all dimensions are exclusive of ~~carpets,~~ rugs, or runners.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.7.4 Stair treads and risers. Stair treads and risers shall meet the requirements of this section. For the purposes of this section all dimensions and dimensioned surfaces shall be exclusive of ~~carpets,~~ rugs or runners.

Reason: This code change will delete the word "carpets" since it does not make any sense to require inspectors to do inspections and sign off on stairs before all of the floor coverings are installed. Building departments will always require all floor finishes to be installed at time of final inspection to verify handicap accessibility requirements and flame/smoke spread requirements – especially on stairs. We also see some stairs that have a mix of carpet and hard surfaces (wood or tile) and the current language would require the stairs to have these hard surfaces but not carpet which would probably not get the treads and risers to meet the plus or minus $^{3}/_{8}$" rule – especially if using ¾" wood at top and/or bottom landings. We typically do quick check of stairs at time of roughs so as to see if they might be way off but a lot times all of the stairs are not even in place at time of roughs so that would necessitate contractor having to call in for special inspection of stairs after hard surfaces are installed but before carpet is installed.

I understand the original proponents' reason statement for bringing in this new section feel that this will result in even more problems when doing inspections. I firmly believe that all of the floor finishes need to be installed and checked at time of complete final inspection and this will result in uniformity in inspection process.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC MEANS OF EGRESS

E71–09/10
1009.4.1 (IFC [B] 1009.4.1); IRC R311.7.4

Proponent: Dave Frable, U.S. General Services Administration, representing the U.S. General Services Administration

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS. PART II WILL BE HEARD BYTHE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1009.4.1 (IFC [B] 1009.4.1) Dimension reference surfaces. For the purpose of this section, all dimensions are ~~exclusive~~ inclusive of carpets, rugs or runners.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.7.4 Stair treads and risers. Stair treads and risers shall meet the requirements of this section. For the purposes of this section all dimensions and dimensioned surfaces shall be ~~exclusive~~ inclusive of carpets, rugs or runners.

Reason: The intent of this code change is to ensure the method for measuring riser height and tread depth includes all floor coverings including carpets, rugs, or runners. Stairs that are covered with resilient floor coverings might need additional tread depth beyond the minimum specified in the IBC. Any horizontal projection of resilient covering materials beyond the tread nosing and riser, such as carpet and underlayment, can interfere with users' feet and thereby reduce usable tread depth. At the tread nosing, such resilient covering materials might not be capable of providing stable support for users' feet. Generally, effective tread depth is reduced by the uncompressed thickness of such resilient coverings and might be further reduced over time if coverings are not well secured and consequently might move forward at the nosings.

Cost Impact: This code change will not increase the cost of construction.

Proponent: Jake Pauls, representing self

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS. PART II WILL BE HEARD BYTHE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1009.4.1. (IFC [B] 1009.4.1) Dimension reference surfaces ~~For the purpose of this section, all dimensions are exclusive of carpets, rugs or runners.~~ Dimensions of rise and tread depth shall be permitted to be taken without carpet, rug runner or pad covering in place provided that all surfaces that are intended to be so covered are consistently measured without such covering in place. Subsequently applied covering, prior to final inspection, shall be securely

fixed in place and be consistent in overall thickness on all surfaces measured for rise and tread depth so that the uniformity limits stipulated in Section 1009.4.4 are maintained. Nosing profiles, in accordance with Section 1009.4.5, shall be limited to those that result, at the time of final inspection, in no more than a 9/16 inch loss of horizontal surface, due to nosing rounding or beveling of the exposed surface of any carpet, rug or runner installed over the treads.

Exception: Up to 1 inch of loss of horizontal surface at the nosing is permitted at the exposed surface of any carpet, rug or runner in place at the time of final inspection provided that the minimum tread depth stipulated in Section 1009.4.2 is increased by the amount by which such loss of horizontal surface exceeds 9/16 inch.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.7.4 Stair treads and risers. Stair treads and risers shall meet the requirements of this section. ~~For the purposes of this section all dimensions and dimensioned surfaces shall be exclusive of carpets, rugs or runners.~~ Dimensions of rise and tread depth shall be permitted to be taken without carpet, rug runner or pad covering in place provided that all surfaces that are intended to be so covered are consistently measured without such covering in place. Subsequently applied covering, prior to final inspection, shall be securely fixed in place and be consistent in overall thickness on all surfaces measured for rise and tread depth so that the uniformity limits stipulated in Sections R311.7.4.1 and R311.7.4.2 are maintained. Nosing profiles, in accordance with Section R311.7.4.3, shall be limited to those that result, at the time of final inspection, in no more than a 9/16 inch loss of horizontal surface, due to nosing rounding or beveling of the exposed surface of any carpet, rug or runner installed over the treads.

Exception: Up to 1 inch of loss of horizontal surface at the nosing is permitted at the exposed surface of any carpet, rug or runner in place at the time of final inspection provided that the minimum tread depth stipulated in Section R311.7.4.2 is increased by the amount by which such loss of horizontal surface exceeds 9/16 inch.

Reason: All my proposals deal with the urgent need to address the recent rapid growth in home stair-related injuries reported in national estimates of the U.S. Consumer Product Safety Commission, CPSC, in its National Electronic Injury Surveillance System (NEISS) and the long-term trend for much greater number of injuries related to home stairs compared to stairs in other settings. This is shown in Figure 1, the same figure used in my proposal on R311.7.4.2 but reproduced here as well because other aspects of the figure are relevant here.

Figure 1 shows two trends with home stairs. One is the long-term (one-third century) trend of home stair related injuries in the CPSC NEISS national estimates (of hospital emergency department-treated injuries) exceeding those in all other settings by about a factor of five. The recent increase to this ratio—growing in the last several years to a factor of about eight—is discussed in relation to my proposal on R311.7.4.2. The long-term trend is shown on Figure 1 with the broken line, with the three simplified straight-trend sections covering the period from about 1975 through 2007. The short-term trend, an average annual growth rate of the national estimate of nearly 5 percent—or about five times the annual rate of US population growth—is shown by the longest vertical bars, for home stair-related injuries in the period 1998 to 2007.

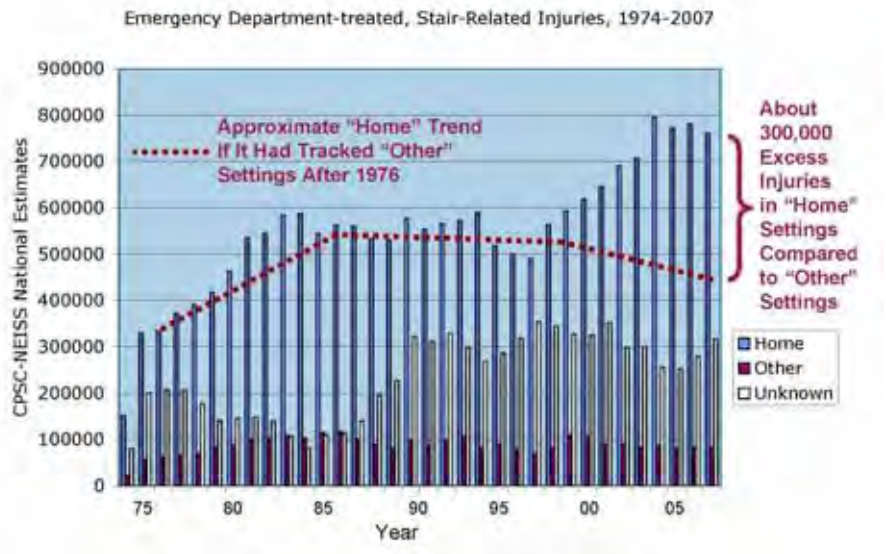

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years.

Among the reasons we have the long-term over-representation of home stair-related injuries is the significantly different code rules and practices on maximum rise, minimum tread depth, control of nosing geometry, and control of carpet and other resilient tread coverings. These differences have been most enshrined in the International Residential Code. Now with the annual societal costs of stair-related injuries in the range of $100 billion per year in the USA (with the medical treatment cost component alone around $10 billion per year or just over $1 million per hour), relative to stair construction costs being only a small fraction of this, it is time for ICC members in particular to understand fully the individual, family and societal costs of all aspects of the double, lower standard for home stairways in the I-codes. After all, ICC members voted strongly in favor of home sprinkler

protection which costs far more than the various home stairway improvements in my proposals and even if sprinklers prevented all of the current fire-related injuries, the societal public health benefit would still pale in comparison with what could be achieved at lower cost with improvements to stairways. The ratio of stair-injuries to structural fire-related injuries is about 50 to one.

Furthermore, for every fall-associated use of a stair there are many that have benefits that must be considered in any benefit-cost evaluation of stairway design and construction improvements. This matter of benefits and costs is further addressed in my accompanying proposal on changes to the minimum tread depth and maximum rise height criteria where it is shown that normal (non-fall) uses of stairs are the largest benefit of providing stairs in the first place. (Sprinklers by contrast have no benefit other than controlling fire, a very, very rare event compared with the number of times daily that people use stairs in their homes for example. Each one of those stair uses has a benefit or value that must be considered in benefit-cost analyses.)

Thus, in relation to this proposal, the intent is to make sure that rise and tread depth criteria required by this code actually make meaningful differences in the usability and safety of the stairways as they are actually used, as opposed to the stairways inspected at various stages of dwelling construction before the dwelling is turned over to its occupants.

Furthermore, in keeping with stairway safety research results, the effort here is to make sure that the effective tread depth dimensions, not including the portion lost at the front of the tread due to beveling and rounding of the nosing, are meaningful in relation to the research that led to the tread depth criteria in the first place. For example, the latest published research specifically on home stair step geometry cleared showed that the tread depth dimension (called the "going" dimension in the UK and some other parts of the world)—***measured nosing face to nosing face***—was more important than was the rise dimension. The results of this study, as reported by Wright and Roys of the UK Building Research Establishment (an organization comparable to the sum of NIST and the NAHB Research Center in relation to building technology) are shown in Figure 2. Figure 2 has been augmented for some of my presentations and, indeed, is one of hundreds of PowerPoint slides in presentations given internationally over the last year or so.

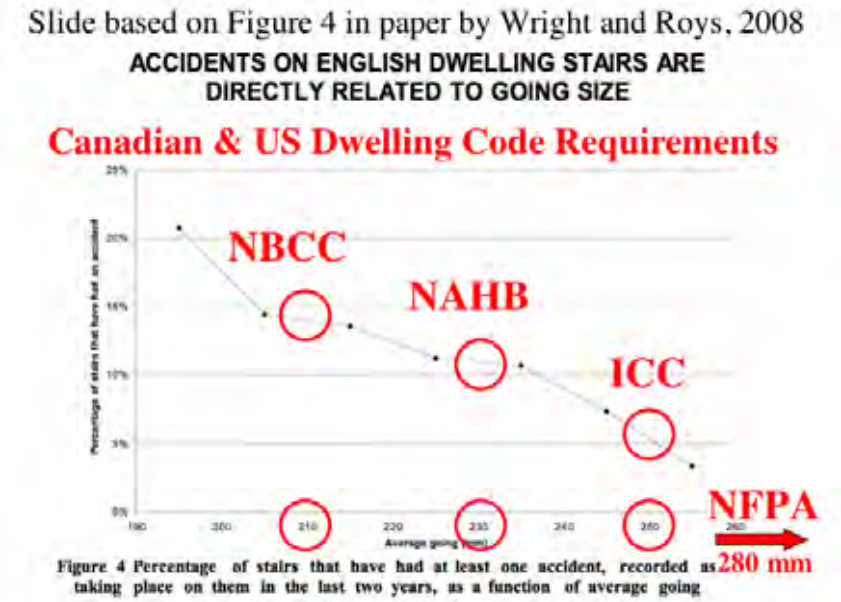

Figure 2. Role of Stair Tread Depth ("Going" in UK) in Stair-related "Accidents" in Homes (PowerPoint slide based on Wright and Roys, 2008)

The circles that I have superimposed on the Figure 2 graph depict the various tread depth (run or going) dimensions of various code criteria used in the USA and Canada. What is especially valuable about this graph is that it allows us to estimate the degrading of stairway safety due to the loss of say 1 inch or 25 mm of effective tread depth. For example, if the ICC minimum tread depth of 10 inches or 250 mm is used for a stair design in which the use of a 1/2-inch radius rounded nosing and a covering of a half-inch thick carpet results in an effective one-inch reduction, that would suggest approximately an increase of "accident" rate from 5 percent to about 11 percent, an effective doubling of the risk of an potentially injurious stair-related fall compared to a square-nosing design without any covering. The conventional, NAHB-favored (by national NAHB policy) tread depth of 9 inches or 230 mm has about a 10 percent base rate of "accident" risk and, with the loss of an additional inch of tread depth, the risk rises to about 14 percent, nearly triple the risk of an IRC-complying tread depth with no loss of effective tread depth due to nosing rounding or beveling.

So, from this we can see the benefit to safety of limiting the loss of effective tread depth as carpet is installed. We should not install thick carpet on top of any already compromised tread with a large nosing rounding or beveling. Thus I am suggesting that anything over 9/16 inch—the current upper limit set in the IBC and IRC for loss of effective tread depth—should be compensated for by increasing the minimum tread depth stipulated in 1009.4.2 and R311-7.4.2. It should also be noted here that the step geometry work performed recently—described in my accompanying proposal on minimum tread depth and maximum rise limits, was based on nosings that ranged between a square design to a rounded 1/2 inch radius design. This is why my proposed language for Exceptions to Sections 1009.4.1 and R311.7.4, is based on the 9/16 inch limit for overall nosing radius or other loss of horizontal surface at the nosing (aside from the fact this is the current limit in 1009.4.5 and R311.7.4.3).

ICC members need to appreciate that the common practice of installing padded carpet on home stairs—prior to occupancy, without accounting for the detrimental safety effects of such installation is a kind of shell game. As home occupants we are not getting the safety benefits the code should be helping to guarantee. The fiction about effective tread depth dimensions on actually occupied, new home stairs has to stop so that the large, growing toll of home stair-related injuries can be brought under control in the same way that we are now beginning to tackle residual fire risks in new homes. Again, with home sprinklers we are spending considerably more to accomplish potentially much, much less in terms of injury prevention.

The overall ratio of home stair-related injuries is, again, about 50 times greater than the injuries from structural fires. And the latter rate has been dropping by about a half in the last few decades while stair-related injuries have been rising. Now, with the improvements made in the last decade or two with non-home stairways, we are finally seeing the same kind of reduction in injuries outside of homes that we have seen in homes and elsewhere with fire-related injuries. But home stair-related injuries are now rising several times faster than the roughly one percent or so we are beginning to see with reduction for stairs other than those serving homes. We have had, over the last several years, a slight reducing injury trend for all but home stairs contrasting with a very large increasing trend for home stair-related injuries.

Bibliography
Wright, M. and Roys, M. (2008). Accidents on English dwelling stairs are directly related to going size. In Bust, P.D. (ed.) *Contemporary Ergonomics 2008*. Taylor and Francis, 632-637.

Cost Impact: The code change proposal will slightly increase the cost of construction for stairs that are covered with thick carpet and possibly a pad underneath.

PART I – IBC MEANS OF EGRESS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Pauls-E2-1009.4.1

E73–09/10
1009.4.2 (IFC [B] 1009.4.2)

Proponent: Jake Pauls, representing self

Revise as follows:

1009.4.2 (IFC [B] 1009.4.2) Riser height and tread depth. Stair riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between the ~~leading edges~~ nosings of adjacent treads. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's ~~leading edge~~ nosing. Winder treads shall have a minimum tread depth of 11 inches (279 mm) measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair.

Exceptions:

1. Alternating tread devices in accordance with Section 1009.10.
2. Ship ladders in accordance with Section 1009.11.
3. Spiral stairways in accordance with Section 1009.9.
4. Aisle stairs in assembly seating areas where the stair pitch or slope is set, for sightline reasons, by the slope of the adjacent seating area in accordance with Section 1028.11.2.
5. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; the maximum riser height shall be 7 ¾ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum winder tread depth at the walkline shall be 10 inches (254 mm); and the minimum winder tread depth shall be 6 inches (152 mm).A nosing projection not less than ¾ inch (19.1 mm) but not more than 1 ¼ inches (32 mm) shall be provided on stairways with solid risers where the tread depth is less than 11 inches (279 mm).
6. See Section 3404.1 for the replacement of existing stairways.
7. In Group I-3 facilities, stairways providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).

Reason: There is no technical change to the requirement in this proposal (although a separate proposal addresses technical issues). It is editorial with respect to replacement, in two places, of the old term "leading edge" with the now-defined term "nosing." There is also a clarification of intent in Exception 5 with the addition of the work "projection." There is a nosing, by definition; what the Code intends here is that there be a projection of such a nosing.

2. Ship ladders in accordance with Section 1009.11.
3. Spiral stairways in accordance with Section 1009.9.
4. Aisle stairs in assembly seating areas where the stair pitch or slope is set, for sightline reasons, by the slope of the adjacent seating area in accordance with Section 1028.11.2.
5. In ~~Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in~~ Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; the maximum riser height shall be 7 ¾ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum winder tread depth at the walkline shall be 10 inches (254 mm); and the minimum winder tread depth shall be 6 inches (152 mm).A nosing not less than ¾ inch (19.1 mm) but not more than 1 ¼ inches (32 mm) shall be provided on stairways with solid risers where the tread depth is less than 11 inches (279 mm).
6. See Section 3404.1 for the replacement of existing stairways.
7. In Group I-3 facilities, stairways providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.7.4.1 Riser height. The maximum riser height shall be 7 inches (178 mm) ~~7 ¾ inches (196 mm)~~. The riser shall be measured vertically between leading edges of the adjacent treads. The greatest riser height within any flight of stairs shall not exceed the smallest by more than $^3/_8$ inch (9.5 mm).

R311.7.4.2 Tread depth. The minimum tread depth shall be 11 inches (279 mm) ~~10 inches (254 mm)~~. The tread depth shall be measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's leading edge. The greatest tread depth within any flight of stairs shall not exceed the smallest by more than $^3/_8$ inch (9.5 mm). Consistently shaped winders at the walkline shall be allowed within the same flight of stairs as rectangular treads and do not have to be within $^3/_8$ inch (9.5 mm) of the rectangular tread depth.

Winder treads shall have a minimum tread depth of 11 inches (279 mm) ~~10 inches (254 mm)~~. measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point within the clear width of the stair. Within any flight of stairs, the largest winder tread depth at the walkline shall not exceed the smallest winder tread by more than $^3/_8$ inch (9.5 mm).

Reason: This is purely a technical change affecting maximum and minimum rise and tread depth dimensions respectively. This is the long overdue mainstreaming of the so-called "7-11" step geometry in terms of maximum rise and minimum tread depth. (The proponent has submitted a separate change proposal which simply formats and restates the current requirements; that proposal and this one should be dealt with separately or independently as their purposes and effects are different.)

Much has been written about this topic, especially around 2003 in relation to the IRC and the NFPA codes (NFPA 101 and NFPA 5000 which adopted this change to the mainstreamed "7-11" step geometry at that time. Since that day nobody has attempted to revert to pre-"7-11" criteria for dwelling unit stairs within NFPA and for non-dwelling unit stairs within ICC. The "7-11" minimum standard is the most widely used step geometry standard internationally and reasons for keeping it at least the minimum standard have grown. This is because all the recent research on use of stairs—*including the matter of falls on stairs, including injurious ones*—confirms that it is a very reasonable minimum standard and that it is a long way—about three inches or more—from an "optimum" standard.

The very extensive 2003 proposal I submitted to both ICC and NFPA is not reproduced within this proposal for reasons of length and, more importantly, its free availability on the Internet, specifically the Downloads area of my website, http://web.me.com/bldguse. Once within the Downloads area (where over a hundred PDF files can be freely downloaded on stairway usability and safety plus means of egress performance), simply open the folder titled, "Home Stairway Safety and Codes," and download the 3.4 MB, 40-page file, "Pauls-R311-2003.pdf." Here follows an outline of what was covered in that proposal which I submitted to ICC with NFPA getting a comparable, earlier one that was approved by NFPA members and withstood technical and procedural challenges from the NAHB.

Summary.

What Has Changed Since 2003?

The changes for the worse appear to be directly attributable to even worse home stair construction and regulation than existed before 2003. This is seen in Figure 1 which shows the growth of home stair-related injuries that are NOT due to the aging of the population—as this was checked out to learn that people under 65 and those 65 or more in age both contributed in more or less the same proportion to the substantial growth in home stair, related injuries. A recent, widely-circulated document described the statistical insights as follows: "For both 1997 and 2007, the percentage of NEISS-reported injuries for the 65-and-older group was 15.3 percent plus/minus 0.4 percent for both home settings and all settings." Thus, both before and after 1997, elderly persons were only slightly—but consistently—over-represented in hospital emergency department-treated injuries associated with stairs as reported in national estimates by the US Consumer Product Safety Commission. (The note, titled "The Home Stairway Safety Problem and Related Code Development, Adoption and Enforcement Problems in the USA," is also posted for free downloading from the website "http://web.me.com/bldguse" Downloads area as file "Pauls2009Letter&InjuryNote" within the folder titled, "Home Stairway Safety and Codes.") A list of the topics addressed therein is provided below Figure 1.

Figure 1 shows an extraordinary growth in the US national estimates from the US CPSC/NEISS for stair-related injuries, particularly in homes. The average annual rate of increase in the last several years exceeds the average annual rate of US population growth by a factor of about five while stair-related injuries in non-home settings decrease slightly, resulting in about a 2 percent reduction annually for non-home stairs over the last several years—since about 1998. During these several years there has been increasing use of the "7-11" minimum step geometry standard for non-home stairs, thanks to the adoption—beginning in the 1980s—of this standard in model building codes. This is further evidence of a partial success story on the stairway safety front and ICC members might rightly claim some of the credit for this partial success. Now building officials who control the adoption of the requirements in model codes need to finish the job where it will count most, in homes.

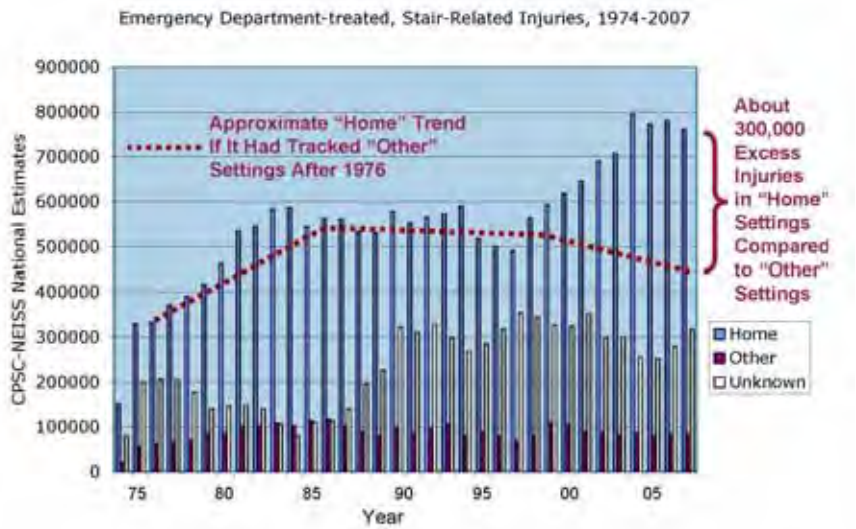

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years.

Updating the 2003 ICC proposal on mainstreaming the "7-11" minimum standard was the note which began circulating in February of 2009. Here are the topics it addressed in its 26 pages (including over two pages of references and additional resources).

Preface

The 2003 proposal to ICC, "Pauls-R311-2003," included substantial benefit-cost information about stair step geometry in homes which must be updated to take account of recent, dramatic growth in home stair-related injuries (in terms of CPSC-NEISS national estimates) as well as higher-than-general inflation rates for medical treatment costs. The latter are currently running at about $1 million per hour in the USA with total, societal costs running at about $10 million per hour in the USA.

Societal Cost of Stair-related Injuries. Currently, for the USA, the annual societal costs of home stair-related injuries—currently comprising about 89 percent of all stair-related injuries where the location or setting is known—are on the order of $100 billion annually for comprehensive, societal costs. (The basis for the 89-percent figure is the NEISS data described above.) The basis for the societal cost (the sum of medical care costs, direct productivity losses and pain-and-suffering or quality of life costs) is a paper by Lawrence, *et al.* (1999). (Among coauthors for this paper are internationally recognized experts in burden of injury, like Ted Miller.) They estimated a societal cost (in 1997 dollars) of $46.7 billion for stair-related injuries occurring in 1995. For that year the NEISS national estimate for US emergency department-treated, stair-related injuries was 892,610 for all settings and 517,641 for homes. Between 1995 and 2007 these increased, respectively, to 1,161,915 (a 30-percent increase) and 761,881 (a 47-percent increase). (These national estimates for 1995 are the "adjusted" ones obtained via the NEISS website; they correct for a change in NEISS sampling that took effect in January 1, 1997.)

Accounting also for inflation (of about 3 to 4 percent annually—although medical care increases were higher), we can assume that, for 2007, the societal costs for stair-related injuries in the USA were on the order of $100 billion in 2007 dollars (including on the order of $10 billion for medical care, $20 billion for direct productivity losses, and $70 billion for pain and suffering or quality of life costs—with this estimated distribution based on a personal communication with Bruce Lawrence and Ted Miller, among the authors of the above noted paper). This cost was about an order of magnitude greater than the annual construction cost of new stairs (just prior to the recent economic downturn) in the USA. For an analysis of home and stair construction costs see Pauls (2003). The smallest cost component, medical care, is about one million dollars per hour in the US."

Quoting also from the paper by Pauls, 2009 on "Injury Increase Comparisons: The apparent, relatively rapid increase recently in home stair-related injuries has an average annual growth rate of about 4.5%, a few times greater than annual population growth (1%). The overall increase, over a three-decade period, was about 130 percent with the most recent ten-year period showing a 55-percent increase. By contrast, fire-related injuries (the majority of which occur in homes), a major concern traditionally in safety standards and codes, have shown a three-decade pattern of average annual *decrease* of about 2 percent. (If fire-related injuries were plotted on Figure 1A, that plot would be appear very close to the base of the graph, declining from about 50,000 to about 25,000 annual injuries over a three-decade period.) Moreover, the trend for all NEISS injury national estimates for home settings—other than stairs, during the period 1997-2007 has a 39-percent increase over the same last ten-year period when home stair-related injuries increased by 55 percent. For *all* products and settings, the increase in NEISS national estimates over the same 1997-2007 period was only 19 percent, about the same as the 18-percent increase for stairs in other settings (i.e., not homes). From this, and other analyses the author has performed with the CPSC-NEISS data, we can see generally, that homes generally are the major site for injuries, relative to other settings; homes account for about 49 percent of the NEISS national estimates of injuries during the 1997-2007 period.

Aside from fire-related injuries—these NEISS-reported national estimates of all injuries in home settings are increasing faster than in other settings (39 percent versus 19 percent for all NEISS national estimates during the 1997-2007 period).

NEISS national estimates of stair-related injuries in home settings have been increasing over the last ten years at a fast rate relative to NEISS national estimates for all NEISS-coded products (55 percent versus 19 percent) and relative to population growth (55 percent versus 10 percent). Over the 1997-2007 period, NEISS national estimates of home stair-related injuries comprised 89 percent of NEISS national estimates for stair-related injuries in all known settings. For early years of NEISS national estimates, specifically 1975-1977, this was 85 percent. Most of the increase in this proportion occurred since 1990.

Generally, in recent years stairs have accounted for about 9 percent of the NEISS national estimates for all products; home stairs accounted for about 6 percent; other settings' stairs accounted for less than 1 percent; unknown settings' stairs accounted for over 2 percent.
Stairs maintain their position, since the earliest days of CPSC-NEISS, as the leading product, associated with injuries coded by NEISS. Floors are the second leading category. See Lawrence, *et al.* (1999), Table 5, using data for 1995-1996, for an analysis for the top ten NEISS-coded products, ranked by injury cost, for various age groups. As well as ranking first for all ages, stairs rank first for 5 of 12 age groups (preschool children and middle-age adults) and second for another three. Only for the two highest age categories, 70-79 and 80 or more (for which stair use is relatively rare), do floors rank first, reflecting the contribution of gait and balance deterioration. However, stairs are still the second leading product for the 70-79 age group and third (after beds) for the 80-plus age group."

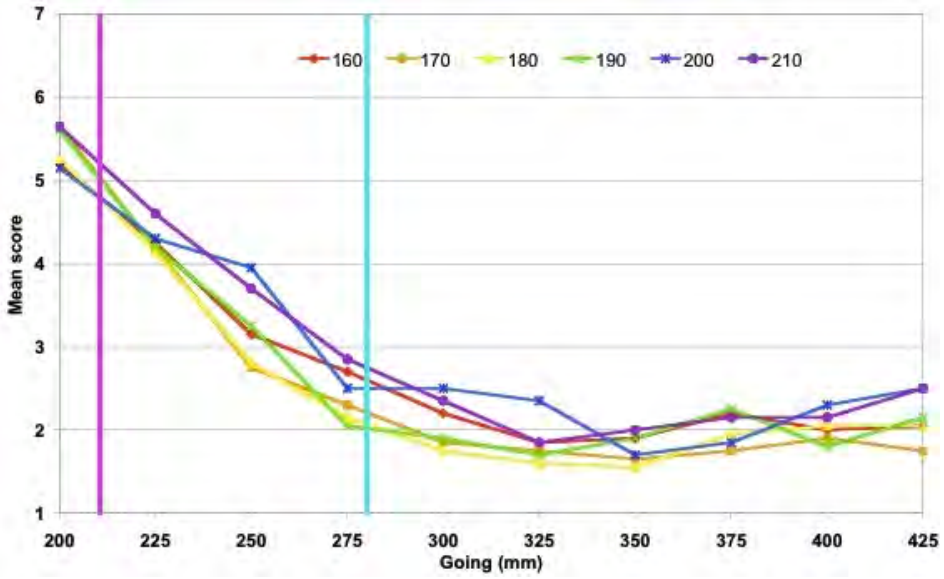
Laboratory and Field Research and Investigations of the Role of Step Geometry on Stairway Safety

The last several years have seen some important work on questions that have long troubled ICC members when addressing this issue of appropriate minimum standards for home step geometry. This work brings no comfort to those arguing that the minimum standards should stay as they are in the IRC and IBC or, even worse, that the NAHB's even lower standard should be the norm. The latter is based on NAHB's long-held national policy position which can be read directly on its website at "www.nahb.org/generic.aspx?sectionID=224&genericContentID=3093" (accessed June 1, 2009): "Support efforts by state and local affiliated Home Builder Associations to oppose the adoption of any new stair geometry that is not consistent with the requirements originally contained in the 1993 BOCA and 1992 CABO Codes by amending those provisions when adopting new editions of model building codes." This is the 8 1/4-inch maximum rise by 9-inch minimum tread depth that, especially with carpeting further degrading the usability and safety of the home stairs, makes them so dangerous and difficult to use. It is indeed beyond belief that, as the stair safety epidemic grows, the homebuilders insist on using a code that was out of date decades ago.

UK Research. Mike Roys and Mike Wright, UK Building Research Establishment have conducted some extraordinarily useful research in recent years, with the last of their papers published in May 2008. Working with a test stairway that offered 10 combinations of tread depth ("going" as it is called in the UK and "run" in some other places), in the range of 200 to 425 mm or 7.9 to 16.7 inches, with 6 combinations of rise height, in the range of 160 to 210 mm or 6.3 to 8.3 inches, they clearly showed the benefits of larger tread depths. Altogether, 60 adult subjects walked up and down each of 20 stair arrangements. Their work, while not completely published yet, is represented centrally in my recent one-day workshops on stairway usability and safety, the PowerPoint slides of which (including a fair selection of the BRE study slides) are available for downloading from my website in the folder titled, "Presentations at MUTN Conference in BC, Canada, April 2009." Papers on this work include Roys, 2001; Wright and Roys, 2005; and Wright and Roys, 2008. (Dr Wright moved to the USA in late 2008 so that now we are fortunate to have, in the USA, one of the top world talents in designing and conducting studies of step geometry and stair use performance.)

Answering a very old question in the code field, they showed that optimum tread depth in terms of many objective and subjective measures was much larger than 11 inches; 14 inches is about where this becomes optimum. The much-used 11-inch criterion is approximately where the graph of some of their findings, reproduced below as Figure 2, shows a change of direction from steep to more gradual slope and finally leveling off at the "optimum" tread depth of about 14 inches or 350 mm. This supports treating 11 inches as the minimum and clearly not the "optimum."

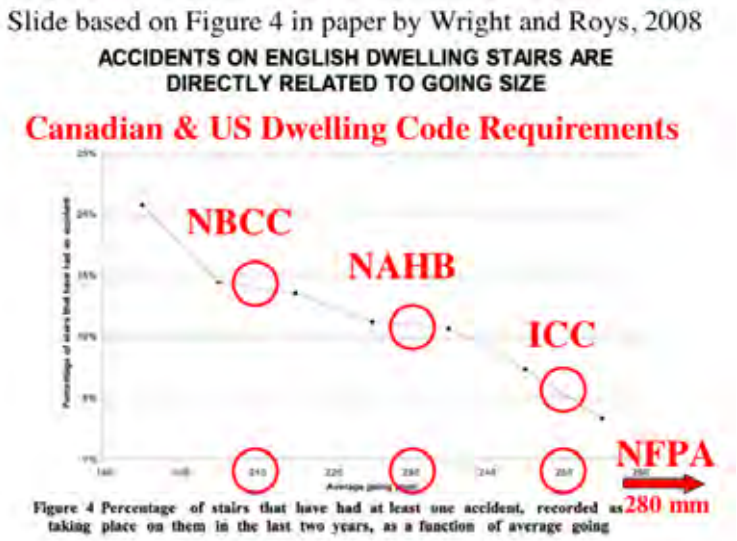
Figure 2. Graph of Findings from the UK Research by Wright and Roys, as Presented (in a PowerPoint) in 2005 at an International Conference on Falls in the UK.



The responses plotted here are to the scaled remark, "I felt safe walking down the stair," with the "most-safe" responses at the bottom of the curves.

The most recent of their papers, Wright and Roys (2008), contains some of the most interesting and valuable work—*in this case conducted in the field and inquiring into actual fall incidents as a function of home stairway rise and tread depth ("going" in the graph).* This is shown in Figure 3, onto which I have superimposed some of the criteria for US and Canadian home stair minimum tread depth, the same range shown in Figure 2 with the vertical bars at the left half of the Figure, specifically at the 210 and 280 mm, 8 1/4 and 11-inch minimum tread depth criteria. Note that any rounding or beveling of the nosing and presence of carpet and pad (in some cases, especially on typical home stairs), the effective tread depth is significantly reduced from these values so that the effective tread depth of some home stairs, built to code, is as small as 180 mm or 7 inches. Incidentally, the testing that led to the results in Figure 2, were with uncarpeted treads with no more than 13 mm or 1/2 inch loss of effective tread depth due to rounding of the nosing. The safety differences among the various tread depths are large and cannot be ignored.

Figure 3. Role of Stair Tread Depth ("Going" in UK) in Stair-related "Accidents" in Homes (PowerPoint slide based on Wright and Roys, 2008)



Recent US Research on Step Geometry. While there are other studies that could be referenced and described here in relation to the step geometry issue, in the interests of time and space, I will note only one more. This was a paper based on 80 relatively intensively investigated stair-related fall injuries that led to litigation and subsequent investigation by one of the top three or so research and investigation experts in North America with excellent ergonomics credentials. The paper was published in January of 2009 *Professional Safety,* the peer-reviewed journal of the American Society of Safety Engineers and was titled, "Stairway Falls: an ergonomic analysis of 80 cases," by Cohen, LaRue and Cohen (2009). Among their conclusions they note: "In this analysis, excessive dimensional variation appeared to be the most pervasive factor in stairway fall causation, followed by noncompliance with the 7-11 design rule for risers and treads, respectively. As with dimensional variation, this investigation showed a tendency for staircase geometry to fall outside the recommended limits of established building codes. Therefore, stairs that do not follow these requirements are more likely to be involved in falls. It stands to reason that greater adherence to the criteria specified in existing codes (i.e., risers in the range of 7 in. and treads in the range of 11 in.) would decrease the number of actual stairway falls that occur. Therefore, it is essential for both architects and builders to adhere to existing codes regarding stairway dimensions. Furthermore, prevailing codes must be enforced by building code officials, plan checkers and field inspectors, since stair dimensions can often be overlooked in the haste to issue building occupancy permits."

Any ICC chapter wishing to have their members participate in a one-day workshop (also slated for presentation in Eastern Canada on September 14, 2009) should contact Jake Pauls. It is available in a not-for-profit mode. Code authorities should be prepared to deal knowledgeably with consumers who, upon discovering the defects in their home stairs, contact their local building department and ask for a re-inspection of their home stairways. If there has been an injurious fall on such a stairway they should also be prepared to deal with resulting legal actions that might name the local building department as a third party defendant. (ICC itself is also a potential third-party defendant—as are homebuilders and their trade associations—a matter taken up in the so-called "New Orleans Decalaration" I issued in the spring of 2009 and posted on my website Downloads area.) Inspectors should at least know about how measurements of the stair step geometry are performed that are of a quality expected in such litigation actions. These measurement techniques, usually requiring use of a spirit level or electronic level, are all described in the workshop materials posted on the above-mentioned website Downloads area and on the DVD of the Spring 2009 workshop noted above. These measurement techniques are consistent with the ICC requirements both as currently stated and as further clarified if the package of proposals I put forward is accepted.

As indicated with all of the epidemiological and etiological work outlined in this proposal, the home stair-related injury issue is many times larger than is the home fire-related injury problem. It should thus be nearly a no-brainer, after adopting home sprinkler requirements, for responsible ICC members to vote for the mainstreaming of the "7-11" step geometry standard. I will be counting on such ICC members and others who can sway opinion to speak out with conviction based on the primacy of their duties to the public, the first item in the code of ethics for certified officials, a code which is available on my website if it cannot be located on ICC's.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1009.4.5 (IFC [B] 1009.4.5) Nosing and Riser Profile. The radius of curvature at the leading edge of the tread shall be not greater than $^{9}/_{16}$ inch (14.3 mm). Beveling of nosings shall not exceed $^{9}/_{16}$ inch (14.3 mm). Risers shall be ~~solid and~~ vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.52 rad) from the vertical. ~~The leading edge (nosings) of treads shall project not more than 1 ¼ inches (32 mm) beyond the tread below and all projections of the leading edges shall be of uniform size, including the leading edge of the floor at the top of a flight.~~

~~**Exceptions:**~~

1. ~~Solid risers are not required for stairways that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).~~
2. ~~Solid risers are not required for occupancies in Group I-3 or in F, H and S occupancies other than areas accessible to the public. There are no restrictions on the size of the opening in the riser.~~
3. ~~Solid risers are not required for spiral stairways constructed in accordance with Section 1009.9.~~
4. ~~Solid risers are not required for alternating tread devices constructed in accordance with Section 1009.10.~~

1009.4.5.1 (IFC [B] 1009.4.5.1) Nosing Projection Size. The leading edge (nosings) of treads shall project not more than 1 ¼ inches (32 mm) beyond the tread below.

1009.4.5.2 (IFC [B] 1009.4.5.2) Nosing Projection Uniformity. All nosing projections of the leading edges shall be of uniform size, including the projections of the nosings leading edge of the floor at the top of a flight.

1009.4.5.3 (IFC [B] 1009.4.5.3) Solid Risers. Risers shall be solid.

Exceptions:

1. Solid risers are not required for stairways that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).

2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas accessible to the public. There are no restrictions on the size of the opening in the riser.
3. Solid risers are not required for spiral stairways constructed in accordance with Section 1009.9.
4. Solid risers are not required for alternating tread devices constructed in accordance with Section 1009.10.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.7.4.3 Nosing and Riser Profile. The radius of curvature at the nosing shall be no greater than $^{9}/_{16}$ inch (14 mm). ~~A nosing not less than ¾ inch (19 mm) but not more than 1 ¼ inches (32 mm) shall be provided on stairways with solid risers. The greatest nosing projection shall not exceed the smallest nosing projection by more than $^{3}/_{8}$ inch (9.5 mm) between two stories, including the nosing at the level of floors and landings.~~ Beveling of nosings shall not exceed ½ inch (12.7 mm). Risers shall be vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.51 rad) from the vertical. ~~Open risers are permitted, provided that the opening between treads does not permit the passage of a 4-inch diameter (102 mm) sphere.~~

~~**Exceptions:**~~

1. ~~A nosing is not required where the tread depth is a minimum of 11 inches (279 mm).~~
2. ~~The opening between adjacent treads is not limited on stairs with a total rise of 30 inches (762 mm) or less.~~

R311.7.4.3.1 Nosing Projection Size. A nosing projection of not less than ¾ inch (19 mm) but not more than 1 ¼ inches (32 mm) shall be provided on stairways with solid risers.

Exception: A nosing projection is not required where the tread depth is a minimum of 11 inches (279 mm).

R311.7.4.3.2 Nosing Projection Uniformity. The greatest nosing projection shall not exceed the smallest nosing projection by more than $^{3}/_{8}$ inch (9.5 mm) within each flight of stairs, including the nosing at the level of floors and landings.

R311.7.4.3.3 Open Risers. Open risers are permitted, provided that the opening between treads does not permit the passage of a 4-inch diameter (102 mm) sphere.

Exception: The opening between adjacent treads is not limited on stairs with a total rise of 30 inches (762 mm) or less.

Reason: There is no technical change to the requirements in this proposal. It is a clarification of intent by separating out and labeling the separate issues of (1) nosing and riser profile or shape, (2) nosing projection size, (3) nosing projection uniformity, and (3) open risers. Based on evidence of poor compliance and inspection, it has been confusing for various topics to be lumped together in one long paragraph.

My special concern here is the apparent widespread failure to build and inspect stairs with regard to uniformity of nosing projection, especially at the top of stair flights. For this reason alone, it is important for this section—with a few topics in one paragraph—to be divided into smaller pieces dealing with a smaller set of issues. It appears that the nosing projection uniformity issue— particularly omitting the nosing projection on the landing nosing—might be mostly responsible for the rapid growth of what I refer to as "Excess Injuries" in Figure 1. Over the several years where these "Excess Injuries" have been seen in the CPSC-NEISS national estimates, there have been a total of about 2 million such "Excess Injuries" which have an associated annual societal cost in the USA of about $200 billion (yes, that is billion with a "b") with the medical care component of these "Excess Injuries" accounting for about $20 billion. (The substantial basis for these cost-of-injury estimates comes from the work of Lawrence, et al., 1999.)

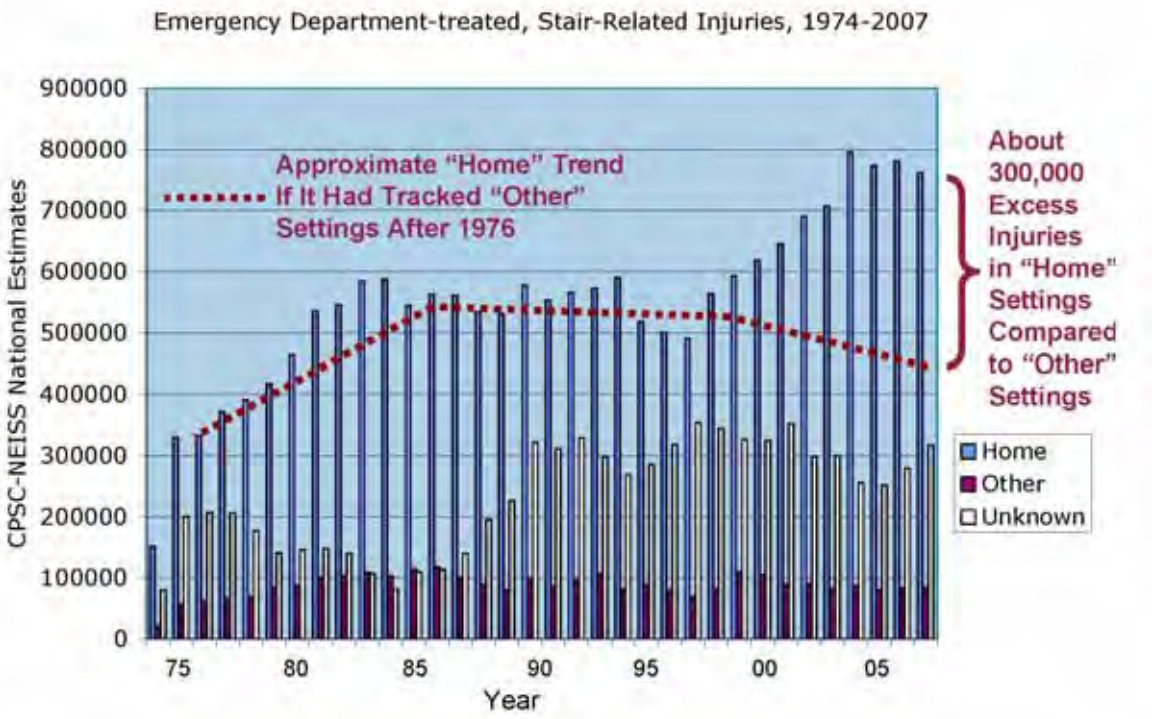

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years.

A far too common error in design and construction of stairways is the lack of attention to keeping all tread depths, especially the top one in a flight, uniform in size, particularly where projecting nosings are provided on a flight of stairs installed as a manufactured unit which does not include the top or landing nosing projection. Thus this is a dual issue of non-uniform tread depths and non-uniform nosing projections. ICC IRC guides for inspection and for the homebuilding industry (published by ICC in conjunction with NAHB) fail to even mention these two important IRC rules. These two ICC publications are listed in the Bibliography. Surely it is fairly strong evidence of a code inadequacy when even ICC experts apparently do not recognize the existence and importance of two rules governing the most potent of factors—step geometry uniformity—for the most dangerous product in homes and other buildings.

The resulting non-uniformities in tread depths, with a larger top tread followed by smaller treads in the flight make the stair flight orders of magnitude more dangerous for descent-direction users. This pervasive systemic defect has also become so concerning to leading stairway safety professionals such as myself that a special website page has been created simply to deal with this issue. See http://web.me.com/bldguse/Site/Stairways.html for information on this including the graph provided below as Figure 1 showing a large increase in the number of home stair-related injuries identified in the CPSC NEISS national estimates for the USA in the last several years. Excerpts of text from the Stairways website page are also quoted below as are excerpts from an American Society of Safety Engineers 2008 Professional Development Conference paper by Pauls and Harbuck. The full ASSE conference paper is freely accessible as a PDF download from the Downloads area of my website, http://web.me.com/bldguse/Site/Downloads.html. Generally, it is suspected that with recent greater use of manufactured stair flights, the incidence of systemic, top-of-flight non-uniformities has grown with resulting significant increases in home stair-related injuries.

On the Stairways website page, referenced above, is the following text and photograph (here identified as Figure 2) of a typical dwelling unit stairway with the systemic top-of-flight defect in nosing projection non-uniformity, the most common reason for the tread depth below the landing to be larger in size than the tread depths below it. Below Figure 2 is an additional photograph, Figure 3, showing what a stair flight looks like it very likely conforms to the uniformity requirements. The crouch-and-sight, visual test is helpful but is neither perfect nor quantitative; therefore, the stair geometry should be properly measured, at least at the top three steps, to confirm that there is not a rare coincidence of both larger tread depth and larger rise dimensions at the top step.

Figure 2. Typical Dwelling Unit Stairway with the Systemic, Top-of-Flight Defect.

Here follows the text from the website (http://web.me.com/bldguse/Site/Stairways.html) which has been publicly available since May 2009.

"While more investigation is required, it appears that a major reason for the recent 'excess' injuries related to home stairs might be a systemic defect on many home stairways (as well as some in other settings) in the USA and Canada. This defect is a non-uniformity of the nosing projection at the top of stair flights; due to the omission of a $10 nosing piece, at the landing level, at the time of stairway construction. This makes the top tread below the landing effectively larger than all the steps below it.

This common defect greatly increases the risk of an 'overstepping misstep' on the second or third step down the flight. Such missteps can lead to a very serious fall down the stair flight, with resulting injuries.

This is why we should now give our stairways 'a second look.' Specifically we should perform the simple 'crouch and sight' test. Do this from the landing above the stair flight you wish to check. Crouch down so you are able to see all the stair nosings (the leading edges) line up. If the top, landing nosing does not line up with all the other step nosings, your stair likely has the systemic defect. Here is a home stairway with the systemic defect."

The "Stairways" page of the website goes on to provide advice specifically for homeowners who perform the "crouch and sight" test and discover that their stairway has the systemic, top-of-flight defect.

"If your home stairway has this defect—which results from the non-uniformities of nosing projections and of what are called 'tread depth' or 'run' dimensions—and your home was recently constructed, call your local building inspection authorities and request that the stairway be re-inspected for building code compliance. Both the non-uniform nosing projection and the non-uniform tread depth or run are building code violations, for example under widely used codes in the USA.

If there has been a fall and significant injury on the non-uniform stair flight, you might also want to confer with an attorney (experienced in dealing with stair-related injury cases), especially if the home was recently constructed.

Much more information on this (and other) safety problems with stairways is found in the downloadable files associated with this website. See especially the latest papers and presentations by Jake Pauls on home stairways in the two most recently posted folders.

•Home Stairway Safety and Codes (Posted February 2009)

•Presentations at MUTN Conference in BC, Canada, April 2009

Also, in early summer 2009, watch this website for an announcement of the availability of an educational DVD package, based on the one-day workshop at the MUTN Conference in BC, Canada, in April 2009. (Contact Jake Pauls for purchase information.)"

Figure 3. Dwelling Unit Stair Very Likely Not Having the Systemic, Top-of-Flight Defect.

Any ICC chapter wishing to have their members participate in a one-day workshop (also slated for presentation in Eastern Canada on September 14, 2009) should contact Jake Pauls. It is available in a not-for-profit form. Code authorities should be prepared to deal knowledgeably with consumers who, upon discovering the systemic defect in their homes (after performing their own "crouch-and-sight" test), contact their local building department and ask for a re-inspection of their home stairways. If there has been an injurious fall on such a stairway they should also be prepared to deal with resulting legal actions that might name the local building department as a third party defendant. They should know how to perform the measurements of the stair step geometry that are of a quality expected in such litigation actions. These measurement techniques, usually requiring use of a spirit level or electronic level, are all described in the workshop materials posted on the above-mentioned website Downloads area and on the DVD of the Spring 2009 workshop noted above. These measurement techniques are consistent with the ICC requirements both as currently stated and as further clarified if this proposal is accepted.

In order to begin stopping all future misinterpretations of the IRC requirements for tread depth uniformity—and thus preventing many predictable and preventable missteps and falls (NOT "accidents" which are defined in the public health field as unpredictable and unpreventable events)—it is hoped that all code enforcement authorities heed very carefully the current and clarified requirements in IBC 109.4.5 (and1009.4.2) as well as R311.7.4.2 (and R311.7.4.3).

Cost Impact: The code change proposal will not increase the cost of construction as there is no technical change proposed. (The nosing piece required to comply with both the current code and the code as clarified by this proposal costs about $10 per home stair flight in terms of material, in oak, at retail level.)

PART I – IBC MEANS OF EGRESS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: PAULS-E1-1009.4.5.1

E76–09/10
1009.5 (IFC [B] 1009.5)

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, Inc.

Revise as follows:

1009.5 (IFC [B] 1009.5) Stairway landings. There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall not be less than the width of stairways they serve. Every landing shall have a minimum ~~dimension~~ width measured perpendicular to ~~in~~ the direction of travel equal to the width of the stairway. Where the stairway has a straight run the depth ~~Such dimension~~ need not exceed 48 inches (1219 mm) ~~where the stairway has a straight run~~. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. When wheelchair spaces are required on the stairway landing in accordance with Section 1007.6.1, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces.

Exception: Aisle stairs complying with Section 1028.

Reason: This change clarifies that landing width is measured perpendicular to the line of travel. The commentary offers clarification of this language to reinforce the most common interpretation allowing the periphery of stairway landings to be curved or segmented because this does not reduce the effective width of the landing to those using the stairway. This proposal will allow more consistent application and enforcement of the intent of this section.

Cost Impact: This proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Cooper-E3-1009.4

E77–09/10
1009.5 (IFC [B] 1009.5)

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise text as follows:

1009.5 (IFC [B] 1009.5) Stairway Landings. There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall not be less than the width of stairways they serve. Every landing shall have a minimum dimension measured in the direction of travel equal to the width of the stairway. Such dimension need not exceed 48 inches (1219 mm) where the stairway has a straight run or where a curved stairway has a continuous radius. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. When wheelchair spaces are required on the stairway landing in accordance with Section 1007.6.1, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces.

Exception: Aisle stairs complying with Section 1028.

Reason: There are many curved or radius stairways that exceed the minimum required egress width. In those cases, to require the length of the landing in the direction of travel to be equal to the width of the stair is impractical and takes up valuable floor space. Per Section 1005.1, egress width must be maintained to the termination of the means of egress so changes in direction of the stair will not be allowed to be less than the width of the stair.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRANZ-E3-1009.5.DOC

E78–09/10
1009.10.2 (IFC [B] 1009.10.2)

Proponent: Elliott Mertz, Lapeyre Stair, representing self

Revise as follows:

1009.10.2 (IFC [B] 1009.10.2) Treads of alternating tread devices. Alternating tread devices shall have a minimum projected tread of 5 inches (127 mm), a minimum tread depth of 8 ½ inches (216 mm), a minimum tread width of 7 inches (178 mm) and a maximum riser height of 9 ½ inches (241 mm). The projected tread depth shall be measured horizontally between the vertical planes of the foremost projections of ~~adjacent treads~~ the tread being measured and the tread directly above the tread being measured. The riser height shall be measured vertically between the leading edges of adjacent treads. The combination of riser height and projected tread depth provided shall result in an alternating tread device angle that complies with Section 1002. The initial tread of the device shall begin at the same elevation as the platform, landing or floor surface.

Exception: Alternating tread devices used as an element of a means of egress in buildings from a mezzanine area not more than 250 square feet (23 m^2) in area which serves not more than five occupants shall have a minimum projected tread of 8 ½ inches (216 mm) with a minimum tread depth of 10 ½ inches (267 mm). The rise to the next alternating tread surface should not be more than 8 inches (203 mm).

Reason: Clarify the code. The only way to measure the projected tread depth of alternating tread devices is using treads that are directly above and below each other rather than adjacent treads which are to the side of each other. An adjacent tread has no effect on the usable depth of a tread adjacent.

Cost impact: The code change proposal will not affect the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Mertz-E2-1009.10.2

E79–09/10
1009.10.2 (IFC [B] 1009.10.2)

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, Inc.

Revise as follows:

1009.10.2 (IFC [B] 1009.10.2) Treads of alternating tread devices. Alternating tread devices shall have a minimum ~~projected~~ tread depth of 5 inches (127 mm), a minimum projected tread depth of 8 ½ inches (216 mm), a minimum tread width of 7 inches (178 mm) and a maximum riser height of 9 ½ inches (241 mm). The ~~projected~~ tread depth shall be measured horizontally between the vertical planes of the foremost projections of adjacent treads. The riser height shall be measured vertically between the leading edges of adjacent treads. The ~~combination of~~ riser height and ~~projected~~ tread depth provided shall result in an ~~alternating tread device~~ angle of ascent from the horizontal that complies with Section 1002. The initial tread of the device shall begin at the same elevation as the platform, landing or floor surface.

Exception: Alternating tread devices used as an element of a means of egress in buildings from a mezzanine area not more than 250 square feet (23 m^2) in area which serves not more than five occupants shall have a minimum ~~projected~~ tread depth of 3.0 inches (76 mm) ~~of 8 ½ inches (216 mm)~~with a minimum projected tread depth of 10 ½ inches (267 mm). The rise to the next alternating tread surface should not be more than 8 inches (203 mm).

Reason: Currently in this section the code recognizes that "projected tread depth" is the distance measured horizontally between the vertical planes of the foremost projections of adjacent treads. This is what the code cites as being "tread depth" in both the stairway and ship ladder sections.

Alternating tread devices, ships ladders, and stairs have several things in common. They are vertical egress devices, they all have treads, and ascend at an angle. Mathematically any angle or slope can be defined by two components called Rise and Run. When calculating an angle it is these two components that are used. In reference to stairs and ladders of all types the horizontal component is usually called Run or Going however the ICC recognizes and substitutes the term "tread depth" for this horizontal unit of the slope that is used to calculate the angle.

If tread depth is the given term used in the ICC codes then it should and can be used correctly and in the same fashion for alternating tread devices, ships ladders and stairs.

The changes above simply correct long mistaken use of terms in this section that were amplified by changes made to this section in 2009 in an attempt to describe how to measure the tread depth.

Please see the graphics attached that provide additional clarification of this proposal in relation to the referenced definition of Alternating tread device in section 1002.

ALTERNATING TREAD DEVICE. A device that has a series of steps between 50 and 70 degrees (0.87 and 1.22 rad) from horizontal, usually attached to a center support rail in an alternating manner so that the user does not have both feet on the same level at the same time.

To assure that the device meets the definition it is necessary to calculate the angle of ascent from the horizontal. The corrected language makes this possible.

Referenced defintion from Section 1002:

ALTERNATING TREAD DEVICE. A device that has a series of steps between 50 and 70 degrees (0.87 and 1.22 rad) from horizontal, usually attached to a center support rail in an alternating manner so that the user does not have both feet on the same level at the same time.

Figure 1

Figure 2

Figures 1 and 2 show the two tread depths and riser heights as corrected by the proposal and the related angles of ascent with the horizontal that are applicable to the referenced definition in Section 1002 for Alternating tread devices.

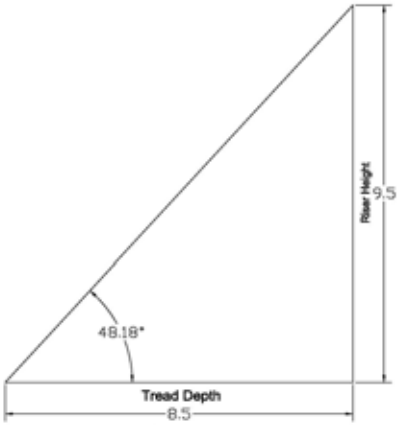

Figure 3

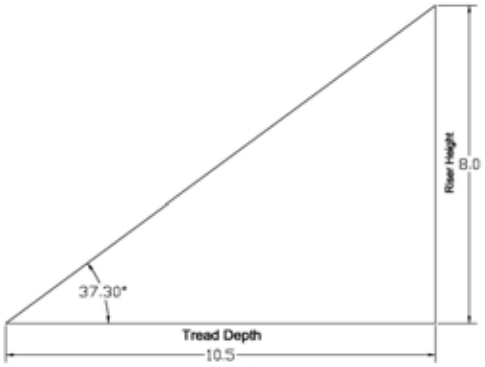

Figure 4

Figures 3 and 4 above show the two tread depths and riser heights as currently stated in the code and the resulutant incorrect angles calculated. These errant angles do not match the devices angle nor do they fit the referenced definition in Section 1002 for Alternating tread devices.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Cooper-E1-1009.9.2

E80–09/10
1009.12, 1010.8, 1028.13 (IFC [B] 1009.12, 1010.8, 1028.13)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1009.12 (IFC [B] 1009.12) Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. Handrails for aisle stairs ~~are not required where permitted by~~ provided in accordance with Section 1028.13.
2. Stairways within dwelling units~~,~~ and spiral stairways ~~and aisle stairs serving seating only on one side~~ are permitted to have a handrail on one side only.
3. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
5. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 occupancies do not require handrails.

1010.8 (IFC [B] 1010.8) Handrails. Ramps with a rise greater than 6 inches (152 mm) shall have handrails on both sides. Handrails shall comply with Section 1012.

Exception: Handrails for ramped aisles ~~are not required where permitted by~~ provided in accordance with Section 1028.13.

1028.13 (IFC [B] 1028.13) Handrails. Ramped aisles having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and aisle stairs shall be provided with handrails in compliance with Section 1012 located either at the side or within the aisle width.

Exceptions:

1. Handrails are not required for ramped aisles having a gradient no greater than one unit vertical in eight units horizontal (12.5-percent slope) and seating on both sides.
2. Handrails are not required if, at the side of the aisle, there is a guard that complies with the graspability requirements of handrails.
3. Handrail extensions are not required at the top and bottom of aisle stairs and aisle ramp runs to permit crossovers within the aisles.

1028.13.1 (IFC [B] 1028.13.1) Discontinuous handrails. Where there is seating on both sides of the aisle, the handrails shall be discontinuous with gaps or breaks at intervals not exceeding five rows to facilitate access to seating and to permit crossing from one side of the aisle to the other. These gaps or breaks shall have a clear width of at least 22 inches (559 mm) and not greater than 36 inches (914 mm), measured horizontally, and the handrail shall have rounded terminations or bends.

1028.13.2 (IFC [B] 1028.13.2) Intermediate handrails. Where handrails are provided in the middle of aisle stairs, there shall be an additional intermediate handrail located approximately 12 inches (305 mm) below the main handrail.

Reason: The handrail requirements for aisle stairs and ramps differ from the handrail requirements for stairs since aisles serve seating to the side of an aisle stair or ramp. The occupant movement between the seating area and the aisle requires unique and specific requirements from that of a stair. Therefore, the exception should not be based upon where a handrail is permitted to be omitted, but rather that the handrail is required to comply with the handrail provisions for aisle stairs and ramps, not the handrail provisions for stairs. Also, there is more clarity by eliminating the portion pertaining to aisle stairs serving seating on one side from the exception pertaining to stairs in dwelling units and spiral stairs. By simply requiring compliance with the section on aisle handrail requirements there is no need for having the aisle serving seating on one side connected with a stair exception. Finally, Section 1028.13 should clearly require compliance with Section 1012 to fully separate and coordinate the requirements for stair handrails and aisle handrails.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-E7-1009.12

E81–09/10
1009.12, 1010.8 (IFC [B] 1009.12, 1010.8)

Proponent: Bill Conner, representing American Society of Theatre Consultants

Revise as follows:

1009.12 (IFC [B] 1009.12) Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. Handrails for aisle stairs are not required where permitted by Section 1028.13.
2. Stairways providing access between the stage and the assembly seating area are permitted to have a handrail on one side only.
3. ~~2.~~ Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.
4. ~~3.~~ Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
5. ~~4.~~ In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
6. ~~5.~~ Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails.

1010.8 (IFC [B] 1010.8) Handrails. Ramps with a rise greater than 6 inches (152 mm) shall have handrails on both sides. Handrails shall comply with Section 1012.

Exceptions:

1. Handrails for ramped aisles are not required where permitted by Section 1028.13.
2. Ramps providing access between the stage and the assembly seating area are permitted to have a handrail on one side only.

Reason: Guards are not required on the front of a stage. Traditionally stairs or ramps leading to the stage have only had a handrail on the wall side to that they do not obstruct view of the stage. Sometimes ramps that wing a stage are also used as part of the stage during events. While single handrails are permitted in aisle steps within the seating areas, it is interpretive if the stairs to the stage are covered by this allowance. This proposal will clarify the issue.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Conner-E3-1028.13 split

E82-09/10
1009.12 (IFC [B] 1009.12)

Proponent: Kyle Hantz, PE, General Services Administration, representing self

Revise as follows:

1009.12 (IFC [B] 1009.12) Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. Handrails for aisle stairs are not required where permitted by Section 1028.13.
2. Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.
3. ~~Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.~~

3.4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
4.5. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails

Reason: Refer to NFPA 101 7.2.2.4.1.1. This states stairs and ramps have handrails. Yet 1009.12 exception #3 allows one change of elevation not to have a handrail. I think Exception #3 is referring to walkways that are not a component of a means of egress.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Hantz-E1-1009.12.doc

E83–09/10
1009.12 (IFC [B] 1009.12)

Proponent: Ali M. Fattah, City of San Diego, representing SD Area Chapter ICC Code Committee

Revise as follows:

1009.12 (IFC [B] 1009.12) Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. Handrails for aisle stairs are not required where permitted by Section 1028.13.
2. Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.
3. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
5. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails.
6. At individual dwellings and their accessory structures, exterior stairways that are located on grade and do not provide the only means of egress to the public way do not require handrail.

Reason: The proposed code change adds clarity to the IBC. Exterior stairways on grade do not require handrails since the fall potential is not as critical on elevated stairways. There will be no obscuration of exterior path in a fire emergency s would be in an interior stairway. The IRC does not regulate exterior means of egress and flatwork.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Fattah-E2-1012.1

E84–09/10
1009.12 (IFC [B] 1009.12)

Proponent: Don Birdsall, LIFT-U Division, Hogan Mfg., Inc., representing self

Revise as follows:

1009.12 (IFC [B] 1009.12) Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. Handrails for aisle stairs are not required where permitted by Section 1028.13.

2. Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.
3. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
5. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails.
6. Changes in elevation of one or two risers where there is an adjacent support on at least one side with a height of not less than 34 inches (864 mm)and not more than 42 inches (1067 mm) and with a top surface that complies with the graspability requirements of a handrail.

Reason: To eliminate the requirement of a handrail on a one or two step stairway when there is a fixed structure in place along the step(s) that can be grasped and used to support the user. A prime example of the situation is in a courtroom. To gain access to the Judges' Bench, the Judge may walk through the Witness Stand or Clerks' Station on one side of his Bench. The elevation change is typically two steps or less. If a wheelchair lift is present in the Witness Stand or Clerks' Station, a hazard is created between the fixed handrail and the wheelchair/user as the platform rises in height to the Judges' Bench. The millwork throughout the Bench area provides horizontal surfaces that can be used for support as would a handrail. By eliminating the requirement for handrails when there are support surfaces available, a potential crushing hazard between the handrail and the wheelchair user is eliminated while protecting the decorum of the courtroom.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BIRDSALL-E1-1009.12.DOC

E85-09/10
1009.13 (IFC [B] 1009.13)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

1009.13 (IFC [B] 1009.13) Stairway to roof. In buildings four or more stories above grade plane, one stairway shall extend to the roof surface, unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope). In buildings four stories or more above grade plane, without an occupied roof, access to the roof from the top story shall be permitted to be by an alternating tread device or ladder.

Reason: The second sentence in Section 1009.13 isn't clear as to what it applies to; buildings four or more stories above grade plane, buildings of any height, or any building without an occupied roof? The proposed amendment clarifies the criteria to apply to buildings four stories above grade plane and having an unoccupied roof.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Collins-E4-1009.13

E86–09/10
1009.13 (IFC [B] 1009.13)

Proponent: J. Nigel Ellis, Ph.D., PE, Ellis Fall Safety Solutions, LLC

Revise as follows:

1009.13 (IFC [B] 1009.13) Stairway to roof. In buildings four or more stories above grade plane, one stairway shall extend to the roof surface, unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope). In buildings without an occupied roof, access to the roof from the top story shall be permitted to be by an alternating tread device. Hatch openings shall be provided with a means to facilitate access and exit such as ladder grab bars that can be grasped by the climber. Ladder grab bars shall be elevated above the roof and horizontally arranged in a uniform manner.

Reason: The code is presently silent on roof hatch fall hazards.

To avoid necessity for crouching to stabilize balance before entering the roof hatch or to reduce the incidence of tripping on the curb before descending, he externally mounted grab bars can be reached without stooping to permit access or bodily turn around with reduced falling hazard; such fall hazard can be up to 30 ft. in some mental buildings with highly injurious or fatal consequences.

The requirement would also apply to fixed ladder roof hatch access where exemptions to the IBC Code are permitted.

ANSI A14.3 – 2008 Section 5.3.4.3 states the following: "5.3.4.3 Hatch opening shall be provided with a means to facilitate access and exit from a fixed ladder (i.e, grab bars or other such items that can be grasped by the climber."

The University of Michigan Biomechanics Laboratory research report 4/08 financed by NIOSH (awarded by The Center to Protect Worker' Rights) supports the selection of effective horizontal grab bars over ineffective vertical grab bars. NIOSH/CDC is the National Institute of Occupational Safety & Health/Center for Disease Control.

A picture of ladder grab bars for roof hatch access is attached for a commercial building roof hatch. Ladder grab bars have been recognized for decades in industry by OSHA and ANSI known simply as "grab bars". Since 1971, OSHA 1910.27(b)(5) and (d)(4) only has "grab bars" in mind for fixed ladders which are typically 12 inches long, one inch diameter, bolted or welded at each end and 1.5-4" space to grab where a fixed ladder is used. I am proposing that these ladder grab bars only be placed horizontally. Side rails are always vertically arranged which when grasped is a hazard when you fall more than approx. six inches because the hand slides as shown in the University of Michigan ladder report which I submitted electronically to ICC with the file name UM_CPWR_Final1.pdf and can be viewed on the FallSafety.com website under Ladder Improvements. CPWR (Center for Protection of Worker Rights) dispenses NIOSH grants for research. Another reference is the US Corps of Engineers EM385-1-1 (2003) (mandatory) Appendix Fixed Ladder and Stairs J3(h) "Openings shall be provided with elevated horizontal grab bars to facilitate access and exit from upper levels", J4(d) Horizontal grab bars shall be provided to facilitate grip in case of a fall".

I also understand the use of the term "grab bar" since 1990 approx. for bathroom safety rails in the building code and to which no reference is made in this proposal.

ANSI (American National Standards Institute) has used the term "grab bars" for ladder holding stability (when rungs and side rails were not available) since 1956 in the A14.3 fixed ladder standard, as defined in section 2 as follows:
"2.14 Grab Bars are individual handholds placed adjacent to or as an extension above ladders for the purpose of providing access beyond the limits of the ladder"

Fixed ladder grab bars are addressed in proposed OSHA standard 1910.23(c)(21), and alternating tread type stairs are addressed in ANSI A1264.1-2007 section 6 and also proposed OSHA Standard 1910.25(f) and Fig. D3 (4 10 90). OSHA/DOL is the Occupational Safety & Health Administration/Department of Labor.

Horizontal grab bars can be attached by bolting or welding to protective guardrails arranged around roof openings for access to and from alternating tread devices and fixed ladders. More information on www.FallSafety.com Ladder Improvements related to ladder horizontal grab bars.

Cost Impact: Roof Hatch grab bars permanently installed approximately $320 cost and four bolt holes to drill for installation. Where guardrails are added around the roof hatch, the total system costs approximately $1300 before installation.

E87–09/10
1010.1 (IFC [B] 1010.1)

Proponent: Jon Siu, City of Seattle, representing Washington Association of Building Officials Technical Code Development Committee

Revise as follows:

1010.1 (IFC [B] 1010.1) Scope. The provisions of this section shall apply to ramps used as a component of a means of egress.

Exceptions:

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2 through 1108.2.4 and 1108.2.6, ramped aisles within assembly rooms or spaces shall conform with the provisions in Section 1028.11.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections 1010.3 through 1010.9 when they are not an accessible route serving accessible parking spaces~~,~~ or other required accessible elements ~~or part of an accessible means of egress~~.
4. In a parking garage where one accessible means of egress serving accessible parking spaces or other accessible elements is provided, a second accessible means of egress serving that area shall be permitted to include a vehicle ramp that does not comply with Sections 1010.4 through 1010.8.

Reason: This proposal solves a practical problem with current code language. In parking garages where parking is provided on the ramps, the accessible parking spaces are usually located on flat areas at the ends of the ramps. One accessible means of egress can usually be easily provided on the flat portion of the garage ramp. However, many times the second required means of egress is provided at the other end or at the center of the garage, and is accessed via the vehicle ramp. While the ramp may be able to provide the correct slope to provide the second accessible means of egress from the accessible parking spaces (1 vertical in 12 horizontal), it is impractical in these types of garages to provide features such as handrails on both sides of the ramp, or to provide a landing for every 30 inches of rise.

The proposed text is modeled on Section 1010.1 exception 3, which allows the deletion of the some provisions for vehicle ramps used as exit access for pedestrians. However, because the ramp still needs to be used as an accessible means of egress, it is necessary to maintain a usable cross-slope (Section 1010.3). In addition, protection at the edges of the ramp should still be provided where the accessible means of egress is along the edge of the vehicle ramp (Section 1010.9). On the other hand, if the accessible means of egress is not near the edge of the vehicle ramp (the most likely scenario), Section 1010.9, Exception 1 can be used to eliminate the edge protection, since the requirement for 1:10 sloped "flares" will easily be met.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: SIU-E1-1010.1

E88–09/10
1010.1 (IFC [B] 1010.1)

Proponent: Ali M. Fattah, City of San Diego, representing SD Area Chapter ICC Code Committee

Revise as follows:

1010.1 (IFC [B] 1010.1) Scope. The provisions of this section shall apply to ramps used as a component of a means of egress.

Exceptions:

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2 through 1108.2.4 and 1108.2.6, ramped aisles within assembly rooms or spaces shall conform with the provisions in Section 1028.11.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections 1010.3 through 1010.9 when they are not an accessible route serving accessible parking spaces, other required accessible elements or part of an accessible means of egress.
4. Sloped driveways used for vehicular access to Group U occupancies or private garages, that are associated with Group R-3 dwelling units that are not required to meet Type B unit requirements in Section 1107, shall not be required to comply with this section.

Reason: The proposed code change adds clarity to the IBC. This requirement existed under the 1997 UBC but was not enforced. The IRC does not regulate exterior means of egress. It is not practical on single family dwellings and two-family dwellings to provide egress ramps.

Cost Impact: This proposal will minimally impact the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Fattah-E3-1010.1

E89–09/10
1011.2, 1011.4, 1011.5.3 (IFC [B] 1011.2, 1011.4, 1011.5.3)

Proponent: Manny Muniz, California Deputy State Fire Marshal (Ret.), representing self

Revise as follows:

1011.2 (IFC [B] 1011.2) Illumination. Exit signs shall be internally or externally illuminated. Exit signs shall be illuminated at all times.

Exceptions:

1. Tactile signs required by Section 1011.3 need not be provided with illumination.
2. When approved by the building official, exit signs are not required to be illuminated when the building is unoccupied.

1011.4 (IFC [B] 1011.4) Internally illuminated exit signs. Electrically powered, self-luminous and photoluminescent exit signs shall be listed and labeled in accordance with UL 924 and shall be installed in accordance with the manufacturer's instructions and Chapter 27. ~~Exit signs shall be illuminated at all times.~~

1011.5 (IFC [B] 1011.5) Externally illuminated exit signs. Externally illuminated exit signs shall comply with Sections 1011.5.1 through 1011.5.3.

1011.5.3 (IFC [B] 1011.5.3) Power source. ~~Exit signs shall be illuminated at all times.~~ To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

Exception: Approved exit sign illumination means that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.

Reason: Many buildings that are required to have exit signs illuminated 24/7 are unoccupied more than they are occupied. This wastes electricity needlessly and often shortens the life span of exit sign bulbs, thus requiring more frequent bulb replacement. Failure to maintain and replace exit sign bulbs is the number one cause of exit sign inoperability. The building official should be given the power to make determinations of when it is appropriate to have exit signs illuminated at all times and when it is not. It should be noted that 1006.1 means of egress illumination (1 foot candle) "..shall be illuminated at all times the building space served by the means of egress is occupied." Means of egress illumination and exit sign illumination should always operate together so that a person can see the egress path and then identify the exit doors. In a typical office building where workers work from 9 AM to 6 PM Monday through Friday, and allowing for the building being opened at 8 AM and closed at 7 PM, the building is occupied less than one-third of the time. Two thirds of the time, electricity consuming exit signs are serving no purpose at all.

Typical Office Building
Exit signs on when building occupied = 55 hrs/week
52 weeks = 2,860 hrs/year

Versus
Exit signs on 24/7 = 168 hrs/week
365 days per year = 8,760 hrs/year

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Muniz-E3-1011.4

E90–09/10
1011.2 (New) [IFC [B] 1011.2 (New)]

Proponent: Donald LeBrun, CBO, State of Indiana, Fire & Building Safety, representing Indiana Association of Building Officials

Add new text as follows:

1011.2 (IFC [B] 1022.1) Location. When exit signs are mounted on the same vertical plane as the exit or exit-access door served the sign shall be centered above the door with the bottom of the sign no more than 12 inches (305 mm) above the door leaf. Other exit signs used to direct persons to the exit or exit-access door shall be no higher than 10' feet (3.05 m) above the finish floor.

(Renumber subsequent sections)

Reason: Currently we have no direction as to where exit signs should be located. With the higher ceilings being used in more structures we are finding exit signs being mounted well above the exit served, sometimes as much as 25 feet above the door. In an emergency situation people will seek exiting information at their eye level and never see the exit sign 20 feet above their heads. Mounting exit signs at the proposed levels would greatly increase the visibility and effectiveness of the exit signs.

Cost Impact: This proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Lebrun-E1-1011.2

E91–09/10
1011.2 (New) [IFC [B] 1011.2 (New)]

Proponent: Donald LeBrun, CBO, State of Indiana, Fire & Building Safety, representing Indiana Association of Building Officials

Add new text as follows:

1011.2 (IFC [B] 1022.1) Floor-level exit signs in Group R-1. Where exit signs are required by Section 1011.1, additional low-level exit signs shall be provided in all corridors serving guest rooms in Group R-1 occupancies.

The bottom of such sign shall be not less than 6 inches (152mm) nor more than 8 inches (203mm) above the floor level. For exit and exit-access doors, the sign shall be on the door or adjacent to the door with the closest edge of the sign within 4 inches (102 mm) of the door frame.

(Renumber subsequent sections)

Reason: This proposal is specifically intended for use group R-1 occupancies where the occupants are transient and not familiar with their surroundings. The current practice of installing exit signs above the heads of most people works well except in a smoke filled space which often accompanies a fire situation. As the space fills with smoke the effectiveness of the high level exit signage diminishes forcing evacuees to crawl on the floor to reach the nearest exit. The installation of these low level will greatly assist these persons in safely exiting the structure.

Cost Impact: This proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Lebrun-E2-1011.2

1011.3, 1011.3.1-1011.3.8 (New) [IFC [B] 1011.3, 1011.3.1-1011.3.8 (New)]

Proponent: Dallas Dixon, representing ERR Architecture INC

Delete and substitute as follows:

.

1011.3 (IFC [B] 1011.3) Tactile ~~exit~~ signs. ~~A tactile sign stating EXIT and complying with ICC A117.1 shall be provided adjacent to each door to an area of refuge, an exterior area for assisted rescue, an exit stairway, an exit ramp, an exit passageway and the exit discharge.~~ Tactile signs shall be provided adjacent to exit access doors and doors leading to enclosed exits where exit signs are required by Section 1011.1. Tactile signs shall be provided adjacent to doors leading to areas of refuge and exterior areas for assisted rescue where identification signs are required by Section 1007.9. Signs shall provide information as indicated in Sections 1101.3.1 through 1101.3.8. All tactile signs shall comply with ICC A117.1 requirements for raised characters and Braille.

Exception: Where the configuration of the walls and doors will not allow for placement of the tactile signage in accordance with ICC A117.1, tactile signage in accordance with this section is not required.

1011.3.1 (IFC [B] 1011.3.1) Exit stairway. Tactile signs shall be provided adjacent to each door leading to an enclosed exit stairway stating 'EXIT STAIR'.

1011.3.2 (IFC [B] 1011.3.2) Exit access. Tactile signs shall be provided adjacent to exit access doorways stating 'EXIT ACCESS.'

1011.3.3 (IFC [B] 1011.3.3) Exit discharge. Tactile signs shall be provided adjacent to each door leading directly to an exit discharge stating 'EXIT'.

1011.3.4 (IFC [B] 1011.3.4) Exit passageway. Tactile signs shall be provided adjacent to each door leading to an exit passageway stating 'PASSAGEWAY TO EXIT'.

1011.3.5 (IFC [B] 1011.3.5) Horizontal exit. Tactile signs shall be provided adjacent to doors leading to horizontal exits stating 'EXIT TO REFUGE AREA'.

1011.3.6 (IFC [B] 1011.3.6) Exit ramps. Tactile signs shall be provided adjacent to each door or on adjacent wall leading to interior or exterior exit ramps.

1. Where an interior exit ramp is located at an exit access or an exit, signage shall state 'INTERIOR EXIT RAMP'.
2. Where an exterior exit ramp is provided, signage shall state 'EXTERIOR EXIT RAMP'

1011.3.7 (IFC [B] 1011.3.7) Exit discharge with Exterior steps. In addition to signage required by Section 1011.3.3, if the exit discharge includes a step down or stairs, tactile signs shall be provided adjacent to the exit door and:

1. Where there is a step down as permitted in Sections 1008.1.5, signage shall state 'STEP DOWN.'
2. Where the exit door landing leads to stairs, signage shall state 'OUTSIDE STAIRS'.

1011.3.8 (IFC [B] 1011.3.8) Area of refuge. Where identification signage is required by Section 1007.9, tactile signage shall be provided at the following locations:

1. Where an area of refuge is located in an elevator lobby, tactile signs shall be provided on all doors leading to the elevator lobby stating 'AREA OF REFUGE'.
2. Where an area of refuge is located inside an exit stairway enclosure, in addition to the sign required by Section 1011.3.1, a tactile sign shall be provided adjacent to the door leading to the stairway stating 'AREA OF REFUGE'.
3. Where an area of refuge is located adjacent to an exit stairway enclosure, in addition to the sign required by Section 1011.3.2, a tactile sign shall be provided adjacent to the door leading to the area of refuge stating 'AREA OF REFUGE.'
4. Where an exterior area for assisted rescue is provided, in addition to the sign required by Sections 1011.3.3 and 1011.3.7, a tactile sign shall be provided adjacent to the exterior door stating 'EXTERIOR AREA FOR ASSISTED RESCUE.'

Reason: The intent of this proposal is to provide clarity where tactile exit signage should be provided. In addition, specific text will help direct persons with vision impairments to a safe path out of the building or to an area of rescue assistance. For example, letting someone with visual impairments know that they will be dealing with steps or ramps when they walk through a door, will provide for safer paths.

With the advent of the Big Box buildings and mega size multi-use building, the requirements for Tactile Signage as addressed in Section 1011.3 does not provide enough specifics or clarity. The exceptions of Section 1011.1 further provide confusion for where tactile signs shall be required and where are they exempted. Section 1011.3 generically addresses the placement of tactile signs adjacent to doors leading to an area of refuge, an area of assisted rescue, an exit stairway, an exit ramp, an exit passageway and exit discharge.

Tactile signage is not required where exit signs are not required so it will be manageable for code officials and fire officials to identify appropriate locations. The intent of the exception to Section 1011.3 is to address situations where there is no practical place to locate such signage so it can be found by a person with visual impairments (i.e., open stairways, horizontal sliding doors, storefront arrangement with glass doors and side lights, multiple doors together like at a main assembly space exit).

Current code does not address tactile signage requirement for exiting through horizontal exits or specific requirement and information when areas of refuge and exterior areas of rescue assistance are required. This code change includes text that specifically addresses these areas with regard to tactile signage

Cost Impact: This code change proposal will not increase the cost of construction

	Assembly:	ASF	AMF	DF

ICCFILENAME: DIXON-E1-1011.3

E93–09/10

1011.6 (New) [IFC [B] 1011.6 (New); IFC 1030.4.1

Proponent: Joshua D. Smith, Fire Protection Specialist, representing New York State Department of State – Office of Fire Prevention and Control

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC MEANS OF EGRESS CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

PART I – IBC MEANS OF EGRESS

Add new text as follows:

1011.6 (IFC [B] 1011.6) Door Mounted Exit Signs. For Groups A, B, E, I, M, and R-1 occupancies, all exit and exit access doors required to have exit signs in accordance with Section 1011.1 shall, in addition, be marked on the door with a self-luminous or photoluminescent exit sign. The bottom of the sign shall not be less than 6 inches above the floor and not more than 18 inches above the floor. The sign shall be permitted to be made of any material, including paint, provided that an electrical charge is not required to maintain the required luminance. Such materials shall include, but are not limited to, self-luminous materials and photoluminescent materials in accordance with Section 1024.4

PART II – IFC

Add new text as follows:

1030.4.1 Door Mounted Exit Signs. For Groups A, B, E, I, M, and R-1 occupancies, all exit and exit access doors required to have exit signs in accordance with Section 1011.1 shall, in addition, be marked on the door with a self-luminous or photoluminescent exit sign. The bottom of the sign shall not be less than 6 inches above the floor and not more than 18 inches above the floor. The sign shall be permitted to be made of any material, including paint, provided that an electrical charge is not required to maintain the required luminance. Such materials shall include, but are not limited to, self-luminous materials and photoluminescent materials in accordance with Section 1024.4

Reason: The current requirements for exit signs have them being hung from the ceiling or mounted high up on a wall. In the event of a fire as a room or corridor is filling with smoke, the exit signs and emergency lighting can quickly become obscured. As building occupants and/or fire fighters are moving through the building with obscured exit signs, determining the difference between an exit door from any other door can become complicated if not impossible at times. Having the floor proximity exit signs mounted on the doors will still provide a marked means of egress when other exit signs are no longer visible. NFPA 101 also has provisions for these signs.

Cost Impact: The code change proposal will increase the cost of construction

PART I – IBC MEANS OF EGRESS

E94–09/10
1012.2 (IFC [B] 1012.2)

Proponent: Kenneth F. Traugott, NVR, Inc, representing self

Revise as follows:

1012.2 (IFC [B] 1012.2) Height. Handrail height, measured above stair tread nosings, or finish surface of ramp slope shall be uniform, not less than 34 inches (864 mm) and not more than 38 inches (965 mm). Handrail height of alternating tread devices and ship ladders, measured above tread nosings, shall be uniform, not less than 30 inches (762 mm) and not more than 34 inches (864mm).

> **Exception:** When handrail fittings or bendings are used to provide continuous transition between flights, transition at winder treads, transition from handrail to guard, or when used at the start of a flight, the handrail height at the fittings or bendings shall be permitted to exceed the maximum height.

Reason: The above information is being requested to clarify the Code. Fittings such as easings and gooseneck risers are commonly used features intended to provide rail continuity at locations where a straight transition is not possible. Incorporating such features is consistent with the provisions of IBC Section 1012.4 (Continuity) and with standard architectural and construction practice.

The intent of the Code is that the provisions of 1012.3 be applied only over the stair run, and not at landings. The handrail height requirements are applicable over the stairway run, not at landings. The height of the handrail, when it doglegs or u-turns over a landing, will vary so that the handrail can remain continuous in accordance with Section 1012.4 and 1012.5. The handrail extensions at the end must also meet the protruding object provisions if they return to a support post (Section 1003.3.2 and 1012.5).

Unfortunately, the current wording of the Code, although it does indicate that height requirements should be "measured above stair tread nosings," does not clearly state that the height requirements do not apply over landings, at winder treads, where handrails meet a guardrail, or when used at the start of a flight. Inspectors, plan reviewers, and other building code officials in many jurisdictions are currently not accepting handrail fittings such as easings or gooseneck risers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAUGOTT-E1-1012.2

E95–09/10
1012.2 (IFC [B] 1012.2)

Proponent: Kenneth F. Traugott, NVR, Inc, representing self

Revise as follows:

1012.2 (IFC [B] 1012.2) Height. Handrail height, measured above stair tread nosings, or finish surface of ramp slope shall be uniform, not less than 34 inches (864 mm) and not more than 38 inches (965 mm). Handrail height of alternating tread devices and ship ladders, measured above tread nosings, shall be uniform, not less than 30 inches (762 mm) and not more than 34 inches (864 mm).

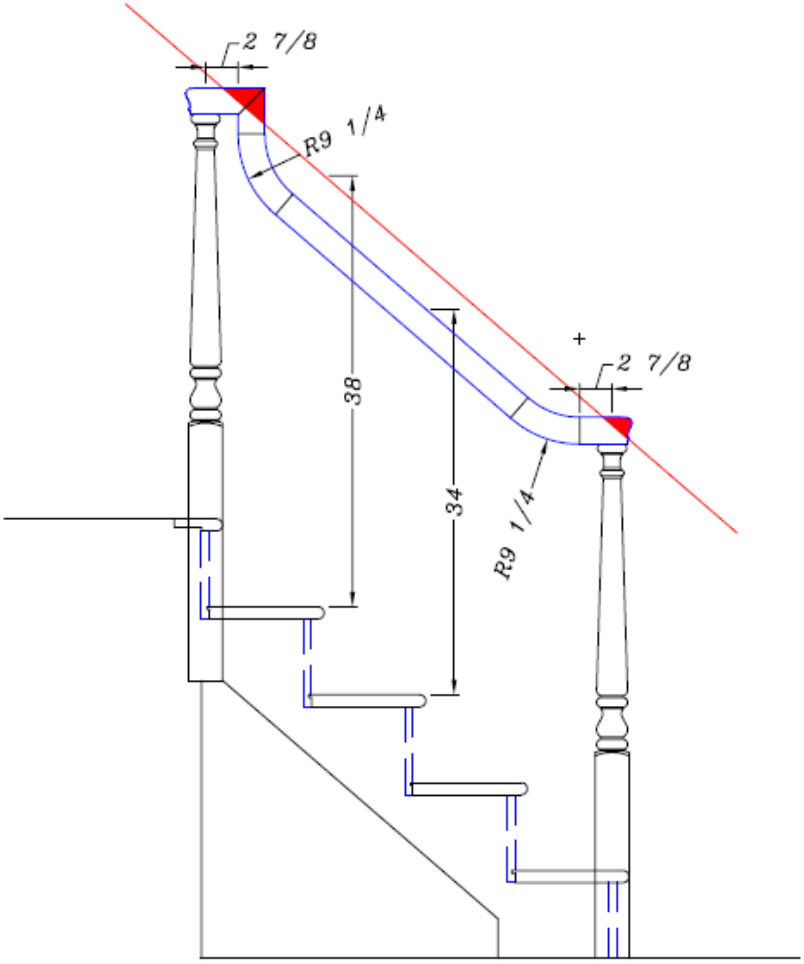
> **Exception:** In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are associated with a Group R-3 occupancy or associated with individual dwelling units in Group R-2 occupancies; when handrail fittings or bendings are used to provide continuous transition between flights, transition at winder treads, transition from handrail to guard, or when used at the start of a flight, the handrail height at the fittings or bendings shall be permitted to exceed the maximum height.

Reason: The above information is being requested to clarify the Code. Fittings such as easings and gooseneck risers are commonly used features intended to provide rail continuity at locations where a straight transition is not possible. Incorporating such features is consistent with the provisions of IBC Section 1012.4 (Continuity) and with standard architectural and construction practice.

The intent of the Code is that the provisions of Section 1012.3 be applied only over the stair run, and not at landings. The handrail height requirements are applicable over the stairway run, not at landings. The height of the handrail, when it doglegs or u-turns over a landing, will vary so that the handrail can remain continuous in accordance with Section 1012.4 and 1012.5. The handrail extensions at the end must also meet the protruding object provisions if they return to a support post (Section 1003.3.2 and 1012.5).

Unfortunately, the current wording of the Code, although it does indicate that height requirements should be "measured above stair tread nosings," does not clearly state that the height requirements do not apply over landings, at winder treads, where handrails meet a guardrail, or when used at the start of a flight. Inspectors, plan reviewers, and other building code officials in many jurisdictions are currently not accepting handrail fittings such as easings or gooseneck risers which are provided to maintain continuity.

This would be consistent with the provisions in the International Residential Code, Section R311.7.7.1, Exp. 2.



Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAUGOTT-E2-1012.2

E96–09/10
1012.3 (IFC [B] 1012.3)

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, Inc.

Revise as follows:

1012.3 (IFC [B] 1012.3) Handrail graspability. At ramps that serve as a portion of an accessible route required by Chapter 11, handrails shall comply with Section 1012.3.1 or shall provide equivalent graspability. All other required handrails shall comply with Section 1012.3.1 or 1012.3.2 or shall provide equivalent graspability.

> ~~**Exception:** In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; handrails shall be Type I, Type II as follows or shall provide equivalent graspability.~~

1012.3.1 Type I. Handrails with a circular cross section shall have an outside diameter of at least 1 ¼ inches (32 mm) and not greater than 2 inches (51 mm). If the handrail is not circular, it shall have a perimeter dimension of at least 4 inches (102 mm) and not greater than 6 ¼ inches (160 mm) with a maximum cross-section dimension of 2 ¼ inches (57 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

1012.3.2 Type II. Handrails with a perimeter greater than 6 ¼ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of ¾ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of at least $^{5}/_{16}$ inch (8 mm) within $^{7}/_{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for at least $^{3}/_{8}$ inch (10 mm) to a level that is not less than 1 ¾ inches (45 mm) below the tallest portion of the profile. The minimum width of the handrail above the recess shall be 1 ¼ inches (32 mm) to a maximum of 2 ¾ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Reason: This proposal identifies additional applications of the use of Type II handrails only in those areas that are not part of an accessible route. The A117.1 standard is not referenced for stairways or their handrails. This provision will clarify that other options are and should be available for advantageous and safe use of all.

Understanding the Options:
Type II Handrails provide many advantageous options recognized in the ICC's acceptance within both the IRC and IBC. Among these of course is regulated design freedom controlled by a standard that will provide rails with known performance equivalent to or exceeding the performance of the minimum standard accepted for type I rails.

Type II Handrails cannot be any shape but are precisely controlled by the code text to provide graspable recesses within the grasp of all.

Type I rails may be any shape, regardless of practicality, provided the perimeter and cross section dimension is met. Lacking specific criteria the handrails may only be designed for hand size specific applications, i.e. small perimeters for smaller hands, larger perimeters for larger hands.

The Type II handrail code language provides a recognized value in describing the best way in which to design handrail shapes other than round and thereby improves the code.

Type II Handrails are not impeded by obstructions to the bottom of the rail. They allow for more versatile installations using brackets or balusters attached to the bottom for support without compromising the graspable surface. Especially in the event of a fall the Type II handrail grasping surface is readily available without interference from supports. In fact its grasping surface is the same as its guidance and stabilizing surface and a continuous grasp is possible without interruption. The user does not need to change the position of the hands and fingers to achieve a stabilizing or fall arresting grasp but only increase the tightness of the grip. In the real world of handrail use this kind of practicality also aids those that need to pull themselves with the benefit of maintaining a controlled continuous grip without the need to release the handrail.

Type I rails require access to the bottom surface of the rail and the formation of a full finger wrap grip in order to exert forces comparable to Type II handrails with required recesses. In the event of a fall the purchase point of a grip is random unlike common type I rail uses where it may only be possible for the user to choose the available purchase points they can see or simply run their fingers on the top or side of the rail. Brackets or balusters are allowed to block up to 20% of the grasping surface in some codes and could easily diminish the effective use of the type I rail in a fall by a similar factor or more in reducing the probability of arresting a fall especially when compared to Type II handrails where a constant continuously safe grip, in the ready state, can be maintained. The extent of this very real detriment of type I rail, although recognized, may be impossible to determine.

Research and Testing Advances Since Previous Proposal in Rochester:
Since the addition of Type II handrails in the IBC in 2007 at the Rochester final action hearings significant advancements have been made. As requested in opposing testimony ***Peer review and publication of the research*** and also ***testing of persons with disabilities***, has been done. These were the reasons for approval of the adoption of Type II handrails in the IBC only for residential applications. I am pleased to report that both these issues have been addressed.

SMA Funded Research Published in Peer Reviewed Journal:
The substantial research and testing funded by the Stairway Manufacturers' Association supporting the adoption of Type II handrails has been peer reviewed, accepted for publication, and published in the July 2009 edition of Applied Ergonomics a highly respected peer review journal. This lengthy and rigorous review process of more than two-years was initiated prior to the Rochester hearing at the request of the A117.1 committee. The paper title and reference are:

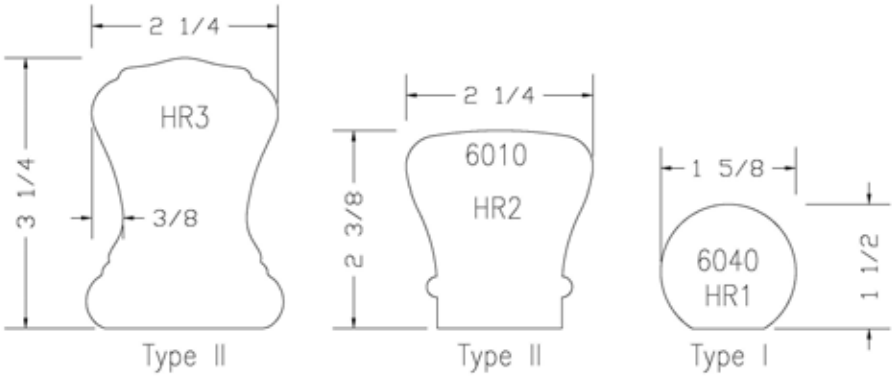
> **"Effect of handrail shape on graspability"**; Donald O. Dusenberry, Howard Simpson, Steven J. DelloRusso; Applied Ergonomics, Volume 40 (2009), issue 4, pp.657-669.

The paper has been published electronically for comment by the scientific community since June 2008. The author's pre-print manuscript can be downloaded at http://www.sgh.com/pdf/Effect-of-Handrail-Shape-on-Graspability.pdf At the time of this submission more than a year has passed and no comments have been received by the author, Applied Ergonomics, or through the on-line scientific collaborative.

Handrail Shape Testing of Persons with Disabilities Funded by SMA

Of additional consequence are the first tests of persons with disabilities related to the shape of handrails in use on stairs and ramps. Three handrail profiles (shown below) were tested by persons in 4 categories of mobility impairments while using stairs and ramps. These tests were performed at PARAQUAD a state of the art assisted living facility in St. Louis, MO, where research related to mobility impairments is done on a regular basis. The tests were performed by **Dr. David B. Gray** a noted researcher from Washington University also in St. Louis. Each of the 28 participants was videotaped in their use of handrails as they ascended and descended stairs and ramps. The complete report of the study and excerpts from the many hours of video are available at http://www.stairways.org/code_changes/A117%20Binder%20SMA%20Presentation%20090105.pdf . The study was completed on the eve of the January 5, 2009 meeting of the A117 Committee. Although the committee had requested testing of persons with disabilities related to handrail shape in testimony, ballot comment, and in committee reason statements the January meeting schedule was reduced from 2 days to I day and only a brief 20 minute summary of the research and the proposal was allowed making the review of any of the video content not possible. At the time of this submission the SMA has filed an appeal with the secretariat in an attempt to have the opportunity to make a detailed presentation of the study and video recordings with in the 2008 cycle of the standard. We would encourage you to read the full study. While further work with larger samples was suggested to provide enough data to analyze for comparison of data between sample groups, some of the findings are summarized here:

> All shapes were rated good to excellent and reported to be of assistance
> Wheelchair users preferred the Type I profile, HR1 shape (reported use only while ascending ramps).
> **All other participants preferred the larger Type II, HR3 handrail. (on left below)**



Other Facts:
This proposal identifies suitable application of the use of type II rails only in those areas that are not part of an accessible route. The A117.1 standard is not referenced by the means of egress code for stairways because stairs are not part of an accessible route. This provision will help to clarify that other options are and should be available for advantageous and safe use by all. Conflict with the accessibility provisions of Chapter 11 and the A117.1 standard referenced there is eliminated by the text that requires use of Type I rails at ramps, which are a part of an accessible route. **No stairway is part of an accessible route.**

It is important to understand that this change only provides the optional use of the scientifically proven, peer reviewed, Type II alternative but does not eliminate the option to use type I rails. This proposal does not create any conflict with the referenced application of the A117.1 Standard.

This option will reduce the cost of construction by allowing materials and fabrication methods in the development of handrail and related guard products now restricted by the code. This will be best illustrated by the use of larger section handrails with necessary strength properties in wood, plastic, and lighter metals may be included with other options currently available and easily fabricated in the field.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1012.3 (IFC [B] 1012.3) Handrail graspability. ~~All required handrails shall comply with Section 1012.3.1 or shall provide equivalent graspability.~~

> **~~Exception:~~** ~~In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; handrails shall be Type I in accordance with Section 1012.3.1, Type II in accordance with Section 1012.3.2 or shall provide equivalent graspability.~~

~~1012.3.1 (IFC [B] 1012.3.1) Type I.~~ Handrails with a circular cross section shall have an outside diameter of at least 1 ¼ inches (32 mm) and not greater than 2 inches (51 mm) or shall provide equivalent graspability. If the handrail is not circular, it shall have a perimeter dimension of at least 4 inches (102 mm) and not greater than 6 ¼ inches (160 mm) with a maximum cross-section dimension of 2 ¼ inches (57 mm). Edges shall have a minimum radius of 0.12 ~~0.01~~ inch (3 mm ~~0.25 mm~~).

~~1012.3.2 (IFC [B] 1012.3.2) Type II.~~ ~~Handrails with a perimeter greater than 6 ¼ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of ¾ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of at least $^{5}/_{16}$ inch (8 mm) within $^{7}/_{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for at least $^{3}/_{8}$ inch (10 mm) to a~~

~~level that is not less than 1 ¾ inches (45 mm) below the tallest portion of the profile. The minimum width of the handrail above the recess shall be 1 ¼ inches (32 mm) to a maximum of 2 ¾ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).~~

PART II – IRC BUILDING/ENERGY

R311.7.7.3 Graspability ~~Grip size~~. ~~All~~ required handrails shall ~~be of one of the following types or provide~~ ~~Equivalent graspability.~~

1. ~~Type I. Handrails with~~ have a circular cross section shall have an outside diameter of at least 1 ¼ inches (32 mm) and not greater than 2 inches (51 mm) or shall provide equivalent graspability. If the handrail is not circular, it shall have a perimeter dimension of at least 4 inches (102 mm) and not greater than 6 ¼ inches (160 mm) with a maximum cross section of dimension of 2 ¼ inches (57 mm). Edges shall have a minimum radius of 0.12 ~~0.01~~ inch (3 mm ~~0.25 mm~~).
2. ~~Type II. Handrails with a perimeter greater than 6 ¼ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of ¾ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of at least $^{5}/_{16}$ inch (8 mm) within $^{7}/_{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for at least $^{3}/_{8}$ inch (10 mm) to a level that is not less than 1 ¾ inches (45 mm) below the tallest portion of the profile. The minimum width of the handrail above the recess shall be 1 ¼ inches (32 mm) to a maximum of 2 ¾ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).~~

Reason: Over the last decade or so there has been much discussion about the research that the Stairway Manufacturers Association (SMA) has funded on handrail graspability. There have been a few conference papers produced specifically on the Type II handrails testing in comparison with the 2-inch round handrail, the largest circular shape permitted under the codes and standards. Identified as Dusenberry and Simpson (1996) and Dusenberry et al. (1999), these lacked detail and were impossible to assess scientifically. The only peer-reviewed, mainstream journal article for which SMA provided research support—but had to let its author, Dr. Brian Maki publish without restriction from SMA—had the appropriate detail and made a great contribution to the field of handrail performance. SMA is congratulated for funding Maki's work but, in saying this, I betray a bit of bias here as I funded Maki's work from my research management position at the National Research Council of Canada in the 1980s.

The SMA-funded work on the Type II handrails was different and thus there was much anticipation of it finally being published in a mainstream, peer-reviewed journal, Applied Ergonomics. While not one of the peer reviewers, I had access to the paper in draft and preprint form through my membership on the A117 Committee on for the ICC/ANSI standard,A117.1, Accessible and Usable Buildings and Facilities (with ICC as its secretariat). SMA's representative on this Committee wanted to have Type II handrails permitted in that standard, especially after SMA efforts to get Type II handrails into the IBC for non-dwelling stairways were blocked by some arguing that the mainstreamed Type II handrails should at least be acceptable to the A117 Committee. As the draft paper worked its way through the Applied Ergonomics review and publication process, it was unclear how the A117 Committee would finally come down on its acceptability for the ICC/ANSI A117.1 standard. There were clear misgivings by many on the Committee about the functionality of such handrails which severely constrained the potential graspability of users and did not permit fingers to wrap around the handrail from any approach direction.

Finally, when the preprint was made available by the publisher, it was finally possible to see exactly what had survived Applied Ergonomics peer review process which, to Dr. Maki and myself, appeared to miss identifying and correcting some serious weaknesses in the study design, execution and reporting. In our view the paper was not suitable for publication in the form we saw. Finally, in January 2009—over a decade since the first, clearly superficial publication of the SMA work (other than the work written up by Dr. Maki)—it finally became clear that there were far deeper problems with SMA's work (other than Maki's). Stated as simply and directly as possible, the early papers glossed over exactly what was done and what the results were to the point that it was not evident that the Type II handrails being tested were not the ones that were being sold in the handrail marketplace. Figure 1, which has now (as of the July 2009 issue has appeared in final print form in Applied Ergonomics) shows what was tested.

Figure 1. Railing Sections Tested by SMA

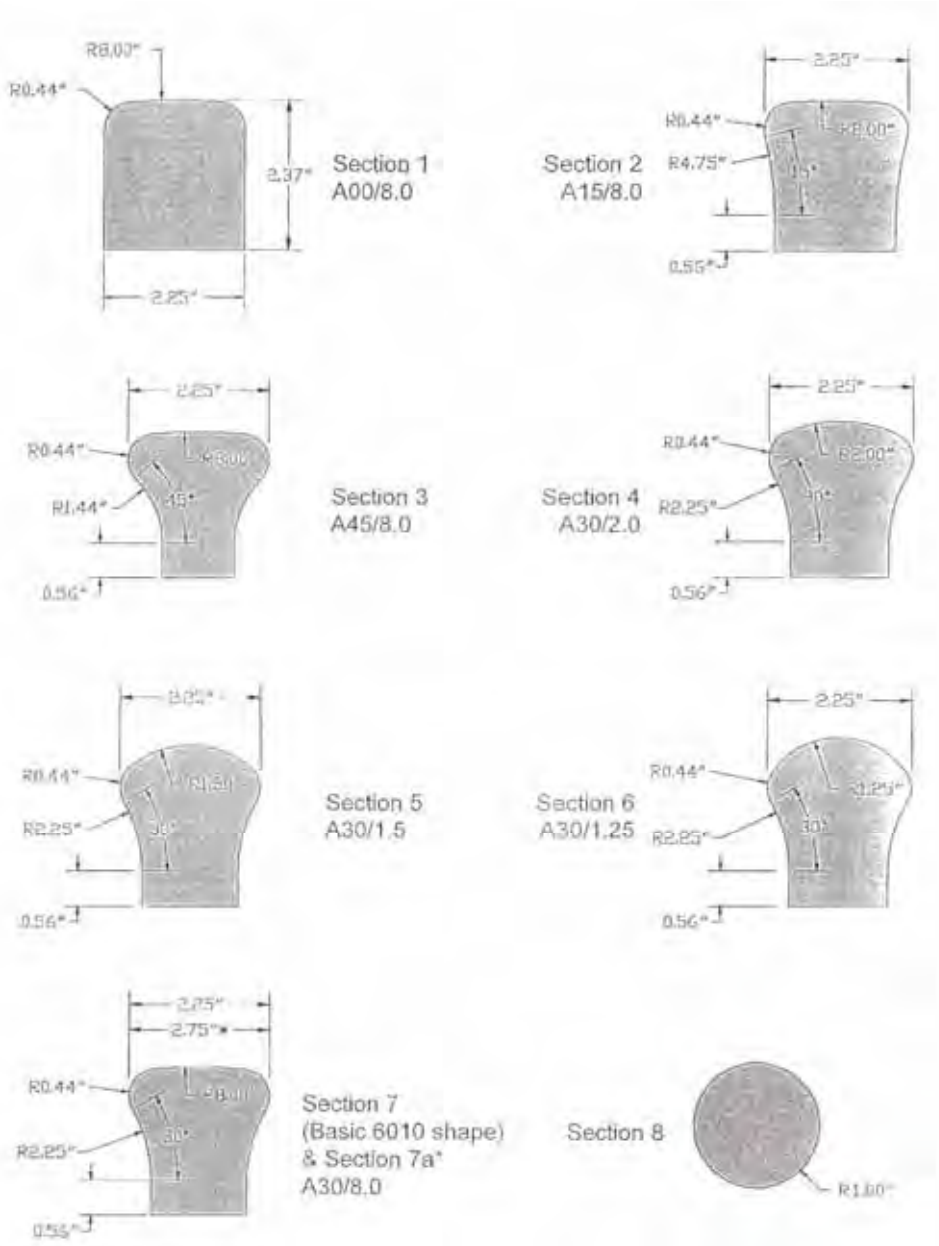

Figure 2 shows the most commonly used Type II handrail. Notably, unlike all of the sections tested (at least as described in the now authoritative Applied Ergonomics paper), the marked Type II handrail, specifically the "6010" designation, had prominent ridges near the bottom of the sides. Figure 2 shows the "6010" Type II rail next to the 2-inch round rail. In effect, SMA compared the worst (or one of the worst) of the standards/codes complying "Type I" handrail with one of the best if not the best of the Type II handrails.

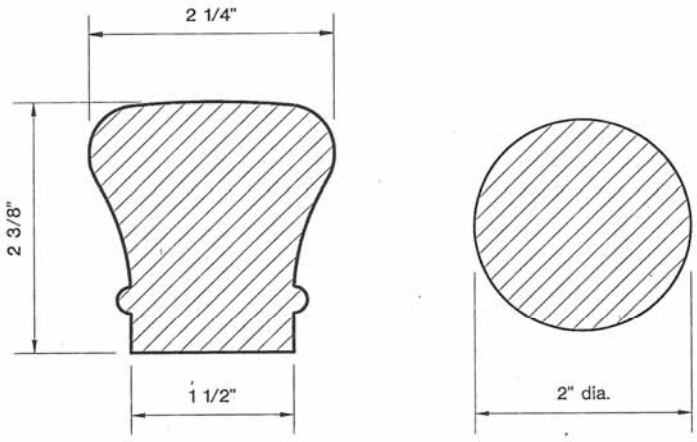
Figure 2. "6010 " Handrail—a Very Commonly Marketed and Installed section (on dwelling unit stairs especially)—and a 2-inch Round Handrail. (Notably, this was not a figure in the Applied Ergonomics paper which only shows sections and testing procedures without the ridges.)

Cross Sections of Handrail Shapes
used in tests performed by Simpson Gumpertz and Heger Inc.
during March and April of 1995



LJ Smith Style "LJ-6010"
Milled Handrail

Two inch diameter
Round Handrail

So there appears to be a kind of "bait and switch" here. The Type II handrails tested were consistent with the handrails sold and installed.

But there are other problems that occupied me (and perhaps Dr. Maki) in reviewing the final preprint in comparison with the results we had dribbled out in public form in earlier publications in the 1990s—and the technical basis for all of the code changes that I am now trying to reverse by eliminating Type II handrails from the IRC and IBC. Figure 3 shows the early version of some test results that were purported to show superiority of the Type II handrail—or, at a minimum, at least equivalency—in comparison to the 2-inch round, again, one of the worst of the Type I handrails. Compare Figure 3 with the finally published figure which, for the first time, shows the actual data points and reveals that the round handrail performed about twice as well as the Type II (designation "6010") without its ridges.

Figure 3. Early Published Comparison of Type II Performance with 2-inch Round Performance.

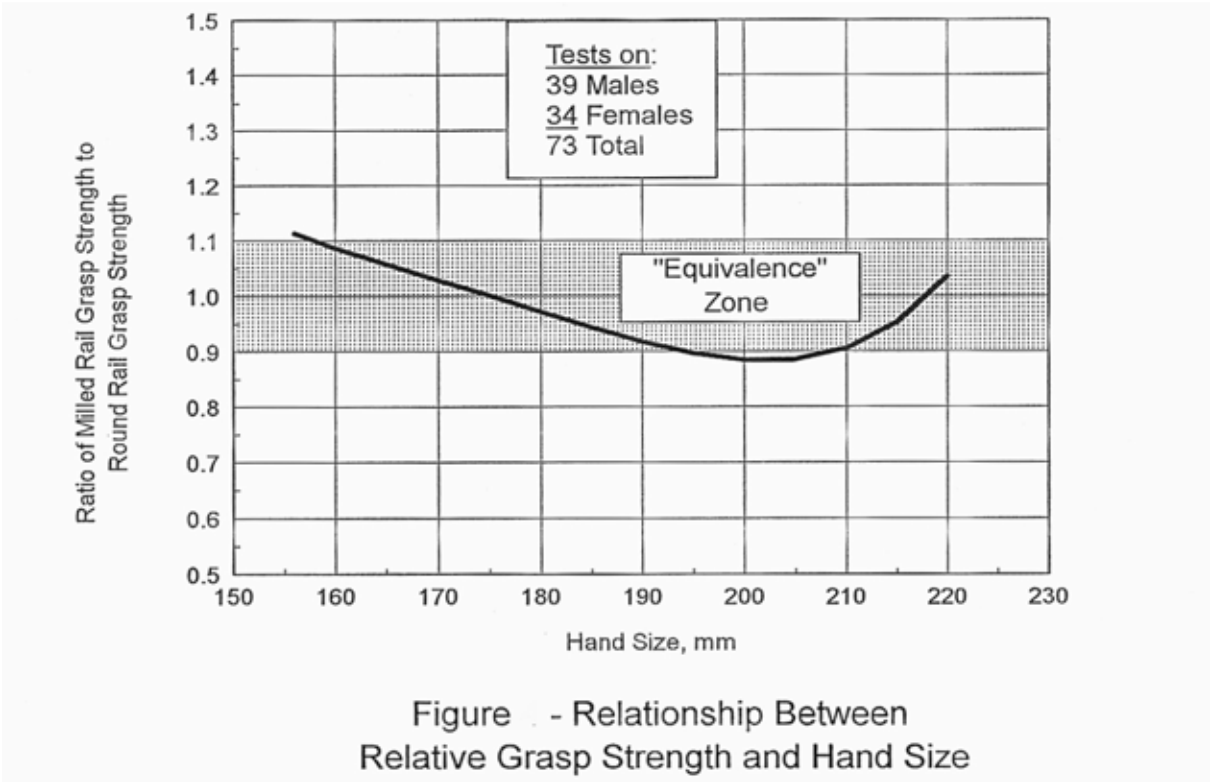


Figure - Relationship Between
Relative Grasp Strength and Hand Size

Figure 4. Finally Published Data (Figure 6 in the Applied Ergonomics Paper) that Should have been Presented in Figure 3 Years Earlier

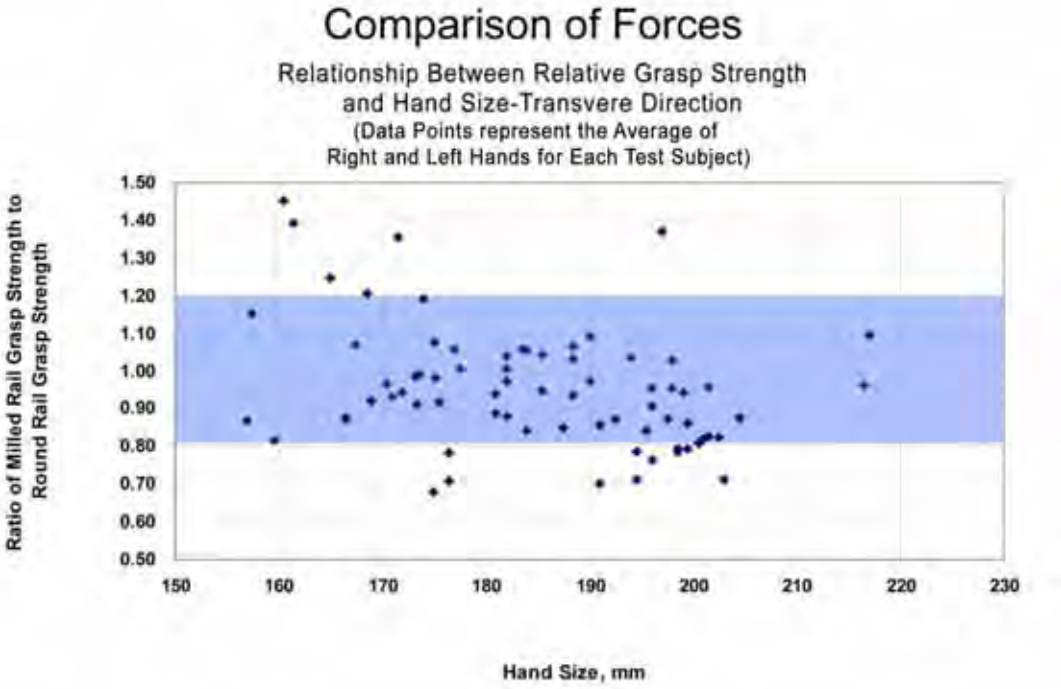

Figure 6- Phase I Graspability Test Results - Comparison of 51-mm Diameter Round Rail and Basic 6010 Milled Shape.

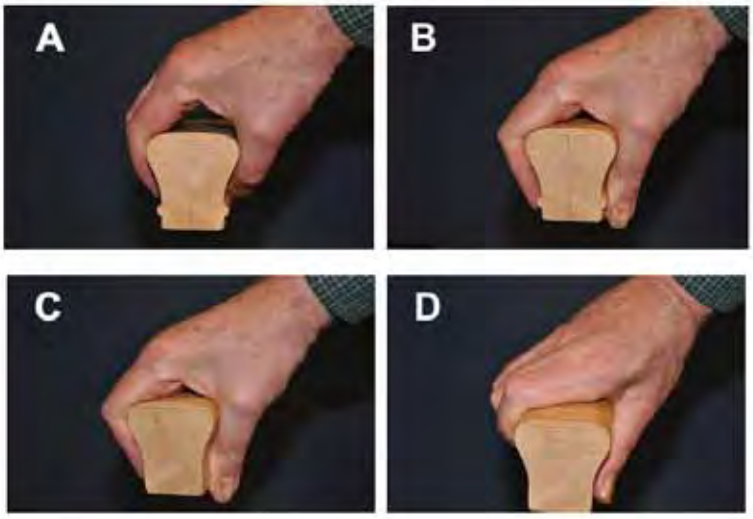
Finally, what is the potential role played by the ridges that, apparently, were conveniently left off the tested sample sections (if we are to believe the Applied Ergonomics paper)?

The remaining figures illustrate the awkward pressure points these ridges cause in various attempts to gain the one type of grip permitted by the Type II rails, a pinch grip (as opposed to the power grip afforded by Type I handrails). Clearly, in my professional opinion, Type II handrails are not superior or even equivalent to Type I handrails, even without the annoying and painful ridges when attempting to get a pinch grip, such as it is.

Figure 5 A, B, C and D (top left, top right, bottom left, bottom right). Examples of Various Attempts to Grasp a "6010" Designation, Type II Handrail and a "6010" with Its Ridges Taken Off.



Experiencing the pressure points from the ridges is painful. Experiencing the same rail without the ridges is frustrating, albeit not as painful. Neither is an appropriate handrail in a safety-oriented code or within a national standard focused on usability.

With the publication of the Applied Ergonomics paper, it is time to clear up exactly what we bought when the Type II handrails were incorporated in the IRC and to a limited extent in the IBC. They do not belong in either with their very dubious justification that we have gotten over the last decade or so. Soon perhaps, there will be the first court case after publication of the Applied Ergonomics paper. It will be interesting to see

how the courts, and the litigation process generally, handle the technical evidence in comparison to how it was handled in the ICC process. (NFPA has stayed clear of Type II handrails.)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Pauls-E5-1012.3

E98–09/10
1012.3.1 (IFC [B] 1012.3.1)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1012.3.1 (IFC [B] 1012.3.1) Type I. *Handrails* with a circular cross-section shall have an outside diameter of at least 1-1/4 inches (32 mm) and not greater than 2 inches (51 mm). If the *handrail* is not circular, it shall have a perimeter dimension of at least 4 inches (102 mm) and not greater than 6-1/4 inches (160 mm) with a maximum cross-section dimension of 2-1/4 inches (57mm) and minimum cross-section dimension of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Reason: The type I profile has no minimum cross sectional dimension. It needs a minimum dimension to assure graspability. The human hand gets its most secure grip on a Type I cross section that is round and smooth and allows the hand to fit comfortably around it. A handrail shape such as a 3/8" x 2" steel flat bar meets both the minimum perimeter and maximum cross section dimensions of Type I, but results in a less secure grip because it requires a pinching grasp. Try doing a chin up or pull up on a 1-½" diameter tube versus a 3/8" x 2" steel bar having the 2 inch dimension oriented vertically. The tube is more comfortable because a flat steel bar does not accommodate the natural curvature of a grasping hand as readily. Even with the required 1/100 of an inch radius at the corners, the flat bar is likely to be painful when applying a firm grip. When falling on a stairway, the handrail becomes the only means to steady or support oneself. For this reason, all handrails should have a shape that is comfortable and accommodating of the human hand's natural grasping shape. The proposed 1 inch minimum cross section was selected to allow use of the maximum 2" cross section in the perpendicular cross section axis and not exceed the maximum allowed 6-1/4" total perimeter.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Maiel-E5-1012.3

E99–09/10
1012.8 (IFC [B] 1012.8)

Proponent: Gene Boecker, Code Consultants, Inc., representing Code Consultants, Inc.

Revise as follows:

1012.8 (IFC [B] 1012.8) Projections. On ramps, the clear width between handrails shall be 36 inches (914 mm) minimum. Projections into the required width of stairways and ramps at each ~~handrail~~ side shall not exceed 4 ½ inches (114 mm) at or below the handrail height. Projections into the required width shall not be limited above the minimum

headroom height required in Section 1009.2. Projections due to intermediate handrails shall not constitute a reduction in the egress width.

Reason: There are two changes in this proposal. First, the second sentence is being reworded to address the actual condition – the side of the ramp or stairway. It is not just the handrail that is the issue; it could be the stringer to the stairway or the edge protection detail for the ramp. Both of these are located at the side. The word "handrail" is extraneous.

Second, there is currently no direction on whether or not the intermediate handrail, required by Section 1012.9 creates a projection or reduces the egress width of the stairway or ramp (if provided). The sentence makes it clear that the intermediate handrail is recognized and does not reduce the width.

Cost Impact: The code change proposal will not increase the cost of construction.

1002.1, 1013.2 (IFC [B] 1002.1, 1013.2); IRC R202, R312.2

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

1. Add new definition as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

FIXED SEATING. Furniture or fixture designed and installed for the use of sitting and secured in place including bench-type seats and seats with or without back or arm rests.

2. Revise as follows:

1013.2 (IFC [B] 1013.2) Height. Required guards shall not be less than 42 inches (1067 mm) high, measured vertically ~~above the~~ as follows:

1. From the adjacent walking surfaces,
2. From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches of a required guard, the guard height shall provide a minimum 42 inches measured diagonally between the top of the guard and the nearest edge of the seat surface ~~or~~
3. On stairs, from the line connecting the leading edges of the tread ~~treads~~ nosings, and
4. On ramps, from the ramp surface at the guard.

Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the *guard* also serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall not be less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
3. The guard height in front row assembly seating areas complying ~~shall be in accordance~~ with Section 1028.14.
4. Along *alternating tread devices* and ship ladders, *guards* whose top rail also serves as a *handrail*, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread *nosing*.

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

SECTION R202
DEFINITIONS

FIXED SEATING. Furniture or fixture designed and installed for the use of sitting and secured in place including bench-type seats and seats with or without back or arm rests.

2. Revise as follows:

R312.2 Height. Required guards at open-sided walking surfaces, including stairs, porches, balconies or landings, shall be not less than 36 inches high measured vertically ~~above the~~ as follows:

1. From the adjacent walking surface,
2. From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches of the required guard, the guard height shall provide a minimum 36 inches measured diagonally between the top of the guard and the nearest edge of the seat surface ~~or~~
3. On stairs, from the line connecting the leading edges of the tread ~~treads~~ nosings and
4. On ramps, from the ramp surface at the guard.

Exceptions:

1. Guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. Where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Climbable Guards". The scope of the activity is noted as:

The study of climbable guards will focus on determining the need for appropriate measures to prevent or inhibit an individual from utilizing the elements of a guard system, including rails, balusters and ornamental patterns, to climb the guard, thereby subjecting that person to the falling hazard which the guard system is intended to prevent.

The purposes of this proposal are to address several items raised last cycle during consideration of code change E85-07/08 which was approved. In particular, this proposal clarifies what constitutes "fixed seating" and proposes a horizontal distance between an object that reduces the "effective" height of a required guard rather than placing total reliance on the term "adjacent".

Definition: The definition of "fixed seating" provides for a common understanding where the term is used. This was a concern that was raised in Public Comment #2 to E85 which was not successful.

Item #2: The concern addressed in this revision is that of fixed seating, with or without arm rests and with or without back rests including bench seating located within 22" of the guard. This seating provides a potential standing surface which as a result reduces the effective height of the guard. For seating within 22" of the guard, the guard height is to be measured diagonally from the nearest edge of the seat to the top of the guard. This measurement method is currently utilized in Section 1028.14.3. The guard would be required to extend past the "last" seat in a row so that the guard top is 42" above the edge of the last seat.

The distance of 22" utilized in this exception has been determined by CTC to be a reasonable distance for the purpose described.

Item #3: The current text is modified to indicate that the line is to be between the tread nosings. In the case of a single riser, hence a single nosing, a minimum tread depth of 11 inches on the lower walking surface establishes the slope.

Item #4: The guard height at the edge of a ramp is to be measured at the guard without consideration for the ramp slope as the dimensional change in the guard height is relatively insignificant. With a ramp slope towards the guard of 1/12, the highest point 22" from the guard is 1.83 inches above the ramp surface at the guard. If the ramp slope is 1/8, at 22" from the guard, the ramp surface is 2.75 inches above the ramp surface at the guard.

IBC Exception **3:** The provisions for guard reduction for front row seating are primarily intended to accommodate the sight line for seated occupants- see section 1028.14.2. The seating within 22 inches of the guards elsewhere would necessitate an increase in the required guard height as indicated in **Item #2.**

E101–09/10
1013.2 (IFC [B] 1013.2)

Proponent: John Woestman, The Kellen Company, representing the Composite Lumber Manufacturers Association (CLMA)

Revise as follows:

1013.2 (IFC [B] 1013.2) Height. Required guards shall be not less than 42 inches (1067 mm) high, measured vertically above the adjacent walking surfaces, adjacent fixed seating or the line connecting the leading edges of the treads.

Exceptions:

1. For occupancy Group R-3 not more than three stories above grade in height and individual dwelling units in occupancy Group R-2 not more than three stories above grade in height with separate means of egress, required guards shall not be less than 36 inches (914 mm) high measured vertically above the adjacent walking surfaces, adjacent fixed seating or the line connecting the leading edges of the treads.
2. ~~1.~~ For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
3. ~~2.~~ For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
4. ~~3.~~ The height in assembly seating areas shall be in accordance with Section 1028.14.
5. ~~4.~~ Along alternating tread devices and ship ladders, guards whose top rail also serves as a handrail, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread nosing.

Reason: This proposal revises the IBC such that guards for one or two family occupancies not more than three stories above-grade in height and individual dwelling units in occupancy Group R-2 not more than three stories above-grade in height with a separate means of egress (i.e. townhouses) may be constructed to the same height requirements as the IRC. This disconnect between the IBC and the IRC has become quite visible in a large jurisdiction that adopted the IBC, but not the IRC, and has been applying the IBC to one and two family dwellings and to townhouses.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The corresponding section in the International Residential Code is Section R312.2.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME:Woestman-E3-1013.2

E102–09/10
1013.2 (IFC [B] 1013.2)

Proponent: Kerwin Lee, AIA, CASp, Rolf Jensen & Associates

Revise as follows:

1013.2 (IFC [B] 1013.2) Height. Required guards shall be not less than 42 inches (1067 mm) high, measured vertically above the adjacent walking surfaces, adjacent fixed seating or the line connecting the leading edges of the treads.

Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
3. The height in assembly seating areas shall be in accordance with Section 1028.14.
4. Along alternating tread devices and ship ladders, guards whose top rail also serves as a handrail, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread nosing.
5. In other than Group E occupancies, guards along stairways shall not be less than 34 inches (864mm) in height above the leading edge of the tread, where the stairway reverse direction at an intermediate landing and the opening between successive flights is 8 inches (203mm) or less, measured horizontally.

Reason: This language is taken from the National Building code. The code does not specifically address if a guard is required in a standard stair that switches back on itself. If the opening between the stair runs is 8 inches or less a guard should not be required. (Section 1013.3 limits openings to 8 inches above 34 inches when the opening is 34 inches or more above the surface). Normally these types of stairs are used for egress only and people do not stop along the stair. Once on the stair run, the user continues to the landing and next run of stairs. The need for a guard is not necessary in these situations. The exception to the exception is with E occupancies where children are present.

Cost Impact: No anticipated cost impact for construction.

1014.2, Table 1018.1 (IFC [B] 1014.2, Table 1018.1)

Proponent: Dennis Richardson PE / dbr group inc. representing self

Revise as follows:

1014.2 (IFC [B] 1014.2) Egress through intervening spaces. Egress through intervening spaces shall comply with this section.

1. Egress from a room or space shall not pass through adjoining or intervening rooms or areas, except where such adjoining rooms or areas and the area served are accessory to one or the other, are not a Group H occupancy and provide a discernible path of egress travel to an *exit*.

   Exception: *Means of egress* are not prohibited through adjoining or intervening rooms or spaces in a Group H, S or F occupancy when the adjoining or intervening rooms or spaces are the same or a lesser hazard occupancy group.

2. An *exit access* shall not pass through a room that can be locked to prevent egress.
3. *Means of egress* from dwelling units or sleeping areas shall not lead through other sleeping areas, toilet rooms or bathrooms.
4. Egress shall not pass through kitchens, storage rooms, closets or spaces used for similar purposes.

   Exceptions:

   1. *Means of egress* are not prohibited through a kitchen area serving adjoining rooms constituting part of the same dwelling unit or sleeping unit.
   2. *Means of egress* are not prohibited through stockrooms in Group M occupancies when all of the following are met:
      2.1. The stock is of the same hazard classification as that found in the main retail area;
      2.2. Not more than 50 percent of the *exit access* is through the stockroom;
      2.3. The stockroom is not subject to locking from the egress side; and

2.4. There is a demarcated, minimum 44-inch-wide (1118 mm) *aisle* defined by full- or partial-height fixed walls or similar construction that will maintain the required width and lead directly from the retail area to the *exit* without obstructions.

5. Egress from a Group A or E occupancy room or space with an occupant load of 501-1000 that passes through non-rated corridors, or adjoining or intervening rooms or areas, shall have at least one of the three required means of egress:
   5.1. Directly from the room to an exit;
   5.2. Through a one hour corridor; or
   5.3. Passing through a smoke compartment protected area, meeting the provisions of Section 1014.2 and restricting the movement of smoke from other exit access areas
6. Egress from a Group A or E occupancy room or space with an occupant load of more than 1000 that passes through non-rated corridors, or adjoining or intervening rooms or areas, shall have at least two of the four required means of egress:
   6.1. Directly from the room to an exit;
   6.2. Through a one hour corridor; or
   6.3. Passing through a smoke compartment protected area, meeting the provisions of Section 1014.2 and restricting the movement of smoke from other exit access areas

TABLE 1018.1 (IFC [B] TABLE 1018.1)
CORRIDOR FIRE-RESISTANCE RATING.

OCCUPANCY	OCCUPANT LOAD SERVED BY ORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not Permitted	1
H-4, H-5	Greater than 30	Not Permitted	1
A[d], B, E[d], F, M, S, U	Greater than 30	1	0
R	Greater than 10	Not Permitted	0.5
I-2[a], I-4	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3.
b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.
c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed
d. For requirement for occupancies in Group A and E, see Section 1014.2, Items 5 and 6.

Reason : The number one complaint heard when teaching egress classes on the IBC is about the language found in Section 1014.2 requiring a "discernible path of egress travel to an *exit"* for egress through intervening spaces. This language is subject to a wide variety of interpretation resulting in non-uniform enforcement. Concern about this language is greatest in situations where a large number of occupants requiring multiple egress paths can wander through an area that is unfamiliar and shares a common atmosphere causing all means of egress paths to potentially fill with smoke from a single source in the event of a fire. There is little in the code other than the language "a discernible path of egress travel to an *exit*" and overall exit travel distance restrictions to provide a minimum level of safety even for large assembly or educational areas surrounded by a number of interconnected spaces. This situation is becoming more common when large warehouse facilities are converted to a church or recreational facility.

This proposal would require at least one of three required means of egress for assembly and educational occupancies of 501 to 1000 occupant load, and at least two of four required means of egress for assembly and educational occupancies of more than 1000 occupant load to be directly into an exit or through a one hour corridor or passing through an area constructed as a smoke compartment independent from other exit access areas. This proposal provides a bare minimum level of independent refuge from smoke for paths of egress from large assembly and educational occupancies. As part of this proposal, a footnote is added to Table 1018.1 to point users of code to this section which affects assembly and educational occupancies with non-rated corridors.

Cost Impact: Since many designers already provide some level of protected means of egress or direct exits this proposal would not add cost to projects in most cases. This proposal could add cost in instances where designers rely solely on a number of egress paths through intervening rooms or spaces for large occupant loads.

1002.1, 1014.2.2 - 1014.2.7, 1015.1, Table 1015.1; (IFC [B] 1002.1, 1014.2.2 - 1014.2.7, 1015.1, Table 1015.1)

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

CARE SUITE. A group of ~~patient~~ treatment rooms, ~~patient~~ care recipient sleeping rooms and their associated support rooms or spaces and circulation space within Group I-2 occupancies where staff are in attendance for supervision of all ~~patients~~ care recipients within the suite, and the suite is in conformance with the requirements of Section 1014.2.2 through 1014.2.6.

1014.2.2 (IFC [B] 1014.2.2) Group I-2. Habitable rooms ~~or suites~~ in Group I-2 occupancies shall have an *exit access* door leading directly to a *corridor*.

Exceptions:

1. Rooms with *exit* doors opening directly to the outside at ground level.
2. Rooms arranged as care suites complying with Section 1014.2.4

~~1014.2.6~~ 1014.2.3 (IFC [B] ~~1014.2.6~~ 1014.2.3) Travel distance. The travel distance between any point in a Group I-2 occupancy ~~patient~~ sleeping room and an *exit access* door in that room shall not exceed 50 feet (15 240 mm).

1014.2.4 (IFC [B] 1014.2.4) Group I-2 care suites. Care suites in Group I-2 shall comply with Section 1014.2.4.1 through 1014.2.4.4 and either Section 1014.2.4.5 or 1014.2.4.6.

~~1014.2.5~~ 1014.2.4.1 (IFC [B] ~~1014.2.5~~ 1014.2.4.1) Exit access through care suites. *Exit access* from all other portions of a building not classified as a care *suite* in ~~a Group I-2 occupancy~~ shall not pass through a care *suite*. In a care suite required to have more than one exit, one exit access may pass through an adjacent care suite provided all of the other requirements of Section 1014.2 are satisfied.

~~1014.2.7~~ 1014.2.4.2 (IFC [B] ~~1014.2.7~~ 1014.2.4.2) Separation. Care *suites* ~~in Group I-2 occupancies~~ shall be separated from other portions of the building by a *smoke partition* complying with Section 711.

1014.2.4.3 (IFC [B] 1014.2.4.3) One intervening room. For rooms other than ~~patient~~ sleeping rooms located within a care suite, ~~*suites* of rooms are~~ exit access travel from the care suite shall be permitted ~~to have~~ through one intervening room where ~~if~~ the travel distance ~~within the *suite*~~ to the *exit access* door from the care suite is not greater than 100 feet (30 480 mm).

1014.2.4.4 (IFC [B] 1014.2.4.4) Two intervening rooms. For rooms other than ~~patient~~ sleeping rooms located within a care *suite*, *exit access* travel ~~from~~ within the care *suite* shall be permitted through two intervening rooms where the travel distance to the *exit access* door from the care suite is not greater than 50 feet (15 240 mm).

~~1014.2.3~~ 1014.2.4.5 (IFC [B] ~~1014.2.3~~ 1014.2.4.5) Care suites containing ~~in patient~~ sleeping rooms areas. ~~Patient~~ Sleeping rooms ~~areas~~ ~~in Group I-2 occupancies~~ shall be permitted to be grouped ~~divided~~ into care *suites* with one intervening room if one of the following conditions is met:

1. The intervening room within the care *suite* is not used as an *exit access* for more than eight ~~patient~~ care recipient beds.
2. The arrangement of the care *suite* allows for direct and constant visual supervision by ~~nursing personnel~~ care providers.

1014.2.4.5.1 ~~1014.2.3.1~~ (IFC [B] 1014.2.4.5.1 ~~1014.2.3.1~~) Area. Care *suites* containing ~~of~~ sleeping rooms shall not exceed 5,000 square feet (465 m^2).

1014.2.4.5.2 ~~1014.2.3.2~~ (IFC [B] 1014.2.4.5.2 ~~1014.2.3.2)~~ Exit access. Any ~~patient~~ sleeping room, or any care *suite* that contains ~~patient~~ sleeping rooms, of more than 1,000 square feet (93 m^2) shall have at least two *exit access* doors from the care suite ~~remotely~~ located in accordance with Section 1015.2. ~~from each other.~~

1014.2.4.5.3 ~~1014.2.3.3~~ (IFC [B] 1014.2.4.5.3 ~~1014.2.3.3)~~ Travel distance. The travel distance between any point in a care *suite* containing sleeping rooms and an *exit access* door ~~of~~ from that care *suite* shall not exceed 100 feet (30 480 mm).

1014.2.4.6 ~~1014.2.4~~ (IFC [B] 1014.2.4.6 ~~1014.2.4~~) Care Suites not containing sleeping rooms. ~~in areas other than patient sleeping areas.~~ Areas not containing sleeping rooms, but only treatment areas and the associated rooms, spaces or circulation space ~~other than patient sleeping areas in Group I-2 occupancies~~ shall be permitted to be grouped into care suites and shall conform to the limitations in Section 1014.2.4.6.1 and 1014.4.6.2. ~~be permitted to be divided into *suites*.~~

1014.2.4.6.1 ~~1014.2.4.1~~ (IFC [B] 1014.2.4.6.1 ~~1014.2.4.1)~~ Area. Care s*uites* of rooms, other than ~~patient~~ sleeping rooms, shall not exceed 10,000 square feet (929 m^2).

.

1014.2.4.6.2 ~~1014.2.4.2~~ (IFC [B] 1014.2.4.6.2 ~~1014.2.4.2)~~ Exit access. Care suites ~~Any room or group of rooms~~, other than ~~patient~~ sleeping rooms, of more than 2,500 square feet (232 m^2) shall have at least two *exit access* doors from the care suite located in accordance with Section 1015.2. ~~remotely located from each other~~.

1015.1 (IFC [B] 1015.1) Exits or exit access doorways from spaces. Two *exits* or *exit access doorways* from any space shall be provided where one of the following conditions exists:

~~Exception:~~ ~~Group I-2 occupancies shall comply with Section 1014.2.2 through 1014.2.7.~~

1. The *occupant load* of the space exceeds one of the values in Table 1015.1.

   Exceptions:

   1. In Group R-2 and R-3 occupancies, one *means of egress* is permitted within and from individual dwelling units with a maximum *occupant load* of 20 where the dwelling unit is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
   2. Care suites in Group I-2 occupancies complying with Section 1014.2.2 through 1014.2.4.6.2.

2. The *common path of egress travel* exceeds one of the limitations of Section 1014.3.
3. Where required by Section 1015.3, 1015.4, 1015.5, 1015.6 or 1015.6.1.

Where a building contains mixed occupancies, each individual occupancy shall comply with the applicable requirements for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1.

TABLE 1015.1 (IFC [B] TABLE 1015.1)
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY

OCCUPANCY	MAXIMUM OCCUPANT LOAD
A, B, E[a], F, M, U	49
H-1, H-2, H-3	3
H-4, H-5, I-1, I-2, I-3, I-4, R	10
S	29

a. Day care maximum occupant load is 10.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as:

Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Care Suites –
This proposal includes changes identified by the ICC CTC care facilities study group in their efforts to coordinate the sections of this Code dealing with the provision of "care". During the course of this study, several items were identified within this section dealing with suites within Group I-2 occupancies. Changes to this section include:

Clarification that the definition applies only to "care suites" used as related to patient sleeping or treatment. This addresses the confusion caused by tenant spaces in other occupancy types that are referred to or addressed as "suite."

The definition of care suite has been modified to correct an unintended consequence of the 2009 code. The proposal clarifies that support spaces, such as clean and soiled utility room and nurses stations are allowed within the suite.

Sections have been re-ordered so that general requirements that apply to all suites are located near the charging section.

The reference to the term "patient" has been replaced with "care recipient" as consistent with other proposals by the CTC. Since the definition of care suite includes the reference to care recipient, wherever possible the term is not repeated in each section.

The requirement for remoteness of exits has been clarified with a reference to the established calculation of remoteness as defined by Section 1015.2

Lastly, a modification is proposed that would allow the second required exit to pass through another suite. This concept is allowed by several jurisdictions and provides a similar safeguard by allowing suite occupants to pass through a smoke partition to a separate atmosphere. This allowance is limited to the second required exit. Single exit suites would not qualify for this allowance.

Section 1015.1
The change made to this section attempts to clarify the existing language. Group I-2 was added to Table 1015.1 to address areas that are not care suites. Spaces that were not suites were not previously addressed in this table. The existing exception to the charging language is more appropriately an exception to condition #1.

Cost Impact: None given.

1014.3, Table 1014.3 (New) [IFC [B] 1014.3, Table 1014.3 (New)]

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

1. Revise as follows:

1014.3 (IFC [B] 1014.3) Common path of egress travel. The common path of egress travel shall not exceed the tavel distances in Table 1014.3. ~~In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Group H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1028.8.~~

~~Exceptions:~~

~~1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.~~

~~2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).~~

~~3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).~~

~~4. The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~

2. Add new Table as follows:

TABLE 1014.3 (IFC TABLE [B] 1014.3)
COMMON PATH OF EGRESS TRAVEL

OCCUPANCY	WITHOUT SPRINKLER SYSTEM (feet)			WITH SPRINKLER SYSTEM [a] (feet)
	Any Occupant Load (OL)	Occupant Load		
		OL 30	OL 30	
B, S	Not Applicable	100	75	100
U	Not Applicable	100	75	75
F	75	Not Applicable	Not Applicable	100
H-1, H-2, H-3	Not Permitted	Not Permitted	Not Permitted	25
R-2	75	Not Applicable	Not Applicable	125 [b]
I-3	100	Not Applicable	Not Applicable	100
All others [c]	75	Not Applicable	Not Applicable	75

a. Approved automatic sprinkler system in accordance with Section 903.3.1.1
b. Approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2
c. For Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1025.8

Reason: This is an editorial change to simplify this code section. The existing paragraphs, with accompanying exceptions, have been replaced with a table which is easier to understand and follow. The content and code requirements are not altered in any form or shape.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME:Maiel-E2-1014.3

E106–09/10
1014.3 (IFC [B] 1014.3)

Proponent: Gene Boecker, Code Consultants Inc., representing Code Consultants, Inc.

Revise as follows:

1014.3 (IFC [B] 1014.3) Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Groups H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1028.8

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 or R-3 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason It is only appropriate that the exception should apply to a dwelling unit that is a single or double and not "three or more." Where a dwelling unit is associated with another occupancy and there are multiple apartments it will be an R-2 occupancy. If there is only the owner's apartment or two small apartments, then it would be treated as an R-3 occupancy. This is the case in urban areas. Additionally, R-3 needs the second means of egress where the area of the dwelling unit exceeds 4,000 sf (resulting in an occupant load >20) or where the unit is more than 3 stories in height.

By extending the exception to these dwelling units, it is only clarifying that the same rules apply to these types of uses whether there are one, two or three units in the same building.

Cost Impact: The code change proposal will not increase the cost of construction.

1015.2.1 (IFC [B] 1015.2.1)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1015.2.1 (IFC [B] 1015.2.1) Two exits or exit access doorways. Where two exits or exit access doorways are required from any portion of the exit access, the exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access doorways. Interlocking or scissor stairs shall be counted as one exit stairway.

Exceptions:

1. Where exit enclosures are provided as a portion of the required exit and are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1018, the required exit separation shall be measured along the shortest direct line of travel within the corridor. <u>The exit or exit access doorway to such enclosures shall not be less than 25 feet (7.62 m), measured in a straight line, from the exit or exit access doorway of another exit enclosure.</u>
2. Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

Reason: The current exception 1 allows the separation of two exits to be measured in a line of travel within a rated corridor. Although this length (traveling within a corridor) may be longer than one-half of the overall diagonal, the exit enclosures can be placed very close to each other. Thus a fire could compromise both exits. Furthermore, the travel distance in the corridor can be reduced to one third (per exception 2) which can further exacerbate this problem.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Maiel-E1-1015.2.1

E108–09/10
1016.1, 1022.1 (IFC [B] 1016.1, 1022.1)

Proponent: Ronald W. Clements, Jr., representing Chesterfield County Virginia Building Inspection Department; Gregory R. Keith, Professional heuristic Development, representing The Boeing Company; and Michael L. Perrino, CBO, representing Code Consultants, Inc.; Sarah Rice, CBO, representing self

Revise as follows:

1016.1 (IFC [B] 1016.1) Travel distance limitations. Exits shall be so located on each story such that the maximum length of exit access travel, measured from the most remote point within a story along the natural and unobstructed path of egress travel to an exterior door at the level of exit discharge, an entrance to a vertical exit enclosure, an exit passageway, a horizontal exit, an exterior exit stairway or an exterior exit ramp shall not exceed the distances given in Table 1016.1.

Exceptions:

1. Travel distance in open parking garages is permitted to be measured to the closest riser of open exit stairways.
2. In outdoor facilities with open exit access components and open exterior exit stairways or exit ramps, travel distance is permitted to be measured to the closest riser of an exit stairway or the closest slope of the exit ramp.
3. ~~In other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps when connecting a maximum of two stories. The two connected stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~
4. ~~In other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps in the first and second stories above grade plane in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories above grade plane shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~

Where applicable, travel distance on unenclosed exit access stairways or ramps and on connecting stories shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.

1022.1 (IFC [B] 1022.1) Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. Exit enclosures shall have a fire-resistance rating not less than the floor assembly penetrated but need not exceed 2 hours. Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. <u>In other than Group H and I occupancies, stairways and ramps that serve only one adjacent story need not be enclosed. Any two such interconnected stories shall not be open to other stories.</u> ~~In all occupancies, other than Groups H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.~~
   - ~~1.1. The stairway is open to not more than one story above its level of exit discharge, or~~
   - ~~1.2. The stairway is open to not more than one story below its level of exit discharge.~~
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
4. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
5. Stairways in Group I-3 occupancies, as provided for in Section 408.3.8, are not required to be enclosed.
6. Means of egress stairways as required by Section 410.5.3 and 1015.6.1are not required to be enclosed.
7. Means of egress stairways from balconies, galleries and press boxes as provided for in Section 1028.5.1, are not required to be enclosed.

Reason: This proposal is intended to correlate and correct fundamental interior exit stairway enclosure provisions. The history and technical inconsistency of current provisions were brought to light during ICC Code Technology Committee (CTC), Unenclosed Exit Stairway Study Group discussions associated with the drafting of a CTC code change proposal for the current (2009/2010) development cycle. One of the main charges of the study group was to validate the relationship between Chapter 10 required exit, access to exit, exit enclosure and exit access travel distance provisions. These provisions lie at the heart of means of egress design philosophy.

Unfortunately, the 2000 Edition of the IBC did not do a particularly good job of consolidating the means of egress provisions contained in the former model (legacy codes). This was owed to several factors, not the least of which was the significantly different systems or approaches to means of egress design used by the various contributing codes. This is probably best illustrated through the 2000 IBC exceptions to interior exit stairway enclosure requirements. In fact, none of the 2000 IBC general design related exceptions appeared in any of the legacy codes. The exceptions were spawned as compromises with former provisions. The BOCA building code fundamentally maintained that required interior exit stairways at all stories be enclosed. The ICBO building code, on the other hand, basically allowed that in other than Group H and I occupancies, exit

enclosures were not required for interior stairways serving only one adjacent story. The 2000 IBC resolved the issue by permitting 50% of the required stairways to be unenclosed. That provision supported neither legacy philosophy.

In subsequent editions, the related provisions have been manipulated to a point that current requirements create or support no functional means of egress strategy. Unfortunately, with the inability of the IBC to effectively state its intent, practitioners have largely resorted to their specific legacy indoctrination resulting in varying interpretations. In the 2003 Edition, an additional exception to exit enclosure provisions allowed for all interior exit stairways to be unenclosed at the first and second stories of a sprinklered building of other than Group H and I occupancies. The 2006 Edition formalized the concept of accessing required exits from adjacent levels by way of unenclosed interior stairways and ramps. In the 2009 Edition of the IBC, two fundamental exceptions to exit enclosure requirements were moved to Section 1016.1, travel distance provisions. As has been previously mentioned, various provisions have been manipulated over time in an attempt to contort them to a desired technical end. Virtually all of these attempts have failed to recognize the delicate technical relationships between the fundamental means of egress concepts of numbers of exits, access to required exits and exit access travel distance.

The 2009/2010 CTC interior stairway proposal effectively establishes such a system with supporting terminology and requirements based on current IBC means of egress provisions. The study group intentionally avoided including substantial technical changes in its code change proposal, although a majority of members may have agreed with a certain concept or provision.

This proposal is intended to further cultivate and clarify the IBC system of means of egress design. Essentially, it allows for a general two-story exception to the enclosure of required interior exit stairways in other than Group H and I occupancies. This arguably represents the cumulative impact of numerous current exceptions addressing unenclosed exits or access to exits. It also serves to reinforce access to exits at adjacent building level provisions. The ultimate goal is to require that all interior exit stairways (required exit components) be enclosed without specifying their required location. Effectively, this allows a given means of egress design to dictate which exit components are employed and where. It also acknowledges that exits may be accessed from an adjacent story or level within prescribed exit access travel distance limitations.

This proposal effectively integrates the related legacy requirements with current IBC provisions. The reason that this provision was not included in the 2009/2010 CTC interior stairway proposal is that it represents a relaxation of current IBC exit enclosure requirements. Again, please bear in mind that current IBC enclosure requirements are based on an ICC Means of Egress Drafting Committee technical compromise. What is recommended in this proposal is identical in concept to that of the former Uniform Building Code. Such a means of egress design method has decades of distinguished performance history. It is also consistent with the means of egress philosophy promoted in the 2009/2010 CTC interior stairway proposal. That is, that formal exits, or access to exits, shall be provided in prescribed numbers from each building level. Unenclosed stairways and ramps (certain occupancies notwithstanding) may access exits at an adjacent building level within prescribed exit access travel distance limitations. Accordingly, buildings more than two stories in height will have not less than two enclosed interior exit stairways. It is acknowledged that such exit enclosures may not serve all building stores based on the specific building and means of egress design; however, such enclosed exits are within the exit access travel distance limitations and are not more than one level removed from the exit. It should be noted that when exit enclosures are employed to support a given design, they typically serve all building stories. Occasionally, security or privacy concerns dictate that access to enclosed interior exit stairways at all stories is undesirable. Nevertheless, occupants at those levels have access to exits comparable to that required for any building level. Additionally, the fire service has protected enclosures to serve as staging areas for the attack of a fire at, above or below the story of incident origin.

In summary, this proposal eliminates many of the technical inconsistencies associated with current means of egress provisions. This proposal, in combination with the 2009/2010 CTC interior stairway proposal, effectively repairs the IBC means of egress system design requirements and their technical relationships. Each of the proponents of this proposal was a voting member of the ICC Code Technology Committee, Unenclosed Exit Stairway Study Group and they represent a majority of voting study group members.

Cost Impact: The code change proposal will not increase the cost of construction.

1016.3 (New), Table 1016.3 (New), 1016.3.1 (New); [IFC [B] 1016.3 (New), Table 1016.3 (New), 1016.3.1 (New)]

Proponent: Jay Wallace, The Boeing Company and Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Add new text and table as follows:

1016.3 (IFC [B] 1016.3) Aircraft manufacturing facilities. In buildings used for the manufacturing of aircraft, exit access travel distances indicated in Section 1016.1 shall be increased in accordance with the following:

1. The building shall be of Type I or II construction.
2. Exit access travel distance shall not exceed the distances given in Table 1016.3.

TABLE 1016.3 (IFC [B] TABLE 1016.3)
AIRCRAFT MANUFACTURING EXIT ACCESS TRAVEL DISTANCE

HEIGHT (feet) [b]	MANUFACTURING AREA (sq. ft.) [a]					
	≥150,000	≥200,000	≥250,000	≥500,000	≥750,000	≥1,000,000
≥ 25	400	450	500	500	500	500
≥ 50	400	500	600	700	700	700

≥75	400	500	700	850	1,000	1,000
≥ 100	400	500	750	1,000	1,250	1,500

For SI: 1 foot = 304.8 mm

a. Contiguous floor area of the aircraft manufacturing facility having the indicated height.

b. Minimum height from finished floor to bottom of ceiling or roof slab or deck.

1016.3.1 (IFC [B] 1016.3.1) Associated areas. Egress from rooms, areas and spaces associated with the primary manufacturing area shall be permitted through such area having a minimum height as indicated in Table 1016.3. Exit access travel distance within the associated room, area or space shall not exceed that indicated in Table 1016.1 based on the occupancy classification of that associated area. Total exit access travel distance shall not exceed that indicated in Table 1016.3.

Reason: Many aircraft manufacturing buildings are unusually large due to the size of the commercial or military aircraft being produced. For instance, an assembled Boeing 747 has a tail height of over 63 feet. The rectangular footprint of a Boeing 747-800 is over 56,000 square feet.

Group F-1 occupancies greater than 150,000 square feet can have difficulty complying with 250 foot, sprinklered exit access travel distance limitations without incorporating exit passageways or horizontal exits into the design of the building means of egress system. The use of either exit component is somewhat problematic. Due to the compartmentalized nature of horizontal exits, they do not lend to aircraft production processes or movement of the finally assembled aircraft. For similar reasons, exit passageways are generally installed below the floor of the assembly level. The use of underground exit passageways during an emergency in a very high volume space is generally contrary to human nature. Once aware of an event, employees would instinctively evacuate the building at the level with which they are most familiar. Also, it is relatively easy to move away from the point of origin of a fire due to a person's sensory awareness within the entire open space. Given the fact that occupants sense safety as they move away from the fire, it is counter-intuitive to enter an underground area unless as a last resort.

Regardless of human nature, it must be demonstrated that high volume spaces provide a tenable environment for the evacuation or relocation of building occupants. The Boeing Company conducted smoke and temperature fire modeling using the NIST FDS (National Institute of Standards and Technology - Fire Dynamics Simulator) computer program.

In order to establish a performance baseline, a series of worse case scenarios were combined into the first test. We referenced previous Boeing proprietary laboratory test data on a large, 10 megawatt fire and duplicated and calibrated those data in our fire and smoke model. We placed the 10 megawatt event in an interior corner of a 400 foot x 400 foot building with exterior exit doors at the midpoints of each exterior wall. A corner fire was considered worse case because anticipated radiation off of adjacent 90° walls focuses and accelerates the progression of the fire. The minimum ceiling height permitted in the means of egress by the International Building Code is 7'-6"--impractically low for an aircraft manufacturing area ceiling height. A similarly impractical ceiling height of 10 feet was selected as a worse case baseline for data determination purposes. Active fire suppression was not included in the model; therefore, the test fire burns until it is consumed. It should be noted that because sprinklers were not utilized in the model, they are not included as a requirement in the proposed provision. That being said, it is recognized that to achieve the qualifying contiguous areas of proposed Table 1016.3, the building would be sprinklered based on the fire area thresholds in Section 903. This proposal lets each issue stand on its own merit without introducing a new sprinkler trade-off. Also, for simplicity, it was also assumed that when smoke is introduced into the space, smoke detection would shut down any HVAC systems. Therefore, no mechanical ventilation is included in the model. The model assumed no fuel contribution by the building itself; therefore, the proposed provisions are limited to buildings of Type I or II construction.

Six modeling runs were conducted. One, for the 400 foot x 400 foot space with a 10 foot ceiling height for data base line purposes. Four additional runs were made for the same building area with ceiling heights of 25, 50, 75 and 100 feet for purposes of data development. One additional run was conducted for a 1,000,000 square foot building with a 100 foot ceiling height for data interpolation purposes. These data points were selected to support the area and height thresholds established in proposed Table 1016.3.

The 160,000 sf, 10' high ceiling baseline model indicates: (Maximum permitted travel distance: 200 feet [Group F-1, unsprinklered; Table 1016.1]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 48 seconds.)

After 4 minutes, the exit nearest the point of origin of the fire is still completely free of smoke and heat from the fire.

Ceiling temperatures near the source immediately reach 165 degrees and the fire sprinkler system would activate.

The 160,000 sf, 25' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends approximately 100 feet from the point of origin of the fire. The smoke level is at approximately 20 feet above the floor. After 360 seconds, the smoke level is at approximately 10 feet above the floor (360 - 96 = 264 ÷ 96 = 2.75 factor of safety).

After 150 seconds, the ceiling temperature has just reached 165 degrees directly above the point of origin of the fire. Sprinkler activation occurs 54 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 127 degrees.

The 160,000 sf, 50' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends approximately 100 feet from the point of origin of the fire. The smoke level is at approximately 42 feet above the floor. After 420 seconds, the smoke level is at approximately 25 feet above the floor (420 - 96 = 324 ÷ 96 = 3.37 factor of safety).

After 150 seconds, the ceiling temperature is 108 degrees directly above the point of origin of the fire. Sprinkler activation occurs 84 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 98.5 degrees.

The 160,000 sf, 75' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends less than 100 feet from the point of origin of the fire. The smoke level is at approximately 60 feet above the floor. After 420 seconds, the smoke level is at approximately 25 feet above the floor at one point (420 - 96 = 324 ÷ 96 = 3.37 factor of safety).

After 150 seconds, the ceiling temperature is 98.5 degrees directly above the point of origin of the fire. Sprinkler activation occurs 144 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 98.5 degrees.

The 160,000 sf, 100' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends less than 100 feet from the point of origin of the fire. The smoke level is at approximately 85 feet above the floor. After 420 seconds, the smoke level is at approximately 30 feet above the floor at one point (420 - 96 = 324 ÷ 96 = 3.37 factor of safety).

After 150 seconds, the ceiling temperature is 89 degrees directly above the point of origin of the fire. Sprinkler activation occurs 144 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 89 degrees.

The 1,000,000 sf, 100' high ceiling model indicates: (Maximum proposed travel distance: 1,500 feet [≥1,000,000 sf, ≥ 100'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 360 seconds.)

After 360 seconds, the smoke plume extends less than 500 feet from the point of origin of the fire. The smoke level is at approximately 75 feet above the floor. After 720 seconds, the smoke level is still at approximately 75 feet above the floor (720 - 360 = 360 ÷ 360 = 1.0 factor of safety).

At 300 seconds, the ceiling temperature is 70 degrees directly above the point of origin of the fire. At 300 seconds, ceiling temperatures are dropping and no temperature is greater than 89 degrees.

Data clearly indicate that the proposed exit access travel distances for aircraft manufacturing facilities provide for a high for level of occupant tenability with a minimum factor of safety of 100 percent. It is intuitive that high volume spaces provide sufficient time for an occupant to safely access an exit. Nevertheless, The Boeing Company has reinforced that common sense through fire modeling that validates and quantifies that logic.

Most manufacturing facilities have other supporting occupancies including offices, break rooms, cafeterias, etc. This proposal would permit occupants of such associated spaces to egress through the manufacturing area with the increased exit access travel distance provided that the exit access travel distance within the associated areas does not exceed that specified in Table 1016.1 for the occupancy(s) under consideration.

Please do not be distracted by some of the larger exit access travel distance values contained in the proposed table. The longest allowance of 1,500 feet appears extreme compared to Table 1016.1 values. In reality, it only represents six minutes of travel time based on an assumed rate of travel of 250 feet per minute (*NFPA Life Safety Code Handbook* data), and it is only permitted in a building with a volume of over one hundred million cubic feet. Upon further examination, 71 percent of the cells of the proposed table require less than three minutes of exit access travel time for buildings having a volume of not less than 3.75 million cubic feet. The results of Boeing modeling runs would indicate that ceiling height is a major factor in the maintenance of occupant tenability during egress from a fire event. This proposal is limited to aircraft manufacturing facilities only. This is because of a high degree of occupant familiarity and the relatively low fuel loading compared with many other Group F-1 and S-1 occupancies.

In summary, the unique size of some aircraft manufacturing facilities inherently provides a tenable environment for building occupants as they travel to an exit. It is logical that spaces with higher ceilings provide for a greater level of occupant tenability than those with lower ceilings. Rather than arbitrarily selecting travel distance values based on former provisions or attempting an educated guess, The Boeing Company has conducted computer modeling in order to determine acceptable travel distances. Supporting data is available for review at http://www.boeing.com/nosearch/tds/. Approval of this proposal will acknowledge means of egress design issues associated with large area, high volume aircraft manufacturing spaces while providing a high degree of occupant safety during egress from such buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

E110–09/10
1017.5 (New) [IFC [B] 1017.5 (New)]

Proponent: Ali M. Fattah, City of San Diego, representing SD Area Chapter ICC Code Committee

Add new text as follows:

1017.5 (IFC [B] 1017.5) Aisles in other than Groups A, B and M. In other than Group A, B and M occupancies, the minimum clear aisle width shall be determined by Section 1005.1 for the occupant load served, but shall not be less than 36 inches (914 mm).

Reason: This proposed code change adds clarity and a requirement inadvertently omitted. The are currently no minimum aisle requirements for F, S, H, I, R occupancies. For example in a parking garage an access aisle may be through a space between two columns to get to the main drive aisle. Or between storage racks or shelving in a warehouse.

Cost Impact: The code change proposal will minimally increase the cost of construction.

E111–09/10
1018.1 (IFC [B] 1018.1)

Proponent: Mark Blanke, PE, New York State Div. of Code Enforcement and Administration

Revise as follows:

1018.1 (IFC [B] 1018.1) Construction. Corridors shall be fire-resistance rated in accordance with Table 1018.1. The corridor walls required to be fire-resistance rated shall comply with Section 709 for fire partitions.

Exceptions:

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has at least one door directly to the exterior and rooms for assembly purposes have at least one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A fire-resistance rating is not required for corridors contained within a dwelling or sleeping unit in an occupancy in Group R.
3. A fire-resistance rating is not required for corridors in open parking garages.
4. A fire-resistance rating is not required for corridors in an occupancy in Group B which is a space requiring only a single means of egress complying with Section 1015.1.
5. A fire-resistance rating is not required for corridors where the length of the corridor is less than 2.5 times the least width.

Reason: This proposed amendment provides a uniform application for corridor enclosure requirements and offers a design option to enlarge a corridor width in lieu of providing a fire resistance rating.

The IBC definition of a corridor does not readily establish when a space should be considered a room or a corridor. This is because it does not acknowledge narrowness or length as corridor characteristics commonly found in most dictionaries. The definition of a corridor is "an enclosed exit access component that defines and provides a path of egress travel to an exit." Any room is an enclosed exit access component that provides a path of egress to an exit. The room becomes a corridor when it actually defines a path to an exit. But the question is what room configuration defines a path to an exit where it becomes a corridor that should be subject to fire-resistance rating requirements. This proposed amendment provides a length-to-width ratio that more clearly and uniformly establishes this threshold.

The purpose of fire rating corridor enclosures is to protect occupants traveling in a confined space from the hazards of fire. The more the space is confined the greater the hazard, and by contrast, decreasing the confinement reduces the hazard. If a corridor width is increased, it begins to resemble a room where it becomes reasonable to eliminate the fire-resistance rating of the enclosure. As an example, a corridor measuring 3'x25' serving an occupant load of 40 in an unsprinklered Group B occupancy is required to have 1-hour fire-resistance rated enclosures with fire protection of door openings. Given the confined nature of this space, it is appropriate to require the necessary fire protection. However, if the corridor width were increased to 10 feet while maintaining its original length, the space becomes much less confined, less hazardous, and begins to resemble an adjoining or intervening room otherwise permitted without rated enclosures as part of an exit access. Some would argue that the enlarged space is no longer a corridor and not subject to the provisions of Section 1018.

The proposed amendment establishes a 2.5 length/width ratio as the transition for requiring fire-resistant rated corridor enclosures. This ratio was chosen because it is the same as that used in exception #3 of Section 1018.4 that would allow an unlimited dead end corridor where the length is less than 2.5 times the width. Given that the code has established this ratio as an appropriate exception to allow unlimited dead end corridors, it seems appropriate to use the same standard to corridor fire-resistance requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Blanke-E1-1018.1

E112–09/10
1018.1 (IFC [B] 1018.1)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1018.1 (IFC [B] 1018.1) Construction. Corridors shall be fire-resistance rated in accordance with Table 1018.1. The corridor walls required to be fire-resistance rated shall comply with Section 709 for fire partitions.

Exceptions:

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has at least one door opening directly to the exterior and rooms for assembly purposes have at least one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A fire-resistance rating is not required for corridors contained within a dwelling or sleeping unit in an occupancy in Group R.
3. A fire-resistance rating is not required for corridors in open parking garages.

4. A fire-resistance rating is not required for corridors in an occupancy in Group B which is a space requiring only a single means of egress complying with Section 1015.1.
5. Corridors adjacent to the exterior walls of buildings shall be permitted to have unprotected openings on the exterior wall where permitted by Table 705.8 and Table 602.

Reason: Since protected openings are only required where corridor walls are required to be fire-resistive construction, the exterior walls of buildings which also form a corridor wall need not be of fire-resistive construction, provided that the protection is not required based on Tables 705.8 and 602.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D

Table 1018.1 (IFC [B] Table 1018.1)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM): Thomas S. Zaremba, Roetzel & Andress, representing self

Revise as follows:

TABLE 1018.1 (IFC [B] TABLE 1018.1)
CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not permitted	1
H-4, H-5	Greater than 30	Not permitted	1
A, B, ~~E~~, F, M, S, U	Greater than 30	1	0
E	Greater than 30	1	1
R	Greater than 10	Not permitted	0.5
I-2[a], I-4	All	Not permitted	0
I-I, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2. see Sections 407.2 and 407.3.
b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.
c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 901.3.1.1 or 903.3.1.2 where allowed.

Reason:
Davidson/Shuman – This code change was proposed by several parties in the last development cycle as E117-07/08. Although half the Committee supported its adoption, the Chair broke a tie vote in favor of a recommendation of disapproval. At the Final Action Hearings, the Committee's recommendation was overturned, but a motion to "approve as submitted" failed to secure the 2/3 majority needed for adoption. The Membership voted 55% in favor of adoption.

There are good reasons that a solid majority of the Membership favors adopting this proposal. First, the E occupancies at issue represent structures built to house a dense population of children ranging from ages 4 through early teens. Group E occupancies typically have paper and other flammables hung from ceilings to floors throughout. Classrooms are filled with desks containing books, papers and other flammables. Science labs use chemicals and accelerants. Lunch rooms have stoves, ovens and trash cans spread throughout loaded with waste paper and other flammables. Theaters house clothing, wooden and cardboard props and paper banners strung from one end of the room to the other. Lockers contain books and hide things that are not easily monitored. Janitorial closets house cleaning solutions and solvents. Many Group E occupancies are multi-story buildings with classrooms on several floors.

Group E occupancies mix a high concentration of children with fuel loads on a daily basis. As budgets shrink, so do the number of adult supervisors. Our children are in schools because they are required to be there. We owe them a duty to ensure they are safe from the risk of fire while in school. We simply cannot wait for a catastrophe to protect children while at school.

Unfortunately the world of elementary, secondary and higher education learning has gone through tremendous changes in security measures undertaken, both operationally and hardware installations, due to the threat of violent acts committed against students and staff. Where we had educational facilities with highly effective fire drill evacuation procedures and actions during system activation, we now have written plans and training in place to ignore the activation of the fire alarm system if a "lockdown" has been declared because the activation of the fire alarm system may be a diversion to bring staff and students out into the open to serve as victims.

This is not a possible situation. This is a very real situation that occurs throughout the country in response to the acts of violence that have occurred at educational facilities. Though the exact procedure may vary site to site, the main premise of a "lockdown" is to gather staff and students into classrooms and offices and to lock the doors, preventing intruders from getting into the room and preventing staff and students from leaving the rooms until an all clear is announced. The staff and students are trained to ignore a fire alarm activation during a lockdown until they are ordered to evacuate after someone in authority, (could be a Principal or could be a Police Commander), makes a determination that the fire threat is real and that they must evacuate to survive the fire.

Because the students and staff will delay their evacuation while a fire is attacking the structure and potentially cutting off escape routes where corridors are not protected, this code change proposal will require all corridors serving an occupant load greater than 30 in group E educational occupancies to have 1 hour fire resistant rating except as allowed by Exception 1 to section 1018.1.

Exception 1 to Section 1018.1 is a legitimate exception for the one hour corridor fire resistant rating requirement, since it requires every classroom to have at least one door directly to the exterior and rooms used for assembly purposes have at least ½ of the required means of egress directly to the exterior as well. Under those conditions, there is no need for the students and other occupants to rely on exiting the building through the corridors since they can go directly to the exterior and move to a safe area of refuge. Once the announcement to evacuate occurs they can exit without being exposed to the fire threat potentially extended into the unprotected corridor.

However, if this is not the case, then the students, teachers, and other occupants of the educational occupancy must rely on the corridor system to exit safely from the building. In that case the paths of travel to get out of the building are restricted and the occupants may be exposed to the room of fire origin while trying to evacuate. Certainly, the basis for 1 hour fire resistive protection for corridors when the occupant load exceeds 30 is to provide for a reasonable level of protection for the occupants as they exit the building without having them unduly be exposed to a fire condition, water, and smoke which may impede their egress because they have delayed their evacuation due to a "lockdown".

It has been reported that there is an annual average of 14,700 fires in educational properties in the United States. The estimated average property loss from these fires is $85 million per year, and caused approximately 100 injuries. The costs of bussing students to alternate facilities, the impact of double sessions in schools to accommodate displaced students, and the mental aspect of the children who fell victim to the fires is less than construction costs of a 1 hour fire resistant corridor.

Nearly half (49.7 %) of these fires were incendiary or suspicious in nature. Structure fires can start in a wide variety of different areas. During 1999-2001, 23% of the fire origins were in bathrooms/locker rooms, 13% started in the kitchen area, 7% in the classrooms, and another 7% started in corridors. Even more disturbing are findings indicating that injuries per school fires are higher than those of ALL non-residential structure fires. Certainly, the fact that more than 70% of fires occur between 0800 and 1600, the hours students are most likely to be in school, and 16% of fires occur between 1700 and 2400; 12% occur between 2400 and 0800 shows that the threat of a fire occurring while children are present is real.

Currently, the International Building Code (IBC) allows the 1-hour fire –resistance rated corridor to be omitted where the building is protected by an automatic sprinkler system. We don't believe that such a "trade-off" is appropriate, especially in an educational occupancy where there are large numbers of children at relatively high density who are placed at risk in a fire situation. We believe that due to the expanding use of "lockdown" procedures a balanced design approach to providing life safety in educational occupancies is prudent so that the 1-hour fire resistance rated corridors can work in conjunction with the automatic sprinkler system to assure the level of life safety for the building's occupants intended by the code.

Note that an I-3 occupancy, (correctional centers, detention centers, jails, prerelease centers, prisons, and reformatories), requires the corridors to have 1 hour fire-resistance ratings when the occupancy is protected by a fire suppression system, regardless of the number of occupants. When a "lockdown" occurs in a school the staff and students are prisoners. They are prohibited from leaving the rooms or areas of protection until given permission (ordered) to do so, or because they are being held hostage. For consistency purposes the staff and students in educational occupancies deserve the same level of protection we provide to inmates. A comparison to the other I groups where evacuation of the occupants may be delayed or prevented because they are incapable of self preservation is also appropriate and substantiates a need to increase the protection level for corridors in the education group occupancies since in the case of "lockdowns" the staff and students are prevented from taking self preservation actions when the fire alarm activates until authorized, (ordered), to evacuate after an undetermined delay in time.

Other points to consider are the construction modifications made due to high-profile events and fuel loads in our schools. Events as the Columbine High School shootings, the need of school security can sometimes conflict with the requirements of fire safety. For example, exits may be restricted for security reasons preventing escape should a fire occur. Today's structures are unquestionably safer, yet the contents of today's classrooms are more combustible. Evidence suggests that fires in schools can spread far more rapidly due to the fuel load in the school buildings.

An additional benefit of the 1-hour fire resistance rated corridor is that it can assist fire fighters and tactical response team members in doing their job by providing a protected means of access to the interior of the building where they can perform their search and rescue missions, as well as fire fighting operations, in relative safety. Fire resistant corridors provide fire fighters and tactical response team members with additional time to conduct their life safety operations more effectively and safely.

From an economic perspective, fires rank as a major national problem, and since no individual safety measure is reliable all of the time, fire protection should and must be redundant. We are concerned that the compounding effect of sprinkler trade-offs could lead to greater risk to the life safety of the building occupants, especially if combined with the reduction in or the elimination of the 1 hour fire resistance rated corridors providing access to the exits or exit stairwells in an occupancy that routinely has staff and students drill and respond in real events to ignore fire alarm system activations. Too much reliance on automatic sprinkler systems may not be wise where life safety is a key consideration. We strongly believe that a balanced approach to fire and life safety in buildings should be provided when a fire occurs.

Zaremba -This code change was proposed by several parties in the last development cycle. Although half the Committee supported its adoption, the Chair broke a tie vote resulting in a Committee recommendation of disapproval. At the Final Action Hearings, however, the Committee recommendation was overturned. Although a motion to "approve as submitted" received a favorable vote of 55% of the Membership, it did not receive the 2/3 majority needed for adoption.

A majority of the Membership had good reason to favor the adoption of this proposal. First, the E occupancies at issue represent structures built to house a dense population of children ranging from ages 4 through early teens. Group E occupancies typically have paper and other flammables hung from ceiling to floor on every wall. Classrooms are filled with desks containing books, papers and other flammables. Science labs use chemicals and accelerants. Lunch rooms have stoves, ovens and trash cans spread throughout, all loaded with waste paper and other flammables. Theaters house clothing, wooden and cardboard props and paper banners strung from one end of to the other. Lockers contain books and hide things that are not easily monitored. Many Group E occupancies are multi-story buildings with relatively long corridors between classrooms and exit discharges.

In short, Group E occupancies represent a daily mix of high occupancy loads, children and significant fuel loads. As budgets shrink, so do the number of adult supervisors. E occupancies should provide children with an environment redundant in fire safety protections.

Especially because large numbers of children would be at risk in the event of a fire, redundant fire protection systems is warranted without waiting for a catastrophic loss of life to provide the motivation for making this change. Sprinklered Group E occupancies with corridors serving occupant loads of more than 30 children should include 1-hour fire resistance rated corridor construction.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Zaremba-E2-Table 1018.1

E114–09/10
1018.1, 1018.1.1 (New) [IFC [B] 1018.1, 1018.1.1 (New)]

Proponent: Robert J Davidson, Code Consultant, Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM); Thomas S. Zaremba, Roetzel & Andress representing self

Add new text as follows:

1018.1 (IFC [B] 1018.1) Construction. Corridors, other than those regulated by Section 1018.1.1, shall be fire-resistance rated in accordance with Table 1018.1. The corridor walls required to be fire-resistance rated shall comply with Section 709 for fire partitions.

Exceptions:

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has at least one door opening directly to the exterior and rooms for assembly purposes have at least one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A fire-resistance rating is not required for corridors contained within a dwelling or sleeping unit in an occupancy in Group R.
3. A fire-resistance rating is not required for corridors in open parking garages.
4. A fire-resistance rating is not required for corridors in an occupancy in Group B which is a space requiring only a single means of egress complying with Section 1015.1.

TABLE 1018.1 (IFC [B] TABLE 1018.1)
CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not Permitted	1
H-4, H-5	Greater than 30	Not Permitted	1
A, B, E, F, M, S, U	Greater than 30	1	0
R	Greater than 10	Not Permitted	0.5
I-2[a], I-4	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3.
b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.
c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

1018.1.1 (IFC [B] 1018.1.1) Category III and IV Buildings in Hurricane-Prone and Seismic Areas. Corridors in all Category III and Category IV buildings as defined in Table 1604.5 shall have a fire resistance rating of 1-hour if located in hurricane-prone regions defined in Section 1609.2 or assigned to seismic design categories C, D, E or F in Section 1613.5.6.

Reason:
Davidson, Shuman - Category III buildings are defined in Table 1604.5 as those "that represent a substantial hazard to human life in the event of failure." They include, but are not limited to:

- Public assembly occupancies with occupant loads greater than 300,
- Elementary or secondary schools or day care facilities with occupant loads greater than 250,
- Adult education facilities with occupant loads greater than 500,
- Group I-2 occupancies with occupant loads greater than 50, and
- Group I-3 occupancies.

Category IV buildings are those which are designated as essential facilities. "Essential Facilities" are defined in section 1602.1 as "[b]uildings and other structures that are intended to remain operational in the event of extreme environmental loading from flood, wind, snow or earthquakes. These include, but are not limited to:

- Designated earthquake, hurricane or other emergency shelters,
- Designated emergency preparedness, communications and operations centers and other facilities required for emergency response, and
- Fire, rescue, ambulance and police stations and emergency vehicle garages.

In the face of impending natural disasters, residents regularly seek refuge in, or are evacuated from their homes to, Category III or IV buildings. At the same time, hurricanes and earthquakes regularly render roads impassable, often times cutting these evacuation shelters off from municipal and emergency medical, police and fire services. Even if these sites remain accessible by road, first responders may be unable to promptly respond when confronted with the wide spread devastations of a hurricane or earthquake.

Adopting this code change would ensure that redundant safety features, in the form of sprinklers and fire resistance rated corridors, are in place to ensure a safe evacuation of high occupancy buildings used as emergency shelters in hurricane and seismic areas.

Zaremba - Buildings and infrastructures can be severely damaged in hurricanes and earthquakes.

Category III buildings are those that represent a "substantial hazard to human life in the event of failure" and include buildings with high occupancy loads, for example, public assembly buildings with occupant loads greater than 300; elementary or secondary schools or day care facilities with occupant loads greater than 250; adult education facilities with occupant loads greater than 500; Group I-2 occupancies with occupant loads greater than 50; and Group I-3 occupancies.

Category IV buildings are specifically intended to provide shelter in natural catastrophes. These are "essential facilities," defined in section 1602.1 as those intended to remain operational throughout a natural disaster. They include designated earthquake, hurricane or other emergency shelters; designated emergency preparedness, communications and operations and emergency response centers; and fire, rescue, ambulance and police stations and emergency vehicle garages.

Hurricanes and earthquakes can quickly interrupt utilities, including power, communications and water supplies, while slowing or prohibiting travel to and from these facilities. A fire in a Category III or IV building during or after a hurricane or seismic event could result in a significant loss of life when large concentrations of people, including first responders, or those suffering from disabilities, are forced to evacuate under circumstances where communications and sprinkler systems are inoperable and emergency fire and rescue services are inaccessible or unavailable. To ensure safe evacuations in the event of fire, this proposal would require Cat. III and IV buildings in hurricane prone and seismic areas to include 1-hour fire-resistance rated corridors.

Cost impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

E115–09/10

1018.2, Table 1018.2 (New) [IFC [B] 1018.2, Table 1018.2 (New)]

Proponent: John England, MCO, England Enterprises Inc., representing self

1. Revise as follows:

1018.2 (IFC [B] 1018.2) Corridor width. The minimum corridor width shall be as determined in Section 1005.1, but not less than specified in Table 1018.2~~ but not less than 44 inches (1118 mm).~~

~~**Exceptions:**~~

1. ~~Twenty-four inches (610 mm) – For access to and utilization of electrical, mechanical or plumbing systems or equipment.~~
2. ~~Thirty-six inches (914 mm) – With a required occupant capacity of less than 50.~~
3. ~~Thirty-six inches (914 mm) – Within a dwelling unit.~~
4. ~~Seventy-two inches (1829 mm) – In Group E with a corridor having a required capacity of 100 or more.~~
5. ~~Seventy-two inches (1829 mm) – In corridors and areas serving gurney traffic in occupancies where patients receive outpatient medical care, which causes the patient to be not capable of self-preservation.~~
6. ~~Ninety-six inches (2438 mm) – In Group I-2 in areas where required for bed movement~~

2. Add new Table as follows:

Table 1018.2 (IFC [B] Table 1018.2)
MINIMUM CORRIDOR WIDTH

Occupancy	Width (min)
Any facilities not listed below	44" (1118 mm)
Access to and utilization of mechanical, plumbing or electrical systems or equipment	24" (610 mm)

Occupant load less than 50	36” (914 mm)
Within a dwelling unit	36” (914 mm)
Group E with occupant load of 100 or more	72” (1829 mm)
Group B or I-2 outpatient medical facilities where patients are moved on gurneys	72” (1829 mm)
Group I-2 in areas where care recipients are moved on beds	96” (2438 mm)

Reason: A table will make it easier to understand.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The terminology used in the text of the exceptions is different than the terminology used in the proposed table. A concern would be if this change in terminology change the original interpretation of these exceptions.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME:England-E1-1018.2

E116–09/10
1018.5 (IFC [B] 1018.5) (IMC [B] 601.2)

Proponent: Guy Tomberlin, Fairfax County, Virginia Plumbing and Mechanical Inspectors Association, representing VA Building and Code Officials

Revise as follows:

1018.5 (IFC [B] 1018.5) (IMC [B] 601.2) Air movement in egress elements. Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.

Exceptions:

1. Use of a corridor as a source of makeup air for exhaust systems in rooms that open directly onto such corridors, including toilet rooms, bathrooms, dressing rooms, smoking lounges and janitor closets, shall be permitted, provided that each such corridor is directly supplied with ~~outdoor air~~ ventilation air at a rate greater than the rate of makeup air taken from the corridor.
2. Where located within a dwelling unit, the use of corridors for conveying return air shall not be prohibited.
3. Where located within tenant spaces of 1,000 square feet (93 m^2) or less in area, utilization of corridors for conveying return air is permitted.
4. Incidental air movement from pressurized rooms within health care facilities, provided that the corridor is not the primary source of supply or return to the room.

Reason: It was not the original intent of this section to provide outdoor air to a corridor to be used as makeup air. This has now been clarified through the addition of new exhaust column found in IMC Table 403.3. If the intent were to use just outdoor air, only corridors served by 100% outdoor air systems would qualify for this exception or exhausting extremely large amounts of ventilation air.

For example: If a bathroom directly off a corridor is required to exhaust 150 cfm of “outdoor air”. And, if the corridor is provided with a ventilation system that has 20% outdoor air, the exhaust rate for the bathroom would have to be increased to 750 cfm (150/0.20)

Cost Impact: The code change proposal will decrease the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: TOMBERLIN-E1-1018.5

E117–09/10
1018.6 (IFC [B] 1018.6)

Proponent: Anne VonWeller, Murray City, representing the Utah Chapter of the International Code Council

Revise as follows:

1018.6 (IFC [B] 1018.6) Corridor continuity. Fire-resistance-rated corridors shall be continuous from the point of entry to an exit, and shall not be interrupted by intervening rooms. Where the path of egress travel within a fire-resistance-rated corridor to the exit includes travel along unenclosed exit access stairways or ramps, the fire resistance-rating shall be continuous for the length of the stairway or ramp and for the length of the connecting corridor on the adjacent floor leading to the exit.

Exception: Foyers, lobbies or reception rooms constructed as required for corridors shall not be construed as intervening rooms.

Reason: This change is offered to clarify how the fire-resistance of rating of a corridor is maintained from the corridor to an exit where an unenclosed exit access stairway or ramp is allowed and occurs along the path of egress travel.

Cost Impact: None.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Vonweller-E2-1018.6

E118–09/10
1020.1 (IFC [B] 1020.1)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1020.1 (IFC [B] 1020.1) General. Exits shall comply with Section 1020 through 1026 and the applicable requirements of Sections 1003 though 1013. An exit shall not be used for any purpose that interferes with its function as a means of egress. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival at the exit discharge.

Exception: A reduced level of exit protection is allowed at the level of exit discharge as permitted by the exceptions to Section 1027.1

Reason: The prohibition of a reduced level of exit protection within an exit as specified in last sentence in Section 1020.1 is permitted to be violated in specific cases. Two exceptions to Section 1027.1 allow certain interior spaces (e.g., a lobby or vestibule) located on the level of exit discharge to have less than two-hour protection from other adjacent interior spaces even though occupants may have previously been inside a two hour rated exit enclosure. The proposed exception to 1020.1 removes the contradiction between the last sentence of 1020.1 and those provisions contained in the exceptions to Section 1027.1 that explicitly permit a reduced level of protection while still inside the building.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

E119–09/10
1021.1, 1021.1.3 (New) [IFC [B] 1021.1, 1021.1.3 (New)]

Proponent: Marshall Klein PE, representing Marshall A. Klein & Associates Inc.

1. Revise as follows:

1021.1 (IFC [B] 1021.1) Exits from stories. All spaces within each story shall have access to the minimum number of approved independent exits as specified in Table 1021.1 based on the occupant load of the story. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories.

Exceptions:

1. As modified by Section 403.15.3.
2. As modified by Section 1021.2.
3. Exit access stairways and ramps that comply with Exception 3 or 4 of Section 1016.1 shall be permitted to provide the minimum number of approved independent exits required by Table 1021.1 on each story.
4. ~~In Group R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~
5~~4~~. Within a story, rooms and spaces complying with Section 1015.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit.

2. Add new text as follows:

1021.1.3 (IFC [B] 1021.1.3) Single-story or multi-story dwelling units. Individual single-story or multi-story dwelling units shall be permitted to have a single exit from the dwelling unit provided all of the following criteria are met:

1. The dwelling unit complies with Section 1015.1 as a space with one means of egress and
2. Either the exit from the dwelling unit is located at the level of exit discharge, or the exit access outside the dwelling unit's entrance door provides access to not less than two approved independent exits.

Exception: Single exits designed in accordance with Section 1021.2

(Renumber subsequent sections)

Reason: This code proposal is only clarifying the application of the single means of egress requirements out of an individual dwelling unit under the Code.

The two criteria that need to be met to have a single means of egress for a dwelling unit are already stated in various sections of the Code, but are not stated in a single location so that code users can quickly find, and apply them, to designs.

Criteria #1 provides the code user Code Section 1015.1 where the provisions for spaces with one exit, or exit access, are given. Also covered in Criteria #1 is existing Section 1014.3 Exception #4 (which is referenced in Section 1015.1(2)) which requires the common path of egress travel within the dwelling unit to be no more than 125', and existing Section 1015.1(1) Exception permits a single means of egress within a dwelling unit with a maximum occupant load of 20.

Criteria #2 provides the code user the code requirements for means of egress after the occupant has left the dwelling unit, i.e. the occupant is now in the exit discharge (which is the exterior of the building/dwelling unit), or the occupant is now in the common exit access component of a building. If the occupant is in the exit discharge, then according to the Code the occupant is considered to be in a safe environment that will lead to a publicway. If the occupant has left the dwelling unit and is not on the level of exit discharge, then the occupant is now continuing through the exit access portion of the building, and will require access to at least two exits from the point he/she walked out of the dwelling unit.

This code proposal references both single and multi-level dwelling units because existing Section 1022.1 Exception #3 permits the stairway(s) within the dwelling unit to be unenclosed.

The exception to this new Section 1021.1.3 is for the special "single exit" design criteria under the existing Section 1021.2, "Single exits".

Please note that the deletion of Exception #4 under Section 1021.1 is NOT intended to remove this exception under the Code. Under existing Section 1015.1 Exception #1's Exception is the same exception as in existing Section 1021.1 Exception #4 that is being proposed for deletion (See approved Code Proposal E115-06/07). Exception #4 is being incorporated into new Section 1021.1.3 under Criteria #1 which references existing Section 1015.1.. Leaving this same exception in existing Section 1021.1 may lead to user confusion on whether this exception would be applied differently under Section 1021.1 vs. Section 1021.1.3. The answer is no, so the redundancy is not needed if it will just cause confusion.

In summary, this proposed new Section 1021.1.3 provides a user friendly section under the minimum number of exits section to the other scattered sections of Code in Article 10 that relate to single exit criteria for dwelling units.

Cost Impact: The code change proposal will not increase the cost of construction.

1021.1, Table 1021.1 (IFC [B] 1021.1, Table 1021.1)

Proponent: Dennis Richardson PE, dbr group inc. representing self

Revise as follows:

1021.1 (IFC [B] 1021.1) Exits from stories. All spaces within each *story* shall have access to the minimum number of *approved* independent *exits* as specified in Table 1021.1 based on the *occupant load* of the *story*. For the purposes of this chapter, occupied roofs shall be provided with *exits* as required for stories.

Exceptions:

1. As modified by Section 403.5.2.
2. As modified by Section 1021.2.
3. *Exit access stairways* and *ramps* that comply with Exception 3 or 4 of Section 1016.1 shall be permitted to provide the minimum number of *approved* independent *exits* required by Table 1021.1 on each *story*.
4. In Group R-2 and R-3 occupancies, one *means of egress* is permitted within and from individual dwelling units with a maximum *occupant load* of 20 where the dwelling unit is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
5. Within a *story*, rooms and spaces complying with Section 1015.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit*.
6. Exits serving specific spaces or areas need not be accessed by the remainder of the story when all of the following are met:
   - 6.1 The number of exits from the entire story complies with Table 1021.1;
   - 6.2 The access to exits from each individual space in the story complies with Section 1015.1; and
   - 6.3 All spaces within each portion of a story shall have access to the minimum number of approved independent exits as specified in Table 1021.1 based on the occupant load of that portion of the story.

TABLE 1021.1 (IFC [B] TABLE 1021.1)
MINIMUM NUMBER OF EXITS FOR OCCUPANT LOAD

OCCUPANT LOAD (persons per story, or portion thereof)	MINIMUM NUMBER OF EXITS (per story, or portion thereof)
1-500	2
501-1,000	3
More than 1,000	4

Reason: Code change E113 06/07 which was approved as modified removed the words “except as modified in Section 1015.1” from section 1019.1 of the 2006 IBC. This language was confusing and should have been revised because Section 1015.1, regulating exit and exit access from spaces, and Section 1019.1, regulating exits from stories, referred back and forth to each other.

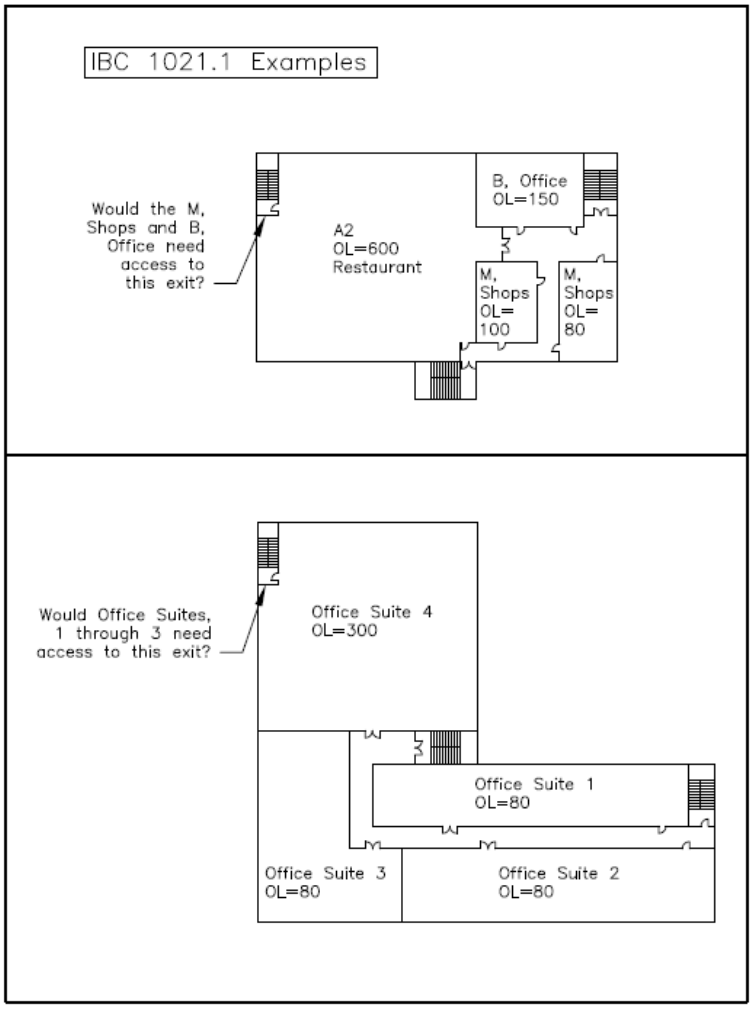
Even though this language was confusing, it did provide some relief from the provisions of 1019.1 which stated “All rooms and spaces within each story shall be provided with and have access to the minimum number of approved independent exits required by Table 1019.1 based on the occupant load of the story…”

It is simply not possible nor is it always necessary with a number of building configurations to provide access to all required exits from all portions of a story (see attached examples). This is true in cases where one or more of the required exits are located independently within a tenant space such as an open office space, large assembly tenant or other portion of the building that is not open for access to all of the other occupants of the building.

This code change proposal provides an exception which allows exits serving a specific area or portion of a building to not be accessible to all other portions of the building so long as:

the overall number of exits are provided from the story as required by Table 1021.1,
access to exits from individual spaces comply with Section 1015.1, and
all spaces within each portion of a story shall have access to the minimum number of approved independent exits as specified in Table 1021.1 based on the occupant load of that portion of the story

The column headings of Table 1021.1 are also revised to acknowledge the number of exits required could also apply to a portion of a story as indicated in the proposed exception.



Cost Impact: This proposed code change will save cost of construction by creating an exception which clarifies the requirements of E113-06/07 which (depending on how interpreted) could cause the loss of floor space and construction of corridors or other modifications to connect all areas of a story with all exits including those which may be located in a specific area or portion of the story.

1021.2, Table 1021.2, Table 1021.2(1) (New); [IFC [B] 1021.2, Table 1021.2, Table 1021.2(1) (New)]

Proponent: Wayne R. Jewell, CBO, Department of Building and Safety Engineering, City of Southfield and Sam Dorchen, representing Martin Associates, Inc.

1. Revise as follows:

1021.2 (IFC [B] 1021.2) Single exits. ~~Only one exit~~ Single exits shall be ~~required~~ permitted from Group R-3 occupancy buildings, Group R-2 dwelling units as indicated in Table 1021.2(1) or from stories of other buildings as indicated in Table 1021.2(2). Occupancies shall be permitted to have a single exit ~~in buildings~~ when otherwise required to have more than one exit if the area~~s~~ served by the single exit ~~do~~ does not exceed the limitations of Tables 1021.2(1) or 1021.2(2). Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Tables 1021.2(1) or 1021.2(2) for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. ~~Basements~~ A basement provided with a single exit shall not be located more than one story below grade plane.

2. Add new Table as follows:

TABLE 1021.2(1) (IFC [B] TABLE 1021.1(1))
SINGLE EXITS FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS PER FLOOR SERVED BY A SINGLE EXIT AND TRAVEL DISTANCE TO THE EXIT
Basement, first, second or third story	R-2[a]	4 dwelling units and 125 feet travel distance

For SI: 1 foot = 3048 mm.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1029.

3. Revise as follows:

TABLE 1021.2(2) (IFC [B] TABLE 1021.1(2))
~~STORIES WITH ONE EXIT~~ SINGLE EXITS FOR OTHER OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM OCCUPANTS ~~(OR DWELLING UNITS)~~ PER FLOOR AND TRAVEL DISTANCE TO THE EXIT
First story or basement	A, B[d], E[e], F[d], M, U, S[d]	49 occupants and 75 feet travel distance
	H-2, H-3	3 occupants and 25 feet travel distance
	H-4, H-5, I, R-1, R-2[c,f], R-4	10 occupants and 75 feet travel distance
	S[a]	29 occupants and 100 feet travel distance
Second story	B[b], F, M, S[a]	29 occupants and 75 feet travel distance
	~~R-2~~	~~4 dwelling units and 50 feet travel distance~~
~~Third story~~	~~R-2[e]~~	~~4 dwelling units and 50 feet travel distance~~

For SI: 1 foot = 3048 mm.

a. For the required number of exits for parking structures, see Section 1021.1.1.
b. For the required number of exits for air traffic control towers, see Section 412.3.
c. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1029.
d. Group B, F and S Occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
e. Day care occupancies shall have a maximum occupant load of 10.
f. This Table is used for R-2 occupancies consisting of sleeping units. For R-2 occupancies consisting of dwelling units, use Table 1021.2(1).

Reason: This proposal is intended to follow up on Code Proposals E136-06/07 and E127-07/08 approved in the past 2 code cycles to clarify the application of single exit requirements under Section 1021.2, "Single exits", and Section 1015.1, "Exits or exit access doorways from spaces".

The revisions to Table 1021.2 splitting the Table into two Tables addresses changes to the Code dealing with the common path of travel for sprinklered R-2 occupancies that consists of dwelling units now required by the code to be sprinklered and not considered in original drafting of Table 1021.2 in the first edition of the IBC. Section 1014.3 Exception #4 of the current code permits up to 125' common path of travel to an exit in sprinklered R-2 occupancies. This proposed revision to Table 1021.2 would be consistent with that requirement. The existing Table has been clarified to apply to the R-1, R-2 and R-4 occupancies that consists of sleeping units, and clarified not to be applicable to R-3 which have been, and continue to be, permitted to have a single exit based on the text in Section 1021.2.

The original Table 1021.2 was placed in the 2000 edition of the Code when R-2 occupancies were not required to be sprinklered and the original travel distance numbers in Table 1021.2 were based on the non-sprinklered requirements. From a life safety aspect, the application of this revision would be equal to, if not considered better than; the presently permitted means of egress for a two exit R-2 occupancy with a typical exit access corridor and exit stairway at each end. The current code will allow a common path of travel of 125' and a total maximum travel distance to one of the exits of 250' (Table 1016.1). This code proposal would reasonably permit multiple groups of 4 dwelling units on a story as long as the design complies with the limitation of 125 feet of travel distance to a single exit provided it complies with the height and area limitations in Chapter 5 and Table 503. For the single exit provisions under this code proposal, the maximum travel distance permitted would be 50% less than presently permitted for a 2 exit R-2 building. The dwelling units' horizontal and vertical separations and stair enclosure requirements are the same regardless of the number of exits. The single exit provisions would still retain the emergency window requirement (Footnote "c" under the existing Table 1021.2 which would become Footnote "a" under the new Table 1021.2(1)) that is not required for a 2 exit R-2 building.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Jewell-Dorchen-E1-1019.2

E122–09/10
1021.2 (IFC [B] 1021.2); R311.4

Proponent: Christine Reed and Stuart Tom, P.E., CBO, representing the California Fire Chiefs Association and the Los Angeles Basin Chapter, ICC; Jonathan C. Siu, representing City of Seattle, Department of Planning and Development

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1021.2 (IFC [B] 1021.2) Single exits. ~~Only one exit shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2.~~ Occupancies shall be permitted to have a single exit in buildings otherwise required to have more than one exit if the areas served by the single exit do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single exit shall not be located more than one story below grade plane.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.4 Vertical egress. Egress from habitable levels including habitable attics and basements not provided with an egress door in accordance with Section R311.2 shall be by ~~a~~ one or more ramps in accordance with Section R311.8 or ~~a~~ one or more stairways in accordance with Section R311.7 or both. Habitable levels larger than 1,000 square feet (92.9 m^2) located more than one story above or below an egress door shall be provided with not less than two means of egress.

Reason:
PART I –Section 1015.1 and Section 1021.1 both contain identical, very specific, exception language that allows Group R-3 occupancies to be permitted with one means of egress provided the occupant load is limited to a maximum of 20 and the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. As currently written, Section 1021.2 creates two (2) potential conflicts.

In one case, a potential conflict arises if the stricken sentence remains because of the reference "… as indicated in Table 1021.2". Table 1021.2 limits the number of occupants on the first story or basement of Group R occupancies to a maximum of 10 and a maximum travel distance of 75 feet. This conflict would result in the severe limitation of the size of 1-story Group R-3 occupancies with one means of egress to only 2,000 square feet, which is contrary to Sections 1015.1 and 1021.1 which allow up to 4,000 square feet in buildings equipped throughout with an automatic sprinkler system.

In the second case, a potential conflict arises if the stricken sentence remains because some readers might ignore the reference " … as indicated in Table 1021.2" and provide only one means of egress for Group R-3 occupancy buildings regardless of size. This would be in conflict with Sections 1015.1 and 1021.1 which impose a size limitation of 4,000 square feet based upon the maximum occupant load limit of 20, considering the occupant load factor of 200 square feet per occupant as indicated in Table 1004.1.1.

This proposal eliminates a confusing sentence within Section 1021.2, that is currently in conflict with Sections 1015.1 and 1021.1, thereby making all three sections consistent.

PART II –The IRC fails to address the fact that a single exit may not be sufficient for every R-3 occupancy One- or Two- Family Dwelling. While a single exit may be suitable for most dwellings, the same cannot be said of all dwellings. The IRC establishes the standards that will also apply to very large dwellings and dwellings constructed on steep lots, where egress design becomes more critical.

In comparison, the IBC addresses the need for a second means of egress through Sections IBC 1015.1 and IBC 1021.1. Both of these provisions will require a second means of egress from a Group R-3 occupancy if the occupant load exceeds 20 persons. Furthermore, since the IBC utilizes the 3-part means of egress design concept, Group R-3 occupancies regulated by the IBC would be required to have both means of egress comply with all applicable provisions of IBC Chapter 10.

Since the IRC does not utilize the 3-part means of egress concept nor the occupant load concept, it is not practical to use the same approach as the IBC in establishing whether a second means of egress is required in R-3 occupancies up to 3-stories in height. Furthermore, the need for a second means of egress is most critical on floors that are located more than one story above or below an egress door. This proposal does not require a second means of egress from 1- or 2- story Group R-3 occupancies because the length of vertical egress travel is inherently limited to a

maximum of one story in such buildings. This proposal will only require a second means of egress from habitable levels that are located more than one level above or below the egress door, and only if such levels exceed 1,000 square feet in area. Egress from such occupied floor levels becomes more critical because of the combination of increased vertical egress travel combined with the increased travel distance within a large floor area exceeding 1,000 square feet.

The IRC also fails to adequately address egress from Group R-3 occupancy dwellings constructed on steep hillside lots, especially lots located on the down-slope side of a street. Many jurisdictions throughout the country have steep hillside residential areas, where it is common to construct homes on the down-slope side of a street with the topmost floor located at street level and two additional floors located below street level. Often such down-slope lots are so steep that there is no usable rear yard. Consequently, homes constructed on such steep terrain typically do not have a rear door (that could serve as a second means of egress), because a door that leads to a steep and unusable rear yard is not likely to be installed. This proposal would require such occupied levels that are greater than 1,000 square feet in area to be provided with a second means of egress.

This code change proposal will not affect the majority of Group R-3 occupancy One- and Two- Family Dwellings regulated by the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC MEANS OF EGRESS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:tom-reed-siu-E1-1021.2

E123–09/10
1021.2 (IFC [B] 1021.2)

Proponent: Maureen Traxler representing City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1021.2 (IFC [B] 1021.2) Single exits. Only one exit shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single exit in buildings otherwise required to have more than one exit if the areas served by the single exit do not exceed the limitations of Table 1021.2. ~~Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1.~~ Basements with a single exit shall not be located more than one story below grade plane.

Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. In each story of a mixed occupancy building, the maximum number of occupants served by a single exit shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants for each occupancy shall not exceed one.

Reason: As written, the provision would allow a single exit from a mixed occupancy story with as much as twice the occupant load allowed for a single occupancy story. For example, if on the second story of a building there are two tenant spaces, one is a B and one is an M, the B has 28 occupants and the M has 28 occupants. Both tenant spaces have a single door to a single exit stairway. Each of these occupancies complies with the limits of Table 1021.2, but cumulatively there are now 56 people using a single exit. The only way to prevent this substantial expansion of the number of occupants relying on a single exit, is to use a 'unity' formula that allows a calculation to see if the number of occupants is reasonable. This proposal moves the sentences regarding mixed occupancy out of the first paragraph and places them in their own paragraph. The new third sentence is added establishing a unity formula for mixed occupancies sharing the same single exit. This is based on the provision in Section 508.4.2 used to determine the allowable area of a separated mixed occupancy building. Finally, this will work in conjunction with the concept of a single story multiple tenant building where each tenant space has its own exterior exit. If someone chooses to have 2 tenant spaces of different occupancies share the same exit, then this added sentence would apply. But if that is too restrictive, they can always put in individual exits from each space.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Traxler-E3-1021.2

E124–09/10
1022.3, 1022.4 (IFC [B] 1022.3, 1022.4)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1022.3 (IFC [B] 1022.3) Openings ~~and penetrations~~. Exit enclosure opening protectives shall be in accordance with the requirements of Section 715.

Openings in exit enclosures other than unprotected exterior openings shall be limited to those necessary for exit access to the enclosure from normally occupied spaces and for egress from the enclosure. There shall be no communicating openings, whether protected or not, between adjacent exit enclosures.

Elevators shall not open into an exit enclosure.

1022.4 (IFC [B] 1022.4) Penetrations. Penetrations into and ~~openings~~ through an exit enclosure are prohibited except for ~~required exit doors,~~ equipment and duct work necessary for independent pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication and electrical raceway serving the exit enclosure and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 713.

There shall be no penetrations ~~or communicating openings~~, whether protected or not, between adjacent exit enclosures.

Reason: The current title of Section 1022.3 is somewhat misleading in that it references "penetrations." No provisions in Section 1022.3 apply to penetrations and there are no cross-references to Section 713. Section 1022.4, however, does address the penetration provisions applicable to exit enclosures. Technical references to openings in Section 1022.4 have either been removed or relocated to Section 1022.3. For instance, the reference to "required exit doors" in the first sentence has been eliminated because that concern is addressed in the second paragraph of Section 1022.3 that limits openings into an exit enclosure to those necessary for egress. Approval of this proposal will reduce confusion and assist users in the correct identification of applicable exit enclosure opening and penetration requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Keith-E8-1022.3

E125–09/10
1022.3 (IFC [B] 1022.3)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1022.3 (IFC [B] 1022.3) Openings and penetrations. Exit enclosure opening protectives shall be in accordance with the requirements of Section 715.

Openings in exit enclosures other than unprotected exterior openings shall be limited to those ~~necessary~~ required for exit access to the enclosure from normally occupied spaces and for egress from the enclosure.

Exception: Protected openings shall be permitted in exit enclosure at the level of exit discharge in accordance with Section 715.

Elevators shall not open into an exit enclosure.

Reasons: The exception is to allow openings from ground level lobbies into exit enclosures. This opening may not be necessary for exit access from the lobby. However, the way the code language is, only openings "necessary" for exit access can open into exit enclosure. This exception will allow any opening, necessary or otherwise, at the exit discharge, to open into exit enclosure. The word "necessary" could be construed as subjective. However, the word "required" is more definitive and has been used in the code more consistently.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Maiel-E7-1022.3

E126–09/10
1022.4, 1023.6 (IFC [B] 1022.4, 1023.6)

Proponent: Matthew Davy, PE, Schirmer Engineering Corporation, representing self

Revise as follows:

1022.4 (IFC [B] 1022.4) Penetrations. Penetrations into and openings through an exit enclosure are prohibited except for required exit doors, equipment and ductwork necessary for independent ventilation or pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication systems and electrical raceway serving the exit enclosure and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 713. There shall be no penetrations or communication openings, whether protected or not, between adjacent exit enclosures.

> **Exception:** Membrane penetrations shall be permitted on the outside of the exit enclosure. Such penetrations shall be protected in accordance with Section 713.3.2.

1023.6 (IFC [B] 1023.6) Penetrations. Penetrations into and openings through an exit passageway are prohibited except for required exit doors, equipment and ductwork necessary for independent pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication and electrical raceway serving the exit passageway and terminating at a steel box not exceeding 16 square inches (0.010m^2). Such penetrations shall be protected in accordance with Section 713. There shall be no penetrations or communicating openings, whether protected or not, between adjacent exit passageways.

> **Exception:** Membrane penetrations shall be permitted on the outside of the exit passageway. Such penetrations shall be protected in accordance with Section 713.3.2.

Reason: The purpose of Sections 1022.4 and 1023.6 is to limit through penetrations into an exit enclosure or exit passageway; however, membrane penetrations should be permitted on the outside of the exit enclosure or exit passageway. As currently written, a pull station next to a door into the stair, fire hose cabinets, fire extinguisher cabinets, request-to-exit devices related to access control locks, notification appliances, etc., are not permitted on the outside of the exit enclosure. This exceptions needs to clarify the intent of Sections 1022.4 and 1023.6.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Davy-E1-1023.5

E127–09/10
1022.8 (IFC [B] 1022.8)

Proponent: Manny Muniz, California Deputy State Fire Marshal (Ret.), representing self

Revise as follows:

1022.8 (IFC [B] 1022.8) ~~Floor~~ Stairway identification signs. A sign shall be provided at each floor landing in exit enclosures connecting more than three stories designating the floor level, the terminus of the top and bottom of the exit enclosure and the identification of the stair or ramp. The signage shall also state the story of, and the direction to, the exit discharge and the availability of roof access from the enclosure for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. ~~Floor level identification~~ In addition to the stairway identification sign, a floor level sign~~s~~ in ~~tactile~~ raised characters and braille complying with ICC A117.1 shall be located at each floor level landing adjacent to the door leading from the enclosure into the corridor to identify the floor level.

1022.8.1 (IFC [B] 1022.8.1) Signage requirements. Stairway identification signs shall comply with all of the following requirements:

1. The signs shall be a minimum size of 18 inches (457 mm) by 12 inches (305 mm).
2. The letters designating the identification of the stair enclosure shall be a minimum of 11/2 inches (38 mm) in height.
3. The number designating the floor level shall be a minimum of 5 inches (127 mm) in height and located in the center of the sign.
4. All other lettering and numbers shall be a minimum of 1 inch (25 mm) in height.
5. Characters and their background shall have a nonglare finish. Characters shall contrast with their background, with either light characters on a dark background or dark characters on a light background.
6. When signs required by Section 1022.8 are installed in interior exit enclosures of buildings subject to Section 1024, the signs shall be made of the same materials as required by Section 1024.4.

Reason: Sections 1022.8 and 1022.8.1 contain three (3) different sign names. “Floor identification signs” in the title of Section 1022.8, “Floor level identifications signs” in the fourth sentence of Section 1022.8 and “Stairway identification signs” in the first sentence of Section 1022.8.1”. The actual intent of this section is that there be two signs, one for the sight-impaired and one for people who can read signs. The first clarification is to use the term “stairway identification sign” as found in Section 1022.8.1. This will clarify what the sign should be called and will be consistent with the NFPA 101 Life Safety Code description of this sign. The second clarification is to make it clear that in addition to the stairway identification sign, a floor level sign in raised characters and braille complying with ICC A117.1 shall be located at each floor level landing adjacent to the door leading from the enclosure into the corridor to identify the floor level.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Muniz-E2-1022.8

E128–09/10
1022.9 (IFC [B] 1022.9)

Proponent: Maureen Traxler representing City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1022.9 (IFC [B] 1022.9) Smokeproof enclosures and pressurized stairways. ~~In buildings~~ Where required by Sections 403.5.4 or 405.7.2 ~~to comply with Section 403 or 405~~, ~~each of the~~ exit enclosures ~~serving a story with a floor surface located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access or more than 30 feet (9144 mm) below the finished floor of a level of exit discharge serving such stories~~ shall be smokeproof enclosures or pressurized stairways in accordance with Section 909.20.

Reason: As written, this provision combines the high-rise and underground building requirements, thus making them unclear. It could be mistakenly read that in a high-rise building, stair enclosures serving parking garage stories more than 30 feet below the level of exit discharge and meeting the exceptions of 405.1 would need to be smokeproof enclosures or pressurized stairways, and that is not the intent of the code. This proposal removes the language that describes which exit enclosures need to be smokeproof or pressurized and directly references the high-rise and underground building sections instead (Sections 403.5.4 and 405.7.2).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

E129–09/10
1023.3 (IFC [B] 1023.3)

Proponent: Michael DiMascio, Arup, representing self

Revise as follows:

1023.3 (IFC [B] 1023.3) Construction. Exit passageway enclosures shall have walls, floors and ceilings of not less than 1-hour fire-resistance rating~~, and not less than that required for any connecting exit enclosure~~. When acting as a horizontal continuation of an exit enclosure on the level of exit discharge, the fire-resistance rating of the exit

passageway shall not be less than the rating required for the exit enclosure. Exit passageways shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

Reason: This amendment is primarily intended as clarification. The present wording uses the term “any connecting exit enclosure”. This has been interpreted to require a 2-hr exit passageway on a floor, other than the level of exit discharge, even when the exit passageway; (1) only provides access to a 2-hr vertical exit enclosure, which in turn continues to exit discharge, (2) only serves the floor on which it is located and (3) is separated from the vertical exit enclosure by 2-hr rated construction and the required opening protectives. This exit passageway is not a “continuation” of the vertical exit enclosure. It provides access to the vertical exit enclosure and is properly separated from the vertical exit enclosure. The level of protection provided is commensurate with the hazard, since the exit passageway is only protecting occupants from the hazards on the floor they are exiting. Whereas the vertical exit enclosure provides protection from the hazards on all floors it connects. In fact the code only requires a 1 hour rated vertical exit enclosure when the enclosure connects three floors or less.

This amendment provides needed clarification to the level of protection intended.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Dimascio-E1-1023.3

E130–09/10
1002.1, 1023.4 (IFC [B] 1002.1, 1023.4)

Proponent: Michael DiMascio, Arup; representing self

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT PASSAGEWAY. An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives, and provides for a protected path of egress travel in a horizontal direction to an exit or an exit discharge ~~or the public way~~.

1023.4 (IFC [B] 1023.4) Termination. Exit passageways on the level of exit discharge shall terminate at an exit discharge ~~or a public way~~. Exit passageways on other levels shall terminate at an exit.

Reason: This amendments are primarily intended as clarification. The present wording does not define the use of exit passageways on levels other than the level of exit discharge. This means it does not address the use of exit passageways in malls and on upper and lower floors in buildings with large floor plates. In malls, exit passageways are frequently used between the mall itself and the vertical exit enclosure. (See Section 402.4.5 and 402.4.6) Using exit passageways on levels other than the level of exit discharge is a common practice where the travel distance to the vertical exit enclosure exceeds the allowable travel distance. The removal of the term, "or a public way" is for consistency. Based on the definition of means-of-egress, you must pass through an exit discharge before you reach a public way. Since the exit passageway is an extension of the exit enclosure, it must end at an exit discharge when located on the level of exit discharge.

This amendment provides needed clarification as to when the exit passageway must terminate at an exit discharge and clarifies it would not end at a public way.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Dimascio-E2-1023.4

E131–09/10
1024.4 (IFC [B] 1024.4)

Proponent: Lee C. DeVito, PE, FIREPRO Incorporated, representing self

Revise as follows:

1024.4 (IFC [B] 1024.4) ~~Self-luminous and photoluminescent~~ Luminescent materials. Luminous egress path markings shall be permitted to be made of any material, including paint, ~~provided that an electrical charge is not required to maintain the required luminance~~. Such materials shall include, but are not limited to, self-luminous materials ~~and~~ photoluminescent materials and electroluminescent materials. Materials shall comply with either:

1. UL 1994; or
2. ASTM E 2072, except that the charging source shall be 1 foot-candle (11 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 30 millicandelas per square meter at 10 minutes and 5 millicandelas per square meter after 90 minutes.

Reason: Electrical systems provide the building management with more flexibility with the operation of the exit path marking systems.

Electrical systems do not need backup lighting which will allow building managers to control lighting. Furthermore, energy savings and Green/LEEDS requirements (for example thru the use of motion sensor lighting) may be further achieved with electroluminescent materials, as separate, continuously operational light sources are not required for charging purposes. A later section of this code, 1024.5 Illumination, requires means of egress illumination for photoluminscent exit path markings is required for at least 60 minutes prior to periods when the building is occupied. Electroluminescent exit path markings would not require this.

Electrical systems can be operated at any time as they have available power and they are protected with battery standby support. Therefore, the building management can utilize the electrical systems when ever there is an alarm activity or other situation in the building, whether the building power is available or not. Self luminous and photoluminescent materials only provide lighting when the background lighting is limited.

Electrical systems are supervised so the building management will know that there is a problem. Self-luminous materials and photoluminescent materials are not supervised, so they can be damaged or removed and no one is notified until a manual check is performed on the system. Whereas the systems are required in some high-rise buildings manual inspection will be time consuming and possibly burdensome, which may mean that self luminous or photoluminescent systems may not be inspected.

The building management can utilize the flexibility of electrical systems to provide further information on the availability or disruption of an egress path.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Devito-E1-1024.4

E132–09/10

707.3.10 (New), 1026 (IFC [B] 1026)

Proponent: Ron Clements, Chesterfield County Virginia Building Inspection Department, representing self

1. Revise as follows:

SECTION 1026 (IFC [B] 1026)
EXTERIOR EXIT STAIRWAYS ~~RAMPS~~ AND RAMPS ~~STAIRWAYS~~

1026.1 (IFC [B] 1026.1) General ~~Exterior exit ramps and stairways.~~ Exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ serving as an exit component in the ~~element of a~~ ~~required~~ means of egress shall comply with this section.

~~Exception~~ Exceptions: ~~Exterior exit ramps and stairways for outdoor stadiums complying with Section 1022.1, Exception 2.~~

1. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside are not required be comply with this section.
2. Stairways in open parking structures that serve only the parking structure are not required to comply with this section.

1026.2 (IFC [B] 1026.2) Occupancy and height limitations ~~Use in a means of egress.~~ ~~Exterior exit stairways shall not be used as an element of a required means of egress for occupancies in Group I-2. For occupancies in other than Group I-2,~~ In other than Group I-2 occupancies, exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ shall be permitted as ~~an element of~~ a required ~~means of egress~~ exit ~~for~~ in buildings not ~~exceeding~~ more than six stories above grade plane in height or having occupied floors more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

1026.3 (IFC [B] 1026.3) Open side. Exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ ~~serving as an~~ ~~element of a required means of egress~~ shall be open to a yard, court or public way on at least one side. ~~An~~ The open side shall have a minimum ~~of~~ 35 square feet (3.3 m^2) of aggregate open area adjacent to each floor level and the level of each intermediate landing. The required open area shall be located not less than 42 inches (1067 mm) above the adjacent floor or landing level.

~~**1026.4 (IFC [B] 1026.4) Side yards.** The open areas adjoining exterior exit ramps or stairways shall be either yards, courts or public ways; the remaining sides are permitted to be enclosed by the exterior walls of the building.~~

~~1026.5~~ 1026.4 (IFC [B] ~~1026.5~~ 1026.4) Fire separation distance ~~Location~~. Exterior exit stairways and ramps ~~and stairways~~ shall ~~be located in accordance with Section 1027.3.~~ have a fire separation distance of not less than 10 feet. The outermost vertical plane of the exterior stair assembly shall be considered the building face for the fire separation distance measurement.

~~1026.6~~ 1026.5 (IFC [B] ~~1026.6~~ 1026.5) Exterior ramps and stairway protection. Exterior exit stairways and ramps ~~and stairways~~ shall be separated from the interior of the building with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Such separation shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories ~~as required in Section 1022.1~~. Openings in such fire barriers shall be limited to those necessary for egress from normally occupied spaces.

Where the sides of the exterior stairway or ramp are exposed to other parts of the building at an angle of less than 180 degrees (3.14 rad), the exterior walls of the building within 10 feet (3048 mm) horizontally of the exterior stairway or ramp exposed sides shall have a fire-resistance rating of not less than 1 hour or the exposed side of the exterior stairway must be a wall constructed as a fire barrier having a fire-resistance rating of not less than 1 hour. Openings within the 1 hour fire-resistive rated exposure protection shall be protected by opening protectives having a fire protection rating of not less than 3/4-hour. The fire rated construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the topmost landing of the stairway or to the roof line, whichever is lower.

Exceptions:

1. In other than Group R-1 or R-2 occupancies, separation from the interior of the building is not required ~~for occupancies, other than those in Group R-1 or R-2,~~ in buildings that are no more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.
2. Separation from the interior of the building is not required where the exterior exit stairway ~~ramp~~ and ramp ~~stairway~~ is served by an exterior ramp ~~and/~~or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior exit stairway ~~ramp~~ and ramp ~~stairway~~ serving ~~located in~~ a building ~~or structure~~ that is permitted to have unenclosed ~~interior~~ stairways in accordance with Section 1022.1.
4. Separation from the interior of the building is not required for exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ connected to open-ended corridors provided that Items 4.1 through 4.4 are met:
   - 4.1. The building, including corridors, exit stairways ~~ramps and~~ or ramps ~~stairs~~, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
   - 4.2. The open-ended corridors comply with Section 1018.
   - 4.3. The open-ended corridors are connected on each end to an exterior exit ramp or stairway complying with Section 1026.
   - 4.4. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior exit stairway ~~ramp~~ and ramp ~~stairway~~ shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

2. Add new text as follows:

707.3.10 Exterior Exit Stairways and ramps. The fire-resistance rating of the fire barrier separating building areas from an exterior exit stairway and ramp shall comply with Section 1026.5.

Reason: This is an attempt to clean up the exterior exit stair provisions. First the majority of exterior exit elements that are designed in accordance with this section are stairs, not ramps therefore Stairway has been placed before Ramp.

Section 1026.1 has been re-titled as General so the title is not a restatement of the overall section title and follows the common code format. The exception for open exterior stairways have been revised to allow exterior exit stairways that are attached to open buildings to not have to meet the provisions in this section since the danger of smoke accumulation in the stairway is not there.

Section 1026.2 changes are all editorial.

Section 1026.4 was deleted and the requirement for the stair to be open to a yard was added to Section 1026.3.

Section 1026.5 Location was renamed separation distance and the 10 fire separation distance based on Section 1027.2 was included in section 1026.5 and the reference to Section 1027.3 was removed. Exterior exit stairs are not part of the exit discharge therefore it is incorrect and confusing to reference the separation requirements on exit discharge requirements. Furthermore a cross reference was added for Section 705.2.

Section 1026.6 was modified to include the fire rated protection requirements for an exterior stair in the exterior stair section and remove the reference to interior exit stairs. These are not interior exit stairs and the protection requirements should be available in the exterior exit stair section specific to exterior exit stairs.

Section 707.3.10 was added in keeping with the organization of Section 707.3 listing as a cross reference all of the locations fire barriers are used.

Cost Impact: This proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Clements-E5-1026

E133–09/10
1026.6 (IFC [B] 1026.6)

Proponent: Anne VonWeller, Murray City, representing the Utah Chapter of the International Code Council

Revise as follows:

1026.6 (IFC [B] 1026.6) Exterior ramps and stairway protection. Exterior exit ramps and stairways shall be separated from the interior of the building as required in Section 1022.1. Openings shall be limited to those necessary for egress from normally occupied spaces.

Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are no more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.
2. Separation from the interior of the building is not required where the exterior ramp or stairway is served by an exterior ramp or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior ramp or stairway located in a building or structure that is permitted to have unenclosed interior stairways in accordance with Section 1022.1 or Exceptions 3 and 4 of Section 1016.1.
4. Separation from the interior of the building is not required for exterior ramps or stairways connected to open-ended corridors, provided that Items 4.1 through 4.4 are met:
   - 4.1. The building, including corridors and ramps and stairs, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
   - 4.2. The open-ended corridors comply with Section 1018.
   - 4.3. The open-ended corridors are connected on each end to an exterior exit ramp or stairway complying with Section 1026.
   - 4.4. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior ramp or stairway shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

Reason: In the 2009 Edition a distinction has been made between 'exit' stairways and ramps and 'exit access' stairways and ramps. In the past all of the exceptions for unenclosed stairways and ramps occurred in Section 1022.1. Now some of those exceptions are located in Section 1022.1 and some in Section 1016. This change is to lead user to the new location for the two exceptions relocated to Section 1016.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Vonweller-E1-1023.6

E134–09/10
1026.6 (IFC [B] 1026.6)

Proponent: Rej Simenson, City of Aurora Building Codes Division, Aurora, Colorado

Revise as follows:

1026.6 (IFC [B] 1026.6) Exterior ramps and stairway protection. Exterior exit ramps and stairways shall be separated from the interior of the building as required in Section 1022.1. Openings shall be limited to those necessary for egress from normally occupied spaces.

Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are no more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.
2. Separation from the interior of the building is not required where the exterior ramp or stairway is served by an exterior ramp or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior ramp or stairway located in a building or structure that is permitted to have unenclosed interior stairways in accordance with Section 1022.1.
4. Separation from the interior of the building is not required for exterior ramps or stairways connected to open-ended corridors, provided that the adjacent exterior wall and openings comply with Section 1022.6 and Items 4.1 through 4.4 are met:
   - 4.1. The building, including corridors and ramps and stairs, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
   - 4.2. The open-ended corridors comply with Section 1018.
   - 4.3. The open-ended corridors are connected on each end to an exterior exit ramp or stairway complying with Section 1026.
   - 4.4. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior ramp or stairway shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

Reason: This code change directs the code user back to Section 1022.6 for the building wall and opening rating requirements adjacent to the exterior exit stairway openings. The 2009 Section 1022.6 requirements protect openings on the exterior of the exit enclosure from fires on the interior of the building that may project through windows or other openings in the exterior building walls at an angle of less than 180 degrees. This code change clarifies the minimum protection for occupants and fire responders using the exit.

The original exception #4 eliminated the interior separation wall and door between the interior corridor and the exterior exit stairway. Separation from the **exterior** building wall at less than 180 degrees is NOT addressed in exception 4 and this has led to varied application of this section to the exterior walls of the building adjacent to the exterior exit stairway when this exception was the end of the code research.

The exterior exit stairway is defined as an exit and the protection of exit enclosures from smoke and fire is addressed in Section 1022.6. This code change makes that code connection for this critical life safety protection within the exception. The designer is directed to that critical reference, so that lesser protection standards are not assumed for openings adjacent to an exterior exit stairway than other vertical exit enclosures. This code change clarifies the minimum exterior wall protection for safe exiting during an emergency for occupants and provides safety to the fire fighters and emergency responders during emergency operations.

The graphics below show an interpretation of this section and the unprotected openings without reference to Section 1022.6 requirements.

ICCFILENAME:Simenson-E1-1026.6

E135–09/10
1027.1 (IFC [B] 1027.1)

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1027.1 (IFC [B] 1027.1) General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 below shall not exceed 50 percent of the number and capacity of the required exits.

Exceptions:

1. A maximum of 50 percent of the number and capacity of exit enclosures is permitted to egress through areas on the level of discharge provided all of the following are met.
   - 1.1 Such exit enclosures egress to a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the exit enclosure.
   - 1.2 The entire area of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
   - 1.3 The egress path from the exit enclosure on the level of exit discharge is protected throughout by an approved automatic sprinkler system. All portions of the level of exit discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the ~~enclosure of exits~~ exit enclosure.
2. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through

a vestibule provided all of the following are met:

~~2.4~~ 2.1 The area is used only for means of egress and exits directly to the outside.

2.2 The vestibule depth from the exterior of the building is not greater than 10 feet (3048 mm) and the vestibule length is not greater than 30 feet (9144 mm).

2.3 The area is separated from the remainder of the level of exit discharge by a fire barrier having a one hour fire-resistance rating. ~~construction providing protection at least the equivalent of approved wire glass in steel frames~~ Doors and windows in the separation walls shall be rated ¾ hour and shall not exceed the size limits specified in Section 707.6. Duct penetrations shall comply with Section 713.1.1, and other penetrations shall comply with Section 713.3.

~~2.1~~ 2.4 The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.

3. Stairways in open parking garages complying with Section 1022.1, Exception 4, are permitted to egress through the open parking garage at their levels of exit discharge.
4. Horizontal exits complying with Section 1025 shall not be required to discharge directly to the exterior of the building.

Reason: Exception item 1.3 is editorially revised to replace the wording "requirements for the enclosure of exits" with "requirements for the "*exit enclosure*". The existing wording is vague because it does not specify the type of exit (exit enclosure) that it intends to require, while the replacement wording matches that used in current items 1.2 and 2.1

In Exception 2, items 2.1 and 2.4 are relocated but their wording is unchanged, and exception items 2.2 and 2.3 are revised with new wording. Exceptions 3 and 4 are unchanged.

Existing item 2.4 is unchanged, but is relocated to the beginning (becomes item 2.1) because it states a primary egress criterion, and because it corresponds to the type of information specified in item 1.1 of Exception 1.

Existing item 2.1 is unchanged, but is relocated to the end (becomes item 2.4).

Existing item 2.2 has the word "vestibule" added before the depth and length dimensions, to clarify that these dimension apply to the vestibule's maximum size.

Existing item 2.3 has its first sentence revised to specify exactly what type of rated wall and what minimum fire resistance must be provided to separate the vestibule from other areas on the level of discharge. Item 2.3 currently only vaguely describes what is intended by making the statement "*construction providing protection at least the equivalent of approved wire glass in steel frames*". Not only does that statement not provide specific guidance regarding wall type or minimum rating, it is also silent regarding the rating of the wire glass or its maximum area.

To remedy this lack of specificity, a new second sentence is added to specify a minimum ¾ hour rating for any door and window openings in the separation wall. That rating is consistent with Table 715.4 for doors in "other fire barriers" having one hour rating, and with Table 715.5 for windows in one hour rated fire barriers. The ¾ hour rating allows wire glass to be used, but places limits on the size of those windows, as specified for ¾ hour wire glass panels in Table 715.5.4. The second sentence also limits total opening area consistent with the limits set forth in Section 707.6 for all fire barrier walls. A new third sentence also specifies that duct penetrations and other penetrations in the separation wall must comply with Sections 713.1.1 and 713.3.

Code users need more specificity regarding the construction of the fire resistive walls surrounding the vestibule permitted in exception 2. Adequate protection of this interior space on the level of discharge is certainly warranted to ensure the safety of occupants during egress and to provide protection of fire personnel entering through the vestibule to use the exit enclosure for rescue or fire suppression. This change intends to bring the necessary specificity into this code provision by providing one hour rated fire barrier walls and ¾ hour rated door or window openings of a size appropriate for the nature of the egress component being protected.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Maiel-E6-1027.1

E136–09/10
1027.1 (IFC [B] 1027.1)

Proponent: Sarah A. Rice, CBO, representing self

Revise as follows:

1027.1 (IFC [B] 1027.1) General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 below shall not exceed 50 percent of the number and capacity of the required exits.

Exceptions:

1. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through areas on the level of discharge provided all of the following are met:
   1.1. Such exit enclosures egress to a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the exit enclosure.

1.2. The entire area of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
1.3. The egress path from the exit enclosure on the level of exit discharge is protected throughout by an approved automatic sprinkler system. All portions of the level of exit discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of exits.

2. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through a vestibule provided all of the following are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the level of exit discharge by construction providing protection at least the equivalent of approved wired glass in steel frames.
   2.4. The area is used only for means of egress and exits directly to the outside.
3. Stairways in open parking garages complying with Section 1022.1, Exception 4, are permitted to egress through the open parking garage at their levels of exit discharge.
4. Horizontal exits complying with Section 1025 shall not be required to discharge directly to the exterior of the building.
5. The exit discharge for an exit enclosure which terminate in a court without direct access to a public way is permitted to reenter the building provided one of the following are met:
   5.1. An exit passageway which has the same fire-resistance rating as the exit enclosure served, is provided through the building from the court to an exterior wall of the building fronting on a public way; or
   5.2. A covered walkway which is open to the atmosphere at opposite ends is provided through the building to an exterior wall fronting on a public way and which has walls and ceiling of not less than 1 hour fire-resistance-rated-construction and opening protected with opening protectives have not less than a ¾ hour rating.

Reason: Prior to 1997 at least one of the legacy codes allowed exit enclosures to terminate into an open central court surround on all sides by a building. To provide exit discharge from such court, the code permitted an exit passageway. The IBC is silent on this type of design, and a strict reading of Section 1027.1 would prohibit it. The exception proposes two options. The first is the exit passageway. The second is an open 'breezeway' or 'tunnel' which goes from the court to the public way. It has been interpreted that the code allows the approach in 5.2 because it doesn't 're-enter' the building, but simply goes 'under' the building. This proposal codifies that interpretation. Essentially the 5.2 option is a passageway without enclosures at either end. To be consistent with other exit passageways, the passageway allowed here should have the same rating as the vertical exit enclosure served. Only one hour is proposed for the open breezeways as this is consistent with the egress court provisions in Section 1027 and because this is an atmospherically open tunnel, 1 hour should be sufficient to protect the users.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Rice-E2-1027.1

E137–09/10
705.2, 1027.3 (IFC [B] 1027.3)

Proponent: Ron Clements, Chesterfield County Virginia Building Inspection Department, representing self

Revise as follows:

1027.3 (IFC [B] 1027.3) Exit discharge separation distance ~~location~~. Exterior balconies, stairways and ramps within the exit discharge component of the means of egress shall be ~~located~~ separated in accordance with Section 705.2.~~at least 10 feet (3048 mm) from adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.~~

705.2 Projections. Cornices, eave overhangs, exterior balconies, exterior stairways, and exterior ramps, and similar projections extending beyond the exterior wall shall conform the requirements of this section and Section 1406. Exterior egress balconies and exterior exit stairways shall also comply with Section 1019 and 1026, respectively. Projections shall not extend beyond the distance determined by the following three methods, whichever results in the lesser projections:

1. A point one-third the distance from the exterior face of the wall to the lot line where protected openings or a combination of protected and unprotected openings are required in the exterior wall.
2. A point one-half the distance from the exterior face of the wall to the lot line where all openings in the exterior wall are permitted to be unprotected or the building is equipped throughout with an automatic sprinkler system installed under the provisions of Section 705.8.2.
3. More than 12 inches (305 mm) into areas where openings are prohibited.

Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section.

Reason: The intent of this change is to refer back to Section 705.2 for separation distance requirements related to exterior exit discharge balconies, ramps and stairways. Additionally Section 705.2 Projections in chapter 7 provides the required separation guidelines for building elements that project out past the exterior wall of the building and includes exterior balconies and exterior exit stairways and ramps. Another issue with the text proposed for deletion is that the 10 feet is measured to the other building on the same lot unless the exterior walls are protected. That leaves the question if the exterior walls are protected for) clearances is no clearance required between the adjacent building's exterior wall and the balcony or stair if 705.2 is limiting the projection per the 3 items in 705.2?

Section 705.2 is included to add Stairways and Ramps to the section.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Clements-E4-1027.3

E138–09/10
1027.3 (IFC [B] 1027.3)

Proponent: Lawrence Brown, CBO, National Association of Home Builders (NAHB); Eirene Oliphant, MCP, Building Official, representing City of Leawood, KS

Revise as follows:

1027.3 (IFC [B] 1027.3) Exit discharge location. Exterior balconies, stairways and ramps shall be located at least 10 feet (3048 mm) from adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.

Exception: Where serving Group R-3 occupancies, exterior balconies, stairways and ramps shall be permitted to be located 5 feet (1524 mm) minimum from adjacent lot lines and from other buildings on the same lot.

Reason: The added exception will help to coordinate this section with the provisions found in Table 705.8. Footnote "f" of Table 705.8 allows an unlimited amount of unprotected openings with a fire separation distance of 5 feet or greater. It would seem reasonable to allow the exterior stairways, ramps and balconies for a Group R-3 to be located in the 5 to 10 foot range if it is permissible to have an unlimited amount of unprotected openings.

While the 10 foot provision of this section does coordinate with the exterior wall rating required in Table 602 for most Group R-3 construction, permitting an unlimited amount of unprotected openings in that wall effectively eliminates the required protection beyond the 5 foot distance. Changing this section will help to coordinate with many local zoning laws that impose a 5 foot side yard requirement in residential areas. In addition Table R302.1 of the IRC permits walls to be non-rated if over 5 feet.

If the committee and members would consider another possible exception, it may be reasonable to add a second exception that would coordinate with footnote "d" of Table 705.8. This second exception would allow exterior stairs, ramps and balconies to have a minimum of 3 feet of separation provided that the wall had no more than 25 percent of unprotected or protected openings. Possible wording would be:

Exceptions:

2. In Group R-3 occupancies where the exterior wall of the exterior stairway, ramp and balcony comply with footnote "d" of Table705.8, a separation of 3 feet (915 mm) minimum shall be provided from adjacent lot lines and from other buildings on the same lot.

This second exception would not only coordinate with the provisions of Table 705.8 but would seem to correct an inconsistency that occurs within the code. As currently written, the code would allow an "interior" stairway to be located within the 3 to 5 foot range and allow 25 percent of the wall to be an unprotected opening. However, if that opening or an opening on an adjacent side exceeded 35 square feet (Section 1026.3) and the stair then was considered as an "exterior" stair it would need to be located "at least 10 feet (3048 mm) from adjacent lot lines." If the level of protection provided for the wall facing the property line is consistent then the code should not impose a 10 foot requirement on "exterior" stairs while allowing "interior" stairs to be 3 feet from the line.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Brown-E1-1027.3

E139–09/10
1019.4 (New), 1026.5, 1027.3 (IFC [B] 1019.4 (New), 1026.5, 1027.3)

Proponent: Gary Pringey representing Colorado Code Consulting, LLC, Colorado Chapter ICC

1. Delete without substitution:

~~**1027.3 (IFC [B] 1027.3) Exit discharge location.** Exterior balconies, stairways and ramps shall be located at least 10 feet (3048 mm) from adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.~~

(Renumber following subsections)

2. Add new text as follows:

1019.4 (IFC [B] 1019.4) Location. Exterior egress balconies shall have a minimum fire separation distance of 10 feet (3048 mm) measured from the exterior edge of the egress balcony to adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.

3. Revise as follows:

1026.5 (IFC [B] 1026.5) Location. Exterior exit ramps and stairways shall ~~be located in accordance with Section 1027.3~~ have a minimum fire separation distance of 10 feet (3048 mm) measured from the exterior edge of the ramp or stairway, including landings to adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.

Reason: The purpose of this proposal is to centralize and clarify design requirements for the exit access portion and exit portion of the means of egress system. Obviously, Section 1027 is titled "EXIT DISCHARGE." Requirements in Section 1027.3 apply only to exterior egress balconies, which are components in the Exit Access, and exterior exit ramps and stairways, which are components in the Exit. These design provisions are mislocated.

Requirements for exterior egress balconies are stated in Section 1019. This proposal relocates the intent of the requirement for the location of exterior egress balconies to Section 1019.4, the applicable subsection for that exit access component. This proposal relocates the intent of the requirement for location of exterior exit ramps and stairways to Section 1026.5. Section 1027.3 is deleted as an inappropriate location to specify design requirements for components of the Exit Access and Exit elements.

Approval of this proposal will clarify current code provisions and assist in the proper determination of exit access and exit design requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

303.1, 1010.2, 1014.3, 1017, 1028, 1104.3, 1104.3.2, 1108.2, (IFC [B] 202, 1010.2, 1014.3, 1017, 1028)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

303.1 (IFC [B] 202) Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

Exceptions:

1. A building or tenant space used for assembly purposes with an occupant load of less than 50 persons shall be classified as a Group B occupancy.
2. A room or space used for assembly purposes with an occupant load of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.

3. A room or space used for assembly purposes that is less than 750 square feet (70m^2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
4. ~~Assembly areas~~ A room or space used for assembly purposes that are ~~accessory to~~ associated with a Group E occupancies are not considered separate occupancies ~~except when applying the assembly occupancy requirements of Chapter 11~~.
5. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

1010.2 (IFC [B] 1010.2) Slope. Ramps used as part of a means of egress shall have a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope). The slope of other pedestrian ramps shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

Exception: Aisle ramp slope in a room or space used for assembly purposes ~~occupancies of Group A or assembly occupancies accessory to Group E occupancies~~ shall comply with Section 1028.11.

1014.3 (IFC [B] 1014.3) Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Group H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in a room or space used for assembly purposes ~~Group A occupancies and assembly occupancies accessory to Group E occupancies~~ having fixed seating, see Section 1028.8.

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

SECTION 1017 (IFC [B] 1017)
AISLES and AISLE ACCESSWAYS

1017.1 (IFC [B] 1017.1) General. Aisles and aisle accessways serving as a portion of the exit access in the means of egress system shall comply with the requirements of this section. Aisles or aisle accessways shall be provided from all occupied portions of the exit access which contain seats, tables, furnishings, displays and similar fixtures or equipment. Aisles serving a room or space used for assembly purposes ~~areas~~ shall comply with Section 1028. ~~Aisles serving reviewing stands, grandstands and bleachers shall also comply with Section 1028.~~ The required width of aisles shall be unobstructed.

Exception: Doors complying with Section 1005.2.

~~**1017.4 (IFC [B] 1017.4) Seating at tables.**~~ *(Relocate to Section 1028)*

~~**1017.4.1 (IFC [B] 1017.4.1) Aisle accessway for tables and seating.**~~ *(Relocate to Section 1028)*

~~**1017.4.2 (IFC [B] 1017.4.2) Table and seating accessway width.**~~ *(Relocate to Section 1028)*

~~**1017.4.3 (IFC [B] 1017.4.3) Table and seating aisle accessway length.**~~ *(Relocate to Section 1028)*

SECTION 1028
ASSEMBLY

1028.1 (IFC [B] 1028.1) General. A room or space used for assembly purposes ~~Occupancies in Group A and assembly occupancies accessory to Group E~~ which contain seats, tables, displays, equipment or other material shall comply with this section.

1028.2 (IFC [B] 1028.2) Assembly main exit. ~~Group A~~ A building, room or space used for assembly purposes ~~occupancies and assembly occupancies accessory to Group E occupancies~~ that ~~have~~ has an occupant load of greater than 300 ~~shall be~~ and provided with a main exit~~. The~~ , the main exit shall be of sufficient width to accommodate not less than one-half of the occupant load, but such width shall not be less than the total required width of all means of egress leading to the exit. Where the building is classified as a Group A occupancy, the main exit shall front on at least one street or an unoccupied space of not less than 10 feet (3048 mm) in width that adjoins a street or public way. In a building, room or space used for assembly purposes where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building provided that the total width of egress is not less than 100 percent of the required width.

~~**Exception:** In assembly occupancies where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building provided that the total width of egress is not less than 100 percent of the required width.~~

1028.3 (IFC [B] 1028.3) Assembly other exits. In addition to having access to a main exit, each level in ~~Group A~~ a building used for assembly purposes ~~occupancies or assembly occupancies accessory to Group E occupancies~~ having an occupant load greater than 300 and provided with a main exit, shall be provided with additional means of egress that shall provide an egress capacity for at least one-half of the total occupant load served by that level and comply with Section 1015.2. In a building used for assembly purposes where there is no well-defined main exit or where multiple main exits are provided, exits for each level shall be permitted to be distributed around the perimeter of the building, provided that the total width of egress is not less than 100 percent of the required width.

~~**Exception:** In assembly occupancies where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building, provided that the total width of egress is not less than 100 percent of the required width.~~

1028.5 (IFC [B] 1028.5) Interior balcony and gallery means of egress. For balconies, galleries or press boxes having a seating capacity of 50 or more located in a building, room or space used for assembly purposes ~~Group A occupancies~~, at least two means of egress shall be provided, with one from each side of every balcony, gallery or press box and at least one leading directly to an exit.

1028.6.2 (IFC [B] 1028.6.2) Smoke-protected seating. The clear width of the means of egress for smoke-protected assembly seating shall not be less than the occupant load served by the egress element multiplied by the appropriate factor in Table 1028.6.2. The total number of seats specified shall be those within the space exposed to the same smoke-protected environment. Interpolation is permitted between the specific values shown. A life safety evaluation, complying with NFPA 101, shall be done for a facility utilizing the reduced width requirements of Table 1028.6.2 for smoke-protected assembly seating.

Exception: For an outdoor smoke-protected assembly seating with an occupant load not greater than 18,000, the clear width shall be determined using the factors in Section 1028.6.3.

TABLE 1028.6.2(IFC [B] 1028.6.2)
WIDTH OF AISLES FOR SMOKE-PROTECTED ASSEMBLY

TOTAL NUMBER OF SEATS IN THE SMOKEPROTECTED ASSEMBLY ~~OCCUPANCY~~ SEATING	INCHES OF CLEAR WIDTH PER SEAT SERVED			
	Stairs and aisle steps with handrails within 30 inches	Stairs and aisle steps without handrails within 30 inches	Passageways, doorways and ramps not steeper than 1 in 10 in slope	Ramps steeper than 1 in 10 in slope

(Portions of table not shown remain unchanged)

1028.6.3 (IFC [B] 1028.6.3) Width of means of egress for outdoor smoke-protected assembly seating. The clear width in inches (mm) of aisles and other means of egress shall be not less than the total occupant load served by the egress element multiplied by 0.08 (2.0 mm) where egress is by aisles and stairs and multiplied by 0.06 (1.52 mm) where egress is by ramps, corridors, tunnels or vomitories.

Exception: The clear width in inches (mm) of aisles and other means of egress shall be permitted to comply with Section 1028.6.2 for the number of seats in the outdoor smoke-protected assembly seating where Section 1028.6.2 permits less width.

1028.9 (IFC [B] 1028.9) Assembly aisles are required. Every occupied portion of any a building, room or space used for assembly purposes ~~occupancy~~ ~~in Group A or assembly occupancies accessory to Group E~~ that contains seats, tables, displays, similar fixtures or equipment shall be provided with aisles leading to exits or exit access doorways in accordance with this section. Aisle accessways for tables and seating shall comply with Section 1017.4.

1028.10 (IFC [B] 1028.10) Aisle accessways. Aisle accessways for seating at tables shall comply with Section 1028.10.1. Aisle accessways for seating in rows shall comply with Section 1028.10.2.

~~1017.4~~ 1028.10.1 (IFC [B] ~~1017.4~~ 1028.10.1) Seating at tables. Where seating is located at a table or counter and is adjacent to an aisle or aisle accessway, the measurement of required clear width of the aisle or aisle accessway shall be made to a line 19 inches (483 mm) away from and parallel to the edge of the table or counter. The 19-inch (483 mm) distance shall be measured perpendicular to the side of the table or counter. In the case of other side boundaries for aisle or aisle accessways, the clear width shall be measured to walls, edges of seating and tread edges, except that handrail projections are permitted.

Exception: Where tables or counters are served by fixed seats, the width of the aisle accessway shall be measured from the back of the seat.

~~1017.4.1~~ 1028.10.1.1 (IFC [B] ~~1017.4.1~~ 1028.10.1.1) Aisle accessway width for seating at tables ~~and seating~~. Aisle accessways serving arrangements of seating at tables or counters shall have sufficient clear width to conform to the capacity requirements of Section 1005.1 but shall not have less than ~~the appropriate minimum clear width specified in Section 1017.4.2~~ a minimum of 12 inches (305 mm) of width plus 1/2 inch (12.7 mm) of width for each additional 1 foot (305 mm), or fraction thereof, beyond 12 feet (3658 mm) of aisle accessway length measured from the center of the seat farthest from an aisle.

~~1017.4.2 (IFC [B] 1017.4.2) Table and seating accessway width.~~ ~~Aisle accessways shall provide a minimum of 12 inches (305 mm) of width plus 1/2 inch (12.7 mm) of width for each additional 1 foot (305 mm), or fraction thereof, beyond 12 feet (3658 mm) of aisle accessway length measured from the center of the seat farthest from an aisle.~~

Exception: Portions of an aisle accessway having a length not exceeding 6 feet (1829 mm) and used by a total of not more than four persons.

~~1017.4.3~~ 1028.10.1.2 (IFC [B] ~~1017.4.3~~ 1028.10.1.2) Seating at table ~~and seating~~ aisle accessway length. The length of travel along the aisle accessway shall not exceed 30 feet (9144 mm) from any seat to the point where a person has a choice of two or more paths of egress travel to separate exits.

~~1028.10~~ 1028.10.2 (IFC [B] ~~1028.10~~ 1028.10.2) Clear width of aisle accessways serving seating in rows. Where seating rows have 14 or fewer seats, the minimum clear aisle accessway width shall not be less than 12 inches (305 mm) measured as the clear horizontal distance from the back of the row ahead and the nearest projection of the row behind. Where chairs have automatic or self-rising seats, the measurement shall be made with seats in the raised position. Where any chair in the row does not have an automatic or self-rising seat, the measurements shall be made with the seat in the down position. For seats with folding tablet arms, row spacing shall be determined with the tablet arm in the used position.

Exception: For seats with folding tablet arms, row spacing is permitted to be determined with the tablet arm in the stored position where the tablet arm when raised manually to vertical position in one motion automatically returns to the stored position by force of gravity.

~~1028.10.1~~ 1028.10.2.1 (IFC [B] ~~1028.10.1~~ 1028.10.2.1) Dual access. For rows of seating served by aisles or doorways at both ends, there shall not be more than 100 seats per row. The minimum clear width of 12 inches (305 mm) between rows shall be increased by 0.3 inch (7.6 mm) for every additional seat beyond 14 seats, but the minimum clear width is not required to exceed 22 inches (559 mm).

Exception: For smoke-protected assembly seating, the row length limits for a 12-inch-wide (305 mm) aisle accessway, beyond which the aisle accessway minimum clear width shall be increased, are in Table 1028.10.1.

TABLE ~~1028.10.1~~ 1028.10.2.1(IFC [B] ~~1028.10.1~~ 1028.10.2.1)
SMOKE-PROTECTED
ASSEMBLY AISLE ACCESSWAYS

TOTAL NUMBER OF SEATS IN THE SMOKEPROTECTED ASSEMBLY ~~OCCUPANCY~~ SEATING	MAXIMUM NUMBER OF SEATS PER ROW PERMITTED TO HAVE A MINIMUM 12-INCH CLEAR WIDTH AISLE ACCESSWAY	
	Aisle or doorway at both ends of row	Aisle or doorway at one end of row only

(Portions of table not shown remain unchanged)

~~1028.10.2~~ 1028.10.2.2 (IFC [B] ~~1028.10.2~~ 1028.10.2.2) Single access. For rows of seating served by an aisle or doorway at only one end of the row, the minimum clear width of 12 inches (305 mm) between rows shall be increased by 0.6 inch (15.2 mm) for every additional seat beyond seven seats, but the minimum clear width is not required to exceed 22 inches (559 mm).

Exception: For smoke-protected assembly seating, the row length limits for a 12-inch-wide (305 mm) aisle accessway, beyond which the aisle accessway minimum clear width shall be increased, are in Table ~~1028.10.1~~ 1028.10.2.1.

1028.12 (IFC [B] 1028.12) Seat stability. In ~~places of~~ a building, room or space used for assembly purposes, the seats shall be securely fastened to the floor.

Exceptions:

1. In ~~places of~~ a building, room or space used for assembly purposes or portions thereof without ramped or tiered floors for seating and with 200 or fewer seats, the seats shall not be required to be fastened to the floor.
2. In ~~places of~~ a building, room or space used for assembly purposes or portions thereof with seating at tables and without ramped or tiered floors for seating, the seats shall not be required to be fastened to the floor.
3. In ~~places of~~ a building, room or space used for assembly purposes or portions thereof without ramped or tiered floors for seating and with greater than 200 seats, the seats shall be fastened together in groups of not less than three or the seats shall be securely fastened to the floor.
4. In ~~places of~~ a building, room or space used for assembly purposes where flexibility of the seating arrangement is an integral part of the design and function of the space and seating is on tiered levels, a maximum of 200 seats shall not be required to be fastened to the floor. Plans showing seating, tiers and aisles shall be submitted for approval.
5. Groups of seats within a ~~places of~~ a building, room or space used for assembly purposes separated from other seating by railings, guards, partial height walls or similar barriers with level floors and having no more than 14 seats per group shall not be required to be fastened to the floor.
6. Seats intended for musicians or other performers and separated by railings, guards, partial height walls or similar barriers shall not be required to be fastened to the floor.

1028.14 (IFC [B] 1028.14) Assembly guards. ~~Assembly~~ Guards adjacent to seating in a building, room or space used for assembly purposes shall comply with Sections 1028.14.1 through 1028.14.3.

~~**1028.15 (IFC [B] 1028.15) Bench seating.** Where bench seating is used, the number of persons shall be based on one person for each 18 inches (457 mm) of length of the bench.~~

1104.3 Connected spaces. When a building or portion of a building is required to be accessible, an accessible route shall be provided to each portion of the building, to accessible building entrances connecting accessible pedestrian walkways and the public way.

Exceptions:

1. In a building, room or space used for assembly purposes ~~areas~~ with fixed seating, an accessible route shall not be required to serve levels where wheelchair spaces are not provided.
2. In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.

1104.3.2 Press boxes. Press boxes in a building, room or space used for assembly purposes ~~areas~~ shall be on an accessible route.

Exceptions:

1. An accessible route shall not be required to press boxes in bleachers that have points of entry at only one level, provided that the aggregate area of all press boxes is 500 square feet (46 m^2) maximum.
2. An accessible route shall not be required to free-standing press boxes that are elevated above grade 12 feet (3660 mm) minimum provided that the aggregate area of all press boxes is 500 square feet (46 m^2) maximum.

1108.2 Assembly area seating. A building, room or space used for assembly purposes ~~areas~~ with fixed seating shall comply with Sections 1108.2.1 through ~~1108.2.8~~ 1108.2.5. Lawn seating areas shall comply with Section 1108.2.6. Assistive listening systems shall comply with Section 1108.2.7. Performance areas viewed from assembly seating areas shall comply with Section 1108.2.8. Dining areas shall comply with Section 1108.2.9. ~~In addition, lawn seating shall comply with Section 1108.2.6~~.

1108.2.2.4 Team or player seating. *(No change to text)*

1108.2.3 Companion seats. *(No change to text)*

1108.2.4 Dispersion of wheelchair spaces in multilevel assembly seating areas. In multilevel assembly seating areas, wheelchair spaces shall be provided on the main floor level and on one of each two additional floor or mezzanine levels. Wheelchair spaces shall be provided in each luxury box, club box and suite within assembly facilities.

Exceptions:

1. In multilevel assembly seating areas ~~spaces~~ utilized for worship services where the second floor or mezzanine level contains 25 percent or less of the total seating capacity, wheelchair spaces shall be permitted to all be located on the main level.
2. In multilevel assembly seating areas where the second floor or mezzanine level provides 25 percent or less of the total seating capacity and 300 or fewer seats, all wheelchair spaces shall be permitted to be located on the main level.
3. Wheelchair spaces in team or player seating serving areas of sport activity are not required to be dispersed.

1108.2.5 Designated aisle seats. *(No change to text)*

1108.2.6 Lawn seating. *(No change to text)*

1108.2.7 Assistive listening systems. Each building, room or space used for assembly purposes ~~area~~ where audible communications are integral to the use of the space shall have an assistive listening system.

Exception: Other than in courtrooms, an assistive listening system is not required where there is no audio amplification system.

1108.2.7.1 Receivers. Receivers shall be provided for assistive listening systems in accordance with Table 1108.2.7.1.

Exceptions:

1. Where a building contains more than one room or space used for assembly purposes ~~area~~, the total number of required receivers shall be permitted to be calculated according to the total number of seats ~~in the assembly areas~~ in the building, provided that all receivers are usable with all systems and if the rooms or spaces used for assembly purposes ~~areas~~ required to provide assistive listening are under one management.
2. Where all seats in ~~an~~ a building, room or space used for assembly purposes ~~area~~ are served by an induction loop assistive listening system, the minimum number of receivers required by Table 1108.2.7.1 to be hearing-aid compatible shall not be required.

1108.2.8 Performance areas. *(No change to text)*

1108.2.9 Dining areas. *(No change to text)*

1108.2.9.1 Dining surfaces. *(No change to text)*

Reason: Throughout the building code there are three distinct use of the term assembly; assembly occupancy, assembly and assembly seating. Primarily, the portions relating to assembly occupancy establish the fire resistance associated with that Use Group. Assembly relates to a room or space where people assemble with the building code addressing life safety and accessibility requirements associated. Assembly seating relates to either seating at tables or row seating, which have unique accessibility and life safety requirements that differ from other assembly areas. This proposal clarifies the requirements associated with assembly and assembly seating from an assembly occupancy. For example, Table 1108.2.2.1 requires a wheelchair space where there are 4 fixed seats in assembly seating, an assembly occupancy requires at least 50 occupants.

The intent of this proposal is for consistency throughout the IBC. The purpose is to separate the Group A occupancy classifications used for height and area requirements, sprinklers, etc., from provisions for assembly areas where the use of the space determines the requirements (i.e., means of egress and accessibility). Sections 1028 and 1108.2 are for spaces used for assembly puroses, not just Group A buildings, therefore the text that references these provisions and included in those provisions should reflect that where appropriate.

The provisions for occupant load, seating, aisles and aisle accessways, and accessibility are associated with the use of the space (items found in Chapter 10 and 11), not the group assigned for height and area limitations, therefore, the limitation in Exception 4 to just Chapter 11 is inappropriate. This proposal also relocated Section 1017.4 that covers aisle access ways in assembly spaces with tables to Section 1028 since aisles for all assembly, including tables, are covered in Sections 1028.9 through 1028.9.6. The assistive listening and performance areas are not always associated with fixed seating. Lawn seating does not contain any fixed seating, therefore, the base paragraph should be revised to reflect the sections appropriately. Section 1028.15 is not needed since it repeats what is required in Section 1004.7.

Cost Impact: The proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-G1-303.1

E141–09/10

303.1, 1010.2, 1014.3, 1028 (IFC [B] 1010.2, 1014.3, 1028)

Proponent: Daniel E. Nichols, PE, New York State Dept. of State, Div. of Code Enforcement and Administration

Revise as follows:

303.1 Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

Exceptions:

1. A building or tenant space used for assembly purposes with an occupant load of less than 50 persons shall be classified as a Group B occupancy.
2. A room or space used for assembly purposes with an occupant load of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.

3. A room or space used for assembly purposes that is less than 750 square feet (70m^2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
4. ~~Assembly areas~~ A room or space used for assembly purposes that are accessory to Group E occupancies are not considered separate occupancies ~~except when applying the assembly occupancy requirements of Chapter 11~~.
5. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

1010.2 (IFC [B] 1010.2) Slope. Ramps used as part of a means of egress shall have a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope). The slope of other pedestrian ramps shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

Exception: Aisle ramp slope in a room or space used for assembly purposes ~~occupancies of Group A or assembly occupancies accessory to Group E occupancies~~ shall comply with Section 1028.11.

1014.3 (IFC [B] 1014.3) Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Group H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in a room or space used for assembly purposes ~~Group A occupancies and assembly occupancies accessory to Group E occupancies~~ having fixed seating, see Section 1028.8.

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

SECTION 1028
ASSEMBLY

1028.1 (IFC [B] 1028.1) General. Occupancies in Group A and assembly occupancies accessory to ~~Group E~~ other use groups which contain seats, tables, displays, equipment or other material shall comply with this section.

1028.2 (IFC [B] 1028.2) Assembly main exit. Group A occupancies and assembly occupancies accessory to ~~Group E occupancies~~ other use groups that have an occupant load of greater than 300 shall be provided with a main exit. The main exit shall be of sufficient width to accommodate not less than one-half of the occupant load, but such width shall not be less than the total required width of all means of egress leading to the exit. ~~Where the building is classified as a Group A occupancy,~~ the main exit shall front on at least one street or an unoccupied space of not less than 10 feet (3048 mm) in width that adjoins a street or public way.

Exception: In assembly occupancies where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building provided that the total width of egress is not less than 100 percent of the required width.

1028.3 (IFC [B] 1028.3) Assembly other exits. In addition to having access to a main exit, each level in Group A occupancies or assembly occupancies accessory to ~~Group E occupancies~~ other use groups having an occupant load greater than 300, shall be provided with additional means of egress that shall provide an egress capacity for at least one-half of the total occupant load served by that level and comply with Section 1015.2.

Exception: In assembly occupancies where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building, provided that the total width of egress is not less than 100 percent of the required width.

1028.4 (IFC [B] 1028.4) Foyers and lobbies. In Group ~~A-1~~A occupancies or assembly occupancies accessory to

other use groups, where persons are admitted to the building at times when seats are not available, such persons shall be allowed to wait in a lobby or similar space, provided such lobby or similar space shall not encroach upon the required clear width of the means of egress. Such foyer, if not directly connected to a public street by all the main entrances or exits, shall have a straight and unobstructed corridor or path of travel to every such main entrance or exit.

1028.5 (IFC [B] 1028.5) Interior balcony, gallery and press boxes means of egress. For balconies, galleries or press boxes having a seating capacity of 50 or more located in Group A occupancies or assembly occupancies accessory to other use groups,, at least two means of egress shall be provided, with one from each side of every balcony, gallery or press box and at least one leading directly to an exit.

1028.9 (IFC [B] 1028.9) Assembly aisles are required. Every occupied portion of any occupancy in Group A or assembly occupancies accessory to ~~Group E~~ to other use groups that contains seats, tables, displays, similar fixtures or equipment shall be provided with aisles leading to exits or exit access doorways in accordance with this section. Aisle accessways for tables and seating shall comply with Section 1017.4.

Reason: The use of the accessory use section is applied to assembly areas in more than just group E occupancies. As an example, a supermarket (Group M) is permitted to be of unlimited area and is able to use up to 10% of the building area to be used as assembly space (cafeteria, restaurant) without classifying such space as a Group A. In essence, the bigger the building, the bigger the assembly area can be without providing exiting requirements. It is appropriate to provide assembly exiting provisions regardless of whether the assembly space is accessory or not.

Specific to 1028.4, waiting areas are utilized in other than Group A-1 occupancies. Examples of persons that wait in a pre-event area while the event area is still occupied (other than movies or cinemas) would be restaurants, multiple religious worship services, and changes during sporting events in tournament-style gymnasiums/arenas. This change will expand the capacity of egress when more than the assembly occupancies 'operational' capacity is within the building.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Nichols-E1-1028.1

E142–09/10

1028.1.1.1 (New) [IFC [B] 1028.1.1.1 (New)]

Proponent: Gerard A. Hathaway, RA, New York State Department of State Building Codes Division, representing self.

Add new text as follows:

1028.1.1.1 (IFC [B] 1028.1.1.1) Spaces under grandstands and bleachers. When spaces under grandstands or bleachers are used for purposes other than toilet rooms and ticket booths less than 100 sq.ft. (9.29 m^2), such spaces shall be separated by fire barriers complying with Section 707 and horizontal assemblies complying with Secction 712 with not less than 1-hour fire-resistance-rated construction.

Reason: The intent is to provide requirements for buildings under bleachers and grandstands that include spaces such as concessions, storage and ticket booths. The provisions are consistent with what permitted in the legacy codes. The location of this section is chosen for its proximity to the reference to the ICC 300. That way it will not be missed.

The legacy codes included provisions for spaces under seats to be kept free of combustible and flammable materials. Rooms under the bleachers were enclosed in a 1 hour fire-resistant rated construction. None of this information was passed forward into any edition of the IBC.

ICC 300, Section 305 sends you to the building and fire codes for requirements. The IBC does not include any specific provisions for this area except space over 1,000 sq.ft. must be sprinklered in accordance with Section 903.2.1.5.

From an intent point of view, the general stairway provisions (which may be viewed as similar to part of the bleacher system) require that any space under a stairway be enclosed with a 1 hour fire-resistance-rated construction (Section 1009.6.3).

Southern had –
403.6.2.2 When spaces under grandstands or bleachers are used for purposes other than toilet rooms, ticket booths less than 100 sq.ft. (9.29 m^2) in area and open ramps or level exiting facilities, such spaces shall be separated by not less than 1-hour fire resistant construction.

BOCA had –
1013.8 Spaces underneath seats: Spaces underneath grandstand seats shall be kept free of all combustible and flammable materials and shall not be occupied or used for other than exits; except that where enclosed in not less than 1-hour fire resistance rated construction, the code official shall approve the use of such spaces for other purposed, provided that the safety of the public is not endangered.

ICBO had the following provisions (see the 4th paragraph for separation requirements)–
Division 4. Stadiums, reviewing stands and amusement park structures not included within other Group A Occupancies. Specific and general requirements for grandstands, bleachers and reviewing stands are to be found in Chapter 10.

303.2 Construction, Height and Allowable Area.

303.2.2 Special provisions.

303.2.2.3 Division 4 provisions. Grandstands, bleachers or reviewing stands of Type III One-hour, Type IV or Type V One-hour construction shall not exceed 40 feet (12 192 mm) to the highest level of seat boards; 20 feet (6096 mm) in cases where construction is Type III-N or Type V-N; and 12 feet (3658 mm) in cases where construction is with combustible members in the structural frame and located indoors.

Division 4 structures other than Type III-N and Type V-N grandstands, bleachers, reviewing stands and folding and telescoping seating of open skeleton-frame type without roof, cover or enclosed usable space are not limited in area or height.

Erection and structural maintenance shall conform to these special requirements as well as with other applicable provisions of this code.

When the space under a Division 4 Occupancy is used for any purpose, including means of egress, it shall be separated from all parts of such Division 4 Occupancy, including means of egress, by walls, floor and ceiling of not less than one-hour-fire-resistive construction.

EXCEPTIONS:

1. A means of egress under temporary grandstands need not be separated.
2. The underside of continuous steel deck grandstands when erected outdoors need not be fire protected when occupied for public toilets.

The building official may cause Division 4 structures to be reinspected at least once every six months.

Grandstands, bleachers or folding and telescoping seating may have seat boards, toeboards, bearing or base pads and footboards of combustible materials regardless of construction type.

Seating and exiting requirements for reviewing stands, grandstands, bleachers, and folding and telescoping seating are provided under Section 1008.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME:Hathaway-E1-1028.1.1.1

E143–09/10
1028.9.1 (IFC [B] 1028.9.1)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1028.9.1 (IFC [B] 1028.9.1) Minimum aisle width. The minimum clear width for aisles shall be as shown:

1. Forty-eight inches (1219 mm) for aisle stairs having seating on each side.

   Exception: Thirty-six inches (914 mm) where the aisle serves less than 50 seats.

2. Thirty-six inches (914 mm) for aisle stairs having seating on only one side.

   Exception: Twenty-three inches (584 mm) between an aisle stair handrail and seating where an aisle does not serve more than five rows on one side.

3. Twenty-three inches (584 mm) between an aisle stair handrail or guard and seating where the aisle is subdivided by a handrail.
4. Forty-two inches (1067 mm) for level or ramped aisles having seating on both sides.

   Exceptions:

   1. Thirty-six inches (914 mm) where the aisle serves less that 50 seats.
   2. Thirty inches (762 mm) where the aisle does not serve more than 14 seats.

5. Thirty-six inches (914 mm) for level or ramped aisles having seating on only one side.

   Exceptions:

   1. Thirty inches (762 mm) where the aisle does not serve more than 14 seats.
   2. Twenty-three inches (584 mm) between an aisle stair handrail and seating where an aisle does not serve more than five rows on one side.

Reason: The aisle width requirements became less clear when item #6 in the 2003 IBC became into an exception to Item #5 in the 2006 IBC, which remains in the 2009 IBC. The width of an aisle stair should not be an exception to a level or ramped aisle. Either it should be a separate item as it

was in the 2003 IBC or an exception to an aisle stair with seating on one side. This proposal relocates the current exception to the appropriate aisle stair provision to maintain the format changes that has occurred over the last several editions.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME:Roether-E8-1025.9.1

E144–09/10
1028.9.1 (IFC [B] 1028.9.1)

Proponent: Bill Conner, representing American Society of Theatre Consultants

Revise as follows:

1028.9.1 (IFC [B] 1028.9.1) Minimum aisle width. The minimum clear width for aisles shall be as shown:

1. Forty-eight inches (1219 mm) for aisle stairs having seating on each side.

   Exception: Thirty-six inches (914 mm) where the aisle serves less than 50 seats.

2. Thirty-six inches (914 mm) for aisle stairs having seating on only one side.
3. Twenty-three inches (584 mm) between an aisle stair handrail or guard and seating where the aisle is subdivided by a handrail.
4. Twenty-three inches (584 mm) between an aisle stair handrail and seating where an aisle does not serve more than five rows on one side.

~~4.~~5. Forty-two inches (1067 mm) for level or ramped aisles having seating on both sides.

   Exceptions:

   1. Thirty-six inches (914 mm) where the aisle serves less that 50 seats.
   2. Thirty inches (762 mm) where the aisle does not serve more than 14 seats.

~~5.~~6. Thirty-six inches (914 mm) for level or ramped aisles having seating on only one side.

   Exception ~~Exceptions~~:

   ~~1.~~ Thirty inches (762 mm) where the aisle does not serve more than 14 seats.
   ~~2. Twenty-three inches (584 mm) between an aisle stair handrail and seating where an aisle does not serve more than five rows on one side.~~

Reason: This undoes a change made in the last cycle we believe was in error. First it relocates what was Item 6 to a second exception under item 5. This moved an item dealing with aisle stairs to an exception on ramped aisles. Second, the reason stated was erroneous: this exception does not duplicate point 3, which is for aisle serving seating on both sides of the aisle, but is for the specific case of serving seats on one side only. This is a special burden on smaller rooms such as black box and Alittle@ theatres. The hazard is equivalent (or less because of 60 person limitation) than allowed by 1028.9.1-3. Changing the order will help clarify the original intent by grouping aisle stair requirements together.

Cost Impact: None or lower cost because of narrower aisle permitted. This aisle might otherwise have to be 36" as required by 1028.9.1-2.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME:Conner-E1-1025.9.1

E145–09/10
1028.13 (IFC [B] 1028.13)

Proponent: Bill Conner, representing American Society of Theatre Consultants

Revise as follows:

1028.13 (IFC [B] 1028.13) Handrails. Ramped aisles having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and aisle stairs shall be provided with handrails located either at one or both sides of the aisle ~~the side~~ or within the aisle width.

Exceptions:

1. Handrails are not required for ramped aisles having a gradient no greater than one unit vertical in eight units horizontal (12.5-percent slope) and seating on both sides.
2. Handrails are not required if, at the side of the aisle, there is a guard that complies with the graspability requirements of handrails.
3. Handrail extensions are not required at the top and bottom of aisle stairs and aisle ramp runs to permit crossovers within the aisles.

Reason: This change simply clarifies the original intent (which I believe came from the BCMC Report on Means of Egress) that handrails could be at one side of an aisle. The plural Ahandrails@ is sometimes interpreted as requiring them on both sides.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Conner-E4-1028.13

E146–09/10
1028.13 (IFC [B] 1028.13)

Proponent: Bill Conner, representing American Society of Theatre Consultants

Revise as follows:

1028.13 (IFC [B] 1028.13) Handrails. Ramped aisles having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and aisle stairs shall be provided with handrails located either at the side or within the aisle width.

Exceptions:

1. Handrails are not required for ramped aisles having a gradient no greater than one unit vertical in eight units horizontal (12.5-percent slope) and seating on both sides.
2. Handrails are not required if, at the side of the aisle, there is a guard that complies with the graspability requirements of handrails.
3. Handrail extensions are not required ~~at the top and bottom of~~ in aisle stairs and aisle ramps ~~ramp runs to permit crossovers within the aisles~~.

Reason: The change in 2009 to limit the handrail extension exemption to just the top and bottom of aisle stairs and aisle ramps is a severe restriction on design of assembly aisles. The previous edition=s exception for all handrails in aisles permitted doors and entrances to and from an aisle. Most importantly, this 2009 wording would literally require a railing extension in a handrail at the side of an aisle stair or ramp prohibiting or restricting passage to aisle accessways.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Conner-E3-1028.13 ex 3

E147–09/10
1028.14.2 (IFC [B] 1028.14.2)

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1028.14.2 (IFC [B] 1028.14.2) Sightline-constrained guard heights. Unless subject to the requirements of Section 1028.14.3, a fascia or railing system in accordance with the *guard* requirements of Section 1013 and having a minimum height of 26 inches (660 mm) measured vertically above the adjacent walking surfaces, adjacent bench seat or the line connecting the leading edges of the treads shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. At *bleachers*, a *guard* must be provided where required by ICC 300.

Exception: The height of the guard shall not be required to be measured vertically above an adjacent automatic or self-rising chair.

Reason: This proposal addresses several things, first it brings clarity to confusion that was created by a change that occurred in the 2009 IBC. The term “seatboard” was replaced with the term “fixed seating” in the 2009 IBC Section 1013.2 on how the height of guards are measured with the stated reason "to clarify the measurement, using common terminology". With respect to assembly seating, the term “fixed seating” does not offer greater clarity, instead it offers significantly more confusion. For example, how do you measure the height of the guard adjacent fixed seats when they are self-rising chairs? (Refer to photographs below.) In assembly seating, fixed seats refers to chairs that are secured to the structure, not that they provide a walking surface. The aisle accessway provisions of Section 1028.10 specifically address the clear width between rows of seats where there is automatic or self-rising chairs and chairs with seats that do not move. Therefore, the clarity provided other occupancies unfortunately increased confusion pertaining to assembly seating. Section 1028.14 needs to include how to measure the height of guards so that clarity can be provided assembly seating and still offer other occupancies the clarity needed for them in Section 1013.2. Please note that this proposal does not include any change to Section 1013.2, only to Section 1028.14.

Following are two photographs of self-rising chairs and one of bench seats. The fixed bench seating could serve as a walking surface, however the self-rising chairs are not easily used as a walking surface. 2007 ICC 300 measures vertically above the leading edge of the tread, adjacent walking surface or adjacent bench seat. This proposal maintains how the height of the guard is measured by 1013.2 with the exception of replacing the term "fixed seat" with the term "bench seat" to coordinate with ICC 300 and to enhance clarity that guard height needs to be measured vertically above such seats. Also, the term "bench seat" rather than "seatboard" is commonly used for this type of seating in assembly seating project specifications. An exception was added for self-rising chairs since these seats are not easily used as a walking surface and there is no well defined way to measure these chairs.

Cost Impact: This code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-E9-1028.14.2

E148–09/10
1028.14.2 (IFC [B] 1028.14.2)

Proponent: Bill Conner, representing American Society of Theatre Consultants

Revise as follows:

1028.14.2 (IFC [B] 1028.14.2) Sightline-constrained guard heights. Unless subject to the requirements of Section 1028.14.3, a fascia or railing system in accordance with the guard requirements of Section 1013 and having a minimum height of 26 inches (660 mm) shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. At bleachers, a guard must be provided where required by ICC 300. Sightline-constrained guard heights shall be measured vertically above the adjacent walking surfaces.

Reason: Section 1013.2 requires all guards to be A....measured vertically above the adjacent walking surfaces, adjacent fixed seating or the line connecting the leading edges of the treads.@ This is not appropriate for sightline constrained rails, as the fixed seating is the reason for the exception, and measuring the 26" from the seat will obstruct sightline.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1029.1 (IFC [B] 1029.1); IRC R310.1

Proponent: Steven Orlowski, representing National Association of Home Builders

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1029.1 (IFC [B] 1029.1) General. In addition to the means of egress required by this chapter, provisions shall be made for emergency escape and rescue in Group R and I-1 occupancies. Basements and sleeping rooms below the fourth story above grade plane shall have at least one exterior emergency escape and rescue opening in accordance with this section. Where basements contain one or more sleeping rooms, emergency escape and rescue openings shall be required in each sleeping room, but shall not be required in adjoining areas of the basement. Such openings shall open directly into a public way or to a yard or court that opens to a public way.

Exceptions:

1. In ~~other than Group R-3 occupancies,~~ Group R buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, ~~or~~ 903.3.1.2 or 903.3.1.3.
2. In other than Group R-3 occupancies, sleeping rooms provided with a door to a fire-resistance-rated corridor having access to two remote exits in opposite directions.
3. The emergency escape and rescue opening is permitted to open onto a balcony within an atrium in accordance with the requirements of Section 404, provided the balcony provides access to an exit and the dwelling unit or sleeping unit has a means of egress that is not open to the atrium.
4. Basements with a ceiling height of less than 80 inches (2032 mm) shall not be required to have emergency escape and rescue windows.
5. High-rise buildings in accordance with Section 403.
6. Emergency escape and rescue openings are not required from basements or sleeping rooms that have an exit door or exit access door that opens directly into a public way or to a yard, court or exterior exit balcony that opens to a public way.
7. Basements without habitable spaces and having no more than 200 square feet (18.6m^2) in floor area shall not be required to have emergency escape windows.

PART II – IRC BUILDING/ENERGY

R310.1 Emergency escape and rescue required. Basements, habitable attics and every sleeping room shall have at least one operable emergency escape and rescue opening. Where basements contain one or more sleeping rooms, emergency egress and rescue openings shall be required in each sleeping room. Where emergency escape and rescue openings are provided they shall have a sill height of not more than 44 inches (1118 mm) above the floor. Where a door opening having a threshold below the adjacent ground elevation serves as an emergency escape and rescue opening and is provided with a bulkhead enclosure, the bulkhead enclosure shall comply with Section R310.3. The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. Emergency escape and rescue openings with a finished sill height below

the adjacent ground elevation shall be provided with a window well in accordance with Section R310.2. Emergency escape and rescue openings shall open directly into a public way, or to a yard or court that opens to a public way.

~~Exception~~ Exceptions:

1. Basements used only to house mechanical equipment and not exceeding total floor area of 200 square feet (18.58 m^2).
2. Emergency escape and rescue openings shall not be required in one- and two family dwellings and townhouses that are equipped with an approved automatic sprinkler system in accordance with Section R313 or Section P2904.

Reason: Based on extensive research on the performance of residential smoke alarms, the NFPA 72 technical committee on residential alarms has determined that both ionization and photoelectric smoke alarms provide adequate escape time along the normal path of egress in both fast flaming and slow smoldering fires. In tests conducted by NIST, the results show that when smoke alarms are present and functioning properly, these devices will detect and notify the occupant with enough time to vacate the structure prior to untenable conditions being reached within the dwelling. The purpose for the emergency egress is to provide a secondary means of escape and rescue, in the event that the normal path of egress becomes blocked or conditions are unsustainable.

During the last code development cycle, the sprinkler proponents testified that residential fire sprinklers are effective in 96% of the fires that grow large enough to activate the system. With the recent addition of residential sprinklers, the time for evacuating the structure before conditions become untenable and incapacitate the occupant have been extended. When sprinklers are used in tandem with smoke alarms, the available escape time in a fast flaming fire is increased and occupants are given more time for escape. Proponents also testified that when sprinklers are present it will provide additional time for firefighters to conduct search and rescue, since the fire will be either extinguished or contained.

If homes are required to be equipped with both an active suppression system and alarm system, it is time to start reevaluating the need for some of the passive life safety features in the home that have previously been justified to protect occupants in the event of a fire. While this proposal may raise the eyebrows of many skeptics, the concept of not requiring emergency egress and rescue openings in one- and two- family dwellings equipped with an automatic suppression system is not new since this exception has been permitted in NFPA 101 The Life Safety Code for several years. In addition, the International Building Code has exempted R-1, R-2 and I-1 occupancies from requiring emergency escape and rescue openings when an approved automatic suppressions system is installed.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 4 PART CODE CHANGE. ALL FOUR PARTS WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE AS SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

PART I – IBC MEANS OF EGRESS

Revise as follows:

1101.2 Design. Buildings and facilities shall be designed and constructed to be accessible in accordance with this code and ICC A117.1.

SECTION 1102
DEFINITIONS

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

ACCESSIBLE UNIT. A dwelling unit or sleeping unit that complies with this code and the provisions for Accessible units in ICC A117.1.

TYPE A UNIT. A dwelling unit or sleeping unit designed and constructed for accessibility in accordance with this code and the provisions for Type A units in ICC A117.1.

TYPE B UNIT. A dwelling unit or sleeping unit designed and constructed for accessibility in accordance with this code and the provisions for Type B units in ICC A117.1, consistent with the design and construction requirements of the federal Fair Housing Act.

1104.4 Multilevel buildings and facilities. At least one accessible route shall connect each accessible level, including mezzanines, in multilevel buildings and facilities.

Exceptions:

1. An accessible route is not required to stories and mezzanines that have an aggregate area of not more than 3,000 square feet (278.7 m2) and are located above and below accessible levels. This exception shall not apply to:
   1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces;
   1.2. Levels containing offices of health care providers (Group B or I); or
   1.3. Passenger transportation facilities and airports (Group A-3 or B).
2. Levels that do not contain accessible elements or other spaces as determined by Section 1107 or 1108 are not required to be served by an accessible route from an accessible level.
3. In air traffic control towers, an accessible route is not required to serve the cab and the floor immediately below the cab.
4. Where a two-story building or facility has one story with an occupant load of five or fewer persons that does not contain public use space, that story shall not be required to be connected by an accessible route to the story above or below.
5. Vertical access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator ~~complying with ICC A117.1~~ can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

1106.7 Passenger loading zones. Passenger loading zones shall be accessible ~~designed and constructed in accordance with ICC A117.1~~.

1107.2 Design. Dwelling units and sleeping units that are required to be Accessible units, Type A units and Type B units shall comply with the applicable portions of Chapter 10 of ICC A117.1. Units required to be Type A units are permitted to be designed and constructed as Accessible units. Units required to be Type B units are permitted to be designed and constructed as Accessible units or as Type A units.

1108.2.2 Wheelchair spaces. In theaters, bleachers, grandstands, stadiums, arenas and other fixed seating assembly areas, accessible wheelchair spaces ~~complying with ICC A117.1~~ shall be provided in accordance with Sections 1108.2.2.1 through 1108.2.2.4.

1108.2.3 Companion seats. At least one companion seat ~~complying with ICC A117.1~~ shall be provided for each wheelchair space required by Sections 1108.2.2.1 through 1108.2.2.3.

1108.4.1.1 Jury box. A wheelchair space ~~complying with ICC A117.1~~ shall be provided within the jury box.

Exception: Adjacent companion seating is not required.

1108.4.1.2 Gallery seating. Wheelchair spaces ~~complying with ICC A117.1~~ shall be provided in accordance with Table 1108.2.2.1. Designated aisle seats shall be provided in accordance with Section 1108.2.5.

1108.4.1.4 Employee work stations. The judge's bench, clerk's station, bailiff's station, deputy clerk's station and court reporter's station shall be located on an accessible route. The vertical access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator ~~complying with ICC A117.1~~ can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

1108.4.1.5 Other work stations. The litigant's and counsel stations, including the lectern, shall be accessible ~~in accordance with ICC A117.1~~.

1109.1 General. Accessible building features and facilities shall be provided in accordance with Sections 1109.2 through 1109.14.

Exception: Accessible units, Type A units and Type B units shall comply with Chapter 10 of ICC A117.1.

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be *accessible*. Where a floor level is not required to be connected by an *accessible route*, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. At least one of each type of fixture, element, control or dispenser in each *accessible* toilet room and bathing room shall be *accessible*.

Exceptions:

1. In toilet rooms or bathing rooms accessed only through a private office, not for *common* or *public use* and intended for use by a single occupant, any of the following alternatives are allowed:
   1.1. Doors are permitted to swing into the clear floor space, provided the door swing can be reversed to meet the requirements in ICC A117.1;
   1.2. The height requirements for the water closet in ICC A117.1 are not applicable;
   1.3. Grab bars are not required to be installed in a toilet room, provided that reinforcement has been installed in the walls and located so as to permit the installation of such grab bars; and
   1.4. The requirement for height, knee and toe clearance shall not apply to a lavatory.
2. This section is not applicable to toilet and bathing rooms that serve *dwelling units* or *sleeping unit*s that are not required to be *accessible* by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be *accessible*.
4. Where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be *accessible*.
5. Toilet rooms that are part of critical care or intensive care patient sleeping rooms are not required to be *accessible*.

1109.2.1.1 Standard. Family or assisted-use toilet and bathing rooms shall comply with Sections 1109.2.1.2 through 1109.2.1.7 ~~and ICC A117.1~~.

1109.2.2 Water closet compartment. Where water closet compartments are provided in a toilet room or bathingfacility, at least one wheelchair-accessible compartment shall be provided. Where the combined total water closet compartments and urinals provided in a toilet room or bathing facility is six or more, at least one ambulatory-accessible water closet compartment shall be provided in addition to the wheelchair-accessible compartment. ~~Wheelchair-accessible and ambulatory-accessible compartments shall comply with ICC A117.1.~~

1109.2.3 Lavatories. Where lavatories are provided, at least 5 percent, but not less than one, shall be *accessible*. Where the total lavatories provided in a toilet room or bathing facility is six or more, at least one lavatory with enhanced reach ranges ~~in accordance with ICC A117.1~~, shall be provided.

1109.3 Sinks. Where sinks are provided, at least 5 percent but not less than one provided in accessible spaces shall be accessible ~~comply with ICC A117.1~~.
Exception: Mop or service sinks are not required to be accessible.

1109.4 Kitchens and kitchenettes. Where kitchens and kitchenettes are provided in accessible spaces or rooms, they shall be accessible ~~in accordance with ICC A117.1~~.

1109.6 Elevators. Passenger elevators on an accessible route shall be accessible and comply with ~~Section 3001.3~~ Chapter 30.

1109.8 Storage. Where fixed or built-in storage elements such as cabinets, shelves, medicine cabinets, closets and drawers are provided in required accessible spaces, at least one of each type shall contain accessible storage space ~~complying with ICC A117.1~~.

1109.13 Fuel-dispensing systems. Fuel-dispensing systems shall be accessible ~~comply with ICC A117.1~~.

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

406.2.2 Clear height. The clear height of each floor level in vehicle and pedestrian traffic areas shall not be less than 7 feet (2134 mm). Vehicle and pedestrian areas accommodating van-accessible parking shall comply with ~~required by~~ Section 1106.5 ~~shall conform to ICC A117.1.~~

SECTION 1007 (IFC [B] 1007)
ACCESSIBLE MEANS OF EGRESS

1007.9 (IFC [B] 1007.9) Signage. Signage indicating special accessibility provisions shall be provided as shown:

1. Each door providing access to an *area of refuge* from an adjacent floor area shall be identified by a sign stating: AREA OF REFUGE.
2. Each door providing access to an exterior area for assisted rescue shall be identified by a sign stating: EXTERIOR AREA FOR ASSISTED RESCUE.

Signage shall comply with the ICC A117.1 requirements for visual characters and include the International Symbol of Accessibility. Where exit sign illumination is required by Section 1011.2, the signs shall be illuminated. Additionally, raised character and braille ~~tactile~~ signage complying with ICC A117.1 shall be located at each door to an *area of refuge* and exterior area for assisted rescue in accordance with Section 1011.3.

SECTION 1010 (IFC [B] 1010)
RAMPS

1010.1 (IFC [B] 1010.1) Scope. The provisions of this section shall apply to ramps used as a component of a means of egress.

Exceptions:

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2 through 1108.2.4 and 1108.2.6, ramped aisles within assembly rooms or spaces shall conform with the provisions in Section 1028.11.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections 1010.3 through 1010.9 when they are not an accessible route serving accessible parking spaces, other required accessible elements or part of an accessible means of egress.

1010.6.5 (IFC [B] 1010.6.5) Doorways. Where doorways are located adjacent to a ramp landing, maneuvering clearances required by ICC A117.1 are permitted to overlap the required landing area.

1010.9 (IFC [B] 1010.9) Edge protection. Edge protection complying with Section 1010.9.1 or 1010.9.2 shall be provided on each side of ramp runs and at each side of ramp landings.

Exceptions:

1. Edge protection is not required on ramps that are not required to have handrails, provided they have flared sides that comply with the ICC A117.1 curb ramp provisions.
2. Edge protection is not required on the sides of ramp landings serving an adjoining ramp run or stairway.
3. Edge protection is not required on the sides of ramp landings having a vertical drop off of not more than ½ inch (12.7 mm) within 10 inches (254 mm) horizontally of the required landing area.
4. In assembly spaces with fixed seating, edge protection is not required on the sides of ramps where the ramps provide access to the adjacent seating and aisle accessways.

SECTION 1011(IFC [B] 1011)
EXIT SIGNS

1011.3 (IFC [B] 1011.3) ~~Tactile~~ Raised character and Braille exit signs. A ~~tactile~~ sign stating EXIT in raised characters and Braille and complying with ICC A117.1 shall be provided adjacent to each door to an area of refuge, an exterior area for assisted rescue, an exit stairway, an exit ramp, an exit passageway and the exit discharge.

SECTION 1022 (IFC [B] 1022)
EXIT ENCLOSURES

1022.8 (IFC [B] 1022.8) Floor identification signs. A sign shall be provided at each floor landing in exit enclosures connecting more than three stories designating the floor level, the terminus of the top and bottom of the exit enclosure and the identification of the stair or ramp. The signage shall also state the story of, and the direction to, the exit discharge and the availability of roof access from the enclosure for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. In addition, floor level identification signs in ~~tactile~~ raised characters and Braille complying with ICC A117.1 shall be located at each floor level landing adjacent to the door leading from the enclosure into the corridor to identify the floor level.

CHAPTER 30
ELEVATORS AND CONVEYING SYSTEMS

3001.3 Accessibility. Passenger elevators required to be accessible ~~by Chapter 11 shall conform to ICC A117.1~~ or serve as part of an accessible means of egress shall comply with Section 1107 and 1109.6.

3008.13.1 Design and installation. The two-way communication system shall include audible and visible signals and shall be designed and installed in accordance with the requirements in ICC A117.1.

3008.13.2 Instructions. Instructions for the use of the two-way communication system along with the location of the station shall be permanently located adjacent to each station. Signage shall comply with the ICC A117.1 requirements for visual characters.

SECTION 3411 (IEBC 310)
ACCESSIBILITY FOR EXISTING BUILDINGS

3411.6 (IEBC 310.6) Alterations. A building, facility or element that is altered shall comply with the applicable provisions in Chapter 11 of this code ~~and ICC A117.1~~, unless technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 3411.7.
2. Accessible means of egress required by Chapter 10 are not required to be provided in existing buildings and facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit ~~and shall comply with the applicable provisions in Chapter 11 and ICC A117.1~~.

3411.8.2 (IEBC 310.8.2) Elevators. Altered elements of existing elevators shall comply with ASME A17.1 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

3411.8.3 (IEBC 310.8.3) Platform lifts. Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

APPENDIX E
SUPPLEMENTARY ACCESSIBILITY REQUIREMENTS

E101.2 Design. Technical requirements for items herein shall comply with this code and ICC A117.1.

SECTION E104
SPECIAL OCCUPANCIES

E104.2 Accessible beds. In rooms or spaces having more than 25 beds, 5 percent of the beds shall have a clear floor space complying with ICC A117.1.

E104.2.1 Sleeping areas. A clear floor space complying with ICC A117.1 shall be provided on both sides of the accessible bed. The clear floor space shall be positioned for parallel approach to the side of the bed.

Exception: This requirement shall not apply where a single clear floor space complying with ICC A117.1 positioned for parallel approach is provided between two beds.

E104.3 Communication features. Accessible communication features ~~complying with ICC A117.1~~ shall be provided in accordance with Sections E104.3.1 through E104.3.4.

E104.3.4 Notification devices. Visual notification devices shall be provided to alert room occupants of incoming telephone calls and a door knock or bell. Notification devices shall not be connected to visual alarm signal appliances. Permanently installed telephones shall have volume controls and an electrical outlet complying with ICC A117.1 located within 48 inches (1219 mm) of the telephone to facilitate the use of a TTY.

SECTION E105
OTHER FEATURES AND FACILITIES

E105.1 Portable toilets and bathing rooms. Where multiple single-user portable toilet or bathing units are clustered at a single location, at least 5 percent, but not less than one toilet unit or bathing unit at each cluster, shall be accessible ~~comply with ICC A117.1~~. Signs containing the International Symbol of Accessibility ~~and complying with ICC A117.1~~ shall identify accessible portable toilets and bathing units.

Exception: Portable toilet units provided for use exclusively by construction personnel on a construction site.

E105.2.1Washing machines. Where three or fewer washing machines are provided, at least one shall be accessible ~~comply with ICC A117.1~~. Where more than three washing machines are provided, at least two shall be accessible ~~comply with ICC A117.1~~.

E105.2.2 Clothes dryers. Where three or fewer clothes dryers are provided, at least one shall be accessible ~~comply with ICC A117.1~~. Where more than three clothes dryers are provided, at least two shall be accessible ~~comply with ICC A117.1~~.

E105.3 Depositories, vending machines, change machines and similar equipment. Where provided, at least one of each type of depository, vending machine, change machine and similar equipment shall be accessible ~~comply with ICC A117.1~~.

Exception: Drive-up-only depositories are not required to comply with this section.

E105.4 Mailboxes. Where mailboxes are provided in an interior location, at least 5 percent, but not less than one, of each type shall be accessible ~~comply with ICC A117.1~~. In residential and institutional facilities, where mailboxes are provided for each dwelling unit or sleeping unit, mailboxes be accessible ~~complying with ICC A117.1~~ shall be provided for each unit required to be an Accessible unit.

E105.6 Two-way communication systems. Where two-way communication systems are provided to gain admittance to a building or facility or to restricted areas within a building or facility, the system shall be accessible ~~comply with ICC A117.1~~.

SECTION E106
TELEPHONES

E106.2 Wheelchair-accessible telephones. Where public telephones are provided, wheelchair-accessible telephones ~~complying with ICC A117.1~~ shall be provided in accordance with Table E106.2.

Exception: Drive-up-only public telephones are not required to be accessible.

E106.3 Volume controls. All public telephones provided shall have accessible volume control ~~complying with ICC A117.1~~.

E106.4 TTYs. TTYs ~~complying with ICC A117.1~~ shall be provided in accordance with Sections E106.4.1 through E106.4.9.

E106.4.9 Signs. Public TTYs shall be identified by the International Symbol of TTY ~~complying with ICC A117.1~~. Directional signs indicating the location of the nearest public TTY shall be provided at banks of public pay telephones not containing a public TTY. Additionally, where signs provide direction to public pay telephones, they shall also provide direction to public TTYs. Such signs shall comply with visual signage requirements in ICC A117.1 and shall include the International Symbol of TTY.

E106.5 Shelves for portable TTYs. Where a bank of telephones in the interior of a building consists of three or more public pay telephones, at least one public pay telephone at the bank shall be provided with a shelf and an electrical outlet ~~in accordance with ICC A117.1~~.

Exceptions:

1. In secured areas of detention and correctional facilities, if shelves and outlets are prohibited for purposes of security or safety shelves and outlets for TTYs are not required to be provided.
2. The shelf and electrical outlet shall not be required at a bank of telephones with a TTY.

SECTION E107
SIGNAGE

E107.1 Signs. Required accessible portable toilets and bathing facilities shall be identified by the International Symbol of Accessibility.

E107.2 Designations. Interior and exterior signs identifying permanent rooms and spaces shall be ~~tactile~~ raised chaacters and braille. Where pictograms are provided as designations of interior rooms and spaces, the pictograms shall have ~~tactile~~ raised chaacter and braille text descriptors. ~~Signs required to provide tactile characters and pictograms shall comply with ICC A117.1~~.

Exceptions:

1. Exterior signs that are not located at the door to the space they serve are not required to comply.
2. Building directories, menus, seat and row designations in assembly areas, occupant names, building addresses and company names and logos are not required to comply.
3. Signs in parking facilities are not required to comply.
4. Temporary (seven days or less) signs are not required to comply.
5. In detention and correctional facilities, signs not located in public areas are not required to comply.

E107.3 Directional and informational signs. Signs that provide direction to, or information about, permanent interior spaces of the site and facilities shall contain visual characters complying with ICC A117.1.

Exception: Building directories, personnel names, company or occupant names and logos, menus and temporary (seven days or less) signs are not required to comply with ICC A117.1.

SECTION E108
BUS STOPS

E108.3 Bus shelters. Where provided, new or replaced bus shelters shall provide a minimum clear floor or ground space complying with ICC A117.1, Section 305, entirely within the shelter. Such shelters shall be connected by an accessible route to the boarding area required by Section E108.2.

E108.4 Signs. New bus route identification signs shall have finish and contrast complying with ICC A117.1. Additionally, to the maximum extent practicable, new bus route identification signs shall provide visual characters complying with ICC A117.1.

Exception: Bus schedules, timetables and maps that are posted at the bus stop or bus bay are not required to meet this requirement.

SECTION E109
TRANSPORTATION FACILITIES AND STATIONS

E109.2.1 Station entrances. Where different entrances to a station serve different transportation fixed routes or groups of fixed routes, at least one entrance serving each group or route shall comply with Section 1104 ~~and ICC A117.1~~.

E109.2.2.1 ~~Tactile~~ Raised chaacter and braille signs. Where signs are provided at entrances to stations identifying the station or the entrance, or both, at least one sign at each entrance shall be ~~tactile~~ raised chaacters and braille. A minimum of one ~~tactile~~ raised chaacter and braille sign identifying the specific station shall be provided on each platform or boarding area. Such signs shall be placed in uniform locations at entrances and on platforms or boarding areas within the transit system to the maximum extent practicable. ~~Tactile signs shall comply with ICC A117.1~~.

Exceptions:

1. Where the station has no defined entrance but signs are provided, the ~~tactile~~ raised chaacter and braille signs shall be placed in a central location.
2. Signs are not required to be ~~tactile~~ raised chaacter and braille where audible signs are remotely transmitted to hand-held receivers, or are user or proximity actuated.

E109.2.2.2 Identification signs. Stations covered by this section shall have identification signs containing visual characters complying with ICC A117.1. Signs shall be clearly visible and within the sightlines of a standing or sitting passenger from within the train on both sides when not obstructed by another train.

E109.2.2.3 Informational signs. Lists of stations, routes and destinations served by the station which are located on boarding areas, platforms or mezzanines shall provide visual characters complying with ICC A117.1 Signs covered by this provision shall, to the maximum extent practicable, be placed in uniform locations within the transit system.

E109.2.3 Fare machines. Self-service fare vending, collection and adjustment machines shall comply with ICC A117.1, Section 707. Where self-service fare vending, collection or adjustment machines are provided for the use of the general public, at least one accessible machine of each type provided shall be provided at each accessible point of entry and exit.

E109.2.5 TTYs. Where a public pay telephone is provided in a transit facility (as defined by the Department of Transportation) at least one public TTY complying with ICC A117.1, Section 704.4, shall be provided in the station. In addition, where one or more public pay telephones serve a particular entrance to a transportation facility, at least one TTY telephone complying with ICC A117.1, Section 704.4, shall be provided to serve that entrance.

E109.2.6 Track crossings. Where a circulation path serving boarding platforms crosses tracks, an accessible route ~~complying with ICC A117.1~~ shall be provided.

Exception: Openings for wheel flanges shall be permitted to be 21/2 inches (64 mm) maximum.

E109.2.8 Clocks. Where clocks are provided for use by the general public, the clock face shall be uncluttered so that its elements are clearly visible. Hands, numerals and digits shall contrast with the background either light-on-dark or dark-on-light. Where clocks are mounted overhead, numerals and digits shall comply with visual character requirements ~~ICC A117.1, Section 703.2~~.

SECTION E110
AIRPORTS

E110.2 TTYs. Where public pay telephones are provided, at least one TTY shall be provided in compliance with ICC A117.1, Section 704.4. Additionally, if four or more public pay telephones are located in a main terminal outside the security areas, a concourse within the security areas or a baggage claim area in a terminal, at least one public TTY complying with ICC A117.1, Section 704.4, shall also be provided in each such location.

E110.4 Clocks. Where clocks are provided for use by the general public, the clock face shall be uncluttered so that its elements are clearly visible. Hands, numerals and digits shall contrast with their background either light-on-dark or dark-on-light. Where clocks are mounted overhead, numerals and digits shall comply with visual character requirements ~~ICC A117.1, Section 703.2~~.

PART II – IFC

Revise as follows:

SECTION [F] 907 (IFC 907)
FIRE ALARM AND DETECTION SYSTEMS

[F] 907.5.2.3.4 (IFC 907.5.2.3.4) Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, all dwelling units and sleeping units shall be provided with the capability to support visible alarm notification appliances in accordance with Chapter 10 of ICC A117.1.

PART III – IPC

Revise 2902.4 to match IPC 403.4 as follows:

SECTION [P] 2902 (IPC 403.4)
MINIMUM PLUMBING FACILITIES

[P] 2902.4 Signage. ~~A legible sign designating the sex shall be provided in a readily visible location near the entrance to each toilet facility~~. Required public facilities shall be designated by a legible sign for each sex. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1110 ~~ICC A117.1~~.

IPC 403.4 Signage. Required *public* facilities shall be designated by a legible sign for each sex. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1110 of the *International Building Code*.

PART IV – IEBC

SECTION 605
ACCESSIBILITY

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the International Building Code ~~and ICC A117.1~~ unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible. A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provisions for Type B dwelling units ~~and shall comply with the applicable provisions in Chapter 11 of the International Building Code and ICC A117.1~~.

605.1.2 Elevators. Altered elements of existing elevators shall comply with ASME A17.1 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

605.1.3 Platform lifts. Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

Reason:
PART I-IBC
Section 1101.2 establishes ICC A117.1 as the standard for accessible design for Chapter 11. Section E101.2 establishes ICC A117.1 as the standard for accessible design for Appendix E. It is unnecessary to repeat this throughout Chapter 11 or Appendix E unless the specific text is an exception to the standard (Ex: Section 1109.2 Ex. 1) or a specific item within the standard (Ex: Section 1002.1, Definitions for Accessible Unit, Type

A unit and Type B unit) . Providing the reference in a haphazard manner within the chapter only serves to create confusion. This is an editorial issue and the editorial committee should verify that there are not other occurrences of this in the chapter. The text provided shows all of the location where ICC A117.1 is currently referenced.

1109.1 – The revisions is correlative with the 2003 A117.1 including Accessible Units in Chapter 10 which only included Type A and Type B units in the 1998 edition. The definition for Accessible units was correlated and approved with the new edition, but this exception was missed.

1109.6 – the reference to Section 3001.3 is only a reference to ICC A117.1, which is not needed since it is already called out in Section 1101.2. All elevators have to comply with Chapter 30 for safety.

406.2.2 – the reference to Section 1106.5 for accessible parking automatically gets ICC A117.1.

1007.9 – ICC A117.1 has changed 'tactile' requirements for signage to 'raised characters and braille'. This revision would correlate with the standard.

1011.3 – ICC A117.1 has changed 'tactile' requirements for signage to 'raised characters and braille'. This revision would correlate with the standard.

3411.6 (IEBC 310.6) - The reference to IBC Chapter 11 already gets the ICC A117.1.

Changes for 'tactile characters' to 'raised characters and braille' is consistent with revisions to the 2009 edition in A117.1.

Part II – IFC - 907.5.2.3.4 – in this situation, the more specific reference would clarify to users where the alarm requirements for dwelling units are found. This would be consistent with the definitions of Accessible units, Type A units and Type B units.

Part III – IPC – 2902.4 (IPC 403.4) – The reference to the signage requirements in Chapter 11 will help a user locate all the provisions for accessible signage associated with toilet rooms and in addition will pick up the ICC A117.1 references. The signage requirements in Chapter 29 should match the Plumbing Code requirements.

Part IV – IEBC – 605.1 – The reference to IBC Chapter 11 already gets the ICC A117.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Marsha K. Mazz, U.S. Architectural and Transportation Barriers Compliance Board (Access Board)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC MEANS OF EGRESS COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE THIS COMMITTEE.

PART I – IBC MEANS OF EGRESS

1. Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

AMUSEMENT RIDE. A system that moves persons through a fixed course within a defined area for the purpose of amusement.

AMUSEMENT RIDE SEAT. A seat that is built-in or mechanically fastened to an amusement ride intended to be occupied by one or more passengers.

AREA OF SPORT ACTIVITY. That portion of a room or space where the play or practice of a sport occurs.

BOARDING PIER. A portion of a pier where a boat is temporarily secured for the purpose of embarking or disembarking.

BOAT LAUNCH RAMP. A sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.

BOAT SLIP. That portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.

GANGWAY. A variable-sloped pedestrian walkway that links a fixed structure or land with a floating structure. Gangways which connect to vessels are not included.

GOLF CAR PASSAGE. A continuous passage on which a motorized golf car can operate.

PLAY AREA. A portion of a site containing play components designed and constructed for children.

PLAY COMPONENT. An element intended to generate specific opportunities for play, socialization, or learning. Play components may be manufactured or natural, and may be stand alone or part of a composite play structure.

TEEING GROUND. In golf, the starting place for the hole to be played.

TRANSFER DEVICE. Equipment designed to facilitate the transfer of a person from a wheelchair or other mobility device to and from an amusement ride seat.

2. Revise as follows:

1104.2 Within a site. At least one accessible route shall connect accessible buildings, accessible facilities, accessible elements and accessible spaces that are on the same site.

Exceptions:

1. An accessible route is not required between accessible buildings, accessible facilities, accessible elements and accessible spaces that have, as the only means of access between them, a vehicular way not providing for pedestrian access.
2. An accessible route to recreational facilities is not required when exempted under Sections 1110.4 or 1110.6

1104.3 Connected spaces. When a building or portion of a building is required to be accessible, an accessible route shall be provided to each portion of the building, to accessible building entrances connecting accessible pedestrian walkways and the public way.

Exceptions:

1. In assembly areas with fixed seating, an accessible route shall not be required to serve levels where wheelchair spaces are not provided.
2. In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.
3. An accessible route to recreational facilities is not required when exempted under Sections 1110.4 or 1110.6

1109.7 Lifts. Platform (wheelchair) lifts are permitted to be a part of a required accessible route in new construction where indicated in Items 1 through ~~10~~ 11. Platform (wheelchair) lifts shall be installed in accordance with ASME A18.1.

1. An accessible route to a performing area and speaker platforms in Group A occupancies.

2. An accessible route to wheelchair spaces required to comply with the wheelchair space dispersion requirements of Sections 1108.2.2 through 1108.2.6.
3. An accessible route to spaces that are not open to the general public with an occupant load of not more than five.
4. An accessible route within a dwelling or sleeping unit.
5. An accessible route to wheelchair seating spaces located in outdoor dining terraces in Group A-5 occupancies where the means of egress from the dining terraces to a public way are open to the outdoors.
6. An accessible route to jury boxes and witness stands; raised courtroom stations including judges' benches, clerks' stations, bailiffs' stations, deputy clerks' stations and court reporters' stations; and to depressed areas such as the well of the court.
7. An accessible route to load and unload areas serving amusement rides.
8. An accessible route to play components or soft contained play structures.
9. An accessible route to team or player seating areas serving areas of sport activity.
10. An accessible route where existing exterior site constraints make use of a ramp or elevator infeasible.
11. Platform lifts shall be permitted to be used instead of gangways that are part of accessible routes serving recreational boating facilities and fishing piers and platforms.

SECTION 1110
RECREATIONAL FACILITIES

1110.1 ~~1109.14~~ Recreational and sports facilities. Recreational and sports facilities shall be provided with accessible features in accordance with Sections 1110.2 ~~1109.14.1~~ through 1110.6 ~~1109.14.4~~.

1110.2 ~~1109.14.1~~ Facilities serving Type B units in a single building. In Group R-2 and R-3 occupancies where recreational facilities are provided serving a single building containing ~~Type A units or~~ Type B units, 25 percent, but not less than one, of each type of recreational facility shall be accessible. Every recreational facility of each type on a site shall be considered to determine the total number of each type that is required to be accessible.

1110.3 ~~1109.14.2~~ Facilities serving Type B units in multiple buildings. In Group R-2 and R-3 occupancies on a single site where multiple buildings containing ~~Type A units or~~ Type B units are served by recreational facilities, 25 percent, but not less than one, of each type of recreational facility serving each building shall be accessible. The total number of each type of recreational facility that is required to be accessible shall be determined by considering every recreational facility of each type serving each building on the site.

1110.4 Facilities serving Accessible and Type A units. In Group R-2 and R-3 occupancies where recreational facilities are provided serving Accessible or Type A units, every recreational facility of each type serving Accessible or Type A units shall be accessible.

1110.5 ~~1109.14.3~~ Other occupancies. All recreational facilities not falling within the purview of Section 1110.2 through 1110.4 ~~1109.14.1 or 1109.14.2~~ shall comply with ICC A117.1 and be located on an accessible route ~~be accessible~~. Each area of sports activity shall be served by an accessible route. Accessible route shall also comply with Section 1110.5.1 through 1110.5.3.

Exception: Areas of sport activity shall not be required to comply with ICC A117.1.

1110.5.1 Protruding objects. Protruding objects shall comply with the requirements of Sections 1003.3.

Exception: Within play areas, protruding objects on circulation paths shall not be required to comply with 1003.3 provided that ground level accessible routes provide vertical clearance in compliance with 1003.3.1.

1110.5.2 Floor surface. Walking surfaces of the accessible route shall comply with ICC ANSI A117.1.

Exception: Within animal containment areas, floor and ground surfaces shall not be required to be stable, firm, and slip resistant.

1110.5.3 Changes in Level. Where changes in level are permitted in floor or ground surfaces, they shall comply with ICC A117.1 for changes in level.

Exception: Animal containment areas shall not be required to comply with ICC A117.1.

1110.6 ~~1109.14.4~~ Recreational and sports facilities exceptions. Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

1110.6.1 ~~1108.2.2.4~~ Team or player seating. At least one wheelchair space shall be provided in team or player seating areas serving areas of sport activity.

Exception: Wheelchair spaces shall not be required in team or player seating areas serving bowling lanes that are not required to be located on an accessible route in accordance with Section ~~1109.14.4.1~~ 1110.6.2.

1110.6.2 ~~1109.14.4.1~~ Bowling lanes. An accessible route shall be provided to at least 5 percent, but no less than one, of each type of bowling lane.

1110.6.3 ~~1109.14.4.2~~ Court sports. In court sports, at least one accessible route shall directly connect both sides of the court.

1110.6.4 ~~1109.14.4.3~~ Raised boxing or wrestling rings. Raised boxing or wrestling rings are not required to be accessible or to be on an accessible route.

1110.6.5 ~~1109.14.4.4~~ Raised refereeing, judging and scoring areas. Raised structures used solely for refereeing, judging or scoring a sport are not required to be accessible or to be on an accessible route.

1110.6.6 Swimming pools, wading pools and spas. Swimming pools, wading pools, and spas shall comply with ICC A117.1.

1110.6.6.1 ~~1109.14.4.5~~ Raised diving boards and diving platforms. Raised diving boards and diving platforms are not required to be accessible or to be on an accessible route.

1110.6.6.2 Water Slides. Water slides are not be required to be accessible or to be on an accessible route.

1110.6.7 Amusement Rides. Amusement rides shall comply with Section 1110.6.7.1 through 1110.6.7.3.

Exception: Mobile or portable amusement rides shall not be required to be accessible.

1110.6.7.1 Load and Unload Areas. Load and unload areas serving amusement rides shall comply with ICC A117.1.

1110.6.7.2 Minimum Number. Amusement rides shall provide at least one wheelchair space, or at least one amusement ride seat designed for transfer, or at least one transfer device.

Exceptions:

1. Amusement rides that are controlled or operated by the rider shall not be required to comply with this section.
2. Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult, shall not be required to comply with this section.
3. Amusement rides that do not provide amusement ride seats shall not be required to comply with this section.

1110.6.7.3 Amusement Rides. Accessible amusement rides shall be on an accessible routes in accordance with Section 1110.6.7.3.1 and 1110.6.7.3.2.

1110.6.7.3.1 Load and Unload Areas. Load and unload areas shall be on an accessible route. Where load and unload areas have more than one loading or unloading position, at least one loading and unloading position shall be on an accessible route.

1110.6.7.3.2 Wheelchair Spaces, Ride Seats Designed for Transfer, and Transfer Devices. When amusement rides are in the load and unload position, wheelchair spaces, amusement ride seats designed for transfer and transfer devices shall be on an accessible route.

1110.6.8 Recreational Boating Facilities. Boat slips required to be accessible by Section 1110.6.8.1 and 1110.6.8.2 and boarding piers at boat launch ramps required to be accessible by Section 1110.6.8.3 shall be on an accessible route.

1110.6.8.1 Boat Slips. Boat slips complying with ICC A117.1 shall be provided in accordance with Table 1110.6.8.1. Where the number of boat slips is not identified, each 40 feet (12 m) of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for the purpose of this section.

TABLE 1110.6.8.1
BOAT SLIPS

Total Number of Boating Slips Provided in Facility	Minimum Number of Required Accessible Boating Slips
1 to 25	1
26 to 50	2
51 to 100	3
101 to 150	4
151 to 300	5
301 to 400	6
401 to 500	7
501 to 600	8
601 to 700	9
701 to 800	10
801 to 900	11
901 to 1000	12
1001 and over	12, plus 1 for every 100, or fraction thereof, over 1000

1110.6.8.2 Dispersion. Accessible boat slips shall be dispersed throughout the various types of boat slips provided. Where the minimum number of accessible boat slips 1 has been met, no further dispersion shall be required.

1110.6.8.3 Boarding Piers at Boat Launch Ramps. Where boarding piers are provided at boat launch ramps, at least 5 percent, but no fewer than one, of the boarding piers shall comply with ICC A117.1.

1110.6.9 Exercise Machines and Equipment. At least one of each type of exercise machines and equipment shall comply with ICC A117.1 and shall be on an accessible route.

1110.6.10 Fishing Piers and Platforms. Fishing piers and platforms shall comply with ICC A117.1 and be on an accessible route.

1110.6.11 Golf Facilities. Golf facilities shall comply with 1110.6.11.1 through 1110.6.11.3.

1110.6.11.1 Golf Courses. Golf courses shall comply with 1110.6.11.1.1 through 1110.6.11.1.3.

1110.6.11.1.1 Teeing Grounds. Where one teeing ground is provided for a hole, the teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where two teeing grounds are provided for a hole, the forward teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where three or more teeing grounds are provided for a hole, at least two teeing grounds, including the forward teeing ground, shall be designed and constructed so that a golf car can enter and exit each teeing ground.

1110.6.11.1.2 Putting Greens. Putting greens shall be designed and constructed so that a golf car can enter and exit the putting green.

1110.6.11.1.3 Weather Shelters. Where provided, weather shelters shall be designed and constructed so that a golf car can enter and exit the weather shelter and shall comply with ICC A117.1.

1110.6.11.2 Practice Putting Greens, Practice Teeing Grounds, and Teeing Stations at Driving Ranges. At least 5 percent, but no fewer than one, of practice putting greens, practice teeing grounds, and teeing stations at driving ranges shall be designed and constructed so that a golf car can enter and exit the practice putting greens, practice teeing grounds, and teeing stations at driving ranges.

1110.6.11.3 Golf Facilities. At least one accessible route shall connect accessible elements and spaces within the boundary of the golf course. In addition, accessible routes serving golf car rental areas; bag drop areas; course

weather shelters; course toilet rooms; and practice putting greens, practice teeing grounds, and teeing stations at driving ranges complying with Section 1110.6.11.2 shall comply with ICC A117.1.

Exception: Golf car passages complying with ICC A117.1 shall be permitted to be used for all or part of accessible routes required by this section.

1110.6.12 Miniature golf facilities. Miniature golf facilities shall comply with 1110.6.12.1 through 1110.6.12.3.

1110.6.12.1 Minimum Number. At least 50 percent of holes on miniature golf courses shall comply with ICC A117.1.

1110.6.12.2 Miniature Golf Course Configuration. Miniature golf courses shall be configured so that the holes complying with ICC A117.1 are consecutive. Miniature golf courses shall provide an accessible route from the last hole complying with ICC A117.1 to the course entrance or exit without requiring travel through any other holes on the course.

Exception: One break in the sequence of consecutive holes shall be permitted provided that the last hole on the miniature golf course is the last hole in the sequence.

1110.6.12.3 Miniature Golf Facilities. Holes required to comply with 1110.6.12.1, including the start of play, shall be on an accessible route.

1110.6.13 Play Areas. Play areas shall comply with ICC A117.1.

1110.6.14 Shooting Facilities with Firing Positions. Where shooting facilities with firing positions are designed and constructed at a site, at least 5 percent, but no fewer than one, of each type of firing position shall comply with ICC A117.1.

1110.6.15 Animal Containment Areas. Animal containment areas that are not for public use are not required to be accessible or to be on an accessible route.

3411.8 (IEBC 310.8) Scoping for alterations. The provisions of Sections 3411.8.1 through ~~3411.8.14~~ 3411.8.16 shall apply to *alterations* to existing buildings and facilities.

3411.8.15 (IEBC 310.8.15) Existing Amusement Rides. Where existing amusement rides are altered, the alteration shall comply with Section 3411.8.15.1 and 3411.8.15.2.

3411.8.15.1 (IEBC 310.8.15.1) Load and Unload Areas. Where load and unload areas serving existing amusement rides are newly designed and constructed, the load and unload areas shall comply with ICC A117.1.

3411.8.15.2 (IEBC 310.8.15.2) Minimum Number. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.6.7.

3411.8.16 (IEBC 310.8) Teeing Grounds. When golf courses are being altered, teeing grounds shall comply with Section 1110.6.11.1.1**.**

Exception: In existing golf courses, the forward teeing ground shall not be required to be one of the teeing grounds on a hole designed and constructed so that a golf car can enter and exit the teeing ground where compliance is not feasible due to terrain.

PART II – IEBC

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through ~~605.1.14~~ 605.2.16, Chapter 11 of the *International Building Code* and ICC A117.1 unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent that is technically feasible.

A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities.
4. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the *International Building Code* and ICC A117.1.

605.1.15 Existing Amusement Rides. Where existing amusement rides are altered, the alteration shall comply with Section 605.1.15.1 and 605.1.15.2.

605.1.15.1 Load and Unload Areas. Where load and unload areas serving existing amusement rides are newly designed and constructed, the load and unload areas shall comply with ICC A117.1.

605.1.15.2 Minimum Number. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.6.7.

605.1.16 Teeing Grounds. When golf courses are being altered, teeing grounds shall comply with Section 1110.6.11.1.1**.**

Exception: In existing golf courses, the forward teeing ground shall not be required to be one of the teeing grounds on a hole designed and constructed so that a golf car can enter and exit the teeing ground where compliance is not feasible due to terrain.

Reason: ICC A117.1-2009 will include a new Chapter 11 which contains accessibility requirements for recreational facilities including: amusement rides, recreational boating and fishing facilities, exercise machines and equipment, golf and miniature golf facilities, play areas, swimming and wading pools and shooting facilities. The new requirements in ICC A117.1 and in this proposal are drawn directly from the U.S. Access Board's Americans with Disabilities Act (ADA) Accessibility Guidelines for Recreation Facilities originally published in the *Federal Register* on September 3, 2002. These guidelines and the previously issued guidelines for Play Areas (October 2000) were both later incorporated into the Access Board's 2004 ADA and Architectural Barriers Act (ABA) Accessibility Guidelines. Together with new Chapter 11 of the ICC A117.1, the proposal is consistent with the aforementioned Federal guidelines and will afford adults and children with disabilities a reasonable level of access to recreation and play.

Amusement Rides: This proposal addresses access to amusement rides for persons with disabilities, including those who use wheelchairs. Specifications require provision of either a wheelchair space on the ride or a ride seat or device designed for transfer to the ride. Access at loading and unloading areas is also addressed. Specific criteria for wheelchair spaces, ride seats designed for transfer, and transfer devices is included in ICC ANSI A117.1. Certain exceptions are provided in proposed IBC Sections 1110.6.7 for rides that are: set up temporarily, such as at a traveling carnival, designed primarily for children, controlled or operated by the rider, or not equipped with seats.

Boating Facilities: Boating facilities, such as piers and docks provided at marinas to serve recreational vessels, are covered by this proposal which addresses the minimum number of accessible boat slips required to be accessible. This number is based on a table according to the total amount of boat slips provided at a facility. The dynamic interface between land and water presents unique and significant challenges in providing access to floating facilities. Therefore, new Chapter 11 in ICC ANSI A117.1 – 2009 for gangways connecting floating facilities take these constraints into account by modifying requirements for accessible routes and ramps with exceptions to criteria for maximum rise and slope, handrail extensions, and level landings.

Fishing Piers and Platforms: ICC ANSI A117.1 contains new provisions addressing railings and edge protection located on fishing piers and platforms. Railings, guardrails, and handrails are not required by this accessibility standard. However, where they are provided, a portion (at least 25%) cannot be more than 34 inches high so that the railings do not obstruct fishing for people using wheelchairs. An exception permits the use of a guard complying with the International Building Code where required or voluntarily provided. Edge protection at least 2 inches high is also addressed to prevent the wheels of mobility aids from slipping over the edge.

Golf : Access to golf courses is typically achieved through the use of golf cars. An exception to proposed 1110.6.11.3 permits golf car passages in lieu of accessible routes throughout golf courses. To comply, courses must be designed so that golf cars can access teeing grounds and putting greens. Modified accessible routes are required to serve practice putting greens and driving ranges since they often are not located within the boundary of a course. Technical specifications are provided for golf car passages, accessible routes, teeing grounds, putting greens, and weather shelters in ICC ANSI A117.1.

Miniature Golf: At least half of the holes on a miniature golf course must be served by an accessible route. Specifications for accessible routes take into account design conventions for miniature golf courses, such as carpeted surfaces and curbs. All level areas of an accessible hole where a ball may come to rest must be within the reach of golf clubs (36 inches) from accessible routes.

Play Areas: Requirements in ICC A117.1 comprise a subsection of the new chapter on recreation facilities. They cover the number of play components required to be accessible, accessible surfacing in play areas, ramp access and transfer system access to elevated structures, and access to soft contained play structures. The guidelines address play areas typically provided at schools, parks, child care facilities (except those based in the operator's home, which are exempted by ICC ANSI A117.1 Section 1108), and other facilities.

Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities: Provisions for exercise equipment, bowling lanes, and shooting facilities are addressed in this proposal. The accessibility standards do not affect the design of exercise equipment and machines, but instead require one of each type to be on an accessible route and to provide transfer space for persons using wheelchairs. Access is also required to a portion (at least 5%) of bowling lanes and shooting facilities.

Swimming Pools and Wading Pools: Specifications are provided for various means of providing pool access, including pool lifts, sloped entries, transfer walls, transfer systems, and stairs. Access to swimming pools can be achieved by sloped entries or pool lifts. For larger pools (those with 300 or more linear feet of pool wall), a secondary means of access is proposed. Stairs, transfer systems, or transfer walls can be used instead of lifts or sloped entries for this secondary means of access. This is a reasonable provision in light of the fact that nationally recognized safety standards require two means of exit from such larger swimming pools. Specific provisions are also provided for wading pools, wave action pools and other types of pools where user access is limited to one area.

Cost Impact: This code change will increase the cost of construction. However, because these changes are harmonized with the U.S. Access Board's ADA and ABA Accessibility Guidelines, costs associated with compliance cannot be avoided once the U.S. Department of Justice adopts the guidelines as enforceable standards under the Americans with Disabilities Act. The guidelines have already been adopted as enforceable standards under the Architectural Barriers Act applicable to federally funded facilities.

PART I – IBC MEANS OF EGRESS

PART II – IEBC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Mazz-E2-1102.1

E153–09/10
1102.1

Proponent: Donald E. Irwin, Program Manager, Delivery, Collection & Carrier Equipment, representing United States Postal Service

Revise as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

COMMON USE: Interior or exterior circulation paths, rooms, spaces or elements that are not for public use and are made available for the shared use of either two or more people <u>in a non-residential facility or the residents of two or more units of a residential facility</u>.

Reason: In support of the effort to clarify what the accessibility requirements are for the individual mail delivery compartments of a centralized mailbox, for residential facilities, the current IBC definition of "common use" is inadequate. The definition needs to be expanded in order to relate to the residents of a building (a "covered multi-family dwelling") or residential complex. There are many "common use" examples of what residents of multiple residential dwelling units do share (for instance, a building's trash receptacle, a common entranceway into the building or to ground-level apartments, or a laundry room (including certain items in the room)). Individual mail delivery compartments of a ganged or centralized mailbox, however, are not shared or "common use" for the residents of multiple residential units. They are designed for assignment to residents of only one street address at a time (although the particular mail compartment assigned to an address can subsequently be changed when required (for instance, if there is a reach issue (an assigned compartment is found to be either too low or too high for the current resident).)

The route to the mail room itself is shared amongst the residents of two or more residential units, the mail room (the floor space in front of the mailbox) is shared amongst these residents, even the parcel lockers that might be integral to any centralized mailbox are shared, but the individual mail delivery compartments are not shared amongst the residents of two or more residential units and, therefore, are not "common use" items. The current definition does not allow for this clarification to be understood properly.

From the Department of Justice website, an analysis of how the term "common use" is applicable to a residential (apartment) complex is available in a 2004 court opinion from the United States Court of Appeals for the Sixth Circuit, USA v. Edward Rose & Sons, et al (2004 FED App. 0279P (6th Cir.). (See the "III. Analysis" section content regarding "the two apartments share".)

http://www.usdoj.gov/crt/housing/documents/rose_opin_landing.php

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Irwin-G2-1102.1

E154–09/10
1102.1

Proponent: Janet Reed, Architect, City of Phoenix – Development Services Department

Revise definition follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

MULTISTORY UNIT. A dwelling unit or sleeping unit with habitable space located on more than one story or above a private garage.

Reason: This amendment is to make the code consistent with Fair Housing Act requirements. Frank Keating, General Counsel for HUD, issued a memo dated 12/16/1991 that exempts carriage house unit designs. These units are stacked housing units designed to incorporate parking for each unit into the dwelling unit design in non-elevator buildings where the garage footprint is used as the footprint for the remaining floor or floors of the unit. See 1.29 of the Fair Housing Act Design Manual.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ReedJ-E2-1102.1

E155–09/10
1102.1

Proponent: Gilles J. Malkine, Action Toward Independence, Inc.

Add new definition as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

OFFICE OF A HEALTH CARE PROVIDER. A location where a person or entity regulated by a state to provide professional services related to the physical or mental health of an individual makes such services available to the public.

Reason: Add new text (as follows) as definition of “health care provider” as defined by the Americans with Disabilities Act standards, Subpart D, section 36:401 (d)(i):

Adopting this ADA definition will ensure that the scope of covered entities under the IBC (e.g., 1104.4 Exp. 1) will be equal in breadth to that of the ADA. It will help in maximizing the types of agencies obliged to provide accessibility to the public if they provide “professional services related to” health care, as may be determined on a case-by-case basis. It will empower code officials to consider their interpretation of the term ‘health care provider’ in the largest possible context, as opposed to using other, more restrictive and less stringent definitions that exclude all but ‘licensed’ or ‘medical’ entities from the obligation to provide accessibility.

The result will be superior to the current IBC as it will prevent code officials, in the absence of any definition, from construing a narrow and constricted view of what services are health care-related.

In support of this view, the US Code recognizes that entities other than licensed medical providers may be authorized (by contract for example) to provide health care services: **Title 42 USC - Sec. 11151. Definitions** (6) The terms "licensed health care practitioner" and "practitioner" mean, with respect to a State, an individual (other than a physician) who is licensed or otherwise authorized by the State to provide health care services.

Example: an ADA Title III privately owned professional non-profit counseling agency that provides its services publicly to AIDS patients through a state Department of Health contract and that is obliged by that contract to abide by specified state DOH regulations would qualify as a health care provider, and as such would be required to comply with applicable Title III accessibility provisions.

THIS IS A 3 PART CODE CHANGE. PARTS I AND II WILL BE HEARD BY THE IBC MEANS OF EGRESS COMMITTEE. PART III WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

1. Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

PUBLIC RIGHT OF WAY. Public land or property, usually in interconnected corridors, that is acquired for or devoted to transportation purposes.

TYPE C (Visitable) UNIT. A dwelling unit designed and constructed for accessibility in accordance with this code and the provisions for Type C units in ICC A117.1.

2. Revise as follows:

1107.2 Design. Dwelling units and sleeping units that are required to be Accessible units, Type A units, ~~and~~ Type B units, and Type C units shall comply with the applicable portions of Chapter 10 of ICC A117.1. Units required to be Type A units are permitted to be designed and constructed as Accessible units. Units required to be Type B units are permitted to be designed and constructed as Accessible units or as Type A units. Units required to be Type C (Visitable) units are permitted to be designed and constructed as Accessible units, as Type A units, or as Type B units.

1107.6 Group R. Accessible units, Type A units, ~~and~~ Type B Units, and Type C (Visitable) units shall be provided in Group R occupancies in accordance with Sections 1107.6.1 through 1107.6.4.

1107.6.2.2 Group R-2 other than apartment houses, monasteries and convents. In Group R-2 occupancies, other than apartment houses, monasteries and convents, Accessible units, ~~and~~ Type B units, and Type C units shall be provided in accordance with Sections 1107.6.2.2.1 through ~~1107.6.2.2.2~~ 1107.6.2.2.3.

1107.6.2.2.3 Type C units. Where there are 6 or more dwelling units in a development site, at least 50 percent shall be a Type C unit. All R-2 units on a development site shall be considered to determine the total number of units and the required number of Type C units.

Exceptions: The following units are not required to be Type C units or be considered to determine the total number of units:

1. Units above other units.
2. Units without garages where the slope between the finish ground level at all unit entrances to all points along the property lines that border a public right of way are no greater than 8.33 percent.

1107.6.3 Group R-3. Type B units and Type C units shall be provided in Group R-3 occupancies in accordance with Sections 1107.6.3.1 and 1107.6.3.2.

1107.6.3.1 Type B units. In Group R-3 occupancies where there are four or more dwelling units intended to be occupied as a residence in a single structure, every dwelling unit intended to be occupied as a residence shall be a Type B unit.

Exception: The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

1107.6.3.2 Type C units. In Group R-3 occupancies, where there are 6 or more dwelling units in a development site, at least 50 percent shall be a Type C unit. All R-3 units on a development site shall be considered to determine the total number of units and the required number of Type C units.

Exceptions: The following units are not required to be Type C units or be considered to determine the total number of units

1. Units above other units.
2. Units without garages where the slope between the finish ground level at all unit entrances to all points along the property lines that border a public right of way are no greater than 8.33 percent.

1107.7.5 Design flood elevation. The required number of Type A units, Type B units, and Type C units shall not apply to a site in accordance with 1107.7.5.1 through 1107.7.5.2.

1107.7.5.1 Type A units and Type B units. The required number of Type A units and Type B units shall not apply to a site where the required elevation of the lowest floor or the lowest horizontal structural building members of nonelevator buildings are at or above the design flood elevation resulting in:

1. A difference in elevation between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15 240 mm) exceeding 30 inches (762 mm), and
2. A slope exceeding 10 percent between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15.24 m).

Where no such arrival points are within 50 feet (15.24 m) of the primary entrances, the closest arrival points shall be used.

1107.7.5.2 Type C units. The required number of Type C dwelling units shall not apply to a site where the required elevation of the lowest floor or the lowest horizontal structural building members are at or above the design flood elevation resulting in:

1. A difference in elevation between the minimum required floor elevation at all unit entrances and the ground elevation at the entrance exceeds 30 inches (762 mm), or
2. A slope exceeding 8.33 percent between the minimum required floor elevation at all unit entrances to all points along the property lines that border a public right of way.

3411.1 (IEBC 310.1) Scope. The provisions of Sections 3411.1 through 3411.9 apply to maintenance, change of occupancy, additions and alterations to existing buildings, including those identified as historic buildings.

Exceptions:

1. Type B dwelling or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities being altered or undergoing a change of occupancy.
2. Type C dwelling required by Section 1107 of this code are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.

(Renumber subsequent sections)

PART II - IEBC

Revise as follows:

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the International Building Code and ICC A117.1 unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible.

A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the International Building Code and ICC A117.1.
5. Type C dwelling required by Section 1107 of the International Building Code are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.

PART III – IRC BUILDING/ENERGY

Add new text as follows:

SECTION R202
DEFINITIONS

PUBLIC RIGHT OF WAY. Public land or property, usually in interconnected corridors, that is acquired for or devoted to transportation purposes.

TYPE C (Visitable) UNIT. A dwelling unit designed and constructed for accessibility in accordance with this code and the provisions for Type C units in ICC A117.1.

R320.2 Visitable (Type C) units. Where there are 6 or more dwelling in a development site, at least 50 percent shall be a Type C unit. All units on a development site shall be considered to determine the total number of units and the required number of Type C units.

Exceptions:

1. Type C units shall be permitted to be designed and constructed as Accessible units, Type A units, or Type B units in accordance with Chapter 11 of the International Building Code.
2. The following units are not required to meet Type C unit requirements or be considered to determine the total number of units:
   - 2.1 Units above other units.
   - 2.2 Units without garages where the slope between the finish ground level at all unit entrances to all points along the property lines that border a public right of way are no greater than 8.33 percent.
3. Type C dwelling are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.
4. The required number of Type C units shall not apply to a site where the required elevation of the lowest floor or the lowest horizontal structural building members are at or above the design flood elevation resulting in:
   - 4.1 A difference in elevation between the minimum required floor elevation at all unit entrances and the ground elevation at the entrance exceeds 30 inches (762 mm), or
   - 4.2 A slope exceeding 8.33 percent between the minimum required floor elevation at all unit entrances to all points along the property lines that border a public right of way.

Reason: Type C dwelling units have been added to the technical requirements in 2009 ICC/A117.1. The intent of this proposal is to scope Type C dwelling units for buildings that fall below the threshold of the Fair Housing Act Accessibility Guidelines.

1. There is a correlative change being proposed for the IBC, IRC and IEBC.
2. Type C (Visitable) units require significantly less accessibility than Type B units do. Type C units require one zero-step entrance on a circulation path (not necessarily an accessible route) from a garage, driveway, sidewalk, or street. The entrance does not have to be the front door. Therefore, an attached garage, with a floor that slopes away from a connecting door that has no step can satisfy the zero-step entrance requirement. Interior requirements for Type C units apply only to the entry level and are equally as lax as the exterior requirements.

3. Jurisdictions across the Country are adding Visitability requirements to their local codes. Neither the technical provisions nor the scoping provisions are consistent. To address the technical provisions, ICC A117.1 created Type C (Visitable) units. This proposed change to the Building Code is to make the scoping provisions consistent.
4. Because of site constraints, individual dwelling units, in-fill units, and small developments may have difficulty with providing a zero-step entrance. Therefore, this proposal limits applicability to developments with 6 or more dwelling units.
5. Other site issues, such as trees, preserving natural terrain, and local design guidelines, when coupled with zero-step entrances may increase construction costs by more than a few hundred dollars. In lieu of listing a series of exceptions, this proposal applies to only half the R-2 and R-3 dwelling units.
6. The technical requirements for Type C units are a subset of the Accessible, Type A, and Type B unit technical requirements. Therefore, requiring those units to comply with Type C units is redundant.
7. Stacked townhomes are becoming popular. The proposal only addresses the units nearest the ground. Upper unit is exempted from compliance. Lower units are exempted when the entrance level is significantly below ground.
8. Providing a zero-step entrance is more expensive on a small lot where the unit does not have a garage, particularly on sites with steeper slopes. Therefore, this proposal exempts units where the difference in grade elevation at all the entrances and the elevation along property lines that are along the public right of way slopes more than 8.33%.
9. Modifying existing structures will cost, on average, more than a few hundred dollars. Therefore, existing structures and additions are exempted.

Cost Impact: $100 to $400 per dwelling unit. See “Increasing Home Access: Designing for Visitability” by the AARP Public Policy Institute. http://assets.aarp.org/rgcenter/il/2008_14_access.pdf

	Assembly:	ASF	AMF	DF

ICCFILENAME:Mazz Mark-E1-1102.1

E157–09/10
1103.2.3

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1103.2.3 Employee work areas. Spaces and elements within employee work areas shall only be required to comply with Sections 907.9.1.2, 1007 and 1104.3.1 and shall be designed and constructed so that individuals with disabilities can approach, enter and exit the work area. Work areas, or portions of work areas, that are less than 300 square feet (30 m^2) in area and ~~elevated~~ located 7 inches (178 mm) or more above or below the ground or finish floor where the change in elevation is essential to the function of the space shall be exempt from all requirements.

Reason: There is no reason to limit the elevation change to raised areas. Employee work areas may also need be lowered in order to function - as in an automotive service pit.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E9-1103.2.3

E158–09/10
1103.2.7, 1103.2.8 (New)

Proponent: Ron Clements, Chesterfield County Virginia Building Inspection Department, representing self

1. Revise as follows:

1103.2.7 Raised areas, safety and security. Raised areas used primarily purposes of security, life safety or fire safety including, but not limited to, observation galleries, prison guard towers, fire towers or lifeguard stands, are not required to be accessible or be served by an accessible route.

2. Add new text as follows:

1103.2.8 Raised and recessed areas in places of religious worship. Raised and recessed areas used primarily for religious ceremonies in a place of religious worship are not required to be accessible or be served by an accessible route.

(Renumber remaining sections)

Reason: The current accessibility provisions of chapter 11 in the IBC and the ICC/ANSI A117.1 standard were developed from the Americans With Disabilities act and in large part by people involved in the ADA. The Americans with Disabilities act section 307 exempts religious organizations and religions buildings from compliance with the act. Due to this exemption accessibility to specific church architectural elements has never been developed and is not addressed in the code or A117.1standard. Providing access routes to elevated areas such as Altars, bimahs, baptisteries, pulpits, platforms and other elevated areas within churches used for the performance of church religious services is very difficult and costly. Furthermore even if an accessible route is provided to these areas there is no guidance to make a religious feature such as a baptistery accessible. Since there is already an accessibility exemption for raised areas used for safety and security this proposal adds "safety and security" to the existing raised area exemption and adds this new exemption directly following the existing raised area exemption. Recessed areas is also addressed do to the use of recessed areas for religious ceremonies and rites by certain religions.

Cost Impact: This will reduce the cost of constructing religious buildings.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Clements-E2-1103.2

E159–09/10
1103.2.12

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Delete without substitution:

~~**1103.2.12 Day care facilities.** Where a day care facility (Groups A-3, E, I-4 and R-3) is part of a dwelling unit, only the portion of the structure utilized for the day care facility is required to be accessible.~~

Reason: A business operated in a dwelling is covered in Sections 1103.2.13 and 419 Live/Work Units. Section 1103.2.12 is duplicative and potentially conflicting.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E10-1103.2.12

E160–09/10
1007.5, 1103.2.13, 1109.7 (IFC [B] 1007.5)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

~~1103.2.13~~ 1109.15 Live/Work units. In Live/Work units constructed in accordance with Section 419, the portion of the unit utilized for nonresidential use is required to be accessible. The residential portion of the Live/Work unit is required to be evaluated separately in accordance with Sections 1107.6.2 and 1107.7.

1109.7 Lifts. Platform (wheelchair) lifts are permitted to be a part of a required accessible route in new construction where indicated in Items 1 through ~~10~~ 11. Platform (wheelchair) lifts shall be installed in accordance with ASME A18.1.

1. An accessible route to a performing area and speaker platforms in Group A occupancies.
2. An accessible route to wheelchair spaces required to comply with the wheelchair space dispersion requirements of Sections 1108.2.2 through 1108.2.6.
3. An accessible route to spaces that are not open to the general public with an occupant load of not more than five.
4. An accessible route within a dwelling or sleeping unit.
5. An accessible route to wheelchair seating spaces located in outdoor dining terraces in Group A-5 occupancies where the means of egress from the dining terraces to a public way are open to the outdoors.
6. An accessible route to jury boxes and witness stands; raised courtroom stations including judges' benches, clerks' stations, bailiffs' stations, deputy clerks' stations and court reporters' stations; and to depressed areas such as the well of the court.
7. An accessible route to load and unload areas serving amusement rides.
8. An accessible route to play components or soft contained play structures.
9. An accessible route to team or player seating areas serving areas of sport activity.
10. An accessible route to or within a live/work unit.

~~10~~.11. An accessible route where existing exterior site constraints make use of a ramp or elevator infeasible.

1007.5 (IFC [B] 1007.5) Platform lifts. Platform (wheelchair) lifts shall not serve as part of an accessible means of egress, except where allowed as part of a required accessible route in Section 1109.7, Items 1 through ~~9~~ 10. Standby power shall be provided in accordance with Chapter 27 for platform lifts permitted to serve as part of a means of egress.

Reason: Live/work units should not be located in Section 1103 as this section is for exceptions only. This provision is applying accessibility to the work portion of the dwelling and possibly the dwelling unit and should therefore be located in the Other Facilities section.
Allowing a platform lift to be used for the required accessible route in a live/work unit is reasonable due to the probable low occupant factor and the potential difficulty in providing a ramp. Given the limited occupants, it should also be permitted as part of an accessible means of egress.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E11-1103.2.13

E161–09/10
1103.2.16 (New), 1109.13

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

1. Add new text as follows:

1103.2.16 Appliance controls. Operating mechanisms and controls on appliances such as ATM machines, vending machines, ovens, microwave ovens, cooktops, washers and dryers are not required to be accessible.

2. Delete without substitution:

~~**1109.13 Fuel-dispensing systems.** Fuel-dispensing systems shall comply with ICC A117.1.~~

Reason: The application of the building code to appliances should be limited to the provision of an accessible route and clear floor space. Controls on the appliance itself should not be regulated by the building code. Civil rights laws provide a better means of addressing these issues.
Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E12-1103.2.16

E162–09/10
1104.3.1

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1104.3.1 Employee work areas. Common use circulation paths within employee work areas shall be accessible routes.

Exceptions:

1. Common use circulation paths, located within employee work areas that are less than ~~300~~ 1,000 square feet (~~27.9~~ 93 m^2) in size and defined by permanently installed partitions, counters, casework or furnishings, shall not be required to be accessible routes.
2. Common use circulation paths, located within employee work areas, that are an integral component of equipment, shall not be required to be accessible routes.
3. Common use circulation paths, located within exterior employee work areas that are fully exposed to the weather, shall not be required to be accessible routes.

Reason: To align with the federal Americans with Disabilities Act Accessibility Guidelines.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E13-1104.3.1

E163–09/10
1104.4

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1104.4 Multilevel buildings and facilities. At least one accessible route shall connect each ~~accessible~~ level, including mezzanines, in multilevel buildings and facilities.

Exceptions:

1. An accessible route is not required to stories and mezzanines that have an ~~aggregate area~~ occupant load of not more than ~~3,000 square feet (278.7 m^2)~~ 30 persons and are located above and below accessible levels. This exception shall not apply to:
   1.1. ~~Multiple tenant facilities~~ Public areas of Group M occupancies ~~containing five or more tenant spaces~~;
   1.2. ~~Levels containing offices~~ Public areas of health care providers (Group B or I); ~~or~~
   1.3. Public areas of Passenger transportation facilities and airports (Group A-3 or B); or
   1.4. Public areas of municipal and government facilities.
2. Levels that do not contain accessible elements or ~~other~~ spaces as determined by Section 1106, 1107 or 1108 are not required to ~~be served by an accessible route from an accessible level~~ comply with Section 1104.4.
3. In air traffic control towers, an accessible route is not required to serve the cab and the floor immediately below the cab.

4. ~~Where a two-story building or facility has one story with an occupant load of five or fewer persons that does not contain public use space, that story shall not be required to be connected by an accessible route to the story above or below.~~

~~5.~~4. Vertical access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator complying with ICC A117.1 can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

Reason: Delete accessible from the charging statement as this is the section that defines which levels are required to be accessible. Including accessible in the charging statement is circuitous.

Changes to Exception 1 represent a new approach to determining which stories and mezzanines require an accessible route. The current language appears to be derived from the federal Americans with Disabilities Act guidelines. This approach is inferior to the proposed language as it is based on size of the space. The federal rules do not have a mechanism to determine occupant load and therefore is limited to measuring the size of the space. Building code applies an occupant load based on the use of the space. This is a superior, more logical and consistent method of determining if access to a space is justified. The proposed language establishes a threshold of 30 people maximum where access would not be required. The exceptions to the 30 person occupant load are areas accessed by the general public in certain use groups. All of the "special use groups" are created equal in this proposal including the Group M occupancies. Other than the ADAAG, there is no justification for the current code providing an exception for retail facilities having four or less tenants. The proposed text allows employee work areas within the "special use groups" to have an occupant load of up to 30 employees without providing an accessible route. Exception 4 can be deleted as the issue is sufficiently addressed in Exception 1.

The modification to Exception 2 is to clarify the original intent that spaces or elements addressed in Section 1107 or 1108 are not required to provide an accessible route per Section 1104.4. A new reference to Section 1106 is added for multistory parking structures which will only require an accessible route to the required accessible parking spaces and passenger loading facilities. Levels that do not provide accessible parking spaces will not be required to be provided with an accessible route.

Cost Impact: The code change proposal will increase cost in some situations and reduce cost in others.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E15-1104.4

E164–09/10
1104.5

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1104.5 Location. Accessible routes shall coincide with ~~or be located in the same area as~~ a general circulation path. Where an accessible route diverges from the general circulation path, the accessible route shall be located in the same area as the general circulation path. Where the circulation path is interior, the accessible route shall also be interior. Where only one accessible route is provided, the accessible route shall not pass through kitchens, storage rooms, restrooms, closets or similar spaces.

Exceptions:

1. Accessible routes from parking garages contained within and serving Type B units are not required to be interior.
2. A single accessible route is permitted to pass through a kitchen or storage room in an Accessible unit, Type A unit or Type B unit.

Reason: Providing two criteria in the same sentence, i.e., that routes coincide or be in the same area, gives both alternatives equal value. The intent of the provision should be that the routes coincide to the extent possible and only separate when necessary. Dividing the criteria into two separate sentences achieves this intent.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E17-1104.5-2

E165–09/10
1104.5

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1104.5 Location. Accessible routes shall coincide with or be located in the same area as a general circulation path. Where the circulation path is interior, the accessible route shall also be interior. Where a circulation path is within a tenant space, the accessible route shall also be within the tenant space. Where only one accessible route is provided, the accessible route shall not pass through kitchens, storage rooms, restrooms, closets or similar spaces.

Exceptions:

1. Accessible routes from parking garages contained within and serving Type B units are not required to be interior.
2. A single accessible route is permitted to pass through a kitchen or storage room in an Accessible unit, Type A unit or Type B unit.

Reason: It is fairly common for retail spaces to have multiple levels. Some retailers in multitenant buildings may have convenience stairs to other floors within the retailer's space but rely on the common use elevator for an accessible route. This requires that customers who are unable to use the stair, leave the store, go to a common use elevator, and reenter the store at the other level. Customers unable to use the stair may have to pay for goods twice if the goods they need are on opposite floors. This is a huge inconvenience for customers unable to use the stair.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E16-1104.5

E166–09/10
1106.5

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1106.5 Van spaces. For every six or fraction of six accessible parking spaces, at least one shall be a van-accessible parking space.

~~**Exception:** In Group R-2 and R-3 occupancies, van accessible spaces located within private garages shall be permitted to have vehicular routes, entrances, parking spaces, and access aisles with a minimum vertical clearance of 7 feet (2134 mm).~~

Reason: This exception is discriminatory as it does not afford an individual equal treatment at Group R-2 and R-3 facilities. The code recognizes that a vertical clearance exceeding 7 feet is required for van parking at all occupancies other than Groups R-2 and R-3. What happens to the van, which the code acknowledges requires a clearance in excess of 7 feet, such that when it arrives at a Group R occupancy it no longer requires the additional height? The only justification for this exception is that two federal agencies that develop accessible design criteria don't provide the same guidance on this issue (my understanding is that the federal discrepancy is more accidental than deliberate). There is no reason for ICC to incorporate federal conflicts into the building code.

Rather than provide inconsistent and conflicting requirements in the building code based on provisions from various federal agencies, ICC should take the initiative to rectify the discrepancies. Deleting the exception in Section 1106.5 acknowledges the fact that a van does not change based on where it's located and whatever provisions are necessary for the vehicle hold true to all occupancies and facilities. Deleting the exception also does not conflict with federal rule. It simply exceeds a federal rule.

The other action available to ICC is to delete the height requirement altogether – for all occupancies and facilities. The additional height is a costly provision and it could be determined that the cost/benefit is not justified. This would conflict with federal rule but would send a signal to the federal authority suggesting that this issue be reconsidered.

The worst result for the building code is to maintain the current internal conflict that provides different standards for different occupancy groups when there is no justification for the discrepancy based on the subject matter (van height).

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E18-1106.5

E167–09/10
1107.3

Proponent: Karen L. Braitmayer, FAIA, Studio Pacifica, Ltd. representing self

Revise as follows:

1107.3 Accessible spaces. Rooms, ~~and~~ spaces and elements available to the general public or available for use by residents and serving Accessible units, Type A units or Type B units shall be accessible. Accessible spaces shall include toilet and bathing rooms, kitchen, living and dining areas and any exterior spaces, including patios, terraces and balconies. Accessible elements shall include, but not be limited to, mailboxes and trash chutes serving Accessible units, Type A units and Type B units.

Exceptions:

1. Recreational facilities in accordance with Section 1109.14.
2. In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.

Reason: Much confusion exists on what elements that are associated with dwelling units must be accessible, and how many. This proposal provides clarity on what build-in elements that directly serve Accessible units, Type A units and Type B units must be accessible, even if they are not contained within the unit itself.

Cost Impact: This code change will not increase the cost of construction.

1107.3.1 (New)

Proponent: Edward L. Repic, Architectural Refuse Solutions, LLC, representing self.

Add new text as follows:

1107.3.1 Accessible Rubbish Chute. Rubbish chutes in residential facilities shall be accessible. Rubbish chute intake doors shall comply with ICC A117.1. The combined door and disposal operations shall be capable of being accomplished with a single hand,

Reason: This submittal is part of four such proposals submitted as independent documents with the intent of adequately addressing Rubbish Chutes (which can include "recycling" chutes that simply redirect parts of the rubbish waste stream to locations other than a landfill) and Linen (or Laundry) Chutes. These proposals individually address Life Safety, Sprinkler Placement, Accessibility in new and existing facilities, and actual Chute Construction and a related component to Rubbish Chutes: Compactors (codes generally address the shaft enclosure but ignore the actual chute being enclosed or the compactor it is feeding).

Rubbish chutes, in this case meaning chute intakes, are not required in buildings, but when provided, chutes are typically general access features for use by the public at large ... typically the building end users ... as opposed to features that are solely available to the housekeeping and/or maintenance staff. As such, it is our belief that rubbish chute intake doors are provided as Public-Use Areas in conformance with Section 1102 and should be accessible. By comparison, the rubbish room and its compactor and/or containers ... the disposal facilities for the rubbish chute features on each living levels ... are not designed for public access. Rather, they are the province of the housekeeping and maintenance staff.

The problem lies in the fact that code does not adequately address chute intake doors. It is our purpose to address this particular oversight.

The original 1990 ADA document addressed what it considered "equipment" and their controls. Successive versions, including the ANSI 117.3-2003 document do not address equipment. Rather they address man doors. Their provisions ultimately boil down to the use of lever or tee handles within stipulated reach ranges; a limitation on the force used to open the doors (5lbf or 20N); a prohibition against tight grabbing, pinching or twisting; and finally a requirement for single hand operation.

It is our belief that the rubbish chute intake door should be considered separately from man doors because of their role as opening protectives on a building feature designed for public use. As such, they should be categorized as needing "accessibility" by the ANSI provisions in the previous paragraph and most certainly should meet the single hand operation requirement. Chute industry technology has, for more than a decade, included pneumatically operated intakes that: open with the push of a palm button (large enough to be depressed with *any* available body part); time their opening; and then slowly close themselves.

Compare this with the operation of a non-accessible, standard intake by a disabled person ... let's say an 80 year old woman using a walker and carrying her own garbage. She must get to the door, *release her walker*, grab the intake door handle with one hand, pull it open, hold it open, lift her garbage for disposal, release the door, grab her walker, turn, and walk away. It is not possible for an able bodied person to open a standard intake door and deposit the garbage with one hand. The disabled have no chance.

Cost Impact: ADA compliant, pneumatic intake door: Less than $1000, installed. Compressor: Approximately $800, installed. (Please note that the most expensive chute we have ever designed had a value equal to ½ of 1% of the total project cost. Typically the actual range is ¼ to 1/3 of 1%, but even that has limitations, we have seen $100,000,000 projects with $30,000 chute installations ... 3/100 of 1%!)

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME:Repic-E1-1103.1

E169–09/10
1107.5.2.1

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1107.5.2 Group I-2 nursing homes. Accessible units and Type B units shall be provided in nursing homes of Group I-2 occupancies in accordance with Sections 1107.5.2.1 and 1107.5.2.2.

1107.5.2.1 Accessible units. At least ~~50~~ 10 percent but not less than one of each type of the dwelling units and sleeping units shall be Accessible units.

1107.5.2.2 Type B units. In structures with four or more dwelling units or sleeping units intended to be occupied as a residence, every dwelling unit and sleeping unit intended to be occupied as a residence shall be a Type B unit.

Exception: The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

Reason: Units designed to the ICC A117.1 standard are intended for unassisted individual use. The overwhelming majority of nursing home residents are incapable of independent use and rely on assistance. The requirement that 50% of the units be designed for independent use is excessive and does not serve the needs of the typical nursing home resident. A common issue in units designed to ICC A117.1 Accessible unit criteria is that the water closet is located next to a side wall making assisted transfers to and from the fixture more difficult. Units not meeting the Accessible unit requirements will be Type B units which can be designed for assisted use.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E19-1107.5.2.1

1107.6.1.1, 1107.6.1.1.1 (New)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Add new text as follows:

1107.6.1 Group R-1. Accessible units and Type B units shall be provided in Group R-1 occupancies in accordance with Sections 1107.6.1.1 and 1107.6.1.2.

1107.6.1.1 Accessible units. ~~In Group R-1 occupancies,~~ Accessible dwelling units and sleeping units shall be provided in accordance with Table 1107.6.1.1. All ~~R-1~~ dwelling units and sleeping units on a site shall be considered to determine the total number of Accessible units. Accessible units shall be dispersed among the various classes of units. Roll-in showers provided in Accessible units shall include a permanently mounted folding shower seat.

1107.6.1.1.1 Accessible unit facilities. All interior and exterior spaces and elements provided as part of or serving an Accessible dwelling unit or sleeping unit shall be accessible and be located on an accessible route.

Exceptions:

1. Where multiple bathrooms are provided within an Accessible unit, at least one full bathroom shall be accessible.
2. Where multiple family or assisted bathrooms serve an Accessible unit, at least 50% but not less than one room for each use at each cluster shall be accessible.

3. Five percent, but not less than one bed shall be accessible.

1107.6.1.2 Type B units. In structures with four or more dwelling units or sleeping units intended to be occupied as a residence, every dwelling unit and sleeping unit intended to be occupied as a residence shall be a Type B unit.

Exception: The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

Reason: Delete reference to Group R-1 as it is implicit from Section 1107.6.1. The new section is to provide exceptions for Accessible units with multiple bathrooms or multiple beds.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E20-1107.6.1.1.1

1107.6.2.2, 1107.6.2.2.1, 1107.6.2.2.2

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1107.6.2.2 Group R-2 other than apartment houses, monasteries and convents. In Group R-2 occupancies, other than apartment houses, monasteries and convents, Accessible units, and Type B units shall be provided in accordance with Sections ~~1107.6.2.2.1 and 1107.6.2.2.2~~ 1107.6.1.1 through 1107.6.1.3.

~~**1107.6.2.2.1 Accessible units.** Accessible dwelling units and sleeping units shall be provided in accordance with Table 1107.6.1.1.~~

~~**1107.6.2.2.2 Type B units.** Where there are four or more dwelling units or sleeping units intended to be occupied as a residence in a single structure, every dwelling unit and every sleeping unit intended to be occupied as a residence shall be a Type B unit.~~

~~**Exception:** The number of Type B units is permitted to be reduced in accordance with Section 1107.7.~~

Reason: To simply the code by deleting duplicative language and to reinforce the concept that these types of units are essentially treated as Group R-1 transient type units.

Note: the reference to Section 1107.6.1.3 is based on approval of a separate proposal to add this new section. If 1107.6.1.3 is not approved, the reference in this proposal should be changed to 1107.6.1.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E22-1107.6.2.2

E172–09/10
1107.7.2

Proponent: Janet Reed, Architect, representing City of Phoenix – Development Services Department

Revise as follows:

1107.7.2 Multistory units. A multistory dwelling or sleeping unit which is not provided with elevator service is not required to be a Type A or Type B unit. Where a multistory unit is provided with external elevator service to only one floor, the floor provided with elevator service shall be the primary entry to the unit, shall comply with the requirements for a Type B unit and a toilet facility shall be provided on the first floor.

Reason: This amendment it needed to meet the original intentions of ICC. As proposed it complies with Fair Housing Act. Accessibility requirements for townhouses conforming to the requirements of the IRC are referred back to IBC section 1107.6.3 which has requirements for only the Type B units and not Type A. unit. The same requirements should apply to two-story units complying with either the IRC or IBC. It might be noted that this amendment was a code change proposal of Jeff Inks, National Association of Home Builders that was submitted as part of the 2006/2007

code development cycle to ICC. Jeff Inks wrote, "The original primary intend of this general exception is to exclude R 2 multistory dwelling units from the accessibility requirements of this chapter. However when this exception was drafted, focus was on the multistory exceptions included under Fair Housing and inclusion of Type A units were therefore overlooked. The intension of the proposal is to exempt multistory townhouse style dwelling units when they fall into Group R-2 from Type A requirements. This would be consistent with Fair Housing requirements.

Cost Impact: The Code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ReedJ-E1-1107.7.2

E173–09/10
1107.7.2.1 (New)

Proponent: Dominic Marinelli, representing United Spinal Association

Add new text as follows:

1107.7.2 Multistory units. A multistory dwelling or sleeping unit which is not provided with elevator service is not required to be a Type B unit. Where a multistory unit is provided with external elevator service to only one floor, the floor provided with elevator service shall be the primary entry to the unit, shall comply with the requirements for a Type B unit and a toilet facility shall be provided on that floor.

1107.7.2.1 Dwelling units with private residence elevators. Multistory dwelling units containing a private residence elevator within the dwelling unit shall be a Type B unit. All levels within the dwelling unit shall be served by the elevator and shall comply with the requirements for a Type B unit.

Reason: The current code language in Section 1107.7 is currently NOT clear as to the ramifications of placing a private residence elevator within the interior of a dwelling unit. This change will add that needed clarity.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

1108.2.7.2, 1108.2.7.2.1, 1108.2.7.2.2

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

1. Revise as follows:

1108.2.7.2 Public address systems. Where stadiums, arenas and *grandstands* have 15,000 fixed seats or more and provide audible public announcements, they shall also provide ~~equivalent text information regarding events and facilities in compliance with Sections 1108.2.7.2.1 and 1108.2.7.2.2~~ pre-recorded or real-time captions of those audible public announcements.

2. Delete without substition:

~~**1108.2.7.2.1 Prerecorded text messages.** Where electronic signs are provided and have the capability to display prerecorded text messages containing information that is the same, or substantially equivalent, to information that is provided audibly, signs shall display text that is equivalent to audible announcements.~~

~~**Exception:** Announcements that cannot be prerecorded in advance of the event shall not be required to be displayed.~~

~~**1108.2.7.2.2 Real-time messages.** Where electronic signs are provided and have the capability to display real-time messages containing information that is the same, or substantially equivalent, to information that is provided audibly, signs shall display text that is equivalent to audible announcements.~~

Reason: This proposal addresses several things. First, currently any grandstand with a public address system requires equivalent text to the information announced, i.e. captioning, and in a little league ballpark the seating would meet the definition of a grandstand and there will likely be a microphone with a loud speaker that would address the public. Therefore, this small volunteer baseball field could be interpreted as a grandstand with a public address system. There are many similar facilities that would be caught by this requirement without any practical way of complying. A facility requires a certain amount of sophistication before captioning can be readily possible. These smaller facilities are often staffed by volunteers rather than the trained staff found in the more sophisticated facilities. Solving the technological challenges alone does not assure effective text to audible announcements, i.e. captioning. This proposal would apply to only those stadiums, arenas and grandstands that would have adequate infrastructure to adequately caption announcements.

The use of the term electronic sign is improper as it relates to providing substantially equivalent text information to audible announcements. "Captions" of audible information is nationally recognized as the term for providing text information that matches audible announcements. Captioning information that is announced over the PA system was ruled as needed for equivalent communication with persons having a hearing impairment in a court decision over civil rights under the Americans with Disabilities Act (ADA) at Fed Ex Field, dated September 30, 2008. It was also proposed as a requirement in the Proposed Rule by the Department of Justice, dated June 17, 2008, to establish new design guidelines for the ADA. Finally, this proposal maintains the use of either pre-recorded or real-time captions of audible announcements at the discretion of the facility as currently required. However, it eliminates the exception for not requiring announcements that cannot be prerecorded in advance under Section 1108.2.7.2.1.

Cost Impact: This code change proposal will not increase the cost of construction overall even though it may increase cost to some facilities and decrease cost to others.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Roether-E1-1108.2.7.2

E177–09/10
1108.2.9

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1108.2.9 Dining and drinking areas. In dining and drinking areas, ~~the total~~ all interior and exterior floor areas ~~allotted for seating and tables~~ shall be accessible.

Exceptions:

1. An accessible route between accessible levels and stories above or below is not required where permitted by Section 1104.4, Exception 1.
2. ~~1.~~ In buildings or facilities not required to provide an accessible route between ~~levels~~ stories, an accessible route to a mezzanine ~~seating area~~ is not required, provided that the mezzanine contains less than 25 percent of the total area and the same services, decor and amenities are provided in the accessible area.
3. ~~2.~~ In sports facilities, tiered dining areas providing seating required to be accessible shall be required to have accessible routes serving at least 25 percent of the dining area, provided that accessible routes serve accessible seating and where each tier is provided with the same services.
4. Employee only work areas shall comply with Sections 1103.2.3 and 1104.3.1.

Reason: Add drinking areas to clarify the intent that this section applies to restaurants and bars, and for consistency with Section 1108.2.8.1. Add interior and exterior spaces to include decks and patios. Delete seating and tables to include all types of public areas such as standing or game areas.

Exception 1 is added because the charging statement literally includes every level including stories.

The term level makes exception 2 irrelevant. A level is any change in elevation and all levels are required to be accessible. Stories is the term used in ADAAG. Décor is added because the mezzanine could provide something unique such as an exterior deck or exceptional exterior views. Decor is used in ADAAG.

Exception 4 is added due to the modification to simplify the charging statement which would cover employee and public areas.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1108.3.2 (New)

Proponent: Joseph R. Hetzel, Thomas Associates Inc. representing the Door & Access Systems Manufacturers Association

Add new text as follows:

1108.3 Self-service storage facilities. Self-service storage facilities shall provide accessible individual self-storage spaces in accordance with Table 1108.3.

TABLE 1108.3
ACCESSIBLE SELF-SERVICE STORAGE FACILITIES
(Portions of table not shown remain unchanged)

1108.3.1 Dispersion. Accessible individual self-service storage spaces shall be dispersed throughout the various classes of spaces provided. Where more classes of spaces are provided than the number of required accessible spaces, the number of accessible spaces shall not be required to exceed that required by Table 1108.3. Accessible spaces are permitted to be dispersed in a single building of a multibuilding facility.

1108.3.2 Access doors. Where upward acting doors are provided as the only means of access, such doors shall meet the following requirements:

1. Handles, pulls, latches, locks, and other operable parts shall have a shape that is easy to grasp with one hand and does not require tight grasping, pinching, or twisting of the wrist to operate. Operable parts of such hardware shall be 34 inches (865 mm) minimum and 48 inches (1220 mm) maximum above the floor.
2. Hardware used for operation shall be exposed and usable.
3. For manually operated doors, the force for manual operation shall not exceed 15 pounds (66.6 N) and the door size shall not exceed 8 feet 8 inches (2.64 m) wide by 8 feet (2.44 m) high.
4. Automatic doors shall include a means of disabling automatic operation devices in order to allow for emergency manual operation. The opening force for emergency operation shall not exceed 25 pounds (111 N).

Reason: Sections 1108.3 and 1108.3.1 are shown for context only. Self-service storage facilities often use upward acting doors as the sole means of accessing storage space. When a particular storage space is required to be accessible, in some cases another type of door meeting accessibility requirements cannot be practically provided. Currently, ICC/ANSI A117.1 does not address upward acting doors. The proposed requirements for operable parts, hardware and manual operation force are taken directly from A117.1 as applied to other types of doors. The maximum force limitations for operating a door, and the corresponding maximum size for a manually operated door, are based on design limitations inherent in upward acting doors. The maximum size is also common to self-service storage facilities.

Cost Impact: The proposal will increase the cost of construction if the automatic door option is chosen. However, automatic doors have advantages over manually operated doors from an operational standpoint, and if only accessible doors are automated, the impact on project cost should be minimal.

ICCFILENAME:Hetzel-E1-1108.3.2

E179–09/10
1108.5 (New), Chapter 35

Proponent: Marsha K. Mazz, U.S. Architectural and Transportation Barriers Compliance Board (Access Board)

1. Add new text as follows:

1108.5 Classroom acoustics. Classrooms in Group E occupancies shall meet the acoustical performance criteria in ANSI/ASA S12.60, Part 1.

Exception: Relocatable classrooms shall be permitted to comply with ANSI/ASA S12.60, Part 2.

2. Add new standard to Chapter 35 as follows:

American National Standards Institute (ANSI)
ANSI/ASA S12.60-2010/Part 1 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools
ANSI/ASA S12.60-200X/Part 2 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools, Relocatable Classroom Factors.

Reason: This code change proposes to reference two new standards: ANSI/ASA S12.60-2010/Part 1 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools and ANSI/ASA S12.60-200X/Part 2 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools, Relocatable Classroom Factors.

Acoustical performance is an important consideration in the design of classrooms. The proposed standard sets specific criteria for maximum background noise (35 decibels) and reverberation time (0.6 to 0.7 seconds) for unoccupied classrooms. Research indicates that levels of background noise and reverberation little noticed by adults, who are mature and skillful listeners, adversely affect learning environments for young children, whose neurological development is incomplete until late adolescence.[1] Amplification cannot remedy poor classroom acoustics because they amplify both wanted and unwanted sound. This code change will remove educational barrier for children who have hearing loss and those who use cochlear implants. In addition, children who have temporary hearing loss, who may comprise up to 15% of the school age population according to the Centers for Disease Control (CDC), will also benefit, as will children who have speech impairments or learning disabilities and those whose home language is different. Without improvements to the listening environment, children of all backgrounds, ages, and abilities are at risk of educational delay and failure.

Background: In 1998, the U.S. Access Board joined with the **Acoustical Society of America** (ASA) to support the development of a classroom acoustics standard. This resulted in the publication of the first ANSI/ASA S12.60-2002 (R 2009) Acoustical Performance Criteria, Design Requirements and Guidelines for Schools which was reaffirmed in 2009. The standard is now being reformatted to make it more easily interpreted and enforced. Additionally, it will include a new Part 2 to better address relocatable classrooms with support from the Modular Building Institute. We understand that the new editions will be published in 2009 (Part 2) and 2010 (Part 1) in time for consideration at the Final Action Hearings.

Supporting Data: In a large study of students in London and Munich schools, classroom noise levels were related to standardized achievement scores showing that higher noise levels resulted in poorer standardized test scores.[2, 3] Similar scores were reported by Armstrong International.

Bibliography

1. Ponton, C., Eggermont, J., Kwong, B. & Don, M. (2000) Maturation of human central auditory system activity: Evidence from multi-channel evoked potentials, Clinical Neurophysiology 111, 220 – 236.
2. Shield. B and Dockrell J (2008) The effects of environmental and classroom noise on the academic attainments of primary school children, J. Acoust. Soc. Am. Volume 123, 133-144
3. Hygge, S, Evans, G W. & Bullinger, M (2002) A Prospective Study of Some Effects of Aircraft Noise on Cognitive Performance in Schoolchildren. Psychological Science 13 (5), 469-474.

Cost Impact: This code change will increase the cost of construction. Evidence obtained from the State of Connecticut where the ANSI/ASA S12.60-2002 is applicable under state law is that cost increases have been nominal even for modular construction. Data from the UK where a similar standard has been applicable over the past five years indicates an average increase of 1.5% in new school construction. We anticipate that any costs attributable to this code change would be offset by the increased availability of Federal funds through the American Recovery and Reinvestment Act. A funding bill has passed in the U.S. House of Representatives which will support school sustainability improvements, specifically including improvements to acoustical environments.

Analysis: A review of the standards proposed for inclusion in the code, ANSI/ASA S12.60-2010/Part 1 and ANSI/ASA S12.60/Part 2, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

E180–09/10
1109.2

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be accessible. Where toilet rooms or bathing facilities are located on a floor level ~~is~~ not required to be connected by an accessible route, the ~~only toilet~~

~~rooms or bathing rooms provided within the facility shall not be located on the inaccessible~~ same type of facilities shall be located on an accessible floor. At least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing room shall be accessible.

Exceptions:

1. In toilet rooms or bathing rooms accessed only through a private office, not for common or public use and intended for use by a single occupant, any of the following alternatives are allowed:
   1.1. Doors are permitted to swing into the clear floor space, provided the door swing can be reversed to meet the requirements in ICC A117.1;
   1.2. The height requirements for the water closet in ICC A117.1 are not applicable;
   1.3. Grab bars are not required to be installed in a toilet room, provided that reinforcement has been installed in the walls and located so as to permit the installation of such grab bars; and
   1.4. The requirement for height, knee and toe clearance shall not apply to a lavatory.
2. This section is not applicable to toilet and bathing rooms that serve dwelling units or sleeping units that are not required to be accessible by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be accessible.
4. Where no more than one urinal is provided in a toilet room or bathing room the urinal is not required to be accessible.
5. Toilet rooms that are part of critical care or intensive care patient sleeping rooms are not required to be accessible.

Reason: This is an equity issue. The current text would allow separate gender facilities on the inaccessible floor and only a unisex on the accessible floor. Or, conversely, the only unisex room could be located on an inaccessible floor. As amended, the accessible facilities are required to be of the same type as on the inaccessible floor.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E25-1109.2

E181–09/10
1109.2

Proponent: Hope Reed, New Mexico Governor's Commission on Disability, representing the agency

Revise as follows:

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be accessible. Where a floor level is not required to be connected by an accessible route, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. At least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing room shall be accessible.

Exceptions:

1. In toilet rooms or bathing rooms accessed only through a private office, not for common or public use and intended for use by a single occupant, any of the following alternatives are allowed:
   1.1. Doors are permitted to swing into the clear floor space, provided the door swing can be reversed to meet the requirements in ICC A117.1;
   1.2. The height requirements for the water closet in ICC A117.1 are not applicable;
   1.3. Grab bars are not required to be installed in a toilet room, provided that reinforcement has been installed in the walls and located so as to permit the installation of such grab bars; and
   1.4. The requirement for height, knee and toe clearance shall not apply to a lavatory.
2. This section is not applicable to toilet and bathing rooms that serve dwelling units or sleeping units that are not required to be accessible by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be accessible.
4. Where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be accessible.

5. Toilet rooms that are part of critical care or intensive care patient sleeping rooms are not required to be accessible.
6. Where toilet facilities are primarily for children's use, required accessible water closets, toilet compartments and lavatories shall be permitted to comply with children's provision of ICC A117.1.

Reason: The added text provides "scoping" for children's water closets, toilet compartments and lavatories within the "ICC/ANSI A117.1-2003 Accessible and Usable Buildings and Facilities" section 604.1 Exception and 604.10 which identifies children's wheelchair accessible fixtures. Designers are unclear whether they need to provide additional accessible fixtures for children beyond those required for adults, and how many additional children's fixtures are needed.

Since adults are the minority in areas primarily used by children (such as in the preschool and kindergarten school wing, children's library and children's museum) the children's population needs to be adequately served with the proper number of children's accessible fixtures. Adults fixtures should be provided in other areas where there is a mix of all ages including staff, parents, students and the general public.

The added text makes it clear that children's wheelchair accessible water closets, toilet compartments and lavatories that are provided primarily for children's use may be substituted for the required number of adult fixtures in that area. No additional fixtures are required for children beyond the occupancy requirement. We use similar language in the New Mexico Building Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:ReedH-E1-1109.2

E182–09/10
1109.2

Proponent: Robert J. Heil, Code Inspections, Inc., representing Pennsylvania Association of Building Code Officials, Inc.

Revise as follows:

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be accessible. Where a floor level is not required to be connected by an accessible route, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. At least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing room shall be accessible.

Exceptions:

1. In toilet rooms or bathing rooms accessed only through a private office, not for common or public use and intended for use by a single occupant, any of the following alternatives are allowed:
   1.1. Doors are permitted to swing into the clear floor space, provided the door swing can be reversed to meet the requirements in ICC A117.1;
   1.2. The height requirements for the water closet in ICC A117.1 are not applicable;
   1.3. Grab bars are not required to be installed in a toilet room, provided that reinforcement has been installed in the walls and located so as to permit the installation of such grab bars; and
   1.4. The requirement for height, knee and toe clearance shall not apply to a lavatory.
2. This section is not applicable to toilet and bathing rooms that serve dwelling units or sleeping units that are not required to be accessible by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be accessible.
4. Where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be accessible.
5. Toilet rooms that are part of critical care or intensive care patient sleeping rooms are not required to be accessible.
6. Where a story or mezzanine is not required to be served by an accessible route in accordance with Section 1104.4 and the occupant load of that level is less than 15, then toilet rooms located on that level are not required to be accessible.

Reason: For a small floor level that is permitted to not be on an accessible route, with a limited occupancy, the requirement to have an accessible toilet room(s) occupies a disproportionate amount of space and does little to serve accessible needs.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

1109.4

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1109.4 Kitchens and kitchenettes. Where kitchens and kitchenettes are provided in accessible spaces or rooms, ~~they~~ at least one kitchen shall be accessible ~~in accordance with ICC A117.1~~.

Reason: It is excessive to require all kitchens to be accessible in spaces that have multiple kitchens such as a classroom.
The reference to ICC A117.1 is unnecessary as it is referenced at Section 1101.2 for the entire chapter.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E26-1109.4

E184–09/10
1109.5.1, 1109.5.2

Proponent: Hope Reed, Governor's Commission on Disability, representing the agency

Revise as follows:

1109.5 Drinking fountains. Where drinking fountains are provided on an exterior site, on a floor or within a secured area, the drinking fountains shall be provided in accordance with Section 1109.5.1 and 1109.5.2.

1109.5.1. Minimum number. No fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

~~Exception~~ Exceptions:

1. A single drinking fountain that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.
2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30" (762 mm) minimum above the floor.

1109.5.2 More than the minimum number. Where more than the minimum number of drinking fountains specified in Section 1109.5.1 are provided, 50 percent of the total number of drinking fountains provided shall comply with the requirements for persons who use a wheelchair and 50 percent of the total number of drinking fountains provided shall comply with the requirements for standing persons.

~~Exception~~ Exceptions:

1. Where 50 percent of the drinking fountains yields a fraction, 50 percent shall be permitted to be rounded up or down, provided that the total number of drinking fountains complying with this section equals 100 percent of the drinking fountains.
2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30" (762 mm) minimum above the floor.

Reason: The added text provides "scoping" for children's drinking fountains within the "ICC/ANSI A117.1-2003 Accessible and Usable Buildings and Facilities" section 602.2 exception. Designers are unclear where and when to provide accessible fixtures for children. The IBC needs to scope the children drinking fountains and state they may be substituted for adult fixtures. Additional fixtures are not needed.

Since adults are the minority in areas primarily used by children (such as in the preschool and kindergarten school wing, children's library and children's museum) the children's population needs to be adequately served with proper number of children's accessible fixtures. Adult fixtures are typically provided where there is a mix of all ages including staff, parents, students and the general public.

Prior to the development of children standards in A117.1 the standing drinking fountains for children were typically located with the spout 30" above the floor. The A117.1 had a children's group and tall people group working on the drinking fountains at the same time and the standing requirement was overlooked for children's areas. This proposal is intended to override the adult standing requirement and provide convenient standing children's access.

See companion proposal for 1109.5.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:ReedH-E2-1109.5.1

E185–09/10
1109.5.1

Proponent: James W. McCall, AIA, Slonaker McCall Architects, representing self

Revise as follows:

1109.5.1 Minimum number. No fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

Exceptions:

1. A single drinking fountain that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.
2. Where Group B, E, I and M occupancies have an occupant load not exceeding 100 persons and where only one drinking fountain is required in accordance with Table 2902.2, the drinking fountain shall comply with the requirements for people who use a wheelchair and a second drinking fountain for standing persons shall not be required.

Reason: Where the plumbing fixture requirement for a small occupancy requires that a single drinking fountain be installed, IBC Section 1109.5.1 currently requires that at least two drinking fountains be installed, one mounted high and one mounted low. In small establishments (those having an occupant load of 100 or less), this is a significant financial burden as well as a waste of precious space for a fixture that will rarely be used especially if the local potable water supply tastes bad. Many small establishments provide bottled water dispensers for their customers and employees because the cost is insignificant and it is often viewed as a "perk" for both customers and workers. I have proposed to a change to the IPC to allow small establishments to substitute bottled water dispensers (or bottled water coolers) for 100 percent of the required number of drinking fountains. However, if the designer chooses to provide a drinking fountain for a small establishment, he should not be penalized by having to supply two drinking fountains. Provision of drinking fountains in small B, E, I and M occupancies should be optional, and if one is provided, the designer should not have to provide two.

Cost Impact: The code change proposal will not increase the cost of construction. (It will decrease for small projects.)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: McCall-E1-1109.5

E186–09/10
1109.6 (New)

Proponent: Marsha K. Mazz, U.S. Architectural and Transportation Barriers Compliance Board (Access Board)

Add new text as follows:

1109.6 Saunas and Steam Rooms. Where provided, saunas and steam rooms shall comply with ICC A117.1.

Exception: Where saunas or steam rooms are clustered at a single location, no more than 5 percent of the saunas and steam rooms, but no fewer than one, of each type in each cluster shall be required to comply with ICC A117.1.

Reason: This proposal provides scoping for saunas and steam rooms which are addressed in new Chapter 11 of the ICC A117.1. The proposal also harmonizes with the U.S. Access Board's 2004 ADA and ABA Accessibility Guidelines Section 241 which establishes a reasonable requirement for access to such facilities.

Cost Impact: This code change will increase the cost of construction. However, because these changes are harmonized with the U.S. Access Board's ADA and ABA Accessibility Guidelines, costs associated with compliance cannot be avoided once the U.S. Department of Justice adopts the guidelines as enforceable standards under the Americans with Disabilities Act. The guidelines have already been adopted as enforceable standards under the Architectural Barriers Act applicable to federally funded facilities.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Mazz-E3-1109.6

E187–09/10
1109.6, 1109.6.1 (New), 1109.6.2 (New)

Proponent: Don Davies, Salt Lake City Corporation, representing the Utah Chapter of ICC

1. Revise text as follows:

1109.6 Elevators. Passenger elevators on an accessible route shall be accessible and comply with Section ~~3001.3~~ 3001.

2. Add new text as follows:

1109.6.1 Limited use limited application elevators. Limited use limited application elevators are permitted to be a part of a required accessible route. The maximum rise of the car platform shall not exceed 25 feet (7.6 m).

1109.6.2 Private Residence elevators. Private residence elevators are permitted to be part of a required accessible route within or serving an individual dwelling unit or sleeping unit. The maximum rise of the car platform shall not exceed 50 feet (15 m).

Reason: The code currently scopes the provisions for passenger elevators (Section 1109.6). A reference to Section 3001 will pick up a reference to safety standard, ASME A17.1, as well as the accessibility standard, ICC A117.1. It is unclear to those unfamiliar with ASME A17.1 that LULAs and private residence elevators are 'passenger elevators' with limited applications. The 25 feet of vertical rise for LULAs is found in ASME A17.1 Section 5.2.1.16.5. The 50 feet of vertical rise for private residence elevators is found in ASME A17.1 Section 5.3.1.10.3. Since the code is very explicit on the limitations of lifts in new construction it seems reasonable that some guidance be placed in the body of the code scoping the provisions and stating the limitations of these types of elevators.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Davies-E1-1109.7

E188–09/10
1109.8, 1109.8.1, 1109.8.3

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Revise as follows:

1109.8 Storage. Where fixed or built-in storage elements such as cabinets, coat hooks, shelves, medicine cabinets, lockers, closets and drawers are provided in required accessible spaces, at least five percent, but not less than one of each type shall be accessible ~~contain storage space complying with ICC A117.1~~.

1109.8.1 ~~Lockers.~~ ~~Where lockers are provided in accessible spaces, at least five percent, but not less than one, of each type shall be accessible.~~ **Equity.** Accessible facilities and spaces shall be provided with the same storage elements as provided in the similar non-accessible facilities and spaces.

1109.8.2 Shelving and display units. Self-service shelves and display units shall be located on an accessible route. Such shelving and display units shall not be required to comply with reach-range provisions.

~~**1109.8.3 Coat hooks and shelves.** Where coat hooks and shelves are provided in toilet rooms or toilet compartments or in dressing, fitting or locker rooms, at least one of each type shall be accessible and shall be provided in accessible toilet rooms without toilet compartments, accessible toilet compartments and accessible dressing, fitting and locker rooms.~~

Reason: This modification simplifies the section and maintains the intent by providing a measurable 5%, not less than one, criteria to the entire list of items.

The concept of Section 1109.8.3 is reworded to include all of the items from the charging statement and relocated to Section 1109.8.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E27-1109.8

E189–09/10
1109.8.4, Appendix E105.4

Proponent: Donald E. Irwin, Program Manager, Delivery, Collection & Carrier Equipment, representing United States Postal Service

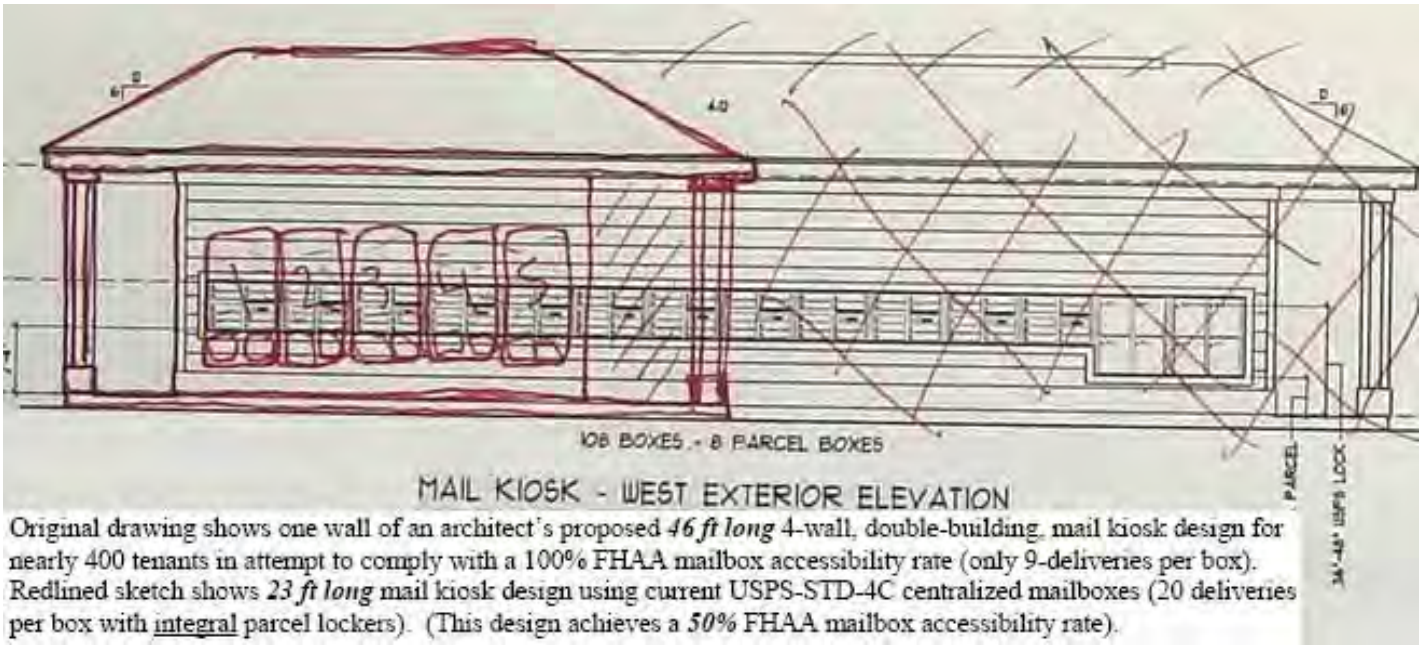
1. Delete without substitution:

~~**E105.4 Mailboxes.** Where mailboxes are provided in an interior location, at least 5 percent, but not less than one, of each type shall comply with ICC A117.1. In residential and institutional facilities, where mailboxes are provided for each dwelling unit or sleeping unit, mailboxes complying with ICC A117.1 shall be provided for each unit required to be an Accessible unit.~~

2. Add new text as follows:

1109.8.4 Centralized Mailboxes and Common Use Parcel Lockers. Centralized mailboxes, which consist of individual mail delivery compartments that are each initially assigned to one address but which are always subject to subsequent reassignment and/or exchange with another compartment, shall be subject to the following accessibility requirements. In non-residential facilities, where mailboxes and common use parcel lockers are provided in a grouped or centralized location, at least 5 percent, but not less than one, of each mailbox type and common use parcel locker type shall comply with ICC A117.1. In residential facilities, where mailboxes and common use parcel lockers are provided in a grouped or centralized location for all dwelling or sleeping units, at least 5 percent, but not less than one, of each mailbox type and common use parcel locker type shall comply with ICC A117.1. In residential and institutional facilities required to have Accessible units or Type A units, all mailboxes for these units shall comply with ICC A117.1.

Reason: The IBC, which is already recognized as an FHA Safe Harbor, needs to address mailbox accessibility directly, not via the optional Appendix E entry (E105.4). There is confusion in the construction industry, the accessibility world, and the courts regarding what mailbox accessibility requirements are for "covered multi-family dwellings" of the Fair Housing Amendments Act of 1988. This confusion is impacting the construction industry and Postal operations while affording suspect at best benefits for the full range of the mobility-disabled community that the Postal Service serves. With USPS requirements restricting mail delivery compartments from being located below a 28 inch wall height, the ICC/ANSI A117.1 upper reach limit of 48 inches only leaves 20 inches of usable wall height. This very restrictive usable wall height, coupled with current misinterpretations of FHA mailbox requirements, is resulting in mailroom designs that are almost double the size they should be. This proposed entry would address this misinterpretation, maintain compliance with all FHA statutory and regulatory requirements, re-establish FHA mailbox accessibility conformity with other accessibility requirements, and formally support what had been in place as the de facto FHA mailbox accessibility requirements for at least the first 15 years after the March 13, 1991 FHA implementation date.



Original drawing shows one wall of an architect's proposed ***46 ft long*** 4-wall, double-building, mail kiosk design for nearly 400 tenants in attempt to comply with a 100% FHAA mailbox accessibility rate (only 9-deliveries per box). Redlined sketch shows ***23 ft long*** mail kiosk design using current USPS-STD-4C centralized mailboxes (20 deliveries per box with integral parcel lockers). (This design achieves a ***50%*** FHAA mailbox accessibility rate).

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Cheryl Kent, representing US Department of Housing and Urban Development

1. Add a new text as follows:

1109.15. Mailboxes. Where mailboxes are provided, accessible mailboxes shall be provided in accordance with 1109.15.1 and 1109.15.2.

1109.15.1 Dwelling units and sleeping units. Mailboxes serving dwelling units or sleeping units shall be accessible in accordance with 1109.15.1.1 or 1109.15.1.2.

1109.15.1.1 Individual Mailboxes. Where a mailbox is provided at a dwelling unit or sleeping unit that is required to be an Accessible unit, Type A unit or Type B unit, the mailbox shall be accessible.

1109.15.1.2 Clustered Mailboxes. Where clustered mailboxes serve dwelling units or sleeping units that are required to be Accessible units, Type A units or Type B units, the mailboxes assigned to each Accessible unit, Type A unit and Type B units shall be accessible.

1109.15.2 Other occupancies. Where mailboxes are provided in occupancies not falling within the purview of Section 1109.15.1 and are provided in an interior location, at least 5 percent, but not less than one, of each type shall be accessible.

2. Delete without substitution:.

~~**E105.4 Mailboxes.** Where mailboxes are provided in an interior location, at least 5 percent, but not less than one, of each type shall comply with ICC A117.1. In residential and institutional facilities, where mailboxes are provided for each dwelling unit or sleeping unit, mailboxes complying with ICC A117.1 shall be provided for each unit required to be an Accessible unit.~~

Reason: This proposed changed is intended to ensure that the IBC is consistent with the accessibility requirements of the Fair Housing Act, HUD's implementing regulations, and HUD's Fair Housing Accessibility Guidelines (the Guidelines). It has come to HUD's attention that Section E105.4 is being interpreted as applying to mailboxes serving Type B dwelling units. This was not HUD's understanding of the IBC. Instead, our understanding was that Section 1107.3 covered mailboxes as well as all other types of public and common use facilities serving Type B dwelling units, and that because there were no requirements to scope less than 100% of mailboxes, that the IBC was consistent with HUD's regulations and the Guidelines. However, because Appendix E includes text for mailboxes at Section E105.4 and it appears some developers are interpreting E105.4 as applying a similar requirement for Type B dwelling units, we are recommending that Section E105.4 be struck out and a new section be added as outlined above to Chapter 11 of the IBC. The above text is intended to ensure that accessibility requirements for Type B dwelling units, Accessible Units and Type A units, as well as for mailboxes serving other types of occupancies are all covered in Chapter 11 of the IBC.

The Fair Housing Act, its implementing regulations and the Guidelines require that covered multifamily dwellings contain accessible public and common use areas. Requirement 2 of the Guidelines covers public and common use areas, and provides a chart entitled "Basic Components for Accessible and Usable Public and Common Use Areas or Facilities." Mailboxes are addressed in Item 14 of the chart, which specifically references the primary sections of 1986 ANSI A117.1 that apply to these elements or spaces. Item 14 encompasses Sections 4.1 through 4.30 of the standard, and the relevant accessibility standards applicable for mailboxes typically would include the requirements for an accessible route, clear floor or ground space, accessible reach ranges, and accessible controls and operating mechanisms. In a building with one or more elevators, all of the mailboxes would have to fall within these reach ranges. In a building without an elevator, mailboxes serving the ground floor units would have to meet those requirements. Although HUD's Fair Housing Accessibility Guidelines reference the 1986 ANSI A117.1 standard, which provides for side reach ranges of 9 inches minimum to 54 inches maximum, we recognize the IBC references more recent editions of A117.1. We are not, however, recommending changes to the A117.1 through this proposal.

We would like to ensure that architects and builders involved in designing and constructed buildings that are covered by the Fair Housing Act provide for accessibility of mailboxes consistent with HUD's regulations and Guidelines. Developers who deviate from these standards by providing mailboxes at higher reach ranges have been subject to enforcement proceedings brought by HUD as well as litigation brought by the Department of Justice. The Department of Justice has entered into a number of consent decrees which have required the developer to change the height of mailboxes serving covered multifamily dwellings. We believe this change is needed to ensure that the IBC is consistent with the Fair Housing Act and HUD's regulations and Guidelines, and to avoid unnecessary litigation with respect to mailboxes serving Type B dwelling units.

Cost Impact: There should be no significant cost impact since the IBC has already incorporated text to assure consistency with the Fair Housing Act, HUD's regulations and the Guidelines, and this change is intended to clearly specify requirements for mailboxes serving Type B dwelling units as opposed to only generally covering all public and common use spaces serving Type B dwelling units in Section 1107.3.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Kent-E1-1109.15

E191–09/10
1109.14.4.6 (New)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Add new text as follows:

1109.14.4.6 Recreational equipment. Equipment such as play structures, amusement rides, and miniature golf are not required to be accessible.

Reason: Accessibility issues for these types of structures are outside the scope of the building code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E28-1109.14.4.6

E192–09/10
1109.14.4.6 (New)

Proponent: Curt Wiehle, Minnesota Construction Codes and Licensing Division, representing CCLD

Add new text as follows:

1109.14.4.6 Trails. Trails and outdoor recreation routes are not required to be accessible.

Reason: The Access Board revised accessibility guidelines (2004 ADA/ABA Accessibility Guidelines) include scoping and technical provisions for several types of recreation facilities, including recreational boating facilities, fishing piers and platforms, golf facilities, play areas, and swimming pools. ICC A117.1 has added the technical criteria for how to make these facilities accessible. However, neither the revised accessibility guidelines or ICC A117.1 address access to such outdoor developed areas, trails, beaches, and picnic and camping facilities. The Access Board is developing technical and scoping requirements for such outdoor developed areas. The regulatory negotiation committee's report is available at the Access Board's website (http://www.access-board.gov/outdoor/outdoor-rec-rpt.htm). At this time, the Access Board has decided to limit this proposed rule to outdoor developed areas designed, constructed, or altered by Federal agencies subject to the Architectural Barriers Act. At a future date, when an

assessment of the impacts on State and local governments and private entities can be prepared, the Access Board will conduct a separate rulemaking for outdoor developed areas subject to the Americans with Disabilities Act. Since the technical information is not currently in ICC A117.1, these types of facilities should not be required to be accessible by the IBC. By limiting this proposal to trails and recreation routes, the intent is to address those routes that exist simply and solely as pedestrian paths. It is not intended to apply to routes that connect buildings or facilities that are on the same site.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME:Wiehle-E21-1109.14.4.7

E193–09/10

1110.4 (New), 1110.4.1 (New), 1110.4.2 (New)

Proponent: Billie Louise Bentzen, PhD, Assoc. for Education & Rehabilitation of the Blind & Visually Impaired

Add new text as follows:

1110.4 Variable Message Signs. Where provided in the locations in Sections 1110.4.1 and 1110.4.2, Variable Message Signs (VMS) shall comply with the VMS requirements of ICC A117.1

1110.4.1 Transportation facilities. Where provided in transportation facilities, variable message signs conveying transportation related information shall comply with Section 1110.4.

1110.4.2 Emergency shelters. Where provided in buildings that are designated as emergency shelters, variable message signs conveying emergency related information shall comply with Section 1110.4.

> **Exception:** Where equivalent information is provided in an audible manner, VMS signs are not required to comply with ICC A117.1.

Reason: Variable Message Sign (VMS) requirements have been developed by the ICC A117.1 committee and added into the updated edition of the standard. This proposal will provide scoping provisions to assure that VMS signage in transportation facilities and emergency shelters is usable by most of the population. The ICC A117.1 language modifies requirements for visual signs primarily by requiring increased character height and spacing for low resolution VMS signs. Even for users with unimpaired vision, there is strong research evidence that character height in low resolution VMS such as the LED signs that are common in the transportation environment and elsewhere must be approximately 30% greater than for equivalent print signs or VMS with high resolution. The requirements for increased character height, etc. for low resolution VMS are not applicable to high resolution VMS such as video.

The proposed sections will not "require" that VMS signage be installed in any facility type, but will instead require that "where provided" within transportation facilities and emergency shelters VMS comply with the standard and are usable by most of the population.

The phrasing "conveying transportation related information" and "conveying emergency related information" was included in the sections to limit the application of the A117.1 VMS requirements to signs that are necessary for the most effective use of transportation information and information in emergency shelters. The intent of this text is that signs that present information that is not necessary for transportation or emergency use of facilities would be exempt. For example, a VMS that advertised what dining options were available in an airport would not be required to comply with the standard's VMS provisions, nor would a television set within the waiting area that had closed captioning of a news program. However any VMS that indicated what flight was departing from what gate or the time of the flight would be regulated. In the case of an emergency shelter located at a school, only the signage related to shelter would be covered. The signage dealing with the school and possibly listing what school activities were occurring that week would not be expected to comply with the VMS requirements.

Transportation facilities have been included in this proposal for several reasons. Riders with reduced vision are especially dependent on public transportation for travel and are required by the ADA to have information provided that is equivalent to that provided to riders having unimpaired vision. The proposal will coordinate the IBC requirements with those of the Americans with Disabilities Act (ADA). Currently Sections E109 and E110 in Appendix E address some signage requirements within "transportation facilities and stations" and "airports." These provisions are located within the appendix but need to be included in the IBC text to match up with the ADA. Including this text within Chapter 11 will help to make the two accessibility laws more consistent. The VMS signs are often used within transportation facilities (See Sections E109.2.2.2, E109.2.2.3, E109.2.7, E110.3) as a primary means of conveying information to riders. Since the ICC A117 committee has provided specific regulations for these signs it is appropriate to reference these provisions so that designers and code officials know exactly what the technical requirements for the signs are. As noted earlier, this section does not "require" the VMS signs but "where provided" is intended to ensure that VMS comply with the requirements that the ICC A117.1 committee has established.

Emergency shelters are typically identified by a jurisdiction when they are studying emergency planning or working with FEMA to develop community plans. Although any building could ultimately be pressed into service as an emergency shelter in some circumstances, the intent of this text is to apply the requirement only to those facilities that are designated in advance or during that planning stage as an intended shelter. In many communities this may include certain schools, civic administration buildings or even large convention facilities that a community designates as intended emergency shelters. Emergency-related information provided by VMS in emergency shelters is most likely to be information or instructions regarding additional problems, or the recovery process.

The emergency shelter provisions contain an exception that would eliminate the requirement to meet the VMS provisions of the standard. Where audible information is conveyed that is either the same or equivalent to the information provided by the sign, compliance with ICC A117.1's VMS requirements is not needed. The VMS provides the information in a visual method and the A117 provisions assure that the information is clearly visible and legible to both the general population and to people with some level of visual impairment. Providing the equivalent information in an audible manner makes the information accessible to people with severe visual impairment or who are blind.

The exception for equivalent audible information is not included within the section dealing with transportation facilities. This is done to not only coordinate with the ADA but is based upon the fact that in many such facilities the audible information is simply not easily understood. Anyone that has stood on a subway or train platform and tried to understand an audible message at the same time that the train is pulling up to the platform will understand this exclusion. Because of the problems with hearing messages in many transportation facilities, the audible message delivery is simply not considered as being adequate to replace or eliminate the clear visual sign information.

This proposal is suggesting that this VMS section be added into section 1110 in order to be located with the other signage requirements. However, it is recognized that this requirement could just as well be placed within Section 1109 and the "other features and facilities" provisions.

Cost Impact: The code change proposal will not increase the cost of construction. Because this proposal will not "require" the VMS signs to be installed, there is no increased construction cost imposed by it.

E194–09/10
1002.1 (IFC [B] 1002.1); IRC R202

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC MEANS OF EGRESS

Add new definition as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

LANDING. A floor area or a designated portion of a floor area, at the top or bottom of a flight of stairs, or at the top or bottom of a ramp, or at the door of an elevator.

PART II – IRC BUILDING/ENERGY

Add new definition as follows:

SECTION R202
DEFINITIONS

LANDING. A floor area or a designated portion of a floor area, at the top or bottom of a flight of stairs, or at the top or bottom of a ramp.

Reason:
(PART I) This proposal adds a definition to the IBC for "landing" which is beneficial when attempting to interpret and apply the IBC. "landing" is used in numerous locations of the IBC but is not defined.

WDMA is of the perspective than "landing" relates to the flight of stairs (or ramp) that may be near a door; and that doors, other than elevator doors, do not have "landings" necessarily associated to them. A flight of stairs, or ramp, may have a landing, and that landing may be on one side of a door. Hence there are requirements in the code for landings at doors. The proposed definition clarifies that landings are associated with stairs, ramps, or elevators.

WDMA members, as they assist their customers, have found that some jurisdictions have interpreted the exception in 1008.1.7 significantly different than the language intends.

(PART II) This proposal adds a definition to the IRC for "Landing" which is beneficial when attempting to interpret and apply the IRC. "Landing" is used in numerous locations in the IRC but currently is not defined.

WDMA is of the perspective than "landing" relates to the flight of stairs (or ramp) that may be near a door; and that doors do not have "landings" necessarily associated to them. A flight of stairs, or ramp, may have a landing, and that landing may be on one side of a door. Hence there are requirements in the code for landings at doors. The proposed definition clarifies that landings are associated with stairs or ramps.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE

STRUCTURAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

PART I – IBC STRUCTURAL

Revise as follows:

1502.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

ROOF ASSEMBLY. A system designed to provide weather protection and resistance to design loads, wind and fire. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly includes the roof deck, vapor retarder, substrate or thermal barrier, insulation, vapor retarder and roof covering.

The definition of "Roof assembly" is limited in application to the provisions of Chapter 15.

PART II – IRC BUILDING/ENERGY

Revise as follows:

SECTION R202
DEFINITIONS

ROOF ASSEMBLY. A system designed to provide weather protection and resistance to design loads, wind and fire. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly includes the roof deck, vapor retarder, substrate or thermal barrier, insulation, vapor retarder and roof covering.

Reason: Roof assemblies are also designed to provide wind resistance and fire resistance.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

S2–09/10
1503.4, 1503.4.1; IPC 1107.1; IRC R903.4, R903.4.1

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB)

THIS IS A 3 PART CODE CHANGE. PARTS I & II WILL BE HEARD BY THE IPC COMMITTEE. PART III WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

1107.1 ~~Secondary drainage required~~. Secondary (emergency overflow) drains or scuppers. Where roof drains are required, secondary (emergency overflow) roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason.

PART II – IBC

Revise as follows:

[P] 1503.4 Roof drainage. Design and installation of roof drainage systems shall comply with Section 1503 of this code and Sections 1106 and 1107 as applicable of the *International Plumbing Code.*

[P] 1503.4.1 ~~Secondary drainage required~~. Secondary (emergency overflow) drains or scuppers. Where roof drains are required, secondary (emergency overflow) roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason. The installation and sizing of secondary emergency overflow drains, leaders and conductors shall comply with Sections 1106 and 1107 as applicable of the *International Plumbing Code*.

PART III – IRC PLUMBING

Revise as follows:

R903.4 Roof drainage. Unless roofs are sloped to drain over roof edges, roof drains shall be installed at each low point of the roof. ~~Where required for roof drainage, scuppers shall be placed level with the roof surface in a wall or parapet. The scupper shall be located as determined by the roof slope and contributing roof area.~~

R903.4.1 Secondary (emergency overflow) drains ~~and~~ or scuppers. Where roof drains are required, secondary emergency overflow roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason. Overflow drains having the same size as the roof drains shall be installed with the inlet flow line located 2 inches (51 mm) above the low point of the roof, or overflow scuppers having three times the size of the roof drains and having a minimum opening height of 4 inches (102 mm) shall be installed in the adjacent parapet walls with the inlet flow located 2 inches (51 mm) above the low point of the roof served. The installation and sizing of overflow drains, leaders and conductors shall comply with Sections 1106 and 1107 as applicable of the *International Plumbing Code*.

Overflow drains shall discharge to an *approved* location and shall not be connected to roof drain lines.

Reason: (IPC/IBC) The purpose of this proposal is to clarify the requirements for roof drains and the requirements for secondary emergency overflow drains, their sizing, location and quantity. The requirements currently in the IBC did not alert the roofer about their responsibility to size drains and or scuppers. This code modification and additional section helps to alert the roofer that additional information and requirements are to be followed and provides a section reference.
(IRC) The purpose of this proposal is to clarify the requirements for roof drains and the requirements for secondary emergency overflow drains, their sizing, location and quantity. The requirements currently in the IRC did not alert the roofer about their responsibility to size drains and or scuppers. This code modification and additional section helps to alert the roofer that additional information and requirements are to be followed.

Cost Impact: The code change proposal will not increase the cost of construction.

S3–09/10
1503.6; IRC R903.2.2

Proponent: John Woestman, The Kellen Company representing the Window and Door Manufacturers Association (WDMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1503.6 Crickets and saddles. A cricket or saddle shall be installed on the ridge side of any chimney or penetration greater than 30 inches (762 mm) wide as measured perpendicular to the slope. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.

Exception: Skylights installed and flashed in accordance with the manufacturer's instructions.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R903.2.2 Crickets and saddles. A cricket or saddle shall be installed on the ridge side of any chimney or penetration more than 30 inches (762 mm) wide as measured perpendicular to the slope. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.

Exception: Skylights installed and flashed in accordance with the manufacturer's instructions.

Reason: This code language, as written, precludes the use of engineered skylight systems that are designed to prevent water infiltration into the penetration without the use of a cricket. The proposed change addresses this unintended consequence of this language of the IBC and the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

S4–09/10
1504.3, Chapter 35

Proponent: Mike Ennis representing Single Ply Roofing Industry (SPRI, Inc.)

1. Revise as follows:

1504.3 Wind resistance of nonballasted roofs. Roof coverings installed on roofs in accordance with Section 1507 that are mechanically attached or adhered to the roof deck shall be designed to resist the design wind load pressures for components and cladding in accordance with Section 1609 and shall be installed in accordance with ANSI/SPRI WD-1.

2. Add standard to Chapter 35 as follows:

SPRI
WD-1-08 Wind Design Standard Practice for Roofing Assemblies

Reason: The International Building Code provides specific requirements for calculating the wind uplift load pressure on the roof assembly. However it does not currently provide a prescriptive method to enhance the perimeter and corner attachment due to the higher wind loads in these regions. ANSI/SPRI WD-1 is a national consensus standard that has been reviewed by testing laboratories, membrane manufacturers, roofing system component suppliers, contractors and consultants. This standard provides prescriptive requirements for corner and perimeter enhancement. The user first identifies a suitable roof assembly that will resist the calculated wind uplift pressure for the field of the roof, then enhances the fastening pattern to meet the calculated corner and perimeter wind uplift load pressure. Designing the roof system to resist the higher wind loads at the perimeter and corner regions is accomplished by either adding additional fasteners or increasing the amount of adhesive used, depending upon the specific roof system chosen. This approach allows the user to work from one base assembly and enhance the attachment of the base assembly for perimeter and corner regions instead of trying to locate tested assemblies for each of these areas.

The ANSI/SPRI standard also requires that a 2.0 safety factor be applied to tested wind uplift values, unless another value is specified. So, for example, if a roof system passes a wind uplift test at 120 lbs/ft2, this value is divided by 2 before determining if the system will resist the calculated wind uplift pressure loads for the building. The IBC does not currently contain this requirement.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, SPRI WD-1-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENNIS-S1-1504.3

S5–09/10
1502.1, 1504.4, 1504.6, 1504.7

Proponent: Mark S. Graham, representing National Roofing Contractors Association (NRCA)

1. Add new definition as follows:

1502.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

LOW SLOPE. In roofing, that which commonly describes an incline of a roof which is less than two units vertical in 12 units horizontal (16.7-percent).
The definition of "Low slope" is limited in application to the provisions of Chapter 15.

2. Revise as follows:

1504.4 Ballasted low-slope roof systems. Ballasted low-slope ~~(roof slope < 2:12)~~ single-ply roof system coverings installed in accordance with Sections 1507.12 and 1507.13 shall be designed in accordance with Section 1504.8 and ANSI/SPRI RP-4.

1504.6 Physical properties. Roof coverings installed on low-slope roofs ~~(roof slope < 2:12)~~ in accordance with Section 1507 shall demonstrate physical integrity over the working life of the roof based upon 2,000 hours of exposure to accelerated weathering tests conducted in accordance with ASTM G 152, ASTM G 155 or ASTM G 154. Those roof coverings that are subject to cyclical flexural response due to wind loads shall not demonstrate any significant loss of tensile strength for unreinforced membranes or breaking strength for reinforced membranes when tested as herein required.

1504.7 Impact resistance. Roof coverings installed on low-slope roofs ~~(roof slope < 2:12)~~ in accordance with Section 1507 shall resist impact damage based on the results of tests conducted in accordance with ASTM D 3746, ASTM D 4272, CGSB 37-GP-52M or the "Resistance to Foot Traffic Test" in Section 5.5 of FM 4470.

Reason: This proposed code change is intended to add clarity to the code by providing a specific definition in Section 1502—Definitions for the term "low slope" that is used in several instances in Chapter 15.

Currently in Chapter 15, there are several instances where usage of the term low-slope is defined parenthetically as "…(roof slope < 2:12)…". In other instance in Chapter 15, the term is not specifically defined. Adding a specific definition for the term in Section 1502—Definitions provides for consistent interpretation throughout the chapter.

The addition of the notation limiting the applicability of the definition to Chapter 15 is necessary to avoid possible conflicts with other chapters; a similar notation is also included in Section 1502—Definitions for the term "Roof assembly."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1504.4, 1504.4.1 (New), 1504.4.2 (New), Table 1504.4 (New), 1504.8, Table 1504.8

Proponent: Thomas L Smith, AIA, RRC, TLSmith Consulting Inc. on behalf of the Roofing Industry Ad Hoc Working Group on Roof Aggregate (including, the Federal Emergency Management Agency, the Asphalt Roofing Manufacturers Association and SPRI).

1. Delete and substitute as follows:

~~**1504.4 Ballasted low-slope roof systems.** Ballasted low-slope (roof slope < 2:12) single-ply roof system coverings installed in accordance with Section 1507.12 and 1507.13 shall be designed in accordance with Section 1504.8 and ANSI/SPRI RP-4.~~

1504.4 Aggregate and paver surfaced low-slope roof coverings. Aggregate and paver surfaced roof system coverings shall be designed and installed in accordance with Section 1504.4.1 or 1504.4.2 as applicable.

2. Add new text as follows:

1504.4.1 Ballasted surfaced roof coverings. Aggregate and paver surfaced roof system coverings shall be designed and installed in accordance with ANSI/SPRI RP-4.

Exceptions:

1. Aggregate and concrete pavers are not permitted where the building height exceeds 150 feet (45 720 mm).
2. In hurricane-prone regions as defined in Section 1609.2, aggregate is not permitted on Occupancy Category III or IV buildings where the basic wind speed is greater than 100 mph (45 m/s).

1504.4.2 Aggregate surfaced roof coverings. Aggregate surfaced roof system coverings shall be designed and installed in accordance with Table 1504.4 based on the exposure category and basic wind speed at the building site. The aggregate shall comply with ASTM D 1863.

Exceptions:

1. In hurricane-prone regions as defined in Section 1609.2, aggregate is not permitted on Occupancy Category III or IV buildings where the basic wind speed is greater than 100 mph (45 m/s).
2. In hurricane-prone regions as defined in Section 1609.2, aggregate is not permitted on Occupancy Category I or II buildings when the basic wind speed is greater than 110 mph (49 m/s).

120	15	NP	NP
Greater than 120	NP	NP	NP

Greater than 120 NP NP NP

For SI: 1 foot = 304.8 mm; 1 mile per hour = 0.447 m/s.

a. Mean roof height in accordance with Section 1609.2.

b. For intermediate values of basic wind speed, the height associated with the next higher value of wind speed shall be used, or direct interpolation is permitted.

c. NP = gravel and stone not permitted for any roof height.

Reason: Concern with roof aggregate blow-off is not new (Minor, 1977). It has continued to be reinforced by field observations, particularly in regard to damage caused to glazing on surrounding buildings as well as the building from which the aggregate was lifted into the airstream. Most problems have been associated with extreme wind events such as hurricanes and have involved roofs not in compliance with RP-4 and with aggregate surfaced roofs for which the RP4 standard was not intended to address. As a result, recent building code changes (i.e., IBC 2006 and 2009) have severely restricted the use of aggregate surfaced roofs. However, these new restrictions were not based on the K-W design method (Kind Wardlaw 1976), the wind tunnel studies underlying the K-W design method (Kind 1977), or a quantitative analysis of observed good and bad roofing system performances in real wind events. Instead, current building code limitations are based on variation in surface pressure with building height which is known to be an inappropriate predictor of aggregate blow-off or scour due to pressure equalization effects (Smith, 1997). Furthermore, these recent restrictions do not address critical parameters such as aggregate size and parapet height which govern performance.

This code change proposal addresses two types of roof coverings: ballasted single ply roofs and those with aggregate surfaces, such as Built-up roofs (BUR) and certain spray polyurethane roof systems. Reasoning statements are provided for each new section:

New section1504.4.1 - Over 6 billion square feet of ballasted single ply roofing applications have been installed over the last two decades The vast majority of these systems have performed very well with respect to their resistance to wind pressure loads. However some damage has been observed due to aggregate blowing off non-code compliant roofs during high wind events. The above proposals are based on over 200 wind tunnel tests in addition to over 40 years of field experience and observations from hurricane investigation teams. These proposals provide restrictions on the use of ballasted single ply roof systems that will allow for the responsible use of aggregate surfacing that is a cost effective method to keep the roof system in place and to improve the energy performance of the building.

ANSI/SPRI RP-4 is the code referenced design guide for ballasted single ply roof systems. The requirements contained in the guide are based on over 200 wind tunnel tests along with extensive field studies. One of the design criteria of ANSI/SPRI RP-4 is to prevent gravel blow-off. Wind tunnel testing conducted at the National Research Council Canada evaluated conventional stone ballasted and stone and paver ballasted protected membrane roofs. For the systems containing stone ballasting the primary objective was to determine 4 critical wind speeds:

1. U_{c1} – the wind speed at which one or more stones were first observed to move an appreciable distance (i.e. several inches)
2. U_{c2} – the wind speed above which scouring of stones would continue more or less indefinitely as long as the wind speed is maintained.
3. U_{c3} – the wind speed at which stones were first observed to leave the roof by going over the upstream parapet (this was the parapet adjacent to the wind direction)
4. U_{c4} – the wind speed at which stones were first observed to leave the roof by going over the downstream parapet (opposite side from the wind)

In these experiments three nominal stone sizes were used. Each nominal stone size represented a mixture of stone sizes (larger and smaller) similar to the gradation, which would be obtained from a stone quarry. These experiments evaluated the impact of the following variables on the critical wind speeds defined above:

Stone size
Parapet height
Building height
Building geometry
Direction of wind impacting the building
Rooftop wind speed, rooftop gust wind speed, and the shape of the approaching wind velocity profile

In addition to the extensive wind tunnel test program, observed field performance was also a basis for the requirements included in ANSI/SPRI RP-Two of the most critical controlling factors identified through this extensive test program on the various critical wind speeds were stone size and parapet height. A brief summary of the wind tunnel test program, and reports written as part of this program follows.

LTR-LA-142 Estimation of Critical Wind Speeds for Scouring of Gravel or Crushed Stone on Rooftops January 1974

Objectives:

Determine the critical wind speeds and corresponding surface shear stress that cause movement of various stone sizes and shapes by taking direct measurements of these values via wind tunnel testing.

Use this data to determine constants that can be used in equations to calculate critical surface shear stress

Obtain guidance about the effects of parapets and obstacles, which cause strong three-dimensional effects, notably vortices.

Conclusions:

The surface shear stress required to cause stone motion is directly proportional to nominal stone diameter.

The constant of proportionality appears to be essentially independent of stone size and shape and of the detailed shape of the velocity profile near the gravel surface.

Critical wind speeds to initiate stone motion can therefore be easily predicted if the relationship between surface shear stress and wind speed is known for the situation of interest.

The dead air region behind a parapet extended downstream about 15 parapet heights. The turbulence of natural wind will tend to reduce the dead air zone.

LTR-LA-162 Wind Tunnel Tests on Some Building Models to Measure Wind Speeds at Which Gravel is Blown Off Rooftops June 1974

Objectives:

This series of tests was conducted to build upon the data obtained in the January 1974 test series. Specifically to provide data for some typical building geometries and to investigate the effects of building form, building height, parapet height, wind direction, and gravel size on the critical wind speeds required to cause scouring and blow-off of roofing gravel.

In this series 1/10 scale models were evaluated in a 30' x 30' wind tunnel.

Conclusions

The critical wind speeds at which scouring of nominal 0.9", 1.5" and 2.8" diameter gravel (scaled to 1/10 size) occurs and begins to blow-off rooftops were investigated. The nominal sizes represent the average size of a typical mixture.

The critical wind speeds are lowest when the wind direction is at or about 45 to the walls of the building.

For a given building configuration the critical wind speeds are proportional to the square root of the gravel size.

The critical wind speeds increase with increasing parapet height and decrease with increasing building height.

The length:width ratio of the building is unimportant as long as the width and length are large compared to the parapet height.

NRC No. 15544 Design of Rooftops Against Gravel Blow-Off September 1976

Objectives:

This report describes a procedure that can be used to estimate the wind speeds at which gravel of a given nominal size will be blown off rooftops.

The report also describes a procedure for determining design wind speeds at rooftop level.

The gravel blow-off procedure is based on data obtained from previous wind tunnel tests described above.

Conclusions

The results of wind tunnel tests conducted to determine critical wind speeds for scour or blow-off of roofing gravel for a specific low-rise building shape can be generalized to apply to any low-rise rectangular building having a flat rooftop.

Similar generalization is possible for high-rise shapes of any particular length:width ratio.

This permits development of a general, easy to use procedure for estimating critical wind speeds required to cause scour or blow-off of roofing gravel from various building configurations.

LTR-LA-189 Further Wind Tunnel Tests on Building Models to Measure Wind Speeds at Which Gravel is Blown Off Rooftops August 1977

Objectives:

Obtain additional data to permit previously obtained results to be generalized so as to be applicable to any rectangular flat-roofed low-rise building.

Provide data on the effects of substituting solid paving blocks for loose gravel in the most wind sensitive areas of the rooftop.

Conclusions:

The wind speed at rooftop level appears to be the dominant factor in controlling gravel scour and blow-off as opposed to the wind velocity profile.

The measured wind speeds at rooftop level were used to reinterpret the data from previous wind tunnel tests.

Within the boundaries of experimental scatter the critical wind speeds are independent of the rooftop level in the wind boundary layer, allowing for generalization of results to various building heights and geometries.

LTR-LA-234 Model Studies of the Wind Resistance of Two Loose-Laid Roof-Insulation Systems May 1979

Objectives:

Investigate the resistance of protected membrane roof systems to damage from high winds.

Identify wind speeds and failure mechanisms for protected membrane roof systems.

Conclusions:

The results show that wind flows induce pressure distributions underneath the roof-insulation systems as well as on their exterior surfaces. These pressure differences cause uplift and are responsible for system failure.

The wind speed to cause failure for the 2 ft. x 2 ft. paver slabs was found to be proportional to the square root of the system weight per unit area. This relationship should also be true for different geometries.

LTR-LA-269 Further Model Studies of the Wind Resistance of Two Loose-Laid Roof-Insulation Systems (High Rise Buildings) April 1984

Objectives:

This study is an extension of the May 1979 study, to investigate the resistance of various protected membrane roof systems to damage from high winds when they are installed on high-rise buildings.

Conclusions:

The mechanisms for wind damage are the same as those identified in earlier tests, namely gravel scour and uplifting of boards by pressure forces.

The static pressure underneath boards or pavers tend to become equal to the exterior surface because of airflow through the joints between boards or pavers. Complete equalization cannot occur, however, in regions where the exterior pressure distribution is highly non-linear and uplifting pressure differences occur in those regions. System failure therefore tends to occur in these regions.

High parapets are very effective in increasing resistance to wind damage.

Mechanical interconnection of boards or pavers by use of strapping, tongue & groove, etc. is an effective method for increasing wind resistance.

For any particular system configuration, the wind speed to cause failure is proportional to the square root of the system weight per unit area.

Gust speed at rooftop level is the pertinent speed for use in assessing the resistance of the roofing system to wind damage.

LTR-LA-294 Further Wind Tunnel Tests of Loose-Laid Roofing Systems April 1987

Objectives:

Conduct extensive wind tunnel work to further assess the resistance to wind damage of protected membrane roofing system using paver slabs, or similar elements.

Low, intermediate and high-rise buildings were tested, each with several parapet heights.

Conclusions:

When a membrane is loose-laid on a leaky roof deck, ballooning will occur due to air flowing through holes in the deck from the interior of the building. This will normally result in failure at wind speeds well below those required to product failure by other mechanisms.

In the case of immobile membranes, failure results from pressure differences, which develop across elements in some regions of the roof. Increased parapet height generally resulted in more favorable pressure distributions. That is, maximum suctions were reduced and suction peaks were broadened, so that pressure was less non-uniform and therefore increased failure speeds could be expected.

Element size has a noticeable effect on failure speed, i.e. failure speeds were higher for larger elements.

Pressure non-uniformity is reduced by vortex generators mounted on the parapets near the upwind corner of the roof, thus increasing failure wind speeds.

LTR-LA-295 Pressure Distribution Data Measured During the September 1986 Wind Tunnel Tests on Loose-Laid Roofing Systems September 1987

Objectives:

This report supplements LTR-LA-294 by including contour plots of mean and peak roof surface pressure coefficients and mean and peak coefficients for pressure differential between the upper surface and the underside of the roofing system.

New Section 1504.4.2 and New Table 1504.4 – The new Section 1504.2 provides prescriptive design requirements to avoid blow-off of loose aggregate used on roof systems such as BUR and certain SPF roofs. Based on the Kind-Wardlaw design method, blow-off of loose aggregate is avoided by using minimum parapet heights determined by wind speed, Exposure Category, roof height, Building Category and aggregate size.

The Kind-Wardlaw design method ("K-W" design method) for prevention of scour and blow-off of aggregate from aggregate surfaced roofs has been available since the 1970s (Kind & Wardlaw 1976). It saw limited use until the 1980s when adopted as the basis for the initial 1988 edition of ANSI/SPRI RP-4, "Wind Design Standard for Ballasted Single-Ply Roofing Systems," (RP-4) standard which, in its updated form, continues to be used by the single-ply roofing industry for ballasted roofs (SPRI 2008). SPRI utilized the K-W design method as the basis for aggregate ballasted roof systems to prevent ballast scour.

For aggregate surfaced roof systems, a main wind-related issue of concern is with aggregate blow-off. Scour is not considered important to aggregate surfaced roofs, except to the extent that it might require maintenance (re-distribution of aggregate) after an extreme wind event to maintain fire resistance and the long-term durability of the roof system against degradation caused by solar (U-V) radiation or cause pile-up of aggregate on a downwind parapet.

The technical underpinnings of this proposal are three-fold:

1. The wind tunnel basis of the K-W design method was re-evaluated to confirm or make technically supported improvements with respect to prevention of aggregate blow-off
2. Quantitative field observations of roofing system performance in extreme wind events were compared with the K-W design method
3. Prescriptive design requirements to prevent aggregate blow-off based on items 1 and 2 were developed as a new Table 1504.4 for inclusion in the IBC.

As a result of this study (Crandell, 2009), improvements are recommended for a modified K-W design method for aggregate surfaced roofs. The improvements include a reconfiguration of the design method that allows critical wind velocity for initiation of aggregate blow-off to be predicted as a linear relationship directly with parapet height. This approach greatly simplifies the design method at no loss of accuracy, thereby improving the utility of the method for design practitioners to address a recognized deterrent to broader application of the K-W design method (Smith, 1997). It also avoids inefficiencies (generally overdesign) caused by use of non-dimensional building geometry-based parameters to determine roof design requirements of actual buildings (e.g., wind speed limit, aggregate size, and parapet height).

In addition, the effect of gravel size on critical velocity for blow-off is improved based on the reviewed wind tunnel data which shows a clear relationship between critical velocity for blow-off and the cube-root of the aggregate diameter (not the square-root as used in the K-W design method).

Finally, the modified K-W design method using the above improvements is compared to field observations with sufficient quantitative data (e.g., local wind speed, exposure, aggregate size, parapet height, and building height) available to allow for a meaningful comparison. As a result, a calibration factor is proposed to bring the modified K-W design method in line with observations of successful performance while still maintaining adequate requirements to eradicate clearly problematic observations of aggregate blow-off. Use of such a calibration approach is consistent the RP-4 standard's application of the K-W design method.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SMITH-S1-1504.4

S7–09/10
1504.5

Proponent: Mark S. Graham, representing National Roofing Contractors Association (NRCA)

Revise as follows:

1504.5 Edge securement for low-slope roofs. Low-slope ~~membrane~~ built-up, modified bitumen and single-ply roof systems metal edge securement, except gutters, shall be designed and installed for wind loads in accordance with Chapter 16 and tested in accordance with ANSI/SPRI ES-1, except the basic wind speed shall be determined from Figure 1609.

Reason: This proposed code change is intended to add clarity to the code by providing the specific roof membrane types to which Section 1504.5 applies.

The term "…membrane…" is not currently specifically defined in the context of roof systems in Section 1505—Definitions or Chapter 2—Definitions.

The description of roof membranes as "…built-up, modified bitumen and single-ply…" is consistent with other descriptions for membrane-type roof systems already included in Chapter 15.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRAHAM-S3-1504.5

S8–09/10
1504.5

Proponent: Mark S. Graham, representing National Roofing Contractors Association (NRCA)

Revise as follows:

1504.5 Edge securement for low-slope roofs. Low-slope membrane roof systems metal edge securement, except gutters, shall be designed and installed for wind loads in accordance with Chapter 16 and tested in accordance with Test Methods RE-1, RE-2 and RE-3 of ANSI/SPRI ES-1, except the basic wind speed shall be determined from Figure 1609.

Reason: This proposed code change is intended to add clarity to the code by providing the specific reference to ANSI/SPRI ES-1's test method requirements (RE-1, RE-2 and RE-3).

ANSI/SPRI ES-1 consists of two primary parts. In the first part the wind loads at a roof edge are determined. In the second part the edge metal flashings' wind resistances are determined according to ANSI/SPRI ES-1's RE-1, RE-2 and RE-3 test methods.

Currently, Section 1504 requires that wind loads be determined according to the code's Chapter 16, not ANSI/SPRI ES-1. Adding specific reference to ANSI/SPRI ES-1's test methods helps clarify that.

This proposed code change is not intended to change the code's current technical requirements; it is only intended to add a specific reference and clarity to which part of ANSI/SPRI ES-1 applies in Section 1504.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: GRAHAM-S4-1504.5

S9–09/10
1504.9 (New), Chapter 35

Proponent: Mike Ennis representing Single Ply Roofing Industry (SPRI)

1. Add new text as follows:

1504.9 Roof gardens and landscaped roofs. Roof gardens and landscaped roofs shall comply with Section 1507.16 and shall be installed in accordance with ANSI/SPRI RP14.

2. Add standard to Chapter 35 as follows:

SPRI
RP 14-07 Wind Design Standard for Vegetative Roofing Systems

Reason: Section 1507.16 requires that roof gardens and landscaped roofs comply with the requirements of Chapter 15. Section 1504.1 provides requirements for wind resistance of various roofing assemblies, however no guidance is provided for designing roof gardens and landscaped roofs to withstand wind loads. Roof gardens and landscaped roofs perform in the same manner as ballasted single ply roof assemblies when exposed to wind loads. ANSI/SPRI RP14 is a national consensus standard that has been developed with input from roof membrane manufacturers, component suppliers, contractors, green roofing professionals, testing organizations, and consultants. This design standard is much like the ballast design guide for single-ply roofs currently recognized by the IBC (ANSI/SPRI RP4). It provides the user with a series of tables that define requirements based on design wind speed, building height, parapet height and wind exposure. Three design options are provided. These design options vary in their ability to resist wind loads. Design option 1 uses a 10 lbs/ft2 minimum required load of growth media or trays, Design option 2 also requires minimum 10 lbs/ft2 of growth media or trays in the field of the roof and 13 lbs/ft2 of growth media or interlocking trays or 22 lbs/ft2 of individual trays in the corner and perimeter regions. Design option 3, which is designed for high wind load areas, requires 13 lbs/ft2 of growth media or interlocking trays, or 22 lbs/ft2 of individual trays in the field of the roof and does not allow any loose growth media or trays in the perimeter and corner regions. The perimeter of the building is defined as 40% of the building height. Adjustments are provided to increase the wind resistance of the design based on specific building conditions such as the buildings importance factor, large openings in adjacent walls and rooftop projections to name a few. The standard also provides requirements for newly planted garden roofs that do not have fully developed root systems. Fully developed root systems allow the garden roof assembly to perform very well when exposed to high wind situations, however prior to development of the root system special precautions must be taken.

The basis for the standard includes wind tunnel data generated in support of the ballasted single ply design guide. This wind tunnel testing helped develop an understanding of the impact of particle size and parapet height on the performance of ballasted assemblies. It also provided information regarding the weight of ballast required to keep the roof systems in place at various wind speeds. This data, along with 50-years of garden roof performance data from both the US and Europe were used in the development of this standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, SPRI RP-14 07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

S10–09/10
Table 1505.1, 1507.16, 1507.16.1 (New)

Proponent: Robert J Davidson, Code Consultant, Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Revise as follows:

TABLE 1505.1[a,b, d]
MINIMUM ROOF COVERING CLASSIFICATION
FOR TYPES OF CONSTRUCTION
(No change to table)

(No change to Notes a. through c.)

d. Any exposed portions of roof coverings on roofs containing roof gardens or landscaped roofs shall have their roof covering fire classification increased one level above the level indicated in the table.

1507.16 Roof gardens and landscaped roofs. Roof gardens and landscaped roofs shall comply with the requirements of this chapter and Sections 1607.11.2.2 and 1607.11.2.3 and the International Fire Code.

1507.16.1 Structural fire-resistance. The structural frame and roof construction supporting the load imposed upon the roof by the roof gardens or landscaped roofs shall comply with the requirements of Table 601.

Reason: As rooftop gardens and landscaped roofs gain in acceptance and popularity reasonable requirements need to be added to the codes to address the fuel load that these additions can add to a building or structure.

The addition of a rooftop garden or landscaped roof adds a fuel load to the roof. In recognition of this increased hazard it is proposed that Table 1505.1 be modified by adding a Note d that would require the exposed portions of roof coverings on roofs that contain roof gardens or landscaped roofs have the required classification of the roof covering increased one level. A reference to the International Fire Code is proposed to be added to Section 1507.16.

Table 601 provides for the Fire-Resistance Rating Requirements For Building Elements. Note b of Table 601 states, "

"b. Roof supports: Fire-resistance ratings of structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only."

This reduction is only permitted when the construction elements are "supporting a roof only." The addition of a roof garden or landscaped roof imposes a load and Note b. would not apply. The additional sentence proposed to be added as Section 1507.16.1 is intended to be a pointer to remind the designer and the code official to verify compliance with Table 601 fire-resistance requirements now that a load is planned to be added to the roof structure.

Cost Impact: These requirements will increase the cost of construction for those buildings where a roof garden or landscaped roof is proposed to be installed on the roof.

Analysis: The reference in Section 1507.16 of this proposal to the IFC is dependent on the action on Code Change FXX-09/10 **[Davidson-Shuman-F9-316]** which appears on the hearing order of the IFC Committee and proposes a new IFC *Section 316 - Roof Gardens and Landscaped Roofs*. If that code change is not approved, the reference to the IFC would be deleted from Section 1507.16.

Table 1505.1

Proponent: Brian Tollisen, PE, New York State Division of Code Enforcement and Administration, representing the New York State Division of Code Enforcement and Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Revise as follows:

TABLE 1505.1[a,b]
MINIMUM ROOF COVERING CLASSIFICATION
FOR TYPES OF CONSTRUCTION

IA	IB	IIA	IIB	IIIA	IIIB	IV	VA	VB
B	B	B	C[c]	B	C[c]	B	B[d]	C[c]

(No change to footnotes a through c)

d. Buildings of Type VA construction with a fire separation distance greater than or equal to 30 feet on all sides of the building and equipped throughout with a sprinkler system conforming to Section 903.3.1.1, shall be permitted to have a Class C roof covering classification provided the maximum area does not exceed what is allowed for a Type VB building of the same use and occupancy Classification as determined by Section 506. The total allowable building area shall be determined by multiplying the allowable area per story (A_a), by 3. This area increase shall not be permitted in H-1 and I-2 occupancy classifications.

Reason: Roof covering classifications are used to mitigate the spread of fire from adjoining structures or from wild fires. This proposal requires the fire separation distance to be at a minimum of 30' on all sides. This distance, 30', is the minimum fire separation distance where no fire-resistance ratings for exterior walls are required (IBC Table 602).

This proposal allows buildings of Type VA construction to have a Class C roof covering classification provided the total building area does not exceed what would be allowed for the total building area of a similar use building of Type VB Construction a value of 3 is used to determine the total allowable building area. This allows buildings of constructed of Type 5A construction and with a sprinkler system to have a Class C roof covering classification and the total building area that is at least 33% less than what is typically allowed for the same building with a Class B roof covering classification.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: TOLLISEN-S1-1505.1

S12–09/10
1505.8 (New), Chapter 35

Proponent: Mike Ennis representing the Single Ply Roofing Industry

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

1. Add new text as follows:

1505.8 Roof gardens and landscaped roofs. Roof gardens and landscaped roofs shall comply with Section 1507.16 and shall be installed in accordance with ANSI/SPRI VF-1.

2. Add standard to Chapter 35 as follows:

SPRI
VF-1-08 Fire Design Standard for Vegetative Roofs

Reason: Section 1507.16 requires that roof gardens and landscaped roofs comply with the requirements of Chapter 15. Section 1505 requires that roofing assemblies be fire classified. The current test procedures used to provide this fire classification are not applicable to garden and landscape roofs due to the many variables (plant types, moisture content, etc.) that exist for these types of systems. ANSI/SPRI VF-1 is a national consensus standard that has been developed with input from roof membrane manufacturers, component suppliers, contractors, green roofing professionals, testing organizations, and consultants. This standard provides a design method to assure an acceptable level of performance of roof gardens and landscaped roofs when exposed to exterior fire sources. The general approach used in this standard is to design in fire breaks for large roof areas, around rooftop equipment and penetrations, and next to adjacent walls. Some of the specific requirements are:

> Exposed membrane areas must conform to the designed fire resistance requirements as determined by the authority having jurisdiction.
> For all vegetated roofing systems abutting combustible vertical surfaces, a Class A (per ASTM E108 or UL790) rated assembly must be achieved for a minimum 6 ft (1.83 m) wide continuous border placed around rooftop structures and all rooftop equipment.
> For large roof areas: Partition the roof area into sections not exceeding 15,625 ft2 (1,450 m^2), with each section having no dimension greater than 125 ft (39 m) by installing a minimum of 3ft. (0.9 m) wide, Class A rated assembly barrier zones.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, VF-1-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1505.8 (New)

Proponent: Mark S. Graham, representing National Roofing Contractors Association (NRCA)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Add new text as follows:

1505.8 Photovoltaic systems. Rooftop installed photovoltaic systems that are adhered or attached to the roof covering shall be labeled to identify their fire classification in accordance with the testing required in Section 1505.1.

Reason: This proposed code change proposal is intended clarify that rooftop photovoltaic systems that are adhered or attached to the roof covering—often referred to as "building integrated photovoltaic (BIPV)"--need to comply with building code requirements for fire classification. The minimum requirement set forth here is intended for the rooftop photovoltaic system to be required to comply with the same minimum fire classification requirements as the underlying roof assembly.

Specific requirements applicable to the electrical portion of rooftop-mounted photovoltaic systems are left to the applicable electrical code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS IS A 2 PART PROPOSAL. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

TABLE 1507.2.7.1(2)
CLASSIFICATION OF ASPHALT SHINGLES PER ASTM D3161

MAXIMUM BASIC WIND SPEED FROM FIGURE 1609	CLASSIFICATION REQUIREMENT
85	~~A,~~ D or F
90	~~A,~~D or F
100	~~A, D or~~ F
110	F
120	~~F~~ Not permitted
130	~~F~~ Not permitted
140	~~F~~ Not permitted
150	~~F~~ Not permitted

PART II – IRC BUILDING/ENERGY

Revise as follows:

TABLE R905.2.4.1(2)
CLASSIFICATION OF ASPHALT SHINGLES PER ASTM D3161

MAXIMUM BASIC WIND SPEED FROM FIGURE R301.2(4) (mph)	CLASSIFICATION REQUIREMENT
85	~~A,~~ D or F
90	~~A,~~D or F
100	~~A, D or~~ F
110	F
120	~~F~~ Not permitted
130	~~F~~ Not permitted
140	~~F~~ Not permitted
150	~~F~~ Not permitted

Reason: This proposed code change is intended to make the classification requirements in IBC Table 1507.2.7.1(2) [IRC Table R905.2.4.1(2)] — Classification of Asphalt Shingles per ASTM D3161 consistent with the classifications described in the test method.

In ASTM D3161, asphalt shingles are classified as Class A (60 mph), Class D (90 mph) and Class F (110 mph).

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

1. Revise as follows:

1507.2.8.1 High wind attachment. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap at a maximum spacing of 36 inches (914mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II, ASTM D 4869 Type IV, or ASTM D 6757. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

2. Add new text as follows:

1507.3.3.3 High wind attachment. Underlayment applied in areas subject to high wind [over 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

1507.4.5 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II, ASTM D 4869 Type IV, or ASTM D 1970. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

1507.5.3.1 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

1507.6.3.1 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

1507.7.3.1 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

1507.8.3.1 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head

diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

1507.9.3.1 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure 1609] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R905.2.7.2 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) per Figure R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II, ASTM D 4869 Type IV, or ASTM D 6757. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

R905.3.3.3 Underlayment and high wind. Underlayment applied in areas subject to high wind [over 110 miles per hour (49 m/s) per R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

2. Add new text as follows:

R905.4.3.2 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) per Figure R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II, ASTM D 4869 Type IV, or ASTM D 1970. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

R905.5.3.2 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) per Figure R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

R905.6.3.2 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) per Figure R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

R905.7.3.2 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) per Figure R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

R905.8.3.2 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) per Figure R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II or ASTM D 4869 Type IV. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

R905.10.5.1 Underlayment and high wind. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) per Figure R301.2(4)] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 226 Type II. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6 inch (152 mm) spacing at the side laps. Head laps shall be 4 inches (102 mm) and end laps shall be a minimum of 6 inches (152 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Underlayment installed where the basic wind speed equals or exceeds 140 mph (63 m/s) shall be attached using metal cap nails with a head diameter of not less than 1 5/8 inches (41 mm) with a shank of at least 32 gauge sheet metal with a length to penetrate through the roof sheathing.

Reason: Observations of roof underlayment performance following Hurricane Ike in Texas and in two sets of tests conducted at the University of Florida and Florida International University demonstrated that relatively new and new ASTM 226 Type I underlayments performed very poorly when subjected to wind over about 110 mph. In the laboratory tests, specimen covered with ASTM 226 Type I and Type II underlayments performed dramatically differently. ASTM Type I felt (15#) material completely blew off some portions of the specimen as winds exceeded 110 mph and pulled over the plastic caps on other parts of the specimen. In contrast, the ASTM 226 Type II (30#) material remained in place and showed very few signs of distress. Plastic caps deformed much more than the metal caps in several installations. Consequently, the use of metal caps is recommended for areas with the highest basic design wind speeds.

Cost Impact: The code change proposal will increase the cost of construction

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Stafford-S3-1507.2.8.1

S16–09/10
1507.2.9.3; IRC R905.2.8.5 (New)

Proponent: T. Eric Stafford, PE, Institute for Business and Home Safety

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1507.2.9.3 Drip edge. Provide drip edge at eaves and gables of shingle roofs. Overlap to be a minimum of 2 inches (51 mm). Eave drip edges shall extend 1/4 inch (6.4 mm) below sheathing and the flange that rests on top of the sheathing shall extend back on the roof a minimum of 2 inches (51 mm). Drip edge shall be mechanically fastened a maximum of 12 inches (305 mm) o.c. Where the basic wind speed in Figure 1609 is 110 mph (49 m/s) or greater, drip edges shall be mechanically fastened a maximum of 4 inches (102 mm) on center using a stagger pattern such that adjacent fasteners along the length of the drip edge are placed towards opposite sides of the flange. Shingles shall not extend beyond the outer edges of the drip edge by more than ¼ inch (6.4 mm).

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R905.2.8.5 Drip edge. Where a drip edge is provided at eaves and gables of shingle roofs, the installation shall be in accordance with this section. Overlap shall be a minimum of 2 inches (51 mm). Eave drip edges shall extend 1/4 inch (6.4 mm) below sheathing and the flange that rests on the top of the roof sheathing shall extend back on the roof a minimum of 2 inches (51 mm). Drip edge shall be mechanically fastened a maximum of 12 inches (305 mm) o.c. Where the basic wind speed in Figure 1609 is 110 mph (49 m/s) or greater, drip edges shall be mechanically fastened a maximum of 4 inches (102 mm) on center using a stagger pattern such that adjacent fasteners along the length of the drip edge are placed towards opposite sides of the flange. Shingles shall not extend beyond the outer edges of the drip edge or the roof edge by more than ¼ inch (6.4 mm).

Reason: (IBC) The purpose of this proposal is to address two issues related to the wind performance of roofs. Recent hurricanes revealed that even in low wind speeds, the vertical part of the drip edge can rotate upward when subjected to wind, thus triggering the blow off of shingles. Sometimes this resulted in a cascading loss of shingles up or across a roof. By placing the fasteners near the edge of the roof, the potential for rotation of the drip edge is greatly reduced. Shingles that extend significantly beyond the edge of roofs are susceptible to being blown off in high winds. Currently the code does not limit this extension. While some extension is warranted to ensure that water sheds directly into the gutter, too much extension subjects the shingle potentially higher wind loads than what the shingle is capable of resisting.

(IRC)The purpose of this proposal is to address two issues related to the wind performance of roofs. While the IRC doesn't require the installation of a drip edge, improper installation can lead to problems in high wind areas. Recent hurricanes revealed that even in low wind speeds, the vertical part of the drip edge can rotate upward when subjected to wind, thus triggering the blow off of shingles. Sometimes this resulted in a cascading loss of shingles up or across a roof. By placing the fasteners near the edge of the roof, the potential for rotation of the drip edge is greatly reduced. Shingles that extend significantly beyond the edge of roofs are susceptible to being blown off in high winds. Currently the code does not limit this extension. While some extension is warranted to ensure that water sheds directly into the gutter, too much extension subjects the shingle to potentially higher wind loads than what the shingle is capable of resisting.

Cost Impact: The code change proposal will increase the cost of construction

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Stafford-S2-1507.2.9.3

S17–09/10
1507.5.5.1 (New); IRC R905.4.5.1 (New)

Proponent: Bob Eugene, Underwriters Laboratories Inc

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Add new text as follows:

1507.5.5.1 Wind resistance. Formed metal roof shingles shall be tested in accordance with procedures adapted from ASTM D 3161. Formed metal roof shingles shall meet the classification requirements of Table 1507.2.7.1(2) for the appropriate maximum basic wind speed. Formed metal roof shingle packaging shall bear a label to indicate compliance with the procedures adapted from ASTM D 3161 and the required classification from Table 1507.2.7.1(2).

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R905.4.5.1 Wind resistance. Formed metal roof shingles shall be tested in accordance with procedures adapted from ASTM D 3161. Metal shingles shall meet the classification requirements of Table R905.2.4.1 (2) for the appropriate maximum basic wind speed. Metal shingle packaging shall bear a label to indicate compliance with the procedures adapted from ASTM D 3161 and the required classification from Table R905.2.4.1 (2).

Reason: (IBC) Metal roof shingles are susceptible to wind. The procedures used in ASTM D 3161 for asphalt shingles are appropriate to use for determining wind resistance, when adapted for testing these types of shingles.
(IRC) This proposal introduces a new section covering wind resistance for metal roof shingles used in residential applications. The text is from IBC Section 1507.5, with an additional requirement for wind resistance (proposed Section R905.4.5.1). Metal roof shingles are susceptible to wind. The procedures used in ASTM D3161 for asphalt shingles are appropriate to use for determining wind resistance, when adapted for testing these types of shingles.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

S18–09/10
1507.10.2, Chapter 35; IRC R905.9.2, Chapter 44

Proponent: Bob Eugene, representing Underwriters Laboratories Inc

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows:

1507.10.2 Material standards. Built-up roof covering materials shall comply with the standards in Table 1507.10.2 or UL 55A.

2. Add standard to Chapter 35 as follows:

UL
55A-04 Materials for Built-Up Roof Coverings

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R905.9.2 Material standards. Built-up roof covering materials shall comply with the standards in Table R905.9.2 or UL 55A.

2. Add standard to Chapter 44 as follows:

UL
55A-04 Materials for Built-Up Roof Coverings

Reason: UL 55A has been in use since 1919, and is still used to evaluate the following materials used in the construction of built-up roof coverings – hot-mopping asphalt, asphalt-saturated and organic felt, coal-tar pitch, coal-tar saturated organic felt, and asphalt-coated glass-fire mat (felt). Several of these materials referenced in listed Roofing Systems evaluated to UL 790 or ASTM E 108 are based on compliance with UL 55A; and therefore UL55A should be referenced as an alternate standard in this code section.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, UL 55A-04, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-S5-1507.10.2

S19–09/10
Table 1507.10.2, Chapter 35

Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturers Association

1. Revise as follows:

TABLE 1507.10.2
BUILT-UP ROOFING MATERIAL STANDARDS

MATERIAL STANDARD	STANDARD
Asphalt coatings used in roofing	ASTM D1227; D 2823 D2824; D4479

(Portions of Table not shown, remain unchanged)

2. Add standard to Chapter 35 as follows:

ASTM International

D 2824-06 Standard Specification for Aluminum-Pigmented Asphalt Roof Coatings, Nonfibered, Asbestos Fibered, and Fibered without Asbestos

Reason: This proposal adds ASTM D2824 to the list of material standards used in BUR systems. The standard is included in the IRC companion table (Table R905.9.2) and should be included in the IBC in order to streamline product approval.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM D2824-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FISCHER-S1-1507.5.2

S20–09/10

1507.14.3, Table 1507.14.3 (New); IRC R905.14.3, Table R905.14.3 (New)

Proponent: Mark S. Graham, representing National Roofing Contractors Association (NRCA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1507.14.3 Application. Foamed-in-place roof insulation shall be installed in accordance with the manufacturer's instructions. A liquid-applied protective coating that complies with ~~Section 1507.15~~ Table 1507.14.3 shall be applied no less than 2 hours nor more than 72 hours following the application of the foam.

TABLE 1507.14.3
PROTECTIVE COATING MATERIAL STANDARDS

MATERIAL	STANDARD
Acrylic coating	ASTM D 6083
Silicone coating	ASTM D 6694
Moisture cured polyurethane coating	ASTM D 6947

PART II – IRC BUILDING/ENERGY

Revise as follows:

R905.14.3 Application. Foamed-in-place roof insulation shall be installed in accordance with this chapter and the manufacturer's instructions. A liquid-applied protective coating that complies with ~~Section R905.15~~ Table R905.14.3 shall be applied no less than 2 hours nor more than 72 hours following the application of the foam.

TABLE R905.14.3
PROTECTIVE COATING MATERIAL STANDARDS

MATERIAL	STANDARD
Acrylic coating	ASTM D 6083
Silicone coating	ASTM D 6694
Moisture cured polyurethane coating	ASTM D 6947

Reason: This proposed code change is intended to clarify the code by adding a table within Section 1507.14.3 that identifies the specific protective coating materials that are applicable to sprayed polyurethane foam roof systems.

The specific coating materials' ASTM standards that are included in this new table are already included in the code in Sec. 1507.15.2. Inclusion of all of the standards from Section 1507.15.2 is not appropriate here because some of these materials are not suitable for spray polyurethane foam roof systems.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDIING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I- IBC STRUCTURAL

Revise as follows:

1507.15 Liquid-applied ~~coatings~~ roofing. The installation of liquid-applied ~~coatings~~ roofing shall comply with the provisions of this section.

1507.15.1 Slope. Liquid-applied r~~oofs~~ roofing shall have a design slope of a minimum of one-fourth unit vertical in 12 units horizontal (2-percent slope).

1507.15.2 Material standards. Liquid-applied roofing ~~coatings~~ shall comply with ASTM C 836, ASTM C 957, ASTM D 1227 or ASTM D 3468, ASTM D 6083, ASTM D 6694 or ASTM D 6947.

PART II- IRC BUILDING/ENERGY

Revise as follows:

R905.15 Liquid-applied ~~coatings~~ roofing. The installation of liquid-applied ~~coatings~~ roofing shall comply with the provisions of this section.

R905.15.1 Slope. Liquid-applied ~~roofs~~ roofing shall have a design slope of a minimum of one-fourth unit vertical in 12 units horizontal (2-percent slope).

R905.15.2 Material standards. Liquid-applied ~~roof~~ roofing ~~coatings~~ shall comply with ASTM C 836, ASTM C 957, ASTM D 1227 or ASTM D 3468, ASTM D 6083, ASTM D 6694 or ASTM D 6947.

R905.15.3 Application. Liquid-applied ~~roof~~ roofing ~~coatings~~ shall be installed according to this chapter and the manufacturer's installation instructions

Reason: This proposed code change is intended to clarify the code by adding terminology that is appropriate for this section and applicable to the referenced material standards.

This section addresses those materials liquid-applied products that form a waterproof barrier that can serve as a roof covering. When serving the function as a roof covering, these products are not necessarily a "coating."

This proposed code change is not intended to change the code's current technical requirements for the products descried in this section.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: GRAHAM-S7-1507.15 –RB-3-R905.15

1502.1, 1507.17 (New), 1509.6 (New), Chapter 35; IRC R202, R905.16 (New), Chapter 44

Proponent: Bob Eugene, representing Underwriters Laboratories Inc

THIS IS A 3 PART CODE CHANGE. PARTS I & II WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART III WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Add definition as follows:

1502.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

PHOTOVOLTAIC MODULES/SHINGLES. A roof covering composed of flat-plate photovoltaic modules fabricated in sheets that resemble three-tab composite shingles.

2. Add new text as follows:

1507.17 Photovoltaic modules/shingles. The installation of photovoltaic modules/shingles shall comply with the provisions of this section.

1507.17.1 Material standards. Photovoltaic modules/shingles shall be listed and labeled in accordance with UL1703.

1507.17.2 Attachment. Photovoltaic modules/shingles shall be attached in accordance with the manufacturer's installation instructions.

1507.17.3 Wind resistance. Photovoltaic modules/shingles shall be tested in accordance with procedures adapted from ASTM D 3161. Photovoltaic modules/shingles shall comply with the classification requirements of Table 1507.2.7.1(2) for the appropriate maximum basic wind speed. Photovoltaic modules/shingle packaging shall bear a label to indicate compliance with the procedures adapted from ASTM D 3161 and the required classification from Table 1507.2.7.1(2).

3. Add standard to Chapter 35 as follows:

UL

1703-02	Flat-Plate Photovoltaic Modules and Panels – with revisions through April 2008

PART II – IBC STRUCTURAL

Add new text as follows:

1509.6 Photovoltaic panels and modules. Photovoltaic panels and modules mounted on top of a roof shall be listed and labeled in accordance with UL 1703 and shall be installed in accordance with the manufacturer's installation instructions.

PART III – IRC BUILDING/ENERGY

1. Add definition as follows:

SECTION R202
DEFINITIONS

PHOTOVOLTAIC MODULES/SHINGLES. A roof covering composed of flat-plate photovoltaic modules fabricated in sheets that resemble three-tab composite shingles.

2. Add new text as follows:

R905.16 Photovoltaic modules/shingles. The installation of photovoltaic modules/shingles shall comply with the provisions of this section.

R905.16.1 Material standards. Photovoltaic modules/shingles shall be listed and labeled in accordance with UL 1703.

R905.16.2 Attachment. Photovoltaic modules/shingles shall be attached in accordance with the manufacturer's installation instructions.

R905.16.3 Wind resistance. Photovoltaic modules/shingles shall be tested in accordance with procedures adapted from ASTM D 3161. Photovoltaic modules/shingles shall comply with the classification requirements of Table R905.2.4.1(2) for the appropriate maximum basic wind speed. Photovoltaic modules/shingle packaging shall bear a label to indicate compliance with the procedures adapted from ASTM D 3161 and the required classification from Table R905.2.4.1(2).

3. Add standard to Chapter 44 as follows:

UL
1703-02 Flat-Plate Photovoltaic Modules and Panels – with revisions through April 2008

Reason: (Parts I & III)The proposal provides guidance for installers and code officials regarding the installation of photovoltaic modules/shingles. These shingles are integrated with the building, and provide both a roof covering and source of electrical power. UL 1703 is the standard used to investigate and list photovoltaic modules. The appropriate design slope and fastening of the shingles are different for each manufacturer's product. For wind resistance, the procedures used in ASTM D 3161 for asphalt shingles are appropriate to use, when adapted for these types of shingles. Several companies currently have listings for these products.
(Part II) The ever increasing number of installations of photovoltaic panels and modules raises concerns about the safety of these installations. This proposal requires these products to be listed and installed in accordance with the manufacturer's instructions. UL 1703 is the standard used to investigate photovoltaic modules and panels, and includes construction and performance requirements to address potential safety hazards. Over 60 companies currently have UL 1703 listings for photovoltaic modules and panels.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, UL 1703-02, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1507.17 (New); IRC R905.16 (New)

Proponent: Bob Eugene, representing Underwriters Laboratories Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Add new text as follows:

1507.17 Formed plastic shingles. The installation of formed plastic shingles shall comply with the provisions of this section.

1507.17.1 Attachment. Plastic shingles shall be attached as required by the manufacturer.

1507.1.1 Wind resistance. Plastic shingles shall be tested in accordance with procedures adapted from ASTM D 3161.Plastic shingles shall comply with the classification requirements of Table 1507.2.7.1(1) for the appropriate maximum basic wind speed. Plastic shingle packaging shall bear a label to indicate compliance with the procedures adapted from ASTM D 3161 and the required classification from Table 1507.2.7.1(2).

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R905.16 Formed plastic shingles. The installation of formed plastic shingles shall comply with the provisions of this section.

R905.16.1 Attachment. Plastic shingles shall be attached as required by the manufacturer.

R905.16.1.1 Wind resistance. Plastic shingles shall be tested in accordance with procedures adapted from ASTM D 3161. Plastic shingles shall meet the classification requirements of Table R905.2.4.1 (2) for the appropriate maximum basic wind speed. Plastic shingle packaging shall bear a label to indicate compliance with the procedures adapted from ASTM D 3161 and the required classification from Table R905.2.4.1 (2).

Reason: The proposal provides guidance for installers and code officials regarding the installation of formed plastic shingles. The appropriate design slope and fastening of the shingles are different for each manufacturer's product. For wind resistance, the procedures used in ASTM D 3161 for asphalt shingles are appropriate to use, when adapted for these types of shingles.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: EUGENE-S2-1507.17

S24–09/10
1508.1

Proponent: Mike Ennis representing Single Ply Roofing Industry (SPRI)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Revise as follows:

1508.1 General. The use of above-deck thermal insulation shall be permitted provided such insulation is covered with an approved roof covering and <u>either</u> passes the tests of FM 4450 or UL 1256 when tested as an assembly <u>or is separated from the interior of the building by an approved thermal barrier in accordance with Section 2603.4.</u>

Exceptions~~:~~

1. ~~Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26.~~
2. Where a concrete roof deck is used and the above-deck thermal insulation is covered with an approved roof covering.

Reason: The proposed wording clarifies requirements for the use of above deck insulation by providing testing options (FM4450 or UL1256) and the installation option (thermal barrier) within the text of Section 1508.1. Chapter 26 of the IBC currently recognizes that thermal barriers provide adequate protection for the use of foam plastic insulation (Section 2603.4). Thermal barriers will also provide adequate protection for other insulation types used in this application. Other commonly used types of insulation for this application are fiberglass, cellular fiber, mineral fiber, perlite and wood fiberboard. By making this change options for including above deck insulation are clearly spelled out, an assembly that has passed UL1256 or FM 4450 must be used, or a thermal barrier must be installed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

S25–09/10
Table 1508.2, Chapter 35

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Proponent: Tony Crimi, AC Consulting Solutions Inc., representing North American Insulation Manufacturers Association

1. Revise as follows:

TABLE 1508.2
MATERIAL STANDARDS FOR ROOF INSULATION

Cellular glass board	ASTM C 552
Composite boards	ASTM C 1289, Type III, IV, V or VI
Expanded polystyrene	ASTM C 578
Extruded polystyrene board	ASTM C 578
Perlite board	ASTM C 728
Polyisocyanurate board	ASTM C 1289, Type I or Type II
Wood fiberboard	ASTM C 208
<u>Mineral Fiber Insulation board</u>	<u>ASTM C 726</u>

2. Add standard to Chapter 35 as follows:

ASTM International
<u>C 726-05e1 Standard Specification for Mineral Fiber Roof Insulation Board</u>

Reason: To add the current ASTM C 726 specification for the composition and physical properties of mineral fiber insulation board used above structural roof decks as a base for built-up roofing and single ply membrane systems in building construction.
This specification covers the composition and physical properties of mineral fiber insulation board used above structural roof decks as a base for built-up roofing and single ply membrane systems in building construction.

The current table in section 1508.2 does not include reference to the appropriate ASTM Standard specification for the composition and physical properties of mineral fiber insulation board used above structural roof decks as a base for built-up roofing and single ply membrane systems in materials in the Table. This Standard covers testing and conformance to the following physical properties: compressive resistance, tensile strength, breaking load strength, water absorption, response to thermal and humid aging, linear dimensional change, thermal resistance, and dimensions.

Cost Impact: This proposal does not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM C726-05e1, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: CRIMI-S2-TABLE 1508.2

S26–09/10
1509.1, 1509.2.4

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Revise as follows:

1509.1 General. The provisions of this section shall govern the construction of rooftop structures and of rooftop mounted enclosures such as mechanical equipment screens.

1509.2.4 Type of construction. Penthouses and other rooftop enclosures shall be constructed with walls, floors and roof as required for the building.

Exceptions:

1. On buildings of Type I construction, the exterior walls and roofs of penthouses with *a fire separation distance* of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be of at least 1-hour fire resistance rated noncombustible construction. Walls and roofs with a *fire separation distance* of 20 feet (6096 mm) or greater shall be of noncombustible construction. Interior framing and walls shall be of noncombustible construction.
2. On buildings of Type I construction two stories above *grade plane* or less in height and Type II construction, the exterior walls and roofs of penthouses with a *fire separation distance* of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be of at least 1-hour fire-resistance-rated noncombustible *or fire-retardant-treated wood* construction. Walls and roofs with *a fire separation distance* of 20 feet (6096 mm) or greater shall be of noncombustible or *fire-retardant-treated wood* construction. Interior framing and walls shall be of noncombustible or fire retardant- treated wood construction.
3. On buildings of Type III, IV and V construction, the exterior walls of penthouses with a *fire separation distance* of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be at least 1-hour fire resistance- rated construction. Walls with a *fire separation distance* of 20 feet (6096 mm) or greater from a common property line shall be of Type IV construction or noncombustible, *or fire-retardant-treated wood* construction. Roofs shall be constructed of materials and fire-resistance rated as required in Table 601 and Section 603 Item 25.3. Interior framing and walls shall be Type IV construction or noncombustible or *fire-retardant-treated wood* construction.
4. On buildings of Type I construction, unprotected noncombustible enclosures including screens housing only mechanical equipment and located with a minimum *fire separation distance* of 20 feet (6096 mm) shall be permitted.
5. On buildings of Type I construction two stories or less above *grade plane* in height, or Type II, III, IV, and V construction, unprotected noncombustible or *fire-retardant-treated wood* enclosures including screens housing only mechanical equipment and located with a *minimum fire separation distance* of 20 feet (6096 mm) shall be permitted.
6. On one-story buildings, combustible unroofed mechanical equipment screens, fences or similar enclosures are permitted where located with a *fire separation distance* of at least 20 feet (6096 mm) from adjacent property lines and where not exceeding 4 feet (1219 mm) in height above the roof surface.
7. Dormers shall be of the same type of construction as the roof on which they are placed, or of the exterior walls of the building.

Reason: The provisions of Section 1509 include more than just "*rooftop structures*" that are defined in Section 1502 as "*an enclosed structure*", such as a penthouse. The section currently contains provisions for unroofed mechanical equipment screens and towers that may be unenclosed. As a result, there have been disagreements between code enforcers and designers regarding the application of fire resistance rules specified within the exceptions to Section 1509.2.4, to *unenclosed* rooftop structures such as mechanical equipment screens. To address this, the scope statement in Section 1509.1 is revised to specifically add rooftop mounted enclosures such as mechanical equipment screens.

Current exceptions 4, 5 and 6 to Section 1509.2.4 address more than just penthouses. According to written interpretations from ICC staff (Paul Wong), these exceptions are intended to address the necessary fire resistance of mechanical equipment screens that are unenclosed rooftop structures. To clarify this intent, the wording in Exceptions 4 and 5 is revised to state "*enclosures including screens*". The wording in exception 6 is not revised because it is clear that it applies to roof screens as currently written. Exception 6 however is limited to screens having a maximum height of 4'-0", and many jurisdictions require taller screens to hide roof mounted HVAC equipment. As a result exceptions 4 and 5 provide rules that can be applied to those taller screens.

Each of these changes in intended to clarify that unenclosed roof screens are specifically included in the provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-S2-1509.1

S27–09/10

1509.2-1509.5.2, 1509.6-1509.7.5 (New)

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing Alcan Composites USA, Inc. and Jesse J. Beitel, Hughes Associates, Inc., representing, Trespa North America, Ltd.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

1. Revise as follows:

1509.1 General. The provisions of this section shall govern the construction of rooftop structures.

1509.2 Penthouses. ~~A penthouse or~~ Penthouses in compliance with Sections 1509.2.1 through ~~1509.2.4~~ 1509.2.5 shall be considered as a portion of the story directly below the roof deck on which such penthouses are located. All other penthouses shall be considered as an additional story of the building.

1509.2.1 Height above roof deck. ~~A penthouse~~ Penthouses ~~or other projection above the roof in structures~~ constructed on buildings of other than Type I construction ~~shall not exceed 28 feet (8534 mm) above the roof where used as an enclosure for tanks or for elevators that run to the roof and in all other cases~~ shall not exceed ~~extend more than~~ 18 feet (5486 mm) in height above the roof deck as measured to the average height of the roof of the penthouse.

Exceptions:

1. Where used to enclose tanks or elevators that travel to the roof level, penthouses shall be permitted to have a maximum height of 28 feet (8534 mm) above the roof deck.
2. Penthouses located on the roof of buildings of Type I construction shall not be limited in height.

1509.2.2 Area limitation. The aggregate area of penthouses and other enclosed rooftop structures shall not exceed one-third the area of the supporting roof deck. Such penthouses and other enclosed rooftop structures shall not be required to be included in determining ~~contribute to either~~ the building area or number of stories as regulated by Section 503.1. The area of ~~the penthouse~~ such penthouses shall not be included in determining the fire area ~~defined~~ specified in Section 901.7 ~~902~~.

1509.2.3 Use limitations. ~~A penthouse~~ Penthouses~~, bulkhead or any other similar projection above the~~ ~~roof~~ shall not be used for purposes other than the shelter of mechanical or electrical equipment or ~~shelter of~~ vertical shaft openings in the roof assembly.

1509.2.4 Weather protection. Provisions such as louvers, louver blades or flashing shall be made to protect the mechanical and electrical equipment and the building interior from the elements. ~~Penthouses or bulkheads used for purposes other than permitted by this section shall conform to the requirements of this code for an additional story. The restrictions of this section shall not prohibit the placing of wood flagpoles or similar structures on the roof of any building.~~

~~1509.2.4~~ **1509.2.5 Type of construction.** Penthouses shall be constructed with walls, floors and roof as required for the type of construction of the building on which such penthouses are built.

Exceptions:

1. On buildings of Type I construction, the exterior walls and roofs of penthouses with a fire separation distance ~~of more~~ greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a ~~of at least~~ 1-hour fire resistance-rating ~~rated noncombustible construction~~. The exterior walls and roofs of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall ~~be of noncombustible construction~~ not be required to have a fire-resistance rating. ~~Interior framing and walls shall be of noncombustible construction.~~
2. On buildings of Type I construction two stories or less in height above grade plane or ~~less in height and~~ Type II construction, the exterior walls and roofs of penthouses with a fire separation distance ~~of more~~ greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a ~~of at least~~ 1-hour fire-resistance-rating ~~rated noncombustible or~~ and be constructed of fire-retardant-treated wood ~~construction~~. The exterior walls and roofs of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall be permitted to be constructed of ~~noncombustible or~~ fire-retardant-treated wood ~~construction~~ and shall not be required to have a fire-resistance rating. Interior framing and walls shall be permitted to be constructed of ~~noncombustible or~~ fire retardant treated wood ~~construction~~.
3. On buildings of Type III, IV or ~~and~~ V construction, the exterior walls of penthouses with a fire separation distance ~~of more~~ greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a ~~at least~~ 1-hour fire-resistance-rating or a lesser fire-resistance rating as required by Table 602 ~~rated construction~~. The exterior walls of penthouses with a fire separation distance of 20 feet (6096 mm) or greater ~~from a common property line~~ shall be of Type IV construction, or shall be constructed of noncombustible~~,~~ or fire-retardant-treated wood, ~~construction~~ and shall not be required to have a fire-resistance rating. ~~Roofs shall be constructed of materials and fire-resistance rated as required in Table 601 and Section 603, Item 25.3. Interior framing and walls shall be Type IV construction or noncombustible or fire-retardant-treated wood construction.~~
4. ~~On buildings of Type I construction, unprotected noncombustible enclosures housing only mechanical equipment and located with a minimum fire separation distance of 20 feet (6096 mm) shall be permitted.~~
4 ~~5~~. On buildings of ~~Type I construction two stories or less above grade plane in height, or~~ Type ~~II,~~ III, or IV ~~and V~~ construction, ~~unprotected~~ penthouses constructed of noncombustible materials or fire-retardant-treated wood, ~~enclosures~~ housing only mechanical equipment, and located with a ~~minimum~~ fire separation distance ~~of~~ not less than 20 feet (6096 mm) shall be permitted and shall not be required to be fire-resistance-rated.
6. ~~On one-story buildings, combustible unroofed mechanical equipment screens, fences or similar enclosures are permitted where located with a fire separation distance of at least 20 feet (6096 mm) from adjacent property lines and where not exceeding 4 feet (1219 mm) in height above the roof surface.~~
7. ~~Dormers shall be of the same type of construction as the roof on which they are placed, or of the exterior walls of the building.~~

1509.3 Tanks. Tanks having a capacity of more than 500 gallons (2 m^3) ~~placed in or~~ located on the roof deck of a building shall be supported on masonry, reinforced concrete, steel or Type IV construction provided that, where such supports are located in the building above the lowest story, the support shall be fire-resistance rated as required for Type IA construction.

1509.3.1 Valve and drain. ~~Such tanks shall have~~ In the bottom or on the side near the bottom of the tank, a pipe or outlet~~,~~ fitted with a suitable quick opening valve for discharging the contents in an emergency into a ~~through an adequate~~ drain shall be provided.

1509.3.2 Location. ~~Such~~ Tanks shall not be placed over or near a ~~line of stairs~~ stairway or an elevator shaft, unless there is a solid roof or floor underneath the tank.

1509.3.3 Tank cover. Unenclosed ~~roof~~ tanks shall have covers sloping toward the ~~outer edges~~ perimeter of the tanks.

1509.4 Cooling towers. Cooling towers located on the roof deck of a building and greater than ~~in excess of~~ 250 square feet (23.2 m^2) in base area or greater than ~~in excess of~~ 15 feet (4572 mm) ~~high~~ in height above the roof deck, as measured to the highest point on the cooling tower, where ~~located on building~~ the roofs ~~more~~ is greater than 50 feet (15 240 mm) ~~high~~ in height above grade plane shall be constructed of noncombustible materials ~~construction~~. The base area of cooling towers shall not exceed one-third the area of the supporting roof deck ~~area~~.

Exception: Drip boards and the enclosing construction shall be permitted to be ~~of~~ wood not less than 1 inch (25 mm) nominal thickness, provided the wood is covered on the exterior of the tower with noncombustible material.

1509.5 Towers, spires, domes and cupolas. ~~Any tower, spire, dome or cupula~~ Towers, spires, domes and cupolas shall be of a type of construction ~~not less in~~ having fire-resistance ~~rating~~ ratings not less than required for the building ~~to~~ on top of which ~~it~~ such tower, spire, dome or cupola is built. ~~attached, except that any such tower, spire, dome or cupula~~ Towers, spires, domes and cupolas greater than ~~that exceeds~~ 85 feet (25 908 mm) in height above grade plane as measured to the highest point on such structures, and either greater than ~~exceeds~~ 200 square feet (18.6 m2) in horizontal area or ~~is~~ used for any purpose other than a belfry or an architectural embellishment, shall be constructed of and supported on Type I or II construction.

1509.5.1 Noncombustible construction required. ~~Any tower, spire, dome or cupula~~ Towers, spires, domes and cupolas ~~that exceeds~~ greater than 60 feet (18 288 mm) in height above the highest point at which ~~it comes in~~ such structure contacts ~~contact with~~ the roof as measured to the highest point on such structure, or that exceeds 200 square feet (18.6 m^2) in area at any horizontal section, or which is intended to be used for any purpose other than a belfry or architectural embellishment, or is located on the top of a building greater than 50 feet (1524 mm) in building height shall be ~~entirely~~ constructed of and supported by noncombustible materials~~. Such structures~~ and shall be separated from the building below by construction having a fire-resistance rating of not less than 1.5 hours with openings protected in accordance with Section 712. ~~with a minimum 1.5-hour fire protection rating. Structures, except aerial supports 12 feet (3658 mm) high or less, flagpoles, water tanks and cooling towers, placed~~ ~~above~~ Such structures located on the top ~~roof~~ of a ~~any~~ building ~~more~~ greater than 50 feet (15 240 mm) in building height~~, shall be of noncombustible material and~~ shall be supported by noncombustible construction ~~of noncombustible material~~.

1509.5.2 Towers and spires. Enclosed towers and spires ~~where enclosed~~ shall have exterior walls constructed as required for the building ~~to~~ on top of which ~~they~~ such towers and spires are built ~~attached~~. The roof covering of spires shall not be ~~of a~~ less than the same class of roof covering ~~as~~ required for the ~~main roof of the rest of the structure~~ building on top of which the spire is located.

2. Add new text as follows:

1509.6 Mechanical equipment screens. Mechanical equipment screens shall be constructed of the materials specified for the exterior walls in accordance with the type of construction of the building without being required to comply with the fire-resistance rating requirements.

1509.6.1 Height limitations. Mechanical equipment screens shall not exceed 18 feet (5486 mm) in height above the roof deck, as measured to the highest point on the mechanical equipment screen, and the highest point on the mechanical equipment screen, as measured to grade plane, shall not exceed the maximum building height allowed for the building by other provisions of this code.

> **Exception:** Where located on buildings of Type IA construction, the height of mechanical equipment screens shall not be limited.

1509.6.2 Types I, II, III, and IV construction. Regardless of the requirements in Section 1509.6, mechanical equipment screens shall be permitted to be constructed of combustible materials where located on the roof decks of building of Type I, II, III, or IV construction in accordance with any of the following limitations:

1. The fire separation distance shall not be less than 20 feet (6096 mm) and the height of the mechanical equipment screen above the roof deck shall not exceed 4 feet (1219 mm) as measured to the highest point on the mechanical equipment screen.
2. The fire separation distance shall not be less than 20 feet (6096 mm) and the mechanical equipment screen shall be constructed of fire-retardant-treated wood complying with Section 2302.2 for exterior installation.
3. The materials shall have a flame spread index of 25 or less when tested in the minimum and maximum thicknesses intended for use with each face tested independently in accordance with ASTM E 84 or UL 723, the facings shall be tested in the minimum and maximum thicknesses intended for use in accordance with, and shall comply with the acceptance criteria of, NFPA 285, and the facings shall be installed as tested but without any substrates or wall assemblies.

1509.6.3 Type V construction. The height of mechanical equipment screens located on the roof decks of buildings of Type V construction, as measured from grade plane to the highest point on the mechanical equipment screen, shall be permitted to exceed the maximum building height allowed for the building by other provisions of this code where complying with any one of the following limitations, provided the fire separation distance is greater than 5 feet (1524 mm):

1. Where the fire separation distance is not less than 20 feet (6096 mm), the height above grade plane of the mechanical equipment screen shall not exceed 4 feet (1219 mm) more than the maximum building height allowed,
2. The mechanical equipment screen shall be constructed of noncombustible materials,
3. The mechanical equipment screen shall be constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation, or
4. Where fire separation distance is not less than 20 feet (6096 mm), the mechanical equipment screen shall be constructed of materials having a flame spread index of 25 or less when tested in the minimum and maximum thicknesses intended for use in accordance with ASTM E 84 or UL 723.

1509.7 Other rooftop structures. Rooftop structures not regulated by Sections 1509.2 through 1509.6 shall comply with Section 1509.7.1 through 1509.7.5 as applicable.

1509.7.1 Aerial supports. Aerial supports shall be constructed of noncombustible materials.

Exception: Aerial supports not greater than 12 feet (3658 mm) in height as measured from the roof deck to the highest point on the aerial supports shall be permitted to be constructed of combustible materials.

1509.7.2 Bulkheads. Bulkheads used for the shelter of mechanical or electrical equipment or vertical shaft openings in the roof assembly shall comply with Section 1509.2 as penthouses. Bulkheads used for any other purpose shall be considered as an additional story of the building.

1509.7.3 Dormers. Dormers shall be of the same type of construction as required for the roof in which such dormers are located or the exterior walls of the building.

1509.7.4 Fences. Fences and similar structures shall comply with Section 1509.6 as mechanical equipment screens.

1509.7.5 Flagpoles. Flagpoles and similar structures shall not be required to be constructed of noncombustible materials and shall not be limited in height or number.

3. Revise as follows:

1502.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

MECHANICAL EQUIPMENT SCREEN. A ~~partially enclosed~~ rooftop structure, not covered by a roof, used to aesthetically conceal ~~heating, ventilating and air conditioning (HVAC)~~ plumbing, electrical or mechanical equipment from view.

PENTHOUSE. An enclosed, unoccupied rooftop structure ~~above the roof of a building, other than a tank, tower, spire, dome, cupola or bulkhead.~~ used for sheltering mechanical and electrical equipment, tanks, elevators and related machinery, and vertical shaft openings.

ROOF DECK. The flat or sloped surface constructed on top of the exterior walls of a building or other supports for the purpose of enclosing the story below, or sheltering an area, to protect it from the elements, not including its supporting members or vertical supports.

ROOFTOP STRUCTURE. ~~An enclosed~~ A structure erected on ~~or above~~ top of the roof deck or on top of any part of a building.

Reason: The vast majority of the revisions proposed in this code change are editorial in nature but there are also a few technical changes, some of which are significant. The editorial changes are provided for:

clarification
elimination of redundant language including redundant Exceptions
consistency of terminology and application of requirements to specific types of rooftop structures
reformatting regarding the use of the Exception format
reformatting into subsections that deal with different requirements contained in the same section
determination of the height of rooftop structures

We have also provided phraseology to address how to determine the height of a rooftop structure since that height is not defined, unlike "Building Height" which is defined in Section 502.1. We have also substituted the term "roof deck" for the word "roof" since it is a defined term found in Section 1502.1. We have also proposed to revise the definition for "Roof Deck" to clarify its application and make it more specific.

The specific revisions proposed to each Subsection of Section 1509 are discussed in the following.

1509.2 Penthouses. The revision to the first sentence clarifies that the story below, of which the penthouse would be considered a portion if complying with these provisions, is the story that is located directly below the roof deck on which the penthouse is located. Since there are many stories below the penthouse, although it may be obvious, this clearly indicates that it is the story directly below the roof deck on which the penthouse is located. The second sentence merely makes it clear that any other penthouse not compliant with these provisions would actually be considered as an additional story of the building.

1509.2.1 Height above roof deck. The reference to other projections above the roof has been deleted since the focus of this section is penthouses which are defined in Section 1502.1. In fact, the definition for "Penthouse" is proposed to be revised by this code change to further clarify it based on the intent of the section addressing penthouses. Also, we have added new Sections 1509.6 and 1509.7 which address other projections above the roof. This section has also been reformatted into Exception format to make its application more clear and the wording has been revised to be consistent with other code text used throughout the code. These revisions should not result in any technical changes.

1509.2.2 Area limitation. The word "enclosed" is proposed to be added to modify the term "rooftop structures" to be consistent with the proposed revision to the definition for "rooftop structure" contained in this code change. It is our opinion that a rooftop structure encompasses all of the types of enclosures and other projections that could be located or constructed on the top of a roof deck of a building, so it would include both enclosed and unenclosed structures. So the definition of rooftop structure has been broadened to delete the limitation on enclosed structures. In this way both mechanical equipment screens, for which the definition is also being revised by this code change proposal, and penthouses become subsets of "rooftop enclosures". Mechanical equipment screens are not covered by a roof so they are not enclosed and "penthouses" are truly enclosed structures. The definition for "Mechanical Equipment Screen," as noted, is proposed to be revised to indicate that it is a rooftop structure that is not covered by a roof and is, thus, not enclosed. We believe this is a better definition than relying on the term "partially enclosed" which is proposed to be deleted in the definition for "Mechanical Equipment Screen." In the last sentence rather than referring to the definition for "Fire Area" in Section 902, we believe it is more appropriate to refer to where fire areas are used in Section 901.7 to clarify the intent of this sentence.

1509.2.3 Use limitations. The reference to "bulkhead or any other similar projection above the roof" has been deleted since it is being addressed in a proposed new Section 1509.7.2 as it is out of context in this section on penthouses. This section has also been revised to include electrical equipment as a part of the sheltering function of a penthouse since most mechanical equipment installations will also be associated with electrical equipment. The word "assembly" has been added to the word "roof" since "roof assembly" is a defined term in Section 1502.1.

New Section 1509.2.4 Weather protection. This is a reformatting of the section since this sentence addresses a separate requirement from the use limitations provisions in Section 1509.2.3. Again, "electrical equipment" has also been added for the same reasons as noted above. The second sentence has been deleted since it is redundant as it has already been addressed in Section 1509.2. The last sentence has been deleted since it is out of context as it addresses wood flagpoles or similar structures on the roofs of buildings. It has been relocated to a new Section 1509.7.5.

1509.2.5 Type of construction. The revision to the charging paragraph is basically a clarification for specifying compliance with the type of construction of the building on which the penthouses are built.

Exception 1. These revisions are editorial to be consistent with terminology used throughout the code. The revisions to the second sentence are to implement the intent of these Exceptions which address the fire-resistance ratings not being required. By default, this results in noncombustible construction in a Type I building. The last sentence has been deleted because it is unnecessary as this is a basic requirement for buildings of Type I construction.

Exception 2. Again, these are basically editorial revisions to use terminology consistent with the rest of the code and to be consistent with the revisions to Exception 1 as noted above. The revisions to the last sentence are made for the same reasons as noted in Exception 1 above where noncombustible construction is the requirement for such partitions, but the intent of the section is to allow for the use of fire-retardant-treated wood in lieu of noncombustible construction.

Exception 3. Since this is an Exception, the word "and" has been changed to "or" in the list of the types of construction to which this Exception is applicable. Additional editorial revisions have been made to be consistent with those made to Exceptions 1 and 2 above. The phrase "from a common property line" has been deleted because it is unnecessary since the term "fire separation distance" is a defined term in Section 702.1. The next to the last sentence has been deleted as it is unnecessary based on the charging sentence in Section 1509.2.4 to which this is an Exception. This appears to be a code requirement within an Exception that is not necessary. Similarly, the last sentence has also been deleted since other provisions of the code already allow such construction.

Exception 4. This Exception has been deleted since it is redundant. It is covered by Exception 1 above and is actually more limiting than Exception 1.

Exception 5. The reference to Types I and II construction have been deleted as they are already covered by Exception 2 above, whereas this Exception as noted in Exception 4 above is somewhat more restrictive than Exception 2. The rest of the revisions are editorial by utilizing consistent terminology to that used throughout the rest of the code and to be consistent with the revisions to Exceptions 1 and 2 above.

Exception 6. This Exception is being deleted since it does not address penthouses and is, thus, out of context. The provisions of this Exception, however, have been utilized in the new Sections 1509.6 and 1509.7 being added by this code change which will be discussed later.

Exception 7. This section is also being deleted since it is out of context as it does not address penthouses. It has been editorially revised and relocated as new Section 1509.7.3.

1509.3 Tanks. This entire subsection including sub-subsections .1, .2, and .3 have been editorially revised with no technical changes.

1509.4 Cooling towers. This section has been revised to make it clear that it is only applicable to cooling towers located on the roof deck of a building. It also provides a clarification on how the height of the cooling tower is to be measured for applying the limitations in this section. The rest of the changes are editorial without technical change.

1509.5 Towers, spires, domes, and cupolas. These are editorial revisions to make the section consistent with the previous sections in terms of format and terminology and also to incorporate the method for measuring the height of these structures.

1509.5.1 Noncombustible construction required. The first sentence has been revised to be consistent with Section 1509.5 including how to make the measurements for the height of these structures. The last sentence has been revised and broken up into separate parts with the one part referencing the noncombustible construction limitation incorporated into the first sentence which deals with the construction of these structures, whereas the last sentence deals with the support of these structures under certain conditions. The second sentence has been revised to be included in the first sentence since it is conditional to the application of the first sentence. The reference to the minimum 1.5 hour fire protection rating for protection of openings in the 1.5 hour separation of the structures from the building below has been deleted with a reference to Section 712 provided. Section 712 addresses how to protect openings in horizontal assemblies. Generally speaking, opening protectives with fire protection ratings are not used to protect openings in horizontal assemblies unless those openings are protected with shaft enclosures with openings. However, there are floor fire door assemblies that can be used which have a fire-resistance rating, as opposed to a fire protection rating.

1509.5.2 Towers and spires. These are basically editorial clarifications without any technical change.

1509.6 Mechanical equipment screens. This is a new section being proposed to specifically address mechanical equipment screens which are defined in Section 1502.1. They are not otherwise addressed in Section 1509 with the exception of the out of context Exception 6 to Section 1509.2.4 which only addresses the type of construction of penthouses as previously noted. Also, as previously noted, we are proposing to revise the definition for "Mechanical Equipment Screen" in Section 1502.1 to make it clear that it is a rooftop structure that is not covered by a roof, rather than a "partially enclosed" rooftop structure.

This new section takes what we believe to be a conservative approach to the construction of mechanical equipment screens on roofs by specifying that they must be constructed of the same materials as required by the code for exterior walls based on the type of construction of the building on which they are located. However, it is proposed that they be exempt from the fire-resistance rating requirements since they do not fully enclose a space as they are without a roof and they represent a different exposure hazard than a penthouse, for example. Basically, the exposure hazard of a mechanical equipment screen is the combustibility of the screen itself and the amount of combustible materials it contains.

1509.6.1 Height limitations. The height limits specified in this section are also conservative, in our opinion, as they are based on those required for penthouses in Section 1509.2.1. The height limit is also based on the assumption that the overall height of the mechanical equipment screen should not exceed that allowed for the maximum building height for the type of construction of the building on which it is constructed. Thus, the need for the Exception for mechanical equipment screens located on buildings of Type IA construction which are not limited in height by Table 503.

1509.6.2 Types I, II, III, and IV construction. This new section is, in essence, an Exception to the requirements in Section 1509.6 for these types of construction which require the exterior walls to be constructed of noncombustible materials. The three itemized limitations in this section allow for combustible materials to be used for the construction of mechanical equipment screens based upon the provisions in those three items as discussed in the following.

Item 1. This item is based on Exception 6 to Section 1509.2.4 as previously noted for penthouses which has been deleted. The 1-story building height limitation has not been included since we believe it is not necessary. In our opinion, the hazard of a combustible mechanical equipment screen located on the roof of a Type I, II, III, or IV building with a fire separation distance of not less than 20 feet and with the height of the mechanical equipment screen limited to 4 feet above the roof deck is not a significant fire hazard. It is interesting to note that Table 705.8 Maximum Area of Exterior Wall Openings Based on Fire Separation Distance and Degree of Opening Protection would allow up to 45% of the exterior wall area of a nonsprinklered building to have unprotected openings and would allow unlimited unprotected openings in sprinklered buildings. Thus, for a building having floor-to-floor heights of at least 10 feet, which is very minimal, unprotected window openings around the entire perimeter could be as tall as 4.5 feet. This would represent a greater fire exposure, once the story flashes over and the windows break out, than a burning 4 foot high mechanical equipment screen which will normally be set back some distance from the face of the exterior wall.

Item 2. The provisions of this Item are based on Exceptions 2 and 3 to Section 1509.2.4 for penthouses with the 2-story limit on Type I buildings omitted. We believe this to be a reasonable approach since the hazard doesn't justify limiting the Type I buildings to two stories in height where fire-retardant-treated wood is used to construct these unenclosed mechanical equipment screens. The main difference between Item 1 above and this Item 2 is that Item 2 does not place a 4 foot height limit on the height of the mechanical equipment screen above the roof deck. That is because it must be constructed of fire-retardant-treated wood as compared to any combustible material allowed by the code being permitted in Item 1. Of course, the height of the mechanical equipment screen is still limited to a maximum of 18 feet above the roof based on Section 1509.6.1. It is also limited to the maximum building height that would be allowed by the type of construction of the building in accordance with Section 1509.6.1 as well.

Item 3. These limitations are based on a totally new concept where the combustible materials used to build the mechanical equipment screen are limited to a maximum flame spread index of 25 (which is also required for fire-retardant-treated wood) and the materials are required to be successfully tested in accordance with NFPA 285 Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Nonload-Bearing Wall Assemblies Containing Combustible Components. This is the same test method that is used to validate the use of foam-plastic insulations in exterior walls of Types I, II, III, and IV construction, as well as for the use of metal composite materials (MCM) in accordance with Section 1407.10. Although the material would be tested as the outer face (or skin) of the exterior wall in the NFPA 285 test as part of an exterior wall assembly, the test clearly assesses the surface flame spread resistance of the materials constituting the outer face, as well as to a certain degree, the inner face where it is exposed to any open cavities in the wall assembly. The NFPA 285 test is conducted for a full 30 minutes under severe fire exposure conditions to both the inside of the wall assembly and the outside of the wall assembly with an exterior window burner replicating a fire that has gone to post-flashover and has broken out a window, exposing the outside face of the exterior wall finish. Since the materials used to construct the mechanical equipment screen do not comprise a completely enclosed wall assembly, the maximum flame spread index of 25 has been proposed as a conservative limitation for the backside face of the material which may not have been directly exposed to the exterior window burner flame in the NFPA 285 test. Since the NFPA 285 test is used to qualify combustible materials for use where noncombustible exterior walls are required, it seems reasonable to allow its use for this application for mechanical equipment screens without the need to have the entire wall assembly constructed as tested for the mechanical equipment screen, instead utilizing the materials tested on the exterior face of the wall system in accordance with NFPA 285.

1509.6.3 Type V construction. This new section is basically an Exception to the requirements in Section 1509.6.1 Height Limitations for Type V construction where the mechanical equipment screens are allowed to be constructed of combustible materials. The one condition that must be met for all four options in this section is that the minimum fire separation distance must be greater than 5 feet which is consistent with Section 1406 Combustible Materials on the Exterior Side of Exterior Walls.

Item 1. This item is based on Exception 6 to Section 1509.2.4 for penthouses which has been deleted. It was limited to one story buildings. However, we don't see the hazard represented by a 4 foot high increase in the overall height of the mechanical equipment screen on buildings of Type V construction (which are allowed to be constructed entirely of combustible materials) as justifying that one story limitation. This is especially true where the fire separation distance specified is not less than 20 feet. Please refer to the discussion on Item 1 of Section 1509.6.2 above.

Item 2. This seems intuitively obvious to allow these mechanical equipment screens to be taller when they are constructed of noncombustible materials where combustible materials would otherwise be permitted. Noncombustible materials pose no additional fire load or fire exposure to the building.

Item 3. This allows the use of fire-retardant-treated wood which, although combustible, does not pose a significant fire hazard, in our opinion, when constructed as a mechanical equipment screen where there is a minimum 5 foot fire separation distance.

Item 4. This is somewhat similar to Item 3 in that fire-retardant-treated wood is required to have a maximum flame spread index of 25 as proposed for the combustible materials allowed in this item. However, there is an additional requirement that the fire separation distance be not less than 20 feet as compared to the base requirement of 5 feet for these provisions to be allowed to be used. We believe that the fire hazard associated with this type of installation would not be significant so as to allow the greater heights for the mechanical equipment screens installed on these Type V buildings. Again, please refer to the discussion on Item 1 of Section 1509.6.2 above regarding the minimum 20 foot fire separation distance limitation.

1509.7 Other rooftop structures. This new section becomes a catchall section to address other rooftop structures that are not specifically regulated by Sections 1509.2 through 1509.6. In reviewing Section 1509 we found references to such other rooftop structures as aerial supports covered in proposed new Section 1509.7.1, bulkheads covered in proposed new Section 1509.7.2, dormers covered in proposed new Section 1509.7.3, fences covered in proposed new Section 1509.7.4, and flagpoles covered in proposed new Section 1509.7.5. So we believe we have addressed all of the rooftop structures the code currently addresses.

1509.7.1 Aerial supports. The requirements for this section are taken from Section 1509.5.1 which were deleted because they were out of context in regard to the provisions of the section which addressed towers, spires, domes, and cupolas.

1509.7.2 Bulkheads. It is proposed to treat bulkheads like penthouses as we believe was intended by Section 1509.2.3 where bulkheads are currently referred to. We eliminated bulkheads from that section since it specifically addresses penthouses. In this way we keep the section clean and then simply reference it and require bulkheads to be constructed to meet those requirements as if they were penthouses. Looking at the definition for "Bulkhead" in Webster's dictionary, the most likely meaning within the context of Section 1509 is "a projecting framework with a sloping door giving access to a cellar stairway or a shaft."

1509.7.3 Dormers. This is where Exception 7 of Section 1509.2.4 was relocated after it was deleted from that section addressing penthouses since it was clearly out of context.

1509.7.4 Fences. It is our best judgment that fences should be treated as mechanical equipment screens since they are similar structures and can be considered similar in fire hazard. It should be noted that they are mentioned in Exception 6 to Section 1509.2.4 for penthouses which was deleted, again, as being out of context.

1509.7.5 Flagpoles. These requirements are taken from the last sentence of Section 1509.2.3 for penthouses which was deleted as being out of context.

In summary, it is readily obvious after delving into Section 1509 that it is very disjointed and inconsistent and utilizes terminology and language that is not consistent with the rest of the code. It appears to be, as it most likely is, an amalgam of the three legacy code requirements for rooftop structures which was put together without a lot of detailed evaluation or review. Since Trespa North America, Ltd. manufactures products that are used in many of these applications, we have come across many projects where Section 1509 has been attempted to be applied but without much success. It is extremely difficult to determine what the true intent is of many of the requirements, especially those that do not specifically address penthouses. We have tried our best to clarify and reformat this section to make it clearer to understand, easier to read and interpret, and, hopefully, more effectively enforced and applied. We hope that the Committee will give this comprehensive revision to Section 1509 serious and in-depth consideration so that we can fix it for the 2012 IBC, remembering that we only have one chance to get it corrected before the next edition is published.

Cost Impact: The proponent shall indicate one of the following regarding the cost impact of the code change proposal: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Thornberry-S1-1509

S28–09/10
1509.6 (New)

Proponent: Mark S. Graham, National Roofing Contractors Association (NRCA)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Add new text as follows:

1509.6 Photovoltaic systems. Rooftop mounted photovoltaic systems shall be designed in accordance with this section.

1509.6.1 Wind resistance. Rooftop mounted photovoltaic systems shall be designed for wind loads in accordance with Chapter 16.

1509.6.2 Fire classification. Rooftop mounted photovoltaic systems shall be shall have the same fire classification as the roof assembly as defined Section 1505.

1509.6.3 Installation. Rooftop mounted photovoltaic systems shall be installed in accordance with the manufacturer's installation instructions.

Reason: Rooftop-mounted photovoltaic systems are becoming more common. This proposed code change proposal is intended clarify that rooftop-mounted photovoltaic systems need to comply with building code requirements. The minimum requirements set forth here are intended for the rooftop-mounted photovoltaic system to be required to comply with the same minimum requirements of the underlying roof assembly.

Specific requirements applicable to the electrical portion of rooftop-mounted photovoltaic systems are left to the applicable electrical code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRAHAM-S8-1509.6 NEW

S29–09/10
1510.3

Proponent: Mike Ennis representing Single Ply Roofing Industry (SPRI, Inc.)

Revise as follows:

1510.3 Recovering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck where any of the following conditions occur:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1510.4.
3. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.
4. The application of a new single-ply membrane directly over an existing roofing system shall be permitted without tear-off of the existing roof coverings except where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing..

Reason: A layer of single-ply membrane is very lightweight, adding approximately 1/3 of a pound per square foot to the existing structure. The single-ply membrane can be used as a reflective layer to reduce rooftop temperatures, thus providing a cooling benefit for the building. The cooling benefits of reflective roof systems are recognized by the energy codes. This exception will allow for a cost effective method for increasing the energy efficiency of the building while providing excellent waterproofing protection. A single layer of membrane will also provide the same function and benefit as a new protective coating over an existing spray polyurethane foam roofing system, which is currently allowed as an exception under Section 1510.3, Exception 3.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Mark S. Graham, representing National Roofing Contractors Association (NRCA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1510.3 Recovering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck where any of the following conditions occur:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1510.4.
3. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.

4. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R907.3 Recovering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings where any of the following conditions exist:

1. Where the existing roof or roof covering is water-soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.
4. For asphalt shingles, when the building is located in an area subject to moderate or severe hail exposure according to Figure R903.5.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Installation of metal panel, metal shingle and concrete and clay tile roof coverings over existing wood shake roofs shall be permitted when the application is in accordance with Section R907.4.
3. The application of new protective coating over existing spray polyurethane foam roofing systems shall be permitted without tear-off of existing roof coverings.
4. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section R905.

Reason: In roof removal situations where an existing ice barrier membrane is adhered to the existing roof deck, it is oftentimes difficult, if not impossible, to remove the existing layer of adhered ice barrier membrane without damaging or replacing the roof deck.

The proposed addition of a new exception to Section 1510.3 (IRC Section R907.3)—Recovering Versus Replacement is intended to account for this situation by allowing existing adhered ice barrier membrane to remain in place and be covered with a new ice barrier membrane as required in Section 1507 (IRC Section R905), followed by the installation of the new primary roof covering material.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

ICCFILENAME: GRAHAM-S9-1510.3

S31–09/10
1602.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

VEHICLE BARRIER SYSTEM. A system of building components near open sides or walls of ~~a~~ garage floors or ramps ~~or building walls~~ that acts as a restraints ~~for~~ for vehicles.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LLSC-LL9, which was approved by the Live Load Subcommittee and is being balloted by the Main Committee (Item #5 of the Second Main Committee Ballot on Live/Dead Load Provisions). It is expected that the Main Committee will approve the proposal.

The revision to the definition of "vehicle barrier system" will more clearly convey the intent that the entire perimeter of a garage floor or ramp, not merely where there are open sides, is subject o the loading requirements for vehicle barrier systems. It will also avoid the interpretation that building walls, regardless of their proximity to garage floors or ramps, are subject to the same loading requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

LIVE LOAD~~S~~. ~~Those loads~~ A load produced by the use and occupancy of the building or other structure ~~and do~~ that does not include construction or environmental loads such as wind load, snow load, rain load, earthquake load, flood load or dead load.

LIVE LOAD~~S~~, ~~(ROOF)~~. ~~Those loads~~ A load on a roof produced (1) during maintenance by workers, equipment and materials; and ~~(2)~~ during the life of the structure by movable objects such as planters ~~and by people~~ or other similar small decorative appurtances that are not occupancy related; or (2) by the use and occupancy of the roof such as for roof gardens or assembly areas.

NOTATIONS.

D = Dead load.
E = Combined effect of horizontal and vertical earthquake induced forces as defined in Section 12.4.2 of ASCE 7.
F = Load due to fluids with well-defined pressures and maximum heights.
F_a = Flood load in accordance with Chapter 5 of ASCE 7.
H = Load due to lateral earth pressures, ground water pressure or pressure of bulk materials.
L = Roof live load greater than 20 psf (0.96 kN/m^2) and floor live load~~, except roof live load, including any permitted live load reduction~~.
L_r = Roof live load ~~including any permitted live load reduction~~ of 20 psf (0.96 kN/m^2) or less.
R = Rain load.
S = Snow load.
T = Self-straining force arising from contraction or expansion resulting from temperature change, shrinkage, moisture change, creep in component materials, movement due to differential settlement or combinations thereof.
W = Load due to wind pressure.

Reason: The purpose for this proposal is to revise the IBC for consistency with an ASCE 7 proposal being considered by the Live Load Subcommittee. The IBC currently treats floor and roof live loads synonymously. Table 1607.1 lists live loads as great as 100 psf for occupied areas of floors and roofs. Roof live load, however, also accounts for loads from maintenance workers. Item #30 of Table 1607.1 separately specifies a uniform load of 20 psf and a concentrated load of 300 lb. for this purpose.

The load combinations in Sections 1605.2 and 1605.3 should account for roof live loads at occupied areas in the same manner as for floor live loads. For strength design in Sec. 1605.2 (neglecting snow load and rain load), Equations 16-3 and 16-4 consider dead load, floor live load, roof live load and wind load. Earthquake load is not considered in combination with roof live load. For allowable stress design in Section 1605.3.1, however (neglecting earth/water pressure, fluid load, snow load and rain load), Equation 16-13 considers dead load, floor live load, roof live load, and wind or earthquake load. Thus, earthquake load is required to be considered in combination with roof live load for allowable stress design but not for strength design.

The proposal changes the notation for floor live load and roof live load by (1) assigning "L" to roof live load greater than 20 psf as well as to floor live load, and (2) assigning "L_r" to roof live load of 20 psf or less. This new boundary between "L" and "L_r" will distinguish between roof live loads intended for the general public ("L") and only for maintenance workers ("L_r").

A separate proposal splits ASD Equation 16-13 into two equations: 16-13 for wind load and 16-14 for earthquake load. This change in the ASD load combinations will make them equivalent to the LRFD load combinations with respect to their treatment of roof live load.

The proposal revises the definitions of "live load" and "live load, roof" for consistency with the corresponding definitions in ASCE 7 as modified by the proposal being considered by the ASCE 7 Live Load Subcommittee. Note that neither the IBC nor ASCE 7 define "floor live load" or utilize the term in their respective provisions. "Live load" in both documents is defined as a load "produced by the use and occupancy of the building or other structure," which can occur on roofs as readily as on floors.

The proposal deletes "including any permitted live load reduction" from the notation "L" and "L_r" in Section 1602.1 for consistency with the same notation in Section 2.2 of ASCE 7, which corresponds to IBC Section 1602.1. This has the added benefit of avoiding potential conflicts with the same notation defined differently in IBC Sections 1607.9.1 ("L") and 1607.11.2.1 ("L_r"), which is reproduced below. These sections define the notation as reduced live load and distinguish them from unreduced live load, L_o, which is tabulated in Table 1607.1. Similar definitions are found in Sections 4.7.1 and 4.8.1 of ASCE 7-10. Note that the addition of "roof" before "live load" in L_r below is in a separate proposal.

IBC Section 1607.9.1 (and Section 4.7.1 of ASCE 7-10):

L = Reduced design live load per square foot (meter) of area supported by the member.

L_o = Unreduced design live load per square foot (meter) of area supported by the member (see Table 1607.1).

IBC Section 1607.11.2.1 (and Section 4.8.1 of ASCE 7-10):

L_r = Reduced roof live load per square foot (m^2) of horizontal projection in pounds per square foot (kN/m^2).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S34-1602.1

S33–09/10

1603.1.3, 1603.1.4, 1603.1.5, 1705.3.4, 2304.6.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1603.1.3 Roof snow load <u>data</u>. The ground snow load, P_g, shall be indicated. In areas where the ground snow load, P_g, exceeds 10 pounds per square foot (psf) (0.479 kN/m^2), the following additional information shall also be provided, regardless of whether snow loads govern the design of the roof:

1. Flat-roof snow load, P_f.
2. Snow exposure factor, C_e.
3. Snow load importance factor, I_s.
4. Thermal factor, C_t.

1603.1.4 Wind design data. The following information related to wind loads shall be shown, regardless of whether wind loads govern the design of the lateral-force-resisting system of the building:

1. Basic wind speed (3-second gust), miles per hour (km/hr).
2. ~~Wind importance factor, *I*, and~~ Occupancy category.
3. Wind exposure; ~~if more than one wind exposure is utilized, the wind exposure and~~ applicable wind direction ~~shall be indicated~~ if more than one wind exposure is utilized.
4. ~~The~~ Applicable internal pressure coefficient.
5. ~~Components and cladding. The~~ Design wind pressures ~~in terms of psf (kN/m^2)~~ to be used for ~~the design of~~ exterior component and cladding materials not specifically designed by the registered design professional responsible for the design of the structure, psf (kN/m^2).

1603.1.5 Earthquake design data. The following information related to seismic loads shall be shown, regardless of whether seismic loads govern the design of the lateral-force-resisting system of the building:

1. ~~Seismic importance factor, *I*, and~~ Occupancy category.
2. Seismic importance factor, I_e.
3. ~~2~~ Mapped spectral response accelerations, S_S and S_1.
4. ~~3~~ Site class.
5. ~~4~~ Spectral response coefficients, S_{DS} and S_{D1}.
6. ~~5~~ Seismic design category.
7. ~~6~~ Basic seismic-force-resisting system(s).
8. ~~7~~ Design base shear(s).

~~8~~9. Seismic response coefficient(s), C_S.
~~9~~10. Response modification factor(s), *R*.
11. Location of base(s) as defined in Section 11.2 of ASCE 7.
~~10~~12. Analysis procedure used.

1705.3.4 Seismic Design Category D. The following additional systems and components in structures assigned to Seismic Design Category D:

1. Systems required for Seismic Design Category C.
2. Exterior wall panels and their anchorage.
3. Suspended ceiling systems and their anchorage.
4. Access floors and their anchorage.
5. Steel storage racks and their anchorage, where the importance factor, I_e, is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.

2304.6.1 Wood structural panel sheathing. Where wood structural panel sheathing is used as the exposed finish on the exterior of outside walls, it shall have an exterior exposure durability classification. Where wood structural panel sheathing is used elsewhere, but not as the exposed finish, it shall be of a type manufactured with exterior glue (Exposure 1 or Exterior). Wood structural panel wall sheathing or siding used as structural sheathing shall be capable of resisting wind pressures in accordance with Section 1609. Maximum wind speeds for wood structural panel sheathing used to resist wind pressures shall be in accordance with Table 2304.6.1 for enclosed buildings with a mean roof height not greater than 30 feet (9144 mm)~~, importance factor (I) of 1.0~~ and topographic factor (K_{zt}) of 1.0.

Reason: The purpose for the proposal is to update the required documentation of snow, wind and seismic design data with respect to the corresponding provisions in ASCE 7. The deletion of wind importance factor is due to ASCE 7 Proposal WSC-WL8-14, which has been approved by the Wind Subcommittee is being balloted by the Main Committee (Item #20 of the First Main Committee Ballot on Wind Load Provisions). It is expected that the Main Committee will approve the proposal. Adding the locations of the seismic base will add a design parameter that is critical to understanding the basis of the structural design. The remaining changes are editorial.

Changes are also being made to the symbols for importance factor in conjunction with ASCE 7 Proposal GPSC-3BR2, which was approved by the General Subcommittee on March 1, 2009 and is being balloted by the Main Committee (Item #14 of the Second Main Committee Ballot on General Requirements). It is expected that the Main Committee will approve the proposal. All instances of "importance factor" in the 2009 IBC are included in this proposal.

A separate proposal revises all instances of "occupancy category" in the IBC and IEBC to "risk category." These revisions are not repeated in this proposal but, should both proposals be approved by the membership, the proponent intends that "occupancy category" in Item #2 of Section 1603.1.4 and Item #1 of Section 1603.1.5 be changed to "risk category."

Cost Impact: The code change proposal will not increase the cost of construction.

1603.1.5

Proponent: Kevin Moore, PE, SE, SECB and Edwin Huston, PE, SE, SECB, representing National Council of Structural Engineers Associations

Revise as follows:

1603.1.5 Earthquake design data. The following information related to seismic design loads shall be shown, regardless of whether seismic loads govern the design of the lateral-force-resisting system of the building:

1. Seismic importance factor, *I*, and *occupancy category.*
2. Mapped spectral response accelerations, S_S and S_1.
3. *Site class.*
4. Spectral response coefficients, S_{DS} and S_{D1}.
5. *Seismic design category.*
6. Basic seismic-force-resisting system(s).
7. Design base shear.
8. Seismic response coefficient(s), C_S.
9. Response modification factor(s), *R*.
10. Analysis procedure used.

11. Applicable horizontal structural irregularities.
12. Applicable vertical structural irregularities.

Reason: Structural irregularities (defined in ASCE-7 section 12.3) can result in restrictions on building height, prohibition of certain configurations, increased design forces, additional analytical requirements, restriction of permissible analytical procedures, greater building separations, or additional detailing requirements for certain structural elements. It is often not evident whether one or more irregularities are applicable to a structure, because many of them require structural analysis to determine their applicability. This information is useful for building officials, plan checkers, peer reviewers, and for structural engineers in future building additions and/or alterations.

Cost Impact: This proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MOORE-HUSTON-S2-1603.1.5

S35–09/10
Table 1604.3

Proponent: Stephen Kerr, PE, SE, representing self

Revise as follows:

TABLE 1604.3
DEFLECTION LIMITS [a, b, c, h, i]

Construction	L	S or W [f]	D + L [d, g]
Roof members: [e]			
Supporting plaster or stucco ceiling	*l* / 360	*l* / 360	*l* / 240
Supporting nonplaster ceiling	*l* / 240	*l* / 240	*l* / 180
Not supporting ceiling	*l* / 180	*l* / 180	*l* / 120
Floor members	*l* / 360		*l* / 240
Exterior walls and interior partitions:			
With plaster or stucco finishes	-	*l* / 360	-
With other brittle finishes	-	*l* / 240	-
With flexible finishes	-	*l* / 120	-
Farm Buildings	-	-	*l* / 180
Greenhouses	-	-	*l* / 120

(Footnotes not shown, remain unchanged)

Reason: The proposal adds a new line item for the deflection limit on plaster or stucco finishes. The intent is to bring the Deflection Limits table into conformance with the IRC deflection table (Table R301.7) and the referenced ASTM standard. ASTM C926-98a Standard Specification for Application of Portland Cement-Based Plaster section Annex A2.1.6 states "Maximum allowable deflection for vertical or horizontal framing for plaster, not including cladding, shall be L/360."

Cost Impact: The code change proposal will not increase the cost of construction, because the defection limit is already required.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KERR-S1-TABLE 1604.3

S36–09/10
Table 1604.3

Proponent: Robert McCluer, RMC Code Consulting, representing the Metal Construction Association (MCA)

Revise as follows:

TABLE 1604.3
DEFLECTION LIMITS a, b, c, h, i, j
(No change to table entries.)

(No change to footnotes a through h)

i. Metal composite material panels shall be designed to have not more than *l*/180 permanent set deflection after the application of the design load.

~~i.~~ j. For cantilever members, *l* shall be taken as twice the length of the cantilever.

Reason: The purpose of this proposed code change is to provide a deflection limitation for metal composite material (MCM) panels.
Objectives of Deflection Limitation:
1. To assure structural integrity so that the panel system will remain on the building during design wind load conditions.
2. To assure that sealant joints do not fail due to movement of panels during design wind load conditions.
3. To assure that "permanent set" of panels is not visually objectionable after occurrence of design wind load conditions.

Rationale for L/180 Permanent Set Limitation:
1. The structural adequacy of the panel system to meet the design load and remain on the building will be verified by structural testing. Therefore, deflection limitation will not be a controlling factor in safety considerations (staying on the building).
2. The adequacy of the sealant joints will be verified by the appropriate Static Air Infiltration (ASTM E283) and Static Water Infiltration (ASTM E331) tests. Therefore, deflection limitation will not be a controlling factor in the ability of the panels to provide appropriate protection for wind and water penetration of the building.
3. Generally, the widest available Metal Composite Material panel is 60". Therefore, if L/180 permanent set limitation is maintained the largest deviation from absolute flatness will be 1/3 inch. On a 60" wide panel this is a very acceptable visual deviation after a very severe climatic wind condition. During more normal wind events, permanent set would not occur. The ability of the panel system to accommodate expansion and contraction due to thermal changes is a much more critical visual concern.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: MCCLUER-S1-T1604.3

S37–09/10
1604.3.6

Proponent: Stephen Kerr, PE, SE, representing self

Delete and substitute as follows:

~~**1604.3.6 Limits.** Deflection of structural members over span, *l*, shall not exceed that permitted by Table 1604.3.~~

1604.3.6 Limits. The deflection limits of Section 1604.3.1 shall be used unless more restrictive deflection limits are required in order to ensure adequate serviceability of the structural members and finish material.

Reason: The intent of this proposal is to address possible increased deflection requirements that may be necessary for certain finishes not specifically addressed in Table 1604.3. Where the manufacturer or association of a specific finish material has deflection requirements more restrictive than Table 1604.3 the designer should take into account possibly changing the deflection limit. While this proposal does not require the designer to adhere to industry standards not specifically referenced in IBC Chapter 35, it is intended to put the designer on notice of possible other criteria for determining deflection limits.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KERR-S2-1604.3.6

S38–09/10
1604.4

Proponent: Randy Lee Dube, Proprietor, representing Tor-Eggs-Tor Design Solutions

Revise as follows:

1604.4 Analysis. *Load effects* on structural members and their connections shall be determined by methods of structural analysis that take into account equilibrium, general stability, geometric compatibility and both short- and long-term material properties.

Members that tend to accumulate residual deformations under repeated service loads shall have included in their analysis the added eccentricities expected to occur during their service life.

Any system or method of construction to be used shall be based on a rational analysis in accordance with well-established principles of mechanics. Such analysis shall result in a system or combined systems that provides a complete load path or combination of load paths capable of transferring loads from their point or multiple points of origin to the load-resisting elements or load-resisting and load-redistributing elements.

The total lateral force shall be distributed to the various vertical elements of the lateral-force-resisting system in proportion to their rigidities, considering the rigidity of the horizontal bracing system or diaphragm. Rigid elements assumed not to be a part of the lateral-force-resisting system are permitted to be incorporated into buildings provided their effect on the action of the system is considered and provided for in the design. Except where diaphragms are flexible, or are permitted to be analyzed as flexible, provisions shall be made for the increased forces induced on resisting elements of the structural system resulting from torsion due to eccentricity between the center of application of the lateral forces and the center of rigidity of the lateral-force-resisting system.

Every structure shall be designed to resist the overturning effects caused by the lateral forces specified in this chapter. See Section 1609 for wind loads, Section 1610 for lateral soil loads and Section 1613 for earthquake loads.

Reason: ICC recognition, authority, enforcement of recently successfully developed (2005-2007) structural body-frame continuous reinforcing method and related structural design, assembly, and performance elements; and design & assembly criteria. (New reinforcing & structural body-frame systems currently not authorized to construction industry by IBC section 1604.4, Par 3 , Sentence 2.)

Cost Impact: Reduces new building/structure reinforcing methods costs; various cost impacts in other applications.

ICCFILENAME: DUBE-S1-1604.4

S39–09/10
Table 1604.5

Proponent: David R. Badger PE, CBO, Virginia Tech, representing self.

Revise as follows:

TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: • Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. • Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250. ~~• Buildings and other structures containing adult education facilities, such as colleges and universities, with an occupant load greater than 500.~~ • Buildings and other structures used for the education of adults who are either above the 12th grade or not in a formal educational system; where the teaching is done in classroom settings with an occupant load density equal to or greater than that required for educational classroom areas per Table 1004.1.1; and the aggregate occupant load of all classrooms exceeds 500. • Group I-2 occupancies with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities. • Group I-3 occupancies. • Any other occupancy with an occupant load greater than 5,000[a]. • Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Occupancy Category IV. • Buildings and other structures not included in Occupancy Category IV containing sufficient quantities of toxic or ex-plosive substances to be dangerous to the public if released.

(Portions of table not shown do not change)
(No change to footnote)

Reason: The general language of 1604.5 is ambiguous and misleading. This problem is well recognized, and there have been several proposals to rewrite major portions of this in recent code change cycles. Although a general overhaul of this section is needed, there is a specific problem that needs to be addressed immediately. There is one phrase in Table 1604.5 that is routinely being misinterpreted, resulting in hidden costs which are extremely high, and completely unnecessary. It is a problem primarily for colleges and universities, has been a problem for many years, and must be corrected.

Under 1604.5 the phrase "*Buildings and other structures containing adult education facilities, such as colleges and universities*" is very easily interpreted to require any building on a college or university campus with an occupant load over 500 to be classified as Occupancy Category III, regardless of use. The phrase is so poorly written, it is difficult to not read it this way. The perceived connection to "adult education facilities"

occurs simply because the building is located on a college or university campus; not because there is an educational function occurring within the building.

For example, a research laboratory building with 600 occupants located in an industrial research park clearly would be classified under Occupancy Category II. If the exact same building was placed on a university campus, the Occupancy Category should not change. But in fact, many design professionals and code officials would classify the building as Category III since it now sits on campus. A check of several local structural engineering firms confirmed that every one of them interprets 1604.5 as requiring an Occupancy Category III for any building on campus with an occupant load greater than 500. This is very likely occurring on a national level as well. But this is not the intent of 1604.5.

Occupancy Category III addresses the extra risk associated with the presence of a large number of occupants concentrated in small areas, such as classrooms or lecture halls. There is nothing special about the act of teaching that warrants a Category III classification. The only reason it is referenced in 1604.5 is that teaching is usually done in groups, and it is the people in those groups to be protected. University laboratory and office buildings, with no classrooms, should not be subject to the 500 occupant threshold. The occupant load threshold for a Category III classification for a lab building is 5,000 occupants, not 500. Classification is a function of the building occupancy and not the property upon which the building sits. The proposed new language clarifies the intent of the current regulation in three ways.

It emphasizes that it is the specific use of the building to be evaluated. Reference is made to both higher education, and a catch-all for any other adult educational building, to ensure that a broad scope of coverage is established.

Since the IBC does not define a "classroom," the proposed change uses the basis for occupant load calculations as a handle to indentify spaces to be included in the analysis. Classrooms are calculated at 20 SF per person and this sets the benchmark for "high" occupant densities. Educational spaces with "low" densities such as teaching labs and vocational areas, at 50 SF per person, would not be included in the analysis. There are non-educational uses identified in Table 1004.1.1 which are also at 50 SF per person, and these are not subject to the 500 occupant threshold. Therefore, if the principle is to be applied consistently, this threshold should not apply to low density educational occupancies. Spaces with densities higher than a classroom will normally be classified as assembly space, but it's possible that a classroom could have a density greater than 20, so this potential is also addressed with the phrase "or greater than."

Since the specific risk being addressed occurs only in the classrooms, it is appropriate to use the summation of the occupant loads of just these rooms as the basis for the analysis, and not the total building occupant load. The limit should apply to those people associated with the higher risk, and should not include other general occupants of the building.

Cost Impact: The change would result in a major savings by minimizing the probability of future misapplication of this section. The cost from this problem isn't immediately apparent; it is buried in the structural engineer's calculations and the resulting overdesign. A recent project cost analysis for a 54,000 square foot laboratory building identified a **$1.2 million savings** ($22.71 / gsf) by changing the Occupancy Category from III to II, as shown in the following.

VBI III Conceptual Estimate on Cost Premium for Category III Construction vs Category II

Description	Qty		Unit Cost		Total	Comments
Increase concrete reinforcing by 40%	147	ton	$ 2,500	/ton	$ 367,000	
Increase perimeter beam size by 20%	28	cyd	$ 1,200	/cyd	$ 33,333	
Increase for pre-cast concrete panel	10,056	sf	$ 4.00	/sf	$ 40,224	
Increase CMU wall reinforcing by 30%	2.93	ton	$ 2,500	/ton	$ 7,313	
Increase grout fill by 30%	88	cyd	$ 175	/cyd	$ 15,381	
Increase for Hokie Stone connections	13,600	sf	$ 10.00	/sf	$ 136,000	
Impact on roof screen	150.00	ton	$ 4,000	/ton	$ 400,000	
Increase for metal panel connections	1,103	sf	$ 3.00	/sf	$ 3,309	
Impact on curtain wall due to wind loading increase	15,935	sf	$ 5.00	/sf	$ 79,675	
Impact on acoustical ceiling supports	23,970	sf	$ 1.50	/sf	$ 35,955	
Impact on elevators and shaft						Possibility?
Impact on MEP for seismic supports	54,000	sf	$ 2.00	/sf	$ 108,000	Equipment associated changes need further discussion
					$1,226,190	
					$ 22.71	/gsf

$1.2 million was saved on just one building. Given how prevalent this misinterpretation is likely being made on colleges and universities nationwide, the net potential savings by correcting the problem is enormous.

Revise as follows:

TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300 Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250 . Buildings and other structures containing adult education facilities, such as colleges and universities, with an occupant load greater than 500 . Group I-2 occupancies with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities . Group I-3 occupancies Any other occupancy with an occupant load greater than 5,000 [a] . Power-generating stations, water treatment for potable water, waste water treatment facilities and other public utility facilities not included in Occupancy Category IV . Buildings and other structures not included in Occupancy Category IV containing ~~sufficient~~ quantities of toxic or explosive ~~substances~~ materials that: Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code*; and Are sufficient to ~~be dangerous~~ pose a threat to the public if released [b]
IV	Buildings and other structures designated as essential facilities, including but not limited to: . Group I-2 occupancies having surgery or emergency treatment facilities . Fire, rescue, ambulance and police stations and emergency vehicle garages . Designated earthquake, hurricane or other emergency shelters . Designated emergency preparedness, communications, and operations centers and other facilities required for emergency response . Power-generating stations and other public utility facilities required as emergency backup facilities for Occupancy Category IV structures . Buildings and other structures containing quantities of highly toxic materials ~~as defined by Section 307 where the quantity of the material~~ that: Exceed~~s the~~ maximum allowable quantities ~~of~~ per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code*; and Are sufficient to pose a threat to the public if released [b] . Aviation control towers, air traffic control centers and emergency aircraft hangars . Buildings and other structures having critical national defense functions . Water storage facilities and pump structures required to maintain water pressure for fire suppression

(Portions of table not shown remain unchanged))

(No change to footnote a)

b. Where approved the building official, the classification of buildings and other structures as Occupancy Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Occupancy Category II, provided it can be demonstrated by a hazard assessment in accordance with Section 1.5.2 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

1705.3.3 Seismic Design Category C. The following additional systems and components in structures assigned to Seismic Design Category C:

1. ~~Heating, ventilating and air-conditioning (HVAC)~~ Ductwork ~~containing~~ designed to carry hazardous materials and anchorage of such ductwork.
2. Piping systems ~~and mechanical units containing flammable, combustible or highly toxic~~ designed to carry hazardous materials and their associated mechanical units.
3. Anchorage of electrical equipment used for emergency or standby power systems.

1707.7 Mechanical and electrical components. Special inspection for mechanical and electrical equipment shall be as follows:

1. Periodic special inspection is required during the anchorage of electrical equipment for emergency or standby power systems in structures assigned to Seismic Design Category C, D, E or F;
2. Periodic special inspection is required during the ~~installation of~~ anchorage of other electrical equipment in structures assigned to Seismic Design Category E or F;
3. Periodic special inspection is required during the installation and anchorage of piping systems ~~intended~~ designed to carry ~~flammable, combustible or highly toxic contents~~ hazardous materials and their associated mechanical units in structures assigned to Seismic Design Category C, D, E or F;
4. Periodic special inspection is required during the installation and anchorage of ~~HVAC~~ ductwork ~~that will contain~~ designed to carry hazardous materials in structures assigned to Seismic Design Category C, D, E or F; and
5. Periodic special inspection is required during the installation and anchorage of vibration isolation systems in structures assigned to Seismic Design Category C, D, E or F where the construction documents require a nominal clearance of 1/4 inch (6.4 mm) or less between the equipment support frame and restraint.

Reason: The purpose for this proposal is to clarify the determination of occupancy category and the requirements for special inspection where hazardous materials are present. It was prepared in conjunction with ASCE 7 Proposal GPSC-5R2, which was approved by the General Subcommittee on March 1, 2009 and is being balloted by the Main Committee (Second Main Committee Ballot on General Requirements). It is expected that the Main Committee will approve the proposal.

Table 1604.5 currently classifies buildings and other structures containing certain quantities of toxic, highly toxic or explosive materials as Occupancy Category III or IV. The Category III classification applies to toxic and explosive materials and the threshold for the classification is subjective: quantities sufficient to be dangerous to the public if released. The Category IV classification applies to highly toxic materials and the threshold is objective: quantities exceeding the maximum allowable quantities of Table 307.1(2). Table 307.1(2) specifies maximum allowable quantities per control area for hazardous materials posing a health hazard.

Explosive materials are classified as posing a "physical hazard." Toxic and highly toxic materials are classified as posing a "health hazard." Materials that pose a physical hazard or a health hazard are classified as "hazardous materials." Refer to IBC Section 307.2 and IFC Section 2702.1 for definitions of these terms. The maximum quantities per control area are given in IBC Table 307.1(1) and IFC Table 2703.1.1(1) for hazardous materials posing a physical hazard and IBC Table 307.1(2) and IFC Table 2703.1.1(2) for hazardous materials posing a health hazard. The maximum quantities per outdoor control area are given in IFC Table 2703.1.1(3) for hazardous materials posing a physical hazard and IFC Table 2703.1.1(4) for hazardous materials posing a health hazard,.

A "control area" is defined in Section 307.2 as a space "within a building where quantities of hazardous materials not exceeding the maximum allowable quantities per control area are stored, used or handled." The effect of this definition on a Category IV classification is that it is limited to quantities of highly toxic materials within buildings. Not considered in the classification are quantities per "outdoor control area," which is defined in Section 2702.1 of the *International Fire Code* (IFC) as "an outdoor area that contains hazardous materials in amounts not exceeding the maximum allowable quantities of (IFC) Table 2703.1.1(3) (e.g., explosive materials) or Table 2703.1.1(4) (e.g., toxic and highly toxic materials)."

The intent in classifying buildings and other structures containing certain quantities of toxic, highly toxic or explosive materials as Occupancy Category III or IV is to reduce the potential for catastrophic release of these hazardous materials resulting from the failure of a building or structure (or a component conveying or supporting the materials and supported by a building or structure) to resist the structural demands of a design event, such as an earthquake. The required classification is limited to toxic, highly toxic and explosive materials because they pose the most serious threat to the general public if released. The threat being addressed is related to large-scale impacts on the general public, which can be characterized as global (e.g., beyond the boundaries of the site where the building or structure is located) rather than local (e.g., within those same boundaries).

Table 1604.5 currently classifies the building or structure as Occupancy Category III based on a subjective threshold but as Occupancy Category IV based on an objective threshold. This proposal revises the thresholds for both classifications so that two conditions are met for classification as Occupancy Category III or IV and they are summarized below. These revised thresholds are more consistent with the global threat discussed above. Similar thresholds are found in Table 1-1 of ASCE 7-10.

1.The quantities exceed maximum allowable quantities per control area within buildings or structures or per outdoor control area for outdoor areas; and

2. The quantities are sufficient to pose a threat to the public if released.

The first condition has the effect of exempting buildings or portions thereof from being classified as Occupancy Category III or IV except where they are classified as Group H. Where the quantities of hazardous materials in the control areas of a building or portion thereof are less than the maximum allowable quantities per control area, the occupancy classifications without considering the presence of hazardous materials are not affected by their presence. The first condition has the effect of exempting such buildings or portions thereof because the small quantities of hazardous materials permitted in occupancies other than Group H do not generally pose a global threat.

The second condition is subjective but the global threat posed by toxic, highly toxic and explosive materials is not easily quantified. Footnote (b) is added to Table 1604.5 permitting classification as Occupancy Category II for a building or structure otherwise classified as Occupancy Category III or IV, provided a hazard assessment in accordance with Section 1.5.2 of ASCE 7 is performed and it is demonstrated that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public. Refer to Section 1.5.2 and Commentary Section C1.5.2 of ASCE 7 for further information.

In Table 1604.5, a reference to IBC Table 307.1(1) is specified as well as Table 307.1(2). This is because explosive materials pose a physical hazard as discussed above but toxic and highly toxic materials pose a health hazard.

Also in Table 1604.5, maximum allowable quantities per outdoor control area are specified as well as maximum allowable quantities per control area. Hazardous materials pose physical or health hazards not only from being located in buildings but also from being located in structures not

generally considered as buildings, such as tanks, towers, bins, hoppers, silos and similar structures. ASCE 7-10 distinguishes between "building structures" (e.g., buildings) and "nonbuilding structures." Refer to Chapter 11 of ASCE 7-10 for definitions of these terms.

In conjunction with Chapter 13 of ASCE 7-10 and the revisions to Table 1604.5 in this proposal, Sections 1705.3.3 and 1707.7 are also revised. All instances of terms related to hazardous materials in the structural chapters (Chapter 16 through 23) in the 2009 IBC are found in these sections. In Item #1 of Section 1705.3.3 and Item #4 of Section 1707.7, "HVAC" is deleted because HVAC ducts typically convey environmental air, not hazardous materials. At items in both sections, the change to "designed to carry" is for consistency with Chapter 13 of ASCE 7-10. The other revisions are either editorial or are intended to make the intent more clear.

Although Section 1705.3.3 is being modified in this proposal, the deletion of this section is the subject of a separate proposal. Should both proposals be approved by the ICC membership, it is not the intent of the proponent to retain Section 1705.3.3 in the 2012 IBC for the purpose of modifying the section in accordance with this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IBC STRUCTURAL

Revise as follows:

SECTION 202
DEFINITIONS

~~**OCCUPANCY**~~ **RISK CATEGORY**. See Section 1602.1.

403.2.3 Structural integrity of exit enclosures and elevator hoistway enclosures. For high-rise buildings of ~~occupancy~~ Risk Category III or IV in accordance with Section 1604.5, and for all buildings that are more than 420 feet (128 000 mm) in building height, exit enclosures and elevator hoistway enclosures shall comply with Sections 403.2.3.1 through 403.2.3.4.

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

~~**OCCUPANCY**~~ **RISK CATEGORY**. A category used to determine structural requirements based on occupancy.

1603.1.4 Wind design data. The following information related to wind loads shall be shown, regardless of whether wind loads govern the design of the lateral-force-resisting system of the building:

1. Basic wind speed (3-second gust), miles per hour (km/hr).
2. Wind importance factor, *I*, and ~~occupancy~~ risk category.
3. Wind exposure. Where more than one wind exposure is utilized, the wind exposure and applicable wind direction shall be indicated.
4. The applicable internal pressure coefficient.
5. Components and cladding. The design wind pressures in terms of psf (kN/m^2) to be used for the design of exterior component and cladding materials not specifically designed by the registered design professional.

1603.1.5 Earthquake design data. The following information related to seismic loads shall be shown, regardless of whether seismic loads govern the design of the lateral-force-resisting system of the building:

1. Seismic importance factor, *I*, and ~~occupancy~~ risk category.
2. Mapped spectral response accelerations, S_S and S_1.
3. Site class.
4. Spectral response coefficients, S_{DS} and S_{D1}.
5. Seismic design category.
6. Basic seismic-force-resisting system(s).
7. Design base shear.
8. Seismic response coefficient(s), C_S.
9. Response modification factor(s), *R*.
10. Analysis procedure used.

1604.5 ~~Occupancy~~ Risk Category. Each building and structure shall be assigned ~~an occupancy~~ a risk category in accordance with Table 1604.5. Where a referenced standard specifies an occupancy category, the risk category shall not be taken as lower than the occupancy category specified therein.

TABLE 1604.5
~~OCCUPANCY~~ RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

~~OCCUPANCY~~ RISK CATEGORY	NATURE OF OCCUPANCY
II	Buildings and other structures except those listed in ~~Occupancy~~ Risk Categories I, III and IV.
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300 Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250 . Buildings and other structures containing adult education facilities, such as colleges and universities, with an occupant load greater than 500 . Group I-2 occupancies with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities . Group I-3 occupancies Any other occupancy with an occupant load greater than 5,000 [a] . Power-generating stations, water treatment for potable water, waste water treatment facilities and other public utility facilities not included in ~~Occupancy~~ Risk Category IV . Buildings and other structures not included in ~~Occupancy~~ Risk Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released
IV	Buildings and other structures designated as essential facilities, including but not limited to: . Group I-2 occupancies having surgery or emergency treatment facilities . Fire, rescue, ambulance and police stations and emergency vehicle garages . Designated earthquake, hurricane or other emergency shelters . Designated emergency preparedness, communications, and operations centers and other facilities required for emergency response . Power-generating stations and other public utility facilities required as emergency backup facilities for ~~Occupancy~~ Risk Category IV structures . Structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.1(2) . Aviation control towers, air traffic control centers and emergency aircraft hangars . Buildings and other structures having critical national defense functions . Water storage facilities and pump structures required to maintain water pressure for fire suppression

(Portions of table not shown, remain unchanged)

1604.5.1 Multiple occupancies. Where a building or structure is occupied by two or more occupancies not included in the same ~~occupancy~~ risk category, it shall be assigned the classification of the highest ~~occupancy~~ risk category corresponding to the various occupancies. Where buildings or structures have two or more portions that are structurally separated, each portion shall be separately classified. Where a separated portion of a building or structure provides required access to, required egress from or shares life safety components with another portion having a higher ~~occupancy~~ risk category, both portions shall be assigned to the higher ~~occupancy~~ risk category.

1609.1.2 Protection of openings. In wind-borne debris regions, glazing in buildings shall be impact-resistant or protected with an impact-resistant covering meeting the requirements of an approved impact-resisting standard or ASTM E 1996 and ASTM E 1886 referenced herein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the Large Missile Test of ASTM E 1996.
2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the Small Missile Test of ASTM E 1996.

Exceptions:

1. Wood structural panels with a minimum thickness of 7/16 inch (11.1 mm) and maximum panel span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings classified as Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding loads determined in accordance with the provisions of ASCE 7, with corrosion-resistant attachment hardware provided anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 with corrosion-resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of 45 feet (13 716 mm) or less where wind speeds do not exceed 140 mph (63 m/s).
2. Glazing in ~~Occupancy~~ Risk Category I buildings as defined in Table 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in ~~Occupancy~~ Risk Category II, III or IV buildings located over 60 feet (18,288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected.

1613.2 Definitions. The following words and terms shall, for the purposes of this section, have the meanings shown herein.

SEISMIC DESIGN CATEGORY. A classification assigned to a structure based on its ~~occupancy~~ risk category and the severity of the design earthquake ground motion at the site.

1613.5.6 Determination of seismic design category. Structures classified as ~~Occupancy~~ Risk Category I, II or III that are located where the mapped spectral response acceleration parameter at 1-second period, S_1, is greater than or equal to 0.75 shall be assigned to Seismic Design Category E. Structures classified as ~~Occupancy~~ Risk Category IV that are located where the mapped spectral response acceleration parameter at 1-second period, S_1, is greater than or equal to 0.75 shall be assigned to Seismic Design Category F. All other structures shall be assigned to a seismic design category based on their ~~occupancy~~ risk category and the design spectral response acceleration coefficients, S_{DS} and S_{D1}, determined in accordance with Section 1613.5.4 or the site-specific procedures of ASCE 7. Each building and structure shall be assigned to the more severe seismic design category in accordance with Table 1613.5.6(1) or 1613.5.6(2), irrespective of the fundamental period of vibration of the structure, T.

TABLE 1613.5.6(1)
SEISMIC DESIGN CATEGORY BASED ON SHORT-PERIOD RESPONSE ACCELERATIONS

$0.133g \le S_{D1} < 0.20g$	C	C	D
$0.20g \le S_{D1}$	D	D	D

1614.1 General. Buildings classified as high-rise buildings in accordance with Section 403 and assigned to ~~Occupancy~~ Risk Category III, or IV shall comply with the requirements of this section. Frame structures shall comply with the requirements of Section 1614.3. Bearing wall structures shall comply with the requirements of Section 1614.4.

1704.5 Masonry construction. Masonry construction shall be inspected and verified in accordance with the requirements of Sections 1704.5.1 through 1704.5.3, depending on the ~~occupancy~~ risk of the building or structure.

Exception: Special inspections shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 6 or 7 of TMS 402/ACI 530/ASCE 5, respectively, when they are part of structures classified as ~~Occupancy~~ Risk Category I, II or III in accordance with Section 1604.5.
2. Masonry foundation walls constructed in accordance with Table 1807.1.6.3(1), 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.

1704.5.1 Empirically designed masonry, glass unit masonry and masonry veneer in ~~Occupancy~~ Risk Category IV. The minimum special inspection program for empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 6 or 7 of TMS 402/ACI 530/ASCE 5, respectively, in structures classified as ~~Occupancy~~ Risk Category IV, in accordance with Section 1604.5, shall comply with Table 1704.5.1.

1704.5.2 Engineered masonry in ~~Occupancy~~ Risk Category I, II or III. The minimum special inspection programfor masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of TMS 402/ACI 530/ASCE 5, in structures classified as ~~Occupancy~~ Risk Category I, II or III, in accordance with Section 1604.5, shall comply with Table 1704.5.1.

1704.5.3 Engineered masonry in ~~Occupancy~~ Risk Category IV. The minimum special inspection program for masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of TMS 402/ACI 530/ASCE 5, in structures classified as ~~Occupancy~~ Risk Category IV, in accordance with Section 1604.5, shall comply with Table 1704.5.3.

1710.2 Structural observations for seismic resistance. Structural observations shall be provided for those structures assigned to Seismic Design Category D, E or F, as determined in Section 1613, where one or more of the following conditions exist:

1. The structure is classified as ~~Occupancy~~ Risk Category III or IV in accordance with Section 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base.
3. The structure is assigned to Seismic Design Category E, is classified as ~~Occupancy~~ Risk Category I or II in accordance with Section 1604.5 and is greater than two stories above grade plane.
4. When so designated by the registered design professional responsible for the structural design.
5. When such observation is specifically required by the building official.

1710.3 Structural observations for wind requirements. Structural observations shall be provided for those structures sited where the basic wind speed exceeds 110 mph (49 m/sec), determined from Figure 1609, where one or more of the following conditions exist:

1. The structure is classified as ~~Occupancy~~ Risk Category III or IV in accordance with Table 1604.5.
2. The building height of the structure is greater than 75 feet (22 860 mm).
3. When so designated by the registered design professional responsible for the structural design,

4. When such observation is specifically required by the building official.

1809.5 Frost protection. Except where otherwise protected from frost, foundations and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods:

1. Extending below the frost line of the locality;
2. Constructing in accordance with ASCE-32; or
3. Erecting on solid rock.

   Exception: Free-standing buildings meeting all of the following conditions shall not be required to be protected:

   1. Assigned to ~~Occupancy~~ Risk Category I, in accordance with Section 1604.5;
   2. Area of 600 square feet (56 m^2) or less for light-frame construction or 400 square feet (37 m^2) or less for other than light-frame construction; and
   3. Eave height of 10 feet (3048 mm) or less.

Shallow foundations shall not bear on frozen soil unless such frozen condition is of a permanent character.

2109.1.1 Limitations. The use of empirical design of masonry walls shall be limited as noted in Section 5.1.2 of TMS 402/ACI 530/ASCE 5. The use of dry-stacked surface-bonded masonry shall be prohibited in ~~Occupancy~~ Risk Category IV structures. In buildings that exceed one or more of the limitations of Section 5.1.2 of TMS 402/ACI 530/ASCE 5, masonry shall be designed in accordance with the engineered design provisions of Section 2101.2.1, 2101.2.2, or 2101.2.3 or the foundation wall provisions of Section 1807.1.5.

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of conventional light-frame construction, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

1. Buildings shall be limited to a maximum of three stories above grade plane. For the purposes of this section, for buildings in Seismic Design Category D or E as determined in Section 1613, cripple stud walls shall be considered to be a story.

   Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a story.

2. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches (3531 mm). Bearing wall height shall not exceed a stud height of 10 feet (3048 mm).
3. Loads as determined in Chapter 16 shall not exceed the following:
   3.1. Average dead loads shall not exceed 15 psf (718 N/m^2) for combined roof and ceiling, exterior walls, floors and partitions.

   Exceptions:

   1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m^2) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.
   2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.

   3.2. Live loads shall not exceed 40 psf (1916 N/m^2) for floors.
   3.3. Ground snow loads shall not exceed 50 psf (2395 N/m^2).
4. Wind speeds shall not exceed 100 miles per hour (mph) (44 m/s) (3-second gust).

   Exception: Wind speeds shall not exceed 110 mph (48.4 m/s) 3-second gust for buildings in Exposure Category B that are not located in a hurricane prone region.

5. Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.
6. The use of the provisions for conventional light-frame construction in this section shall not be permitted for ~~Occupancy~~ Risk Category IV buildings assigned to Seismic Design Category B, C, D, E or F, as determined in Section 1613.

7. Conventional light-frame construction is limited in irregular structures in Seismic Design Category D or E, as specified in Section 2308.12.6.

3408.4 Change of occupancy. When a change of occupancy results in a structure being reclassified to a higher ~~occupancy~~ risk category, the structure shall conform to the seismic requirements for a new structure of the higher ~~occupancy~~ risk category. Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.

Exceptions:

1. Specific seismic detailing requirements of this code or Section 1613 for a new structure shall not be required to be met where it can be shown that the level of performance and seismic safety is equivalent to that of a new structure. Such analysis shall consider the regularity, overstrength, redundancy and ductility of the structure within the context of the existing and retrofit (if any) detailing provided.
2. When a change of use results in a structure being reclassified from ~~Occupancy~~ Risk Category I or II to ~~Occupancy~~ Risk Category III and the structure is located in a seismic map area where $S_{DS} < 0.33$, compliance with the seismic requirements of this code and Section 1613 are not required.

PART II- IEBC

TABLE 101.5.4.1
PERFORMANCE CRITERIA FOR IBC LEVEL SEISMIC FORCES

~~OCCUPANCY~~ RISK CATEGORY (BASED ON IBC TABLE 1604.5)	PERFORMANCE LEVEL FOR USE WITH ASCE 41 BSE-1 EARTHQUAKE HAZARD LEVEL	PERFORMANCE LEVEL FOR USE WITH ASCE 41 BSE-2 EARTHQUAKE HAZARD LEVEL
I	Life safety (LS)	Collapse Prevention (CP)
II	Life safety (LS)	Collapse Prevention (CP)
III	Note a	Note a
IV	Immediate Occupancy (IO)	Life safety (LS)

a. Acceptance criteria for ~~Occupancy~~ Risk Category III shall be taken as 80 percent of the acceptance criteria specified for ~~Occupancy~~ Risk Category II performance levels, but need not be less than the acceptance criteria specified for ~~Occupancy~~ Risk Category IV performance levels.

101.5.4.2 Compliance with reduced IBC level seismic forces. Where seismic evaluation and design is permitted to meet reduced *International Building Code* seismic force levels, the procedures used shall be in accordance with one of the following:

1. The *International Building Code* using 75 percent of the prescribed forces. Values of R, Ω_0 and C_d used for analysis shall be as specified in Section 101.5.4.1 of this code.
2. Structures or portions of structures that comply with the requirements of the applicable chapter in Appendix A as specified in Items 2.1 through 2.5 shall be deemed to comply with this section.
   2.1. The seismic evaluation and design of unreinforced masonry bearing wall buildings in ~~Occupancy~~ Risk Category I or II are permitted to be based on the procedures specified in Appendix Chapter A1.
   2.2. Seismic evaluation and design of the wall anchorage system in reinforced concrete and reinforced masonry wall buildings with flexible diaphragms in ~~Occupancy~~ Risk Category I or II are permitted to be based on the procedures specified in Appendix Chapter A2.
   2.3. Seismic evaluation and design of cripple walls and sill plate anchorage in residential buildings of light-frame wood construction in ~~Occupancy~~ Risk Category I or II are permitted to be based on the procedures specified in Chapter A3.
   2.4. Seismic evaluation and design of soft, weak, or open-front wall conditions in multiunit residential buildings of wood construction in ~~Occupancy~~ Risk Category I or II are permitted to be based on the procedures specified in Chapter A4.
   2.5. Seismic evaluation and design of concrete buildings in all ~~occupancy~~ risk categories are permitted to be based on the procedures specified in Chapter A5.
3. Compliance with ASCE 31 based on the applicable performance level as shown in Table 101.5.4.2. It shall be permitted to use the BSE-1 earthquake hazard level as defined in ASCE 41 and subject to the limitations in Item 4 below.
4. Compliance with ASCE 41 using the BSE-1 Earthquake Hazard Level and the performance level shown in Table 101.5.4.2. The design spectral response acceleration parameters S_{XS} and S_{X1} specified in ASCE 41

shall not be taken less than seventy-five percent of the respective design spectral response acceleration parameters S_{DS} and S_{D1} defined by the *International Building Code*.

TABLE 101.5.4.2
PERFORMANCE CRITERIA FOR REDUCED IBC LEVEL SEISMIC FORCES

~~OCCUPANCY~~ RISK CATEGORY (BASED ON IBC TABLE 1604.5)	PERFORMANCE LEVEL FOR USE WITH ASCE 31	PERFORMANCE LEVEL FOR USE WITH ASCE 41 BSE-1 EARTHQUAKE HAZARD LEVEL
I	Life safety (LS)	Life safety (LS)
II	Life safety (LS)	Life safety (LS)
III	Note a	Note a
IV	Immediate Occupancy (IO)	Immediate Occupancy (IO)

a. Acceptance criteria for ~~Occupancy~~ Risk Category III shall be taken as 80 percent of the acceptance criteria specified for ~~Occupancy~~ Risk Category II performance levels, but need not be less than the acceptance criteria specified for ~~Occupancy~~ Risk Category IV performance levels.
b. For ~~Occupancy~~ Risk Category III, the ASCE 31 screening phase checklists shall be based on the life safety performance level.

[B] 307.4 Structural. When a *change of occupancy* results in a structure being reclassified to a higher ~~occupancy~~ risk category, the structure shall conform to the seismic requirements for a new structure of the higher ~~occupancy~~ risk category. Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.

Exceptions:

1. Specific seismic detailing requirements of this code or ASCE 7 for a new structure shall not be required to be met where it can be shown that the level of performance and seismic safety is equivalent to that of a new structure. Such analysis shall consider the regularity, overstrength, redundancy and ductility of the structure within the context of the existing and retrofit (if any) detailing provided.
2. When a change of use results in a structure being reclassified from ~~Occupancy~~ Risk Category I or II to ~~Occupancy~~ Risk Category III and the structure is located in a seismic map area where $S_{DS} < 0.33$, compliance with the seismic requirements of this code and Section 1613 of the *International Building Code* are not required.

907.3.1 Compliance with the *International Building Code* level seismic forces. Where a building or portion thereof is subject to a change of occupancy that results in the building being assigned to a higher ~~occupancy~~ risk category based on Table 1604.5 of the *International Building Code*; or where such change of occupancy results in a reclassification of a building to a higher hazard category as shown in Table 912.4; or where a change of a Group M occupancy to a Group A, E, I-1 R-1, R-2 or R-4 occupancy with two-thirds or more of the floors involved in Level 3 alteration work, the building shall comply with the requirements for *International Building Code* level seismic forces as specified in Section 101.5.4.1 for the new ~~occupancy~~ risk category.

Exceptions:

1. Group M occupancies being changed to Group A, E, I-1, R-1, R-2 or R-4 occupancies for buildings less than six stories in height and in Seismic Design Category A, B or C.
2. Where approved by the code official, specific detailing provisions required for a new structure are not required to be met where it can be shown that an equivalent level of performance and seismic safety is obtained for the applicable ~~occupancy~~ risk category based on the provision for reduced *International Building Code* level seismic forces as specified in Section 101.5.4.2.
3. Where the area of the new occupancy with a higher hazard category is less than or equal to 10 percent of the total building floor area and the new occupancy is not classified as ~~Occupancy~~ Risk Category IV. For the purposes of this exception, buildings occupied by two or more occupancies not included in the same ~~occupancy~~ risk category shall be subject to the provisions of Section 1604.5.1 of the *International Building Code*. The cumulative effect of the area of occupancy changes shall be considered for the purposes of this exception.
4. Unreinforced masonry bearing wall buildings in ~~Occupancy~~ Risk Category III when assigned to Seismic Design Category A or B shall be allowed to be strengthened to meet the requirements of Appendix Chapter A1 of this code [*Guidelines for the Seismic Retrofit of Existing Buildings* (GSREB)].

907.3.2 Access to ~~Occupancy~~ Risk Category IV. Where a change of occupancy is such that compliance with Section 907.3.1 is required and the building is assigned to ~~Occupancy~~ Risk Category IV, the operational access to the building shall not be through an adjacent structure unless the adjacent structure conforms to the requirements for ~~Occupancy~~ Risk Category IV structures. Where operational access is less than 10 feet (3048 mm) from either an interior lot line or from another structure, access protection from potential falling debris shall be provided by the owner of the ~~Occupancy~~ Risk Category IV structure.

A102.2 Essential and hazardous facilities. The provisions of this chapter shall not apply to the strengthening of buildings or structures in ~~Occupancy~~ Risk Category III when assigned to Seismic Design Category C, D, or E or buildings or structures in ~~Occupancy~~ Risk Category IV. Such buildings or structures shall be strengthened to meet the requirements of the *International Building Code* for new buildings of the same ~~occupancy~~ risk category or other such criteria that have been established by the jurisdiction.

Reason: The purpose for this proposal is to correlate the IBC and IEBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal GPSC-3AR2, which was approved by the General Subcommittee on March 1, 2009 and is being balloted by the Main Committee (Item #10 of the Second Main Committee Ballot on General Requirements). It is expected that the Main Committee will approve the proposal.
The proposed changes will reduce confusion between occupancies and their classifications utilized by the codes promulgated by the International Code Council in their fire- and life-safety regulations, and occupancy considerations associated with structural safety. In addition, this proposal recognizes that the factor determining whether a building or other structure falls into a specific Category is not specifically its occupancy, but rather, the risk that failure would pose to persons and society at large. Indeed, some of the structures that fall under the provenance of the IBC and IEBC are unoccupied, such as water treatment plants, but still fall into Category III because their failure would pose a substantial risk to the public.
In Section 1604.5, a statement is added to assign a risk category to an occupancy category specified in a referenced standard. A similar statement is being added to Section 1.5.1 of ASCE 7-10 by Proposal GPSC-3AR1. This is being done in the event that a standard referenced by the 2012 IBC has not updated to be consistent with the change from "occupancy category" to "risk category."
All instances of "occupancy category" in the 2009 IBC and IEBC are included in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Part I-IBC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Part II-IEBC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

S42–09/10
Table 1604.5

Proponent: Michael Mahoney, Federal Emergency Management Agency and Ron Lynn, Clark County, Nevada representing Western States Seismic Policy Council Code Committee

Revise as follows:

TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: • Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. ~~• Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250.~~ • Buildings and other structures containing adult education facilities, such as colleges and universities, with an occupant load greater than 500. • Group I-2 occupancies with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities. • Group I-3 occupancies. • Any other occupancy with an occupant load greater than 5,000[a]. • Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Occupancy Category IV. • Buildings and other structures not included in Occupancy Category IV containing sufficient quantities of toxic or ex-plosive substances to be dangerous to the public if released.
IV	Buildings and other structures designated as essential facilities, including but not limited to: • Group I-2 occupancies having surgery or emergency treatment facilities. • Fire, rescue, ambulance and police stations and emergency vehicle garages. • Designated ~~earthquake, hurricane or other~~ emergency shelters<u>, including elementary school, secondary school or day care facilities with an occupant load greater than 100</u>. • Designated emergency preparedness, communications and operations centers and other facilities required for emergency response. • Power-generating stations and other public utility facilities required as emergency backup facilities for Occupancy Category IV structures. • Structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.1(2). • Aviation control towers, air traffic control centers and emergency aircraft hangars. • Buildings and other structures having critical national defense functions. • Water storage facilities and pump structures required to maintain water pressure for fire suppression.

(Portions of table not shown remain unchanged)
(No change to footnote)

Reason: This proposal makes two changes. The first is to eliminate the list of hazards, since emergency shelters are normally designed to withstand all applicable natural and man-made hazards and are very rarely designated as hazard specific. The second and more significant change is to specifically include elementary, secondary and day care school buildings. The reason for this second change is that 1) most communities have designated their school buildings as community shelters in their emergency operations plans, and 2) almost every school district in the country has instituted a policy of keeping students sheltered in place if disaster strikes during school hours until parents can pick up their children, effectively making school buildings shelters for their students. Further, the impact of losses of school buildings in natural disaster was made painfully aware to the entire world in the China earthquake last year. This country also has its school-related disaster, which was the 1933 Long Beach earthquake, which collapsed a significant percentage of school buildings. Fortunately, the buildings were not occupied at the time, but the disaster led the State of California to adopt the Field Act, which to this day mandates special construction requirements for school buildings.

Cost Impact: The only potential cost impact would potentially be a slight increase to the cost of new schools. However, past similar studies on seismic design by FEMA have shown that the increase would be less than one percent of the total cost of the structure.

1604.7, 1702.1, 1703.4, Table 1704.5.1, Table 1704.5.3, 1714.2, 1714.3.1, 1715.1, 1715.2, 1715.3, 2303.4.7, 2407.1, 2408.2.1, 2408.3

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1604.7 Preconstruction load tests. Materials and methods of construction that are not capable of being designed by approved engineering analysis or that do not comply with the applicable ~~material design~~ referenced standards ~~listed in Chapter 35~~, or alternative test procedures in accordance with Section 1712, shall be load tested in accordance with Section 1715.

1702.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

FABRICATED ITEM. Structural, load-bearing or lateral load-resisting assemblies consisting of materials assembled prior to installation in a building or structure, or subjected to operations such as heat treatment, thermal cutting, cold working or reforming after manufacture and prior to installation in a building or structure. Materials produced in accordance with standard specifications referenced by this code, such as rolled structural steel shapes, steel-reinforcing bars, masonry units and wood structural panels or in accordance with a referenced standard, ~~listed in Chapter 35,~~ which provides requirements for quality control done under the supervisions of a third party quality control agency, shall not be considered "fabricated items."

1703.4 Performance. Specific information consisting of test reports conducted by an approved testing agency in accordance with the appropriate referenced standards ~~referenced in Chapter 35~~, or other such information as necessary, shall be provided for the building official to determine that the material meets the applicable code requirements.

TABLE 1704.5.1
LEVEL 1 REQUIRED VERIFICATION AND INSPECTION OF MASONRY CONSTRUCTION
(No changes to Table)

For SI: °C = (°F - 32)/1.8.
~~a. The specific standards referenced are those listed in Chapter 35.~~

TABLE 1704.5.3
LEVEL 2 REQUIRED VERIFICATION AND INSPECTION OF MASONRY CONSTRUCTION
(No changes to Table)

For SI: °C = (°F - 32)/1.8.
~~a. The specific standards referenced are those listed in Chapter 35.~~

1714.2 Test standards. Structural components and assemblies shall be tested in accordance with the appropriate ~~material~~ referenced standards ~~listed in Chapter 35~~. In the absence of a standard that contains an applicable load test procedure, the test procedure shall be developed by a registered design professional and approved. The test procedure shall simulate loads and conditions of application that the completed structure or portion thereof will be subjected to in normal use.

1714.3.1 Load test procedure specified. Where a referenced standard ~~listed in Chapter 35~~ contains an applicable load test procedure and acceptance criteria, the test procedure and acceptance criteria in the standard shall apply. In the absence of specific load factors or acceptance criteria, the load factors and acceptance criteria in Section 1714.3.2 shall apply.

1715.1 General. In evaluating the physical properties of materials and methods of construction that are not capable of being designed by approved engineering analysis or do not comply with the applicable ~~material design~~ referenced standards ~~listed in Chapter 35~~, the structural adequacy shall be predetermined based on the load test criteria established in this section.

1715.2 Load test procedures specified. Where specific load test procedures, load factors and acceptance criteria are included in the applicable ~~design~~ referenced standards ~~listed in Chapter 35~~, such test procedures, load factors and

acceptance criteria shall apply. In the absence of specific test procedures, load factors or acceptance criteria, the corresponding provisions in Section 1715.3 shall apply.

1715.3 Load test procedures not specified. Where load test procedures are not specified in the applicable ~~design~~ referenced standards ~~listed in Chapter 35~~, the load-bearing and deformation capacity of structural components and assemblies shall be determined on the basis of a test procedure developed by a registered design professional that simulates applicable loading and deformation conditions. For components and assemblies that are not a part of the seismic-load-resisting system, the test shall be as specified in Section 1715.3.1. Load tests shall simulate the applicable loading conditions specified in Chapter 16.

2303.4.7 Truss quality assurance. Trusses not part of a manufacturing process in accordance with either Section 2303.4.6 or a referenced standard ~~listed in Chapter 35~~, which provides requirements for quality control done under the supervision of a third-party quality control agency, shall be manufactured in compliance with Sections 1704.2 and 1704.6, as applicable.

2407.1 Materials. Glass used as a handrail assembly or a guard section shall be constructed of either single fully tempered glass, laminated fully tempered glass or laminated heat-strengthened glass. Glazing in railing in-fill panels shall be of an approved safety glazing material that conforms to the provisions of Section 2406.1.1. For all glazing types, the minimum nominal thickness shall be 1/4 inch (6.4 mm). Fully tempered glass and laminated glass shall comply with Category II of CPSC 16 CFR 1201 or Class A of ANSI Z97.1~~, listed in Chapter 35~~.

2408.2.1 Testing. Test methods and loads for individual glazed areas in racquetball and squash courts subject to impact loads shall conform to those of CPSC 16 CFR 1201 or ANSI Z97.1~~, listed in Chapter 35,~~ with impacts being applied at a height of 59 inches (1499 mm) above the playing surface to an actual or simulated glass wall installation with fixtures, fittings and methods of assembly identical to those used in practice.

Glass walls shall comply with the following conditions:

1. A glass wall in a racquetball or squash court, or similar use subject to impact loads, shall remain intact following a test impact.
2. The deflection of such walls shall not be greater than 1-1/2 inches (38 mm) at the point of impact for a drop height of 48 inches (1219 mm).

Glass doors shall comply with the following conditions:

1. Glass doors shall remain intact following a test impact at the prescribed height in the center of the door.
2. The relative deflection between the edge of a glass door and the adjacent wall shall not exceed the thickness of the wall plus 1/2 inch (12.7 mm) for a drop height of 48 inches (1219 mm).

2408.3 Gymnasiums and basketball courts. Glazing in multipurpose gymnasiums, basketball courts and similar athletic facilities subject to human impact loads shall comply with Category II of CPSC 16 CFR 1201 or Class A of ANSI Z97.1~~, listed in Chapter 35~~.

Reason: The purpose for this proposal is to correlate the references to referenced standards with their charging text in Section 102.4 and to eliminate superfluous text. A “referenced standard” is understood to be a standard listed in Chapter 35, the title of which is “Referenced Standards,” and statements that they are “listed in Chapter 35” are not needed in the IBC. All such references to Chapter 35 in the IBC are included in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: Brazil-S36-1604.7

S44–09/10
1604.8.2, 1613.7

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self
Jim Rossberg, SEI of ASCE, representing self

1. Revise as follows:

1604.8.2 Structural walls. Walls that provide vertical load bearing resistance or lateral shear resistance for a portion of the structure shall be anchored to the roof and to all floors~~, roofs~~ and ~~other structural elements~~ members that provide lateral support for the wall or that are supported by the wall. ~~Such anchorage shall provide a positive direct connection~~ The connections shall be capable of resisting the horizontal forces specified in ~~this chapter but not less than the minimum strength design horizontal force specified in~~ Section ~~11.7.3~~ 1.4.4 of ASCE 7~~, substituted for "*E*" in the load combinations of Section 1605.2 or 1605.3~~ for walls of structures assigned to Seismic Design Category A and to Section 12.11 of ASCE 7 for walls of all other structures. Concrete and masonry walls shall be designed to resist bending between anchors where the anchor spacing exceeds 4 feet (1219 mm). Required anchors in masonry walls of hollow units or cavity walls shall be embedded in a reinforced grouted structural element of the wall. See Section 1609 for wind design requirements and see Section 1613 for earthquake design requirements.

2. Delete without substitution:

~~**1613.7 ASCE 7, Section 11.7.5.** Modify ASCE 7, Section 11.7.5 to read as follows:~~

> ~~**11.7.5 Anchorage of walls.** Walls shall be anchored to the roof and all floors and members that provide lateral support for the wall or that are supported by the wall. The anchorage shall provide a direct connection between the walls and the roof or floor construction. The connections shall be capable of resisting the forces specified in Section 11.7.3 applied horizontally, substituted for E in the load combinations of Section 2.3 or 2.4.~~

.
Reason:
(BRAZIL)-The purpose for this proposal is to delete a revision to ASCE 7-05 that will no longer be needed because a similar revision will have been incorporated into the 2010 edition of ASCE 7. Section 1604.8.2 is also revised for consistency with this and other related revisions to ASCE 7. These are being accomplished by ASCE 7 Proposal GPSC-2R2, which was approved by the General Subcommittee on March 1, 2009 and is being balloted by the Main Committee (Item #2 of the Second Main Committee Ballot on General Requirements); and by ASCE 7 Proposal SSC TC-4-CH14-07-R1, which was approved by the Seismic Subcommittee on May 15, 2009 and is being balloted by the Main Committee (Item #1 of the Seventh Main Committee Ballot on Seismic Provisions). It is expected that the Main Committee will approve both proposals.
(ROSSBERG)- This provision has been considered and approved by the Seismic Subcommittee of ASCE 7 for inclusion into the 2010 edition of ASCE 7 hence with the adoption of ASCE 7-10 by reference this provision becomes duplicative. As of the submission date of this code change, the ASCE 7 Standards Committee is completing the committee balloting portion of the 2010 edition of ASCE/SEI 7. The document is designated ASCE/SEI 7-10 *Minimum Design Loads for Buildings and Other Structures* and it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in May of 2010 . Any person interested in obtaining a public comment copy of ASCE/SEI 7-10 may do so by contacting the proponent at jrossberg@asce.org.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-Rossberg-S23-1604.8.2

S45–09/10
1604.9

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1604.9 Counteracting structural actions. Structural members, systems, components and cladding shall be designed to resist forces due to earthquake and wind, with consideration of overturning, sliding and uplift. Continuous load paths shall be provided for transmitting these forces to the foundation. Where sliding is used to isolate the elements, the effects of friction between sliding elements shall be included as a force. Where all or a portion of the resistance to these forces is provided by dead load, the dead load shall be taken as the minimum dead load likely to be in place during the event causing the considered forces. Consideration shall be given to the effects of vertical and horizontal deflections resulting from such forces.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The added text will align IBC Section 1604.9 with Section 1.3.5 of ASCE 7.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S40-1604.9

S46–09/10
1604.11 (New)

Proponent: Daniel J. Walker, PE, Thomas Associates, Inc. representing the National Sunroom Association

Add new text as follows:

1604.11 Patio cover design loads. *Patio covers* shall be designed and constructed to sustain, within the stress limits of this code, all dead loads plus a minimum vertical live load of 10 pounds per square foot (0.48 kN/m^2) except that snow loads shall be used where such snow loads exceed this minimum. Such *patio covers* shall be designed to resist the minimum wind and seismic loads set forth in this code.

Reason: This language has long been included in Appendix I of the code. The requirements are specific to this section and therefore should be included here.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Walker-S1-1604.11

S47–09/10
1605.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist:

1. The load combinations specified in Section 1605.2, 1605.3.1 or 1605.3.2,
2. The load combinations specified in Chapters 18 through 23, and
3. The load combinations with overstrength factor specified in Section 12.4.3.2 of ASCE 7 where required by Section 12.2.5.2, 12.3.3.3 or 12.10.2.1 of ASCE 7. With the simplified procedure of ASCE 7 Section 12.14, the load combinations with overstrength factor of Section 12.14.3.2 of ASCE 7 shall be used.

Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero. Where members, elements or components of a structure are designed in accordance with a particular material chapter of this code or a reference standard, they shall be designed to resist all applicable load combinations of Section 1605.2 or of Section 1605.3.

Where the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 apply, they shall be used as follows:

1. The basic combinations for strength design with overstrength factor in lieu of Equations 16-5 and 16-7 in Section 1605.2.1.
2. The basic combinations for allowable stress design with overstrength factor in lieu of Equations 16-12, 16-13 and 16-15 in Section 1605.3.1.
3. The basic combinations for allowable stress design with overstrength factor in lieu of Equations 16-20 and 16-21 in Section 1605.3.2.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LCSC LC-12-R1, which has been approved by the Load Combinations Subcommittee and is being balloted by the Main Committee (Item #22 of the Second Main Committee Ballot on Load Combinations). It is expected that the Main Committee will approve the proposal.

Where proportioning members, elements or components of a particular construction material, Section 2.1 of ASCE-05 requires, throughout the structure, the exclusive use of the load combinations for strength/LRFD design or for allowable stress design (ASD). This requirement does not exist in the 2009 IBC but the modification to Section 2.1 in ASCE 7-10 warrants its inclusion in the 2012 IBC.

ASCE 7 has contained the requirement in Section 2.1 since the introduction of load combinations for strength/LRFD design in the 1982 edition of the standard. The primary reason was to avoid an indiscriminate mixture of strength and allowable stress design methods, which may lead to unpredictable structural system performance. The reliability analyses and code calibrations leading to the strength/LRFD load combinations were based on member limit states rather than system limit states.

The change to Section 2.1 of ASCE 7 acknowledges current industry practice while continuing to prohibit indiscriminate mixing of strength/LRFD and ASD load combinations where it is not appropriate. For example, the design of cold-formed steel framing and open web steel joists is typically done using ASD load combinations but the design of the structural steel is typically done using strength/LRFD load combinations. The AISC Code of Standard Practice indicates that cold-formed steel and steel joists are not considered structural steel. Foundations are also commonly designed at the soil-structure interface using ASD load combinations but the design of the concrete is typically done using strength/LRFD load combinations.

The change permits the mixing of strength/LRFD and ASD load combinations for the design of a structure, provided mixing does not occur for design of the individual classes of members, elements or components (e.g., cold-formed steel, steel joists and structural steel) in accordance with their respective material standards.

The addition to Section 1605.1 will make the 2012 IBC consistent with ASCE 7-10 with respect to this aspect of structural design but the text in this proposal does not match the corresponding text in ASCE 7-10. It has been adapted for inclusion in the IBC. For comparison purposes, the text from ASCE 7 Proposal LCSC LC-12-R1 is: "Where elements of a structure are designed by a particular material standard or specification, they shall be designed exclusively by either Section 2.3 or 2.4."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

S48–09/10
1605.1, 1810.3.6.1, 1810.3.9.4, 1810.3.11.2, 1810.3.12

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist:

1. The load combinations specified in Section 1605.2, 1605.3.1 or 1605.3.2,
2. The load combinations specified in Chapters 18 through 23, and
3. The ~~load combinations with~~ seismic load effects including overstrength factor ~~specified~~ in accordance with Section ~~12.4.3.2~~ 12.4.3 of ASCE 7 where required by Section 12.2.5.2, 12.3.3.3 or 12.10.2.1 of ASCE 7. With the simplified procedure of ASCE 7 Section 12.14, the ~~load combinations with~~ seismic load effects including overstrength factor ~~of~~ in accordance with Section 12.14.3.2 of ASCE 7 shall be used.

Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

Where the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 apply, they shall be used as follows:

1. The basic combinations for strength design with overstrength factor in lieu of Equations 16-5 and 16-7 in Section 1605.2.1.
2. The basic combinations for allowable stress design with overstrength factor in lieu of Equations 16-12, 16-13 and 16-15 in Section 1605.3.1.
3. The basic combinations for allowable stress design with overstrength factor in lieu of Equations 16-20 and 16-21 in Section 1605.3.2.

1810.3.6.1 Seismic Design Categories C through F. For structures assigned to Seismic Design Category C, D, E, or F, splices of deep foundation elements shall develop the lesser of the following:

1. The ~~full~~ nominal strength of the deep foundation element; and
2. The axial and shear forces and moments from the ~~load combinations with~~ seismic load effects including overstrength factor in accordance with Section 12.4.3.2 or 12.14.3.2 of ASCE 7.

1810.3.9.4 Seismic reinforcement. Where a structure is assigned to Seismic Design Category C reinforcement shall be provided in accordance with Section 1810.3.9.4.1. Where a structure is assigned to Seismic Design Category D, E, or F reinforcement shall be provided in accordance with Section 1810.3.9.4.2.

Exceptions:

1. Isolated deep foundation elements supporting posts of Group R-3 and U occupancies not exceeding two stories of light-frame construction shall be permitted to be reinforced as required by rational analysis but with not less than one No. 4 bar, without ties or spirals, where detailed so the element is not subject to lateral loads and the soil provides adequate lateral support in accordance with Section 1810.2.1.
2. Isolated deep foundation elements supporting posts and bracing from decks and patios appurtenant to Group R-3 and U occupancies not exceeding two stories of light-frame construction shall be permitted to be reinforced as required by rational analysis but with not less than one No. 4 bar, without ties or spirals, where the lateral load, *E*, to the top of the element does not exceed 200 pounds (890 N) and the soil provides adequate lateral support in accordance with Section 1810.2.1.
3. Deep foundation elements supporting the concrete foundation wall of Group R-3 and U occupancies not exceeding two stories of light-frame construction shall be permitted to be reinforced as required by rational analysis but with not less than two No. 4 bars, without ties or spirals, where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations with overstrength factor in Section 12.4.3.2 or 12.14.3.2 of ASCE 7 and the soil provides adequate lateral support in accordance with Section 1810.2.1.
4. Closed ties or spirals where required by Section 1810.3.9.4.2 shall be permitted to be limited to the top 3 feet (914 mm) of deep foundation elements 10 feet (3048 mm) or less in depth supporting Group R-3 and U occupancies of Seismic Design Category D, not exceeding two stories of light-frame construction.

1810.3.11.2 Seismic Design Categories D through F. For structures assigned to Seismic Design Category D, E, or F in accordance with Section 1613, deep foundation element resistance to uplift forces or rotational restraint shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop a minimum of 25 percent of the strength of the element in tension. Anchorage into the pile cap shall ~~be capable of developing~~ comply with the following:

1. In the case of uplift, the anchorage shall be capable of developing the least of the following:
   1.1. The nominal tensile strength of the longitudinal reinforcement in a concrete element;
   1.2. The nominal tensile strength of a steel element; and
   1.3. The frictional force developed between the element and the soil multiplied by 1.3~~; and~~.

   Exception: The anchorage is permitted to be designed to resist the axial tension force resulting from the ~~load combinations with~~ seismic load effects including overstrength factor in accordance with Section 12.4.3.2 or 12.14.3.2 of ASCE 7.

2. In the case of rotational restraint, the ~~lesser of the following:~~ anchorage shall be designed to resist the axial ~~force,~~ and shear forces, and ~~bending~~ moments resulting from the ~~load combinations with~~ seismic load effects including overstrength factor in accordance with Section 12.4.3.2 or 12.14.3.2 of ASCE 7; ~~or development of~~ or shall be capable of developing the full axial, bending and shear nominal strength of the element.

Where the vertical lateral-force-resisting elements are columns, the pile cap flexural strengths shall exceed the column flexural strength. The connection between batter piles and pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be ~~capable of resisting forces and moments from the load combinations with~~ designed to resist the seismic load effects including overstrength factor in accordance with Section 12.4.3.2 or 12.14.3.2 of ASCE 7.

1810.3.12 Grade beams. For structures assigned to Seismic Design Category D, E, or F in accordance with Section 1613, grade beams shall comply with the provisions in Section 21.12.3 of ACI 318 for grade beams, except where they ~~have the capacity~~ are designed to resist the ~~forces from the load combinations with~~ seismic load effects including overstrength factor in accordance with Section 12.4.3.2 or 12.14.3.2 of ASCE 7.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal SSC TC-2-CH12-63-R1, which was approved by the Seismic Subcommittee on 12/10/08 and is being balloted by the Main Committee (Item #23 of the Fourth Main Committee Ballot on Seismic Provisions). It is expected that the Main Committee will approve the proposal.
Proposal SSC-TC-2-CH12-63-R1 changes several references in ASCE 7 from Section 12.4.3.2 to Section 12.4.3 (and from Section 12.14.3.2.2 to Section 12.14.3.2 for the simplified procedure) so that the Exception to Section 12.4.3.1 (and to Section 12.14.3.2.1 for the simplified procedure)

permitting the maximum force that can be developed in the element to substitute for the horizontal seismic effects with overstrength is included. In the process of doing this, "load combinations with overstrength factor" was changed to "seismic load effects including overstrength factor" throughout ASCE 7 for consistency with the subject (and title) of Section 12.4.3 (and Section 12.14.3.2 for the simplified procedure).
This proposal revises the IBC for consistency with the revisions to ASCE 7 in Proposal SSC-TC-2-CH12-63-R1. In Item 3 of Paragraph #1 in Section 1605.1, the references to Sections 12.2.5.2, 12.3.3.3 and 12.10.2.1 of ASCE 7-05 will not be changing in ASCE 7-10. The references to Sections 12.4.3 and 12.14.3.2 of ASCE 7-05 throughout this proposal will also not be changing in ASCE 7-10. The IBC sections in this proposal correspond to the following sections of ASCE 7:

1. IBC Section 1810.3.6.1 corresponds to Section 12.13.6.6 of ASCE 7.
2. IBC Section 1810.3.11.2 corresponds to Section 12.13.6.5 of ASCE 7.
3. IBC Section 1810.3.12 corresponds to Section 14.2.3.2.2 of ASCE 7.

All instances of "load combinations with overstrenght factor" in the 2009 IBC are included in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S47-1605.1

S49–09/10
1605.2.1, 1605.3.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1605.2.1 Basic load combinations. Where strength design or load and resistance factor design is used, structures and portions thereof shall resist the most critical effects from the following combinations of factored loads:

1.4 ($D + F$) **(Equation 16-1)**

1.2 ($D + F + T$) + 1.6 ($L + H$) +
0.5 (L_r or S or R) **(Equation 16-2)**

1.2 (D + F) + 1.6 (L_r or S or R) + 1.6 H + (f_1 L or 0.8 W) **(Equation 16-3)**

1.2 (D + F) + 1.6 W + f_1 L + 1.6 H + 0.5 (L_r or S or R) **(Equation 16-4)**

1.2 (D + F) + 1.0 E + f_1 L + 1.6 H + f_2 S **(Equation 16-5)**

0.9 D + 1.6 W + 1.6 H **(Equation 16-6)**

0.9 D + 1.0 E + 1.6 H **(Equation 16-7)**

where:

f_1 = 1 for floors in places of public assembly, for live loads in excess of 100 pounds per square foot (4.79 kN/m^2), and for parking garage live load, and
= 0.5 for other live loads.
f_2 = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure, and
= 0.2 for other roof configurations.

Exceptions:

1. Where other factored load combinations are specifically required by ~~the~~ other provisions of this code, such combinations shall take precedence.
2. Where the effect of H resists the primary variable load effect, a load factor of 0.9 shall be included with H where H is permanent and H shall be set to zero for all other conditions.

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$ **(Equation 16-8)**

$D + H + F + L + T$ **(Equation 16-9)**

$D + H + F + (L_r \text{ or } S \text{ or } R)$ **(Equation 16-10)**

$D + H + F + 0.75 (L + T) +$
$0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-11)**

$D + H + F + (W \text{ or } 0.7 E)$ **(Equation 16-12)**

$D + H + F + 0.75$ ~~$(W \text{ or } 0.7 E)$~~ $+$
$0.75 L + 0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-13)**

$D + H + F + 0.75 (0.7 E) + 0.75 L + 0.75 S$ **(Equation 16-14)**

$0.6 D + W + H$ **(Equation 16-~~14~~15)**

$0.6 D + 0.7 E + H$ **(Equation 16-~~15~~16)**

(Renumber remaining equations)

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.
3. Where the effect of H resists the primary variable load effect, a load factor of 0.6 shall be included with H where H is permanent and H shall be set to zero for all other conditions.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LCSC LC-9a, which has been approved by the Load Combinations Subcommittee (LCSC) and is being balloted by the Main Committee (Item #2 of the Second Main Committee Ballot on Load Combinations). It is expected that the Main Committee will approve the proposal. This proposal is being submitted in conjunction with a similar proposal that revises IBC Sections 1605.2 and 1605.3 to closely match Sections 2.3 and 2.4 of ASCE 7-10 as revised by the ASCE 7 proposal. This proposal is equivalent to that proposal but relies more on the actual load combinations and less on text modifying the load combinations.

The changes will improve the equivalency of the Strength/LRFD and ASD load combinations with respect to the inclusion of loads due to fluids, *F*, and loads due to lateral earth pressures, ground water pressures or the pressure of bulk materials, *H.* The ASCE 7 proposal noted above was prompted, in part, by a proposal that added *F*, *H*, and loads due to self-straining forces, *T*, to the basic strength design load combinations of ASCE 7 necessary to achieve this equivalency. The removal of *T* from the Strength/LRFD and ASD load combinations is the subject of a separate proposal. The removal of earthquake load, *E*, from Equation 16-13 and the addition of Equation 16-14 has the effect of retaining roof live load, L_r, and rain load, *R*, in combination with wind load, *W* (Equation 16-13) but removing these loads in combination with earthquake load, *E* (Equation 16-14). This is being done to improve the equivalency of these load combinations with Strength/LRFD Equations 16-4 and 16-5. A similar deletion from the ASD load combinations in Section 2.4.1 of ASCE 7 is made by Proposal LCSC LC-9a but L_r and *R* are deleted in combination with *W* and *E*.

Correlation of LRFD and Basic ASD load combinations:

1. 1.4 (D+F)	8. D + F

7. 0.9D + 1.6H + 1.0E	15. 0.6D + H + 0.7 E

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Brazil-S30-1605.2.1

S50–09/10
1605.2.1, 1605.3.1, 1605.3.2

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1605.2.1 Basic load combinations. Where strength design or load and resistance factor design is used, structures and portions thereof shall resist the most critical effects from the following combinations of factored loads:

1.4 (D + F) **(Equation 16-1)**

1.2 (D + F + T) + 1.6 (L + H)
+ 0.5 (L_r or S or R) **(Equation 16-2)**

1.2*D* + 1.6 (L_r or *S* or *R*) + (f_1*L* or 0.8*W*) **(Equation 16-3)**

1.2*D* + 1.6*W* + f_1*L* + 0.5 (L_r or *S* or *R*) **(Equation 16-4)**

1.2*D* + 1.0*E* + f_1*L* + ~~f_2~~ 0.2 *S* **(Equation 16-5)**

0.9D + 1.6W + 1.6H **(Equation 16-6)**

0.9D + 1.0E + 1.6H **(Equation 16-7)**

where:

f_1 = 1 for floors in places of public assembly, for live loads in excess of 100 pounds per square foot (4.79 kN/m^2), and for parking garage live load, and
= 0.5 for other live loads.
~~f_2 = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure, and~~
~~= 0.2 for other roof configurations.~~

~~**Exception:** Where other factored load combinations are specifically required by the provisions of this code, such combinations shall take precedence.~~

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$ **(Equation 16-8)**

$D + H + F + L + T$ **(Equation 16-9)**

$D + H + F + (L_r \text{ or } S \text{ or } R)$ **(Equation 16-10)**

$D + H + F + 0.75 (L + T) + 0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-11)**

$D + H + F + (W \text{ or } 0.7E)$ **(Equation 16-12)**

$D + H + F + 0.75 (W \text{ or } 0.7E) + 0.75L + 0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-13)**

$0.6D + W + H$ **(Equation 16-14)**

$0.6D + 0.7E + H$ **(Equation 16-15)**

Exceptions:

1. ~~1.~~ Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. ~~2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.~~

1605.3.2 Alternative basic load combinations. In lieu of the basic load combinations specified in Section 1605.3.1, structures and portions thereof shall be permitted to be designed for the most critical effects resulting from the following combinations. When using these alternate basic load combinations that include wind or seismic loads, allowable stresses are permitted to be increased or load combinations reduced, where permitted by the material chapter of this code or the referenced standards. For load combinations that include the counteracting effects of dead and wind loads, only two-thirds of the minimum dead load likely to be in place during a design wind event shall be used. Where wind loads are calculated in accordance with Chapter 6 of ASCE 7, the coefficient ω in the following equations shall be taken as 1.3. For other wind loads, ω shall be taken as 1.0. When using these alternative load combinations to evaluate sliding, overturning and soil bearing at the soil-structure interface, the reduction of foundation overturning from Section 12.13.4 in ASCE 7 shall not be used. When using these alternative basic load combinations for proportioning foundations for loadings, which include seismic loads, the vertical seismic load effect, E_v, in Equation 12.4-4 of ASCE 7 is permitted to be taken equal to zero.

$D + L + (L_r \text{ or } S \text{ or } R)$ **(Equation 16-16)**

$D + L + (\omega W)$ **(Equation 16-17)**

$D + L + \omega W + S/2$ **(Equation 16-18)**

$D + L + S + \omega W/2$ **(Equation 16-19)**

$D + L + S + E/1.4$ **(Equation 16-20)**

$0.9D + E/1.4$ **(Equation 16-21)**

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. Most of the provisions being deleted were the product of a legacy code (UBC Section 1612.2.1 for roof configurations and Exception 1 to Section 1612.3.2 for snow and seismic loads). They have not appeared in recent editions of ASCE 7 and there are no proposals being considered by the committees of ASCE 7 to add them to the 2010 edition.

The exception to Section 1605.2.1 for factored load combinations in other sections of the IBC taking precedence over the Strength/LRFD load combinations in Section 1605.2.1 has been in the IBC since the 2003 edition. In that edition, there were other factored load combinations in Section 1605.4. They have since been removed from the IBC by Proposal S8-06/07-AMPC2,3 and there are no other factored load combinations in the IBC. Thus, the exception no longer serves a purpose and should be deleted.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

1605.2.1 Basic load combinations. Where strength design or load and resistance factor design is used, structures and portions thereof shall resist the most critical effects from the following combinations of factored loads:

$1.4\,(D + F)$ **(Equation 16-1)**

$1.2\,(D + F + T) + 1.6\,(L + H) + 0.5\,(L_r \text{ or } S \text{ or } R)$ **(Equation 16-2)**

$1.2D + 1.6\,(L_r \text{ or } S \text{ or } R) + (f_1 L \text{ or } \sout{0.8}\ \underline{0.5}\ W)$ **(Equation 16-3)**

$1.2D + \sout{1.6}\ \underline{1.0}\ W + f_1 L + 0.5\,(L_r \text{ or } S \text{ or } R)$ **(Equation 16-4)**

$1.2D + 1.0E + f_1 L + f_2 S$ **(Equation 16-5)**

$0.9D + \sout{1.6}\ \underline{1.0}\ W + 1.6H$ **(Equation 16-6)**

$0.9D + 1.0E + 1.6H$ **(Equation 16-7)**

where:

f_1 = 1 for floors in places of public assembly, for live loads in excess of 100 pounds per square foot (4.79 kN/m^2), and for parking garage live load, and
= 0.5 for other live loads.

f_2 = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure, and
= 0.2 for other roof configurations.

Exception: Where other factored load combinations are specifically required by the provisions of this code, such combinations shall take precedence.

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$ **(Equation 16-8)**

$D + H + F + L + T$ **(Equation 16-9)**

$D + H + F + (L_r \text{ or } S \text{ or } R)$ **(Equation 16-10)**

$D + H + F + 0.75 (L + T) + 0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-11)**

$D + H + F + (\underline{0.6}\ W \text{ or } 0.7E)$ **(Equation 16-12)**

$D + H + F + 0.75 (\underline{0.6}\ W \text{ or } 0.7E) + 0.75L + 0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-13)**

$0.6D + \underline{0.6}\ W + H$ **(Equation 16-14)**

$0.6D + 0.7E + H$ **(Equation 16-15)**

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LCSC LC-10-R1, which has been approved by the Load Combinations Subcommittee and is being balloted by the Main Committee (Item #17 of the Second Main Committee Ballot on Load Combinations). It is expected that the Main Committee will approve the proposal.

In the load combinations of Section 1605.2.1 for strength/LRFD design, the load factors on wind load are being reduced because of the change in the specification of the design wind speed in Chapter 6 of ASCE 7-10. The wind speed in ASCE 7-10 is mapped at much longer return periods than in ASCE 7-05 (700-1700 years depending on occupancy category), which eliminates a discontinuity in risk between hurricane-prone coastal areas and the remainder of the country and better aligns the treatment of wind and earthquake effects.

Corresponding reductions are made to the basic load combinations for allowable stress design in Section 1605.3.1.

Note that this proposal does not contain similar changes to the alternative basic load combinations in Section 1605.3.2. The ASCE 7 proposal described above does not address these load combinations because they are not included in ASCE 7. Revisions to the alternative basic load combinations for compatibility with the revisions to the wind load provisions in ASCE 7-10 should be pursued by others. The deletion of the alternative basic load combinations is the subject of a separate proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S52-1605.2.1

S52–09/10

1602.1, 1605.2.1, 1605.2.2, 1605.3.1, 1605.3.1.2, 1605.3.2.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

NOTATIONS.

D = Dead load.
E = Combined effect of horizontal and vertical earthquake induced forces as defined in Section 12.4.2 of ASCE 7.
F = Load due to fluids with well-defined pressures and maximum heights.
F_a = Flood load in accordance with Chapter 5 of ASCE 7.
H = Load due to lateral earth pressures, ground water pressure or pressure of bulk materials.
L = Live load, except roof live load, including any permitted live load reduction.
L_r = Roof live load including any permitted live load reduction.
R = Rain load.
S = Snow load.
T = Self-straining ~~force arising from contraction or expansion resulting from temperature change, shrinkage, moisture change, creep in component materials, movement due to differential settlement or combinations thereof~~ load.
W = Load due to wind pressure.

1605.2.1 Basic load combinations. Where strength design or load and resistance factor design is used, structures and portions thereof shall resist the most critical effects from the following combinations of factored loads:

1.4 (D + F) **(Equation 16-1)**

1.2 (D + F ~~+ T~~) + 1.6 (L + H) +
0.5 (L_r or S or R) **(Equation 16-2)**

1.2*D* + 1.6 (L_r or *S* or *R*) + (f_1L or 0.8*W*) **(Equation 16-3)**

1.2*D* + 1.6*W* + f_1L + 0.5 (L_r or *S* or *R*) **(Equation 16-4)**

1.2*D* + 1.0*E* + f_1L + f_2S **(Equation 16-5)**

0.9D + 1.6W + 1.6H **(Equation 16-6)**

0.9D + 1.0E + 1.6H **(Equation 16-7)**

where:

f_1 = 1 for floors in places of public assembly, for live loads in excess of 100 pounds per square foot (4.79 kN/m^2), and for parking garage live load, and
= 0.5 for other live loads.
f_2 = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure, and
= 0.2 for other roof configurations.

Exception: Where other factored load combinations are specifically required by the provisions of this code, such combinations shall take precedence.

1605.2.2 ~~Flood~~ Other loads. Where flood loads, F_a, are to be considered in the design, the load combinations of Section 2.3.3 of ASCE 7 shall be used. Where self-straining loads, *T*, are considered in design, their structural effects in combination with other loads shall be determined in accordance with Section 2.3.5 of ASCE 7.

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

D + F **(Equation 16-8)**

D + H + F + L ~~+ T~~ **(Equation 16-9)**

D + H + F + (L_r or S or R) **(Equation 16-10)**

D + H + F + 0.75 (L ~~+ T~~) +

0.75 (L_r or S or R) **(Equation 16-11)**

D + H + F + (W or 0.7E) **(Equation 16-12)**

D + H + F + 0.75 (W or 0.7E)
+ 0.75L + 0.75 (L_r or S or R) **(Equation 16-13)**

0.6D + W + H **(Equation 16-14)**

0.6D + 0.7E + H **(Equation 16-15)**

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.

1605.3.1.2 ~~Flood~~ Other loads. Where flood loads, F_a, are to be considered in design, the load combinations of Section 2.4.2 of ASCE 7 shall be used. Where self-straining loads, *T*, are considered in design, their structural effects in combination with other loads shall be determined in accordance with Section 2.4.4 of ASCE 7.

1605.3.2.1 Other loads. Where *F*, *H* or *T* are to be considered in design, each applicable load shall be added to the combinations specified in Section 1605.3.2. Where self-straining loads, *T*, are considered in design, their structural effects in combination with other loads shall be determined in accordance with Section 2.4.4 of ASCE 7.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LCSC LC-1-R1, which has been approved by the Load Combinations Subcommittee and is being balloted by the Main Committee (Item #4 of the Second Main Committee Ballot on Load Combinations). It is expected that the Main Committee will approve the proposal.

Self-straining forces are important to the design of many types of structures, for example, the pretensioning and post-tensioning forces in prestressed concrete structures. The self-straining load, *T*, has been in the load combinations of IBC Section 1605 since the 2003 edition, all editions of ASCE 7, and ANSI A58.1-72. However, a consensus emerged within the ASCE 7 Committee to remove *T* from the load combinations of Section 2.3 for strength/LRFD design and Section 2.4 for allowable stress design in favor of text in new Sections 2.3.5 and 2.4.4 requiring consideration of *T* and additional commentary. This is similar to what had been in ASCE 7 prior to the 1995 edition. For example, the load combinations in Sections 2.3 and 2.4 of ASCE 7-88 and ASCE 7-93 did not include *T* but Section 2.3.2 for allowable stress design and Section 2.4.3 for strength design stated that the structural effects of *T* (as well as *F*, *H* and *P*) "shall be considered in design."

Note that the statements being added to Sections 1605.2.2, 1605.3.1.2 and 1605.3.2.1 for self-straining loads, *T*, do not constitute charging text. They are cross references to Section 2.3.5 of ASCE 7-10 for Strength/LRFD load combinations and Section 2.4.4 of ASCE 7-10 for ASD load combinations, which provide the necessary charging text.

The statements in Sections 1605.2.2 and 1605.3.1.2 on flood loads, F_a, also do not constitute charging text but Section 1612.1 serves as the charging text for flood loads in the IBC in that it requires buildings, structures and portions thereof to be designed and constructed to resist the effects of flood loads in flood hazard areas. The revisions in this proposal may appear to eliminate charging text for *T* but the 2009 IBC contains no such charging text except indirectly through the definition of *T* in Section 1602.1.

Although Section 1605.3.2.1 on other loads for use with the alternative basic load combinations is being modified in this proposal, the deletion of these load combinations is the subject of a separate proposal. Should the deletion of the alternative basic load combinations be approved by the ICC membership, it is not the intent of the proponent to retain Section 1605.3.2.1 in the 2012 IBC for the purpose of adding the statement in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S42-1602.1

S53–09/10
1605.3.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$ **(Equation 16-8)**

$D + H + F + L + T$ **(Equation 16-9)**

$D + H + F + (L_r \text{ or } S \text{ or } R)$ **(Equation 16-10)**

$D + H + F + 0.75 (L + T) +$
$0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-11)**

$D + H + F + (W \text{ or } 0.7 E)$ **(Equation 16-12)**

$D + H + F + 0.75 (W \text{ or } 0.7 E) +$
$0.75 L + 0.75 (L_r \text{ or } S \text{ or } R)$ **(Equation 16-13)**

$0.6 D + W + H$ **(Equation 16-14)**

$0.6 D + 0.7 E + H$ **(Equation 16-15)**

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.
3. <u>In Equation 16-14, the wind load, *W*, is permitted to be reduced 10 percent for design of the foundation other than anchorage of the structure to the foundation.</u>
4. <u>In Equation 16-15, 0.6 *D* is permitted to be increased to 0.9 *D* for the design of special reinforced masonry shear walls complying with Chapter 21.</u>

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LCSC LC-4, which has been approved by the Load Combinations Subcommittee (LCSC) and is being balloted by the Main Committee (Item #3 of the Second Main Committee Ballot on Load Combinations). It is expected that the Main Committee will approve the proposal.
The current ASD counteracting load combinations in Equations 16-14 and 16-15 are needed to maintain consistency with the Strength/LRFD counteracting load combinations in Equations 16-6 and 16-7 (Section 1605.2.1). Predictability of dead load cannot justify increasing the ASD counteracting dead load factor from 0.6 because of the large variability in the destabilizing force due to wind or earthquake forces. However, where the effects of fluctuating wind forces are aggregated at the foundation, a measure of conservatism is introduced with a dead load factor of 0.6 due to area-averaging, which justifies an increase. Rather than increase the dead load factor in ASD Load Combination 7 of ASCE-7 (IBC Equation 16-14), the LCSC concluded it was more rational to reduce the wind effects (Exception #3) for evaluating global stability, bearing and uplift at the structure-foundation interface. Similar approaches are taken for seismic actions in Exception #2 of Section 12.4.2.2 and in Section 12.13.4 of ASCE 7-05.

Exception #4 for special reinforced masonry shear walls is being added due to the determination of seismic load effects reduced by the response modification coefficient, R, which means that inelastic action occurs before reaching the limit state. In special reinforced masonry shear walls designed in accordance with Chapter 21, there is a minimum quantity or vertical reinforcement, a conservative value of allowable stress is assumed in proportioning the reinforcement, and there is protection against premature crushing at the compression face. Given these, the limit state of unrestrained overturning is not judged to be a concern, justifying the increase from 0.6 to 0.9 in the load factor for D in Equation 16-15.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S19-1605.3.1

S54–09/10
1605.1, 1605.3.1, 1605.3.2, 1605.3.2.1, 1806.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Revise as follows:

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist:

1. The load combinations specified in Section 1605.2~~, 1605.3.1 or 1605.3.2~~ <u>or 1605.3</u>,
2. The load combinations specified in Chapters 18 through 23, and

3. The load combinations with overstrength factor specified in Section 12.4.3.2 of ASCE 7 where required by Section 12.2.5.2, 12.3.3.3 or 12.10.2.1 of ASCE 7. With the simplified procedure of ASCE 7 Section 12.14, the load combinations with overstrength factor of Section 12.14.3.2 of ASCE 7 shall be used.

Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

Where the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 apply, they shall be used as follows:

1. The basic combinations for strength design with overstrength factor in lieu of Equations 16-5 and 16-7 in Section 1605.2.1.
2. The basic combinations for allowable stress design with overstrength factor in lieu of Equations 16-12, 16-13 and 16-15 in Section ~~1605.3.1~~ 1605.3.
3. ~~The basic combinations for allowable stress design with overstrength factor in lieu of Equations 16-20 and 16-21 in Section 1605.3.2.~~

1605.3 Load combinations using allowable stress design.

~~1605.3.1 Basic load combinations.~~ Where allowable stress design ~~(working stress design)~~, as permitted by this code, is used, buildings and other structures, and portions thereof, shall be designed to resist the most critical effects resulting from the following combinations of loads:

$D+F$ **(Equation 16-8)**

$D+H+F+L+T$ **(Equation 16-9)**

$D+H+F+(L_r \text{ or } S \text{ or } R)$ **(Equation 16-10)**

$D+H+F+0.75(L+T)+0.75(L_r \text{ or } S \text{ or } R)$ **(Equation 16-11)**

$D+H+F+(W \text{ or } 0.7E)$ **(Equation 16-12)**

$D+H+F+0.75(W \text{ or } 0.7E)+0.75L+0.75(L_r \text{ or } S \text{ or } R)$ **(Equation 16-13)**

$0.6D+W+H$ **(Equation 16-14)**

$0.6D+0.7E+H$ **(Equation 16-15)**

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.

2. Delete without substitution:

~~**1605.3.2 Alternative basic load combinations.** In lieu of the basic load combinations specified in Section 1605.3.1, structures and portions thereof shall be permitted to be designed for the most critical effects resulting from the following combinations. When using these alternate basic load combinations that include wind or seismic loads, allowable stresses are permitted to be increased or load combinations reduced, where permitted by the material chapter of this code or the referenced standards. For load combinations that include the counteracting effects of dead and wind loads, only two-thirds of the minimum dead load likely to be in place during a design wind event shall be used. Where wind loads are calculated in accordance with Chapter 6 of ASCE 7, the coefficient ω in the following equations shall be taken as 1.3. For other wind loads, ω shall be taken as 1.0. When using these alternative load combinations to evaluate sliding, overturning and soil bearing at the soil-structure interface, the reduction of foundation overturning from Section 12.13.4 in ASCE 7 shall not be used. When using these alternative basic load combinations~~

~~for proportioning foundations for loadings, which include seismic loads, the vertical seismic load effect, E_v, in Equation 12.4-4 of ASCE 7 is permitted to be taken equal to zero.~~

~~$D + L + (L_r$ or S or $R)$~~ **(Equation 16-16)**

~~$D + L + (\omega W)$~~ **(Equation 16-17)**

~~$D + L + \omega W + S/2$~~ **(Equation 16-18)**

~~$D + L + S + \omega W/2$~~ **(Equation 16-19)**

~~$D + L + S + E/1.4$~~ **(Equation 16-20)**

~~$0.9D + E/1.4$~~ **(Equation 16-21)**

~~Exceptions:~~

1. ~~Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.~~
2. ~~Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.~~

~~1605.3.2.1 Other loads.~~ ~~Where F, H or T are to be considered in design, each applicable load shall be added to the combinations specified in Section 1605.3.2.~~

3. Revise as follows:

1806.1 Load combinations. The presumptive load-bearing values provided in Table 1806.2 shall be used with the allowable stress design load combinations specified in Section 1605.3. ~~The values of vertical foundation pressure and lateral bearing pressure given in Table 1806.2 shall be permitted to be increased by one-third where used with the alternative basic load combinations of Section 1605.3.2 that include wind or earthquake loads.~~

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. Most of the provisions being deleted were the product of a legacy code. They have not appeared in recent editions of ASCE 7 nor are they likely to appear in the 2010 edition.

The provisions of IBC Sections 1605.1 through 1605.3.1.2 for the load combinations using strength/LRDF design and the basic load combinations using allowable stress design are based on Chapter 2 of ASCE 7 (Combinations of Loads). The ASCE 7 Committee develops and maintains the provisions of Chapter 2 and has not chosen not to add provisions for alternative load combinations using allowable stress design into the standard. The differences between the basic and alternative load combinations are such that structural performance of buildings and other structures can be expected to differ depending on which set of load combinations using allowable stress design are utilized in the design. The ICC code development process does not provide the means for adequate deliberation over the merits of each set of load combinations using allowable stress design in providing adequate levels of public safety. This deliberation should be done by the ASCE 7 Committee.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S24-1605.1

S55–09/10
106.1, 1607.1.1

Proponent: Larry Brown, representing National Association of Home Builders

Delete Section 106, Relocate 106.1 to become 1607.1.1 as follows:

1607.1.1 ~~**106.1**~~ **Live loads posted.** Where the live loads for which each floor or portion thereof of a commercial or industrial building is or has been designed to exceed 50 psf (2.40 kN/m^2), such design live loads shall be conspicuously posted by the owner in that part of each *story* in which they apply, using durable signs. It shall be unlawful to remove or deface such notices

~~**106.2 Issuance of certificate of occupancy.** A certificate of occupancy required by Section 111 shall not be issued until the floor load signs, required by Section 106.1, have been installed.~~

(Moved to Section 109.2.1 in CCP ADM1-09/10)

~~106.3 Restriction on loading.~~ ~~It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a building, structure or portion thereof, a load greater than is permitted by this code.~~
(Moved to Section 102.11.2 in CCP ADM1-09/10)

Reason: The requirements for the actual determination and posting of the live load is better suited to be located with the actual provisions related to these live loads that are located in IBC Section 1607.1.1. This relocation of Section 106.41is similar to the provisions for Smoke Control Systems in Section 909.19, and a Change of Occupancy in Section 3408.2, both relative to the issuance of a Certificate of Occupancy.

Also, as show in a related proposed change, the requirement on restriction on loading of current Section 106.3 are moved to Section 102.11.2 (Specific application of the IBC), and the provisions on the issuance of a Certificate of Occupancy is located from Section 106.2 to Section 109.2 (Certificate of Completion and Occupancy).

Cost Impact: This code change proposal will not increase the cost of construction.

Note: Consideration in this code change proposal is for relocation of Section 106.1 to Section 1607.1.1. The relocation of Section s 106.2 to 109.2.1 and 106.3 to 102.11.2 are proposed for consideration by the Administrative Code Development Committee in CCC ADM1-09/10, and are shown for information only.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-S1-ITEM_#3_IBC_106_MOVED

S56-09/10
1603.1.3, Table 1607.1

Proponent: Philip Brazil, PE, SE, representing self

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
16. Garages (passenger vehicles only)	40	Note a
Trucks and buses	See Section	1607.6
Piled snow (from snow removal operations)	Note m	

(No changes to the remaining Table)

(No change to footnotes a through l)

m. Piled snow from snow removal operations shall be based on a density of 40 pounds per cubic foot and anticipated maximum depths subject to the approval of the building official.

1603.1.3 Roof snow load. The ground snow load, P_g, shall be indicated. In areas where the ground snow load, P_g, exceeds 10 pounds per square foot (psf) (0.479 kN/m^2), the following additional information shall also be provided, regardless of whether snow loads govern the design of the roof:

1. Flat-roof snow load, P_f.
2. Snow exposure factor, C_e.
3. Snow load importance factor, I.
4. Thermal factor, C_t.
5. Piled snow load from snow removal operations (see Table 1607.1).

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LLSC-LL-4, which has been approved by the Live Load Subcommittee. It is expected that the Main Committee will ballot and approve the proposal. The specified density is based on case histories primarily conducted in the northeast region of the United States. The snow was typically piled using a utility vehicle or a truck with an attached plow. The density was either directly determined through measurements or derived based on the expected failure load. The observed densities ranged form 25 to 46 pcf.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC RESIDENTIAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES

Part I—IBC Structural:

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
27. Residential		
One- and two-family dwellings		
Uninhabitable attics without storage [i]	10	
Uninhabitable attics with ~~limited~~ storage [i, j, k]	20	
Habitable attics and sleeping areas [k]	30	–
All other areas	40	
Hotels and multiple-family dwellings		
Private rooms and corridors serving them	40	
Public rooms and corridors serving them	100	

(No changes to the remaining Table not shown)

(No change to footnotes a through h)

I. Uninhabitable attics without storage are those where the maximum clear height between the joist and rafter is less than 42 inches, or where there are not two or more adjacent trusses with ~~the same~~ web configurations capable of ~~containing a~~ accommodating an assumed rectangle 42 inches ~~high~~ in height by ~~2 feet wide~~ 24 inches in width, or greater, ~~located~~ within the plane of the trusses. ~~For attics without storage~~, This live load need not be assumed to act concurrently with any other live load requirements.

j. ~~For~~ Uninhabitable attics with ~~limited~~ storage ~~and constructed with trusses, this live load need only be applied to those portions of the bottom chord~~ are those where the maximum clear height between the joist and rafter is 42 inches or greater, or where there are two or more adjacent trusses with ~~the same~~ web configurations ~~containing a~~ capable of accommodating an assumed rectangle 42 inches ~~high~~ in height by ~~2 feet wide~~ 24 inches in width, or greater, ~~located~~ within the plane of the trusses. ~~The rectangle shall fit between the top of the bottom chord and the bottom of any other truss member, provided that each of the following criteria is met~~

At the trusses, the live load need only be applied to those portions of the bottom chords where both of the following conditions are met:

i. The attic area is accessible ~~by a pull-down stairway or framed opening in accordance with Section 1209.2~~ from an opening not less than 20 inches in width by 30 inches in length that is located where the clear height in the attic is a minimum of 30 inches; and

ii. The slopes of the truss ~~shall have a~~ bottom chords ~~pitch less than 2:12~~ are no greater than 2 units vertical to 12 units horizontal.

~~iii.~~ The remaining portions of the bottom chords ~~of trusses~~ shall be designed for ~~the greater of actual imposed dead load or 10 psf,~~ a uniformly distributed ~~over the entire span~~ concurrent live load of not less than 10 lb/ft^2.

k. Attic spaces served by ~~a fixed stair~~ stairways other than pull-down type shall be designed to support the minimum live load specified for habitable attics and sleeping rooms.

(No change to footnote l)

Part II: IRC

Revise as follows:

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
(in pounds per square foot)

USE	LIVE LOAD
Uninhabitable attics without storage [b]	10
Uninhabitable attics with ~~limited~~ storage [b, g]	20
Habitable attics and attics served with fixed stairs	30

(No changes to the remaining Table not shown)

(No change to footnote a)

b. Uninhabitable attics without storage are those where the maximum clear height between the joist and rafter is less than 42 inches, or where there are not two or more adjacent trusses with ~~the same~~ web configurations capable of ~~containing a~~ accommodating an assumed rectangle 42 inches ~~high~~ in height by ~~2 feet wide~~ 24 inches in width, or greater, ~~located~~ within the plane of the trusses. ~~For attics without storage,~~ This live load need not be assumed to act concurrently with any other live load requirements.

(No change to footnotes c through f)

g. ~~For~~ Uninhabitable attics with ~~limited~~ storage ~~and constructed with trusses, this live load need be applied only to those portions of the bottom chord~~ are those where the maximum clear height between the joist and rafter is 42 inches or greater, or where there are two or more adjacent trusses with ~~the same~~ web configurations ~~containing a~~ capable of accommodating an assumed rectangle 42 inches ~~high or greater~~ in height by ~~2 feet wide~~ 24 inches in width, or greater, ~~located~~ within the plane of the trusses. ~~The rectangle shall fit between the top of the bottom chord and the bottom of any other truss member, provided that each of the following criteria is met~~

At the trusses, the live load need only be applied to those portions of the bottom chords where all of the following conditions are met:

1. The attic area is accessible ~~by a pull-down stairway or framed opening in accordance with Section R807.1~~ from an opening not less than 20 inches in width by 30 inches in length that is located where the clear height in the attic is a minimum of 30 inches.
2. The slopes of the truss ~~has a~~ bottom chords ~~pitch less than 2:12~~ are no greater than 2 units vertical to 12 units horizontal.
3. Required insulation depth is less than the bottom chord member depth.

The remaining portions of the bottom chords ~~of trusses meeting the above criteria for limited storage~~ shall be designed for ~~the greater of the actual imposed dead load or 10 psf,~~ a uniformly distributed ~~over the entire span~~ concurrent live load of not less than 10 lb/ft^2.

(No change to footnote h)

Reason: The purpose for this proposal is to correlate the IBC and IRC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LLSC-LL-9, which has been approved by the Live Load Subcommittee and is being balloted by the Main Committee (Item #5 of the Second Main Committee Ballot on Live/Dead Load Provisions). It is expected that the Main Committee will approve the proposal.
The changes are seen as largely editorial. In Footnotes (i) and (j), the threshold that is based on a 24-inch by 42-inch rectangular is changed to an assumed condition (rather than an actual one), which is considered more appropriate for a building code requirement.
In Footnote (j), the reference to "a pull-down stairway or framed opening in accordance with Section 1209.2" is replaced with minimum opening dimensions that are consistent with IBC Section 1209.2 on openings to attic areas. These dimensions are objective and considered more appropriate for a building code requirement, whereas "pull-down stairway" and "framed opening" are considered vague and subject to a wide variation in interpretation.

In Footnote (k), the reference to a "fixed stair" is changed to "stairways other than pull-down type" in conjunction with the deletion of "pull-down type stairway" in Footnote (j) and for consistency with the definitions of "stair" and "stairway" in Section 1002.1. These definitions apply to all instances of the terms throughout the IBC. "Stair" is a "change in elevation consisting of one or more risers." "Stairway" is "one or more flights of stairs…with the necessary landings and platforms connecting them to form a continuous and uninterrupted passage form one level to another" and is the better choice for the footnote. The change will revise the footnote to better convey its intent: require an otherwise uninhabitable attic to be designed for live loads specified for habitable attics where the attic is served by a stairway that could enable it become occupiable. The current threshold of "fixed stair" before design for live loads specified for habitable attics is required is considered vague and subject to a wide variation in interpretation.

In Table 1607.1 and Footnote (j), "limited" at uninhabitable attics with storage is considered superfluous and is deleted. The three categories of uninhabitable attics without storage, uninhabitable attics with storage and habitable attics are sufficiently clear to account for all design conditions. Retaining "limited" begs the question: what is an uninhabitable attic with more than limited storage?

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II- IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: Brazil-S3-T1607.1

S58–09/10
Table 1607.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
4. Assembly areas and theaters		
Fixed seats (fastened to floor)	60	
~~Follow spot, projections and control rooms~~	~~50~~	
Lobbies	100	–
Movable seats	100	
Stages ~~and~~	~~125~~ 150	
Platforms	100	
Other assembly areas	100	

(Portions of Table not shown, remain unchanged)

Reason The primary purpose for this proposal is to align IBC Table 1607.1 with Table 4-1 of ASCE 7, which specifies separate live loads of 150 psf for stages and 100 psf for platforms in assembly areas. Follow spot, projection and control rooms are being deleted from Table 1607.1 because they are not listed in Table 4-1 of ASCE 7 and a uniform live load of 60 psf for projection rooms conflicts with Table C4-1 of ASCE-7, which specifies a uniform live load of 100 psf. With these changes, the items under "assembly areas" in Table 1607.1 will be within the scope of areas within assembly occupancies where live loads due to assembly use are warranted. There are areas of buildings with assembly occupancies, such as control rooms and dressing rooms, where classification as assembly occupancies are not warranted. Such areas are not listed with "assembly areas" in Table 4-1 of ASCE 7 and will no longer be listed with "assembly areas" in IBC Table 1607.1.

A separate proposal correlates the IBC with changes to the provisions of ASCE 7-10 where reduction of live loads at floors and occupied roofs is restricted or prohibited. That proposal adds Footnote (m) to all the uniform live loads under assembly areas in Item #4 of Table 1607.1 except follow spot, projection and control rooms. The addition of the footnote is not repeated in this proposal but, should this proposal and the proposal adding the footnote be approved by the membership, the proponent intends that Footnote (m) be specified with each uniform live load at Item #4 in Table 1607.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Brazil-S16-T1607.1

S59–09/10
Table 1607.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
35. ~~Stairs and exits~~ Stairways and ramps		Note f
One- and two-family dwellings	40	
All other	100	
39. Walkways and elevated platforms (other than ~~exitways~~ means of egress)	60	–

(Portions of Table not shown, remain unchanged)

Reason: The purpose for this proposal is to more clearly identify the live loads required for components of the means of egress, including corridors, stairways and ramps. In Item 35, "stair" does not account for landings to or from, or intermediate landings between, flights of stairs. In Section 1002.1, "stair" is defined as a "change in elevation consisting of one or more risers" and "stairway" is defined as "one or more flights of stairs…with the necessary landings and platforms connecting them to form a continuous and uninterrupted passage form one level to another." Stairway is a more technically sound choice.

Also in Item 35, “exit” is one of three components of the means of egress along with the exit access and exit discharge. The distinction between them is related to the requirements of Chapter 10 for the means of egress, not live loads. In Item 39, “exitway” has no technical meaning and is too easily confused with corridors whose live loads are typically required to be the same as the occupancy served.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S44-T1607.1

S60–09/10

1605.2.1, Table 1607.1, 1607.9.1, 1607.9.1.4, 1607.9.2, 1607.11.2.2

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Revise as follows:

1605.2.1 Basic load combinations. Where strength design or load and resistance factor design is used, structures and portions thereof shall resist the most critical effects from the following combinations of factored loads:

1.4 (*D* + *F)*	**(Equation 16-1)**
1.2 (*D* + *F* + *T)* + 1.6 (*L* + *H)* + *0.5 (*L_r *or S or R*)	**(Equation 16-2)**
1.2 *D* + 1.6 (L_r or *S* or *R*) + (f_1 *L* or 0.8 *W*)	**(Equation 16-3)**
1.2 *D* + 1.6 *W* + f_1 *L* + 0.5 (L_r or *S* or *R*)	**(Equation 16-4)**
1.2 *D* + 1.0 *E* + f_1 *L* + f_2 *S*	**(Equation 16-5)**
0.9 *D* + 1.6 *W* + 1.6 *H*	**(Equation 16-6)**
0.9 *D* + 1.0 *E* + 1.6 *H*	**(Equation 16-7)**

where:

f_1 = 1 for floors in ~~places of public~~ assembly areas and recreational uses (see Table 1607.1), for live loads, *L*, in excess of 100 pounds per square foot (4.79 kN/m^2), and for ~~parking~~ floors in passenger vehicle garages ~~live load~~; and

= 0.5 for other live loads, *L*.

f_2 = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure; and

= 0.2 for other roof configurations.

Exception: Where other factored load combinations are specifically required by the provisions of this code, such combinations shall take precedence.

(Portions of table not shown are unchanged)

c. Design in accordance with the ICC 300.
m. Live load reduction is not permitted unless specific exceptions of Section 1607.9 apply.

(Footnotes not shown are unchanged)

1607.9.1 General. Subject to the limitations of Sections 1607.9.1.1 through ~~1607.9.1.4~~ 1607.9.1.3 and Table 1607.1, members for which a value of $K_{LL} A_T$ is 400 square feet (37.16 m^2) or more are permitted to be designed for a reduced live load in accordance with the following equation:

$$L = L_o \left[0.25 + \frac{4.57}{\sqrt{K_{LL} A_T}}\right]$$

$$In\ SI: L = L_o \left[0.25 + \frac{4.57}{\sqrt{K_{LL} A_T}}\right]$$

(Equation 16-22)

where:

L = Reduced design live load per square foot (meter) of area supported by the member.
L_o = Unreduced design live load per square foot (meter) of area supported by the member (see Table 1607.1).
K_{LL} = Live load element factor (see Table 1607.9.1).
A_T = Tributary area, in square feet (square meters).

L shall not be less than 0.50 L_o for members supporting one floor and L shall not be less than 0.40 L_o for members supporting two or more floors.

2. Delete without substitution:

~~**1607.9.1.4 Group A occupancies.** Live loads of 100 psf (4.79 kN/m^2) and at areas where fixed seats are located shall not be reduced in Group A occupancies.~~

3. Revise as follows:

1607.9.2 Alternate floor live load reduction. As an alternative to Section 1607.9.1 and subject to the limitations of Table 1607.1, floor live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

~~1.~~ ~~A reduction shall not be permitted in Group A occupancies.~~
~~2~~ 1. A reduction shall not be permitted when the live load exceeds 100 psf (4.79 kN/m^2) except that the design live load for members supporting two or more floors is permitted to be reduced by 20 percent.

Exception: For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.

~~3~~ 2. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.
~~4~~ 3. For live loads not exceeding 100 psf (4.79 kN/m^2), the design live load for any structural member supporting 150 square feet (13.94 m^2) or more is permitted to be reduced in accordance with Equation 16-23.
~~5~~ 4. For one-way slabs, the area, A, for use in Equation 16-23 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.

$R = 0.08\,(A - 150)$ **(Equation 16-23)**
For SI: $R = 0.861\,(A - 13.94)$

Such reduction shall not exceed the smallest of:

1. 40 percent for horizontal members,
2. 60 percent for vertical members, or
3. R as determined by the following equation:

$R = 23.1\,(1 + D / L_o)$ **(Equation 16-24)**

where:

A = Area of floor supported by the member, square feet (m^2).
D = Dead load per square foot (m^2) of area supported.
L_o = Unreduced live load per square foot (m^2) of area supported.
R = Reduction in percent.

1607.11.2.2 Special-purpose roofs. Roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes, and marquees, shall be designed for a minimum live load, L_o, as specified in Table 1607.1. Such live loads are permitted to be reduced in accordance with Section 1607.9. ~~Live loads of 100 psf or more at areas of roofs classified as Group A occupancies shall not be reduced.~~

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposals LLSC-LL9 and LLSC-LL11, which were approved by the Live Load Subcommittee and are being balloted by the Main Committee (Items #5 and #6 of the Second Main Committee Ballot on Live/Dead Load Provisions). It is expected that the Main Committee will approve the proposals.

The proposal focuses on correlating the IBC with changes to the provisions of ASCE 7-10 where reduction of live loads at floors and occupied roofs is restricted or prohibited. The applicable provisions in the IBC are currently located in Section 1607.9. Reduction of live loads is typically permitted except for live loads exceeding 100 psf, in passenger vehicle garages, and in Group A occupancies where the live load is 100 psf or where fixed seats are located. There are exceptions for members supporting two or more floors where the live load exceeds 100 psf or in passenger vehicle garages but the reduction is limited to 20 percent. The corresponding provisions in ASCE 7-05 are nearly identical except that Group A occupancies are identified as assembly occupancies.

The proposal adds a footnote to Table 1607.1 that prohibits live load reduction "unless specific exceptions of Section 1607.9 apply." The footnote is specified at each use or occupancy in Table 1607.1 where live load reduction is to be restricted. With the addition of this footnote, Table 1607.1 will contain limitations on live load reduction and references to Table 1607.1 are added to Sections 1607.9.1 and 1607.9.2 to correlate with the footnote. Section 1607.9.1.4 (basic live load reduction), Item #1 of Section 1607.9.2 (alternative live load reduction), and the last sentence of Section 1607.11.2.2, on Group A occupancies are deleted because their purpose is supplanted by the changes to Table 1607.1. Sections 1607.9.1.2 and 1607.9.1.3 (basic live load reduction) and Items #2 and #3 of Section 1607.9.2 (alternative live load reduction) are retained because they specify exceptions to Section 1607.9 that the proposed footnote of Table 1607.1 references.

These changes will clarify where live load reduction is prohibited or restricted by effectively specifying the requirement at each applicable use or occupancy in Table 1607.1 and they will align the applicable provisions of IBC Section 1607 with the corresponding provisions in Chapter 4 of ASCE 7-10. The change will also eliminate reliance on occupancy classification (Group A), which is not related to structural design but to fire- and life-safety regulations, for determination of whether live load reduction is permitted.

The proposal also consolidates several separately listed items in Table 1607.1 into a single category of recreational use and will align the table with Table 4-1 of ASCE 7-10. This is seen as simplifying the data in the table by grouping similar uses together. With respect to this consolidation, Section 1607.9.1.4 (basic live load reduction) and Item #1 of Section 1607.9.2 (alternative live load reduction) currently prohibit live load reduction in areas of Group A occupancies as noted above. IBC Section 303.1 lists bowling alleys, dance halls, gymnasiums, and pool and billiard parlors as Group A-3 occupancies; arenas and skating rinks as Group A-4 occupancies; and bleachers, grandstands and stadiums as Group A-5 occupancies.

Skating rinks are deleted from Table 1607.1 rather than being an item under "recreational uses" in Table 1607.1 because it is not listed in Table 4-1 of ASCE 7 and it conflicts with Table C4-1 of ASCE-7, which specifies uniform live loads of 250 psf for ice skating rinks and 100 psf for roller skating rinks.

The application of a value of 1.0 for f_1 in Section 1605.2.1 is revised for consistency with the other changes in this proposal. The notation for "L" is added to make it clear that roof live load, L_r, is not intended.

This proposal was prepared in conjunction with a proposal to editorially correlate IBC Section 1607 with Chapter 4 of ASCE 7-10 and is intended to further revise Section 1607 without any overlapping or conflicting changes between the two proposals.

A separate proposal also revises Item 4 of Table 1607.1 with respect to the live loads. These revisions are not repeated in this proposal but, should both proposals be approved by the membership, the proponent intends that Footnote (m) be specified for the uniform live loads at stages and platforms.

A separate proposal also revises Item 29 of Table 1607.1 in conjunction with correlating the IBC with changes to the provisions of ASCE 7-10 where reduction of live loads at floors and occupied roofs is restricted or prohibited. These revisions are not repeated in this proposal but, should both proposals be approved by the membership, the proponent intends that Footnote (m) be specified for the uniform live load at roofs used for assembly purposes but that all other changes to Item 29 in this proposal be disregarded.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Brazil-S45-T1607.1

S61–09/10
Table 1607.1; IRC Table R301.5

Proponent: Gary Ehrlich, PE, National Association of Home Builders (NAHB)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS[g]

(Table remains unchanged)

(No change to footnotes a through i)

j. For attics with limited storage ~~and constructed with trusses~~, this live load need only be applied to those portions of the ceiling joist or the truss bottom chord where there are two or more adjacent trusses or rafter/ceiling joist assemblies with the same web member or purlin brace, rafter tie, or collar tie configuration capable of containing a rectangle 42 inches high by 2 feet wide or greater, located within the plane of the truss or rafter/ceiling joist assembly. The rectangle shall fit between the top of the bottom chord and the bottom of any other truss member, or the top of ceiling joist and bottom of any other roof framing member, provided that each of the following criteria is met:

i. The attic area is accessible by a pull-down stairway or framed opening in accordance with Section 1209.2, and

ii. The truss shall have a bottom chord pitch less than 2:12.
iii. Bottom chords of trusses shall be designed for the greater of actual imposed dead load or 10 psf, uniformly distributed over the entire span.

(No change to footnotes k and l)

PART II – IRC BUILDING/ENERGY

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
(in pounds per square foot)
(Table remains unchanged)

(No change to footnotes a through f)

g. For attics with limited storage ~~and constructed with trusses~~, this live load need be applied only to those portions of the ceiling joist or the truss bottom chord where there are two or more adjacent trusses or rafter/ceiling joist assemblies with the same web member or purlin brace, rafter tie, or collar tie configuration capable of containing a rectangle 42 inches high by 2 feet wide or greater, located within the plane of the truss or rafter/ceiling joist assembly. The rectangle shall fit between the top of the bottom chord and the bottom of any other truss member, or the top of ceiling joist and bottom of any other roof framing member, provided that each of the following criteria is met:
1. The attic area is accessible by a pull-down stairway or framed opening in accordance with Section 807.1.
2. The truss shall have a bottom chord pitch, or the ceiling joist shall have a slope, less than 2:12.
3. Required insulation depth is less than the bottom chord member or ceiling joist depth.

Bottom chords of trusses, and ceiling joists, meeting the above criteria for limited storage shall be designed for the greater of actual imposed dead load or 10 psf, uniformly distributed over the entire span.

(No change to footnote h)

Reason: (IBC) The purpose of this proposal is to allow the relaxed attic storage live load requirement to be applied to roof rafter/ceiling joist assemblies as well as trusses. Rafter/ceiling joist assemblies constructed in accordance with either Section 2308.10.4 are required to have collar ties (per Section 2308.10.4.1) and may have rafter ties (also per Section 2308.10.4.1) and purlin braces (per Section 2308.10.5). Similar requirements would apply for a roof assembly constructed in accordance with the AF&PA WFCM. It is possible these conventionally-framed assemblies can meet the same geometric criteria applied in footnote "f" for trusses. Therefore, it makes sense to permit the same relaxation to be applied to rafter/ceiling joist assemblies. This may be particularly useful in renovations where it is desired to add access to an existing attic, which might otherwise trigger extensive strengthening or replacement of the ceiling joists.
(IRC) The purpose of this proposal is to allow the relaxed attic storage live load requirement to be applied to roof rafter/ceiling joist assemblies as well as trusses. Rafter/ceiling joist assemblies constructed in accordance with Section R802 are required to have collar ties (per Section R802.3.1) and may have rafter ties (per Section R802.3.1) and purlin braces (per Section R802.5.1). It is possible these conventionally-framed assemblies can meet the same geometric criteria applied in footnote "g" for trusses. Therefore, it makes sense to permit the same relaxation to be applied to rafter/ceiling joist assemblies. This may be particularly useful in renovations where it is desired to add access to an existing attic, which might otherwise trigger extensive strengthening or replacement of the ceiling joists.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ehrlich-S2-T1607 1

S62–09/10
Table 1607.1; IRC Table R301.5

Proponent: John England, MCO, England Enterprises Inc., representing self

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS[g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
5. Balconies (exterior) and decks[h]	~~Same as occupancy served~~ 60 minimum or same as occupancy served-whichever is greater	—

(Portions of table not shown remain unchanged)
(No change to footnotes)

PART II – IRC BUILDING/ENERGY

Revise as follows:

TABLE R310.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
(in pounds per square foot)

USE	LIVE LOAD
Balconies (exterior) and decks[e]	~~40~~ 60

(Portions of table not shown remain unchanged)
(No change to footnotes)

Reason: Decks have been collapsing in residential occupancies and a 60# live load is not unreasonable. Hot tubs, and large groups of people are on decks having parties --the 60# live load will provide more life safety to the occupants on the decks

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Revise text as follows:

SECTION 202
DEFINITIONS

AWNING. An architectural projection that provides weather protection, identity or decoration and is partially or wholly supported by the building to which it is attached. An *awning* is comprised of a lightweight frame structure over which a covering is attached

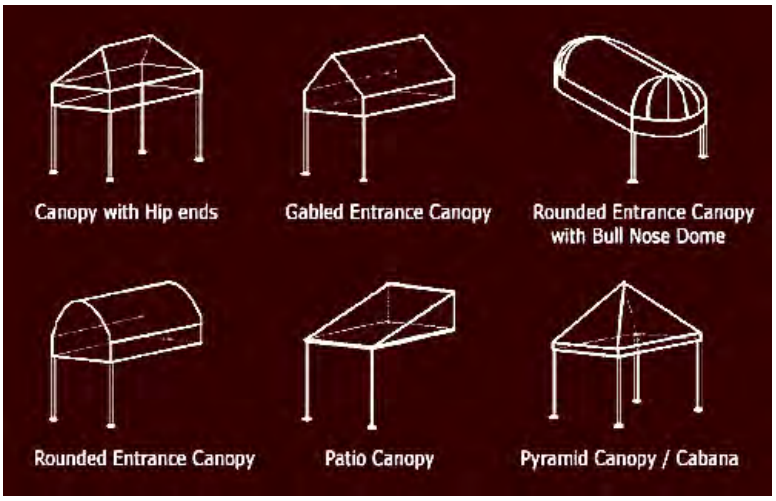
CANOPY. A permanent structure or architectural projection of rigid construction over which a covering is attached that provides weather protection, identity or decoration.~~,~~ A canopy is permitted to ~~and shall~~ be structurally independent or supported by attachment to a building ~~on one end and by not less than one stanchion on the outer end~~ on one or more sides. Canopies shall be sloped more than 25 degrees from the horizontal or so constructed so as to inhibit access other than for maintenance functions.

CORNICE. A projection at the top of a wall or a projecting element over an architectural feature, such as a doorway. Portions of a cornice which are sloped less than 25 degrees from the horizontal and are less than 10 feet (3.05 m) above the ground, more than 10 feet (3.05 m) below an adjacent roof, or located less than 10 feet (3.05 m) from operable openings above or adjacent to the level of the cornice, shall be designed for the live load from Table 1607.1.

MARQUEE. A permanent roofed structure attached to and supported by the building on one or more sides ~~and~~ that ~~projects into the public right-of-way~~ has a top surface which is sloped less than 25 degrees from the horizontal. A marquee shall be less than 10 feet (3.05 m) above the ground, more than 10 feet (3.05 m) below an adjacent roof, or located less than 10 feet (3.05 m) from operable openings above or adjacent to the level of the marquee.

Reason: The current definitions for Awning, canopy and marquee are not adequate.

Lightweight, fabric covered, frame structures also have stanchion(s), in which case the awning definition would not apply. This doesn't make them canopies. Awnings are listed in Table 1607.1, Item 11 with a live load of 5 psf.



Architectural projections of rigid construction over which a covering is attached don't always have stanchion(s). If they do not, they are not defined in the IBC. What if, instead of a stanchion, the canopy cantilevers from the building, or has a hanger rod, chain or cable suspension system?

Copywrited MMP

Cornices are not defined in the IBC, yet they are listed in Table 1607.1, Item 11 with a live load of 60 psf.

Currently, a Marquee must project over the public right-of-way. It is listed in Table 1607.1, Item 24 with a live load of 75 psf. If it doesn't project over the public right-of-way, what is it and what live load should it be designed for? The chapter-by-chapter synopsis for Chapter 32 on page xii of the 2009 IBC notes that "steps, columns, awnings, canopies, marquees, signs, windows, balconies and similar architectural features above grade" can all encroach into the public right-of-way. This effectively negates the definition of a marquee.

With these problems, the definitions in the IBC are not enforceable.

The definition of an "Awing" is retained. However, it can now have a stanchion. The proposed definition, which is tied to a 5 psf live load in Table 1607.1, is now keyed to the lightweight frame structure.

The definition of a "Canopy" is retained. However, instead of relying on a stanchion for its defining characteristic, it is defined by its permanent, rigid construction and its function of providing weather protection, identity or decoration.

From the position of structural engineers, architects and building officials, these definitions need to be able to be tied to Table 1607.1. The proposed revisions do this and include a discernable intent to allow for better code interpretation for other, undefined situations.

That is, when the canopy is like a roof, it is designed for 20 psf, like a roof structure. If a canopy, marquee or cornice has a reasonably flat surface, and is accessible, such as by a short ladder or an operable opening, so that the public might be inclined to get onto it, then it should be designed for a more robust live load.

Cost Impact: This code change proposal will not increase the cost of construction.

S64–09/10
202, Table 1607.1

Proponent: Edwin Huston, National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee

Revise as follows:

SECTION 202
DEFINITIONS

AWNING. An architectural projection that provides weather protection, identity or decoration and is partially or wholly supported by the building to which it is attached. An *awning* is comprised of a lightweight frame structure over which a covering is attached

CANOPY. A permanent structure or architectural projection of rigid construction over which a covering is attached that provides weather protection, identity or decoration.~~,~~ A canopy is permitted to ~~and shall~~ be structurally independent or supported by attachment to a building ~~on one end and by not less than one stanchion on the outer end~~ on one or more sides. Canopies shall be sloped more than 25 degrees from the horizontal or so constructed so as to inhibit access other than for maintenance functions.

CORNICE. A projection at the top of a wall or a projecting element over an architectural feature, such as a doorway.

MARQUEE. A permanent roofed structure attached to and supported by the building on one or more sides ~~and projects into the public right-of-way~~.

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS[g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
11. Cornices[m]	60	—
24. Marquees[n]	75	—

(Remainder of Table remains unchanged)

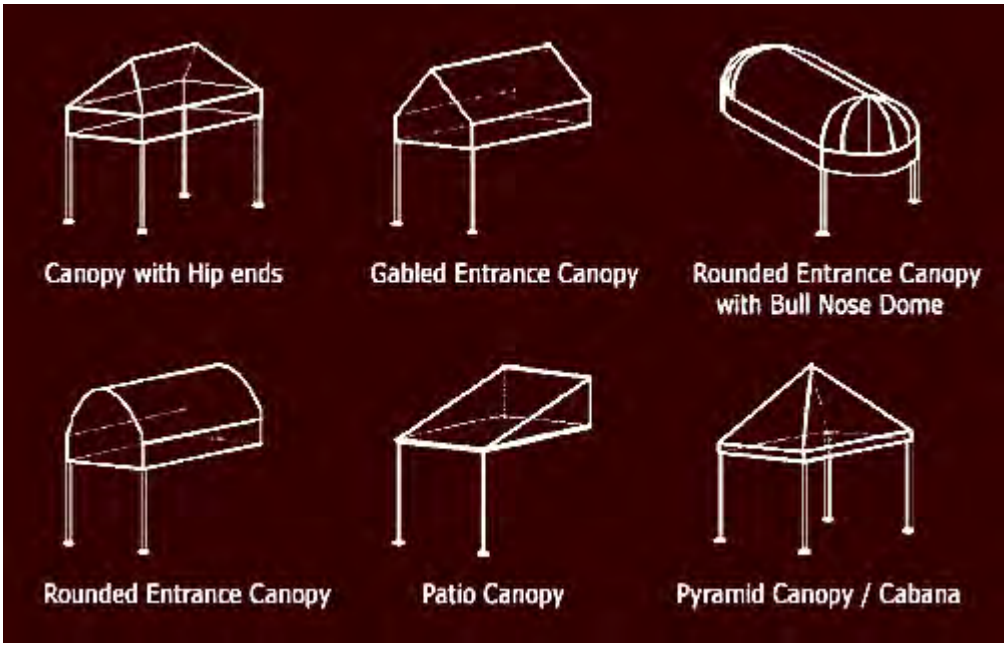
a. through l. (No change to text.)

m. Imposed live load for portions of a cornice which are sloped less than 25 degrees from the horizontal and are less than 10 feet above the ground, more than 10 feet below an adjacent roof, or located less than 10 feet from operable openings above or adjacent to the level of the cornice, shall be designed for the live load from Table 1607.1.

n. Imposed live load for portions of a marquee which are sloped less than 25 degrees from the horizontal. A marquee shall be less than 10 feet above the ground, more than 10 feet below an adjacent roof, or located less than 10 feet from operable openings above or adjacent to the level of the marquee.

Reason: The current definitions for Awning, canopy and marquee are not adequate.

Lightweight, fabric covered, frame structures also have stanchion(s), in which case the awning definition would not apply. This doesn't make them canopies. Awnings are listed in Table 1607.1, Item 11 with a live load of 5 psf.



Architectural projections of rigid construction over which a covering is attached don't always have stanchion(s). If they do not, they are not defined in the IBC. What if, instead of a stanchion, the canopy cantilevers from the building, or has a hanger rod, chain or cable suspension system?

Copywrited MMP

Cornices are not defined in the IBC, yet they are listed in Table 1607.1, Item 11 with a live load of 60 psf.

Currently, a Marquee must project over the public right-of-way. It is listed in Table 1607.1, Item 24 with a live load of 75 psf. If it doesn't project over the public right-of-way, what is it and what live load should it be designed for? The chapter-by-chapter synopsis for Chapter 32 on page xii of the 2009 IBC notes that "steps, columns, awnings, canopies, marquees, signs, windows, balconies and similar architectural features above grade" can all encroach into the public right-of-way. This effectively negates the definition of a marquee.

With these problems, the definitions in the IBC are not enforceable.

The definition of an "Awing" is retained. However, it can now have a stanchion. The proposed definition, which is tied to a 5 psf live load in Table 1607.1, is now keyed to the lightweight frame structure.

The definition of a "Canopy" is retained. However, instead of relying on a stanchion for its defining characteristic, it is defined by its permanent, rigid construction and its function of providing weather protection, identity or decoration.

From the position of structural engineers, architects and building officials, these definitions need to be able to be tied to Table 1607.1. The proposed revisions do this and include a discernable intent to allow for better code interpretation for other, undefined situations.

That is, when the canopy is like a roof, it is designed for 20 psf, like a roof structure. If a canopy, marquee or cornice has a reasonably flat surface, and is accessible, such as by a short ladder or an operable opening, so that the public might be inclined to get onto it, then it should be designed for a more robust live load. This version of this code change proposal accomplishes this through footnotes to Table 1607.1.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HUSTON-S6-Table 1607.1

S65–09/10
Table 1607.1

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building Components Association (SBCA)

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS[g]
(Portions of table and footnotes not shown remain unchanged)

j. For attics with limited storage and constructed with trusses, this live load need only be applied to those portions of the bottom chord where there are two or more adjacent trusses with the same web configuration capable of containing a rectangle 42 inches high by 2 feet wide or greater, located within the plane of the truss. The rectangle shall fit between the top of the bottom chord and the bottom of any other truss member, provided that each of the following criteria is met:

i. The attic area is accessible by a pull-down stairway or framed opening in accordance with Section 1209.2 and
ii. The truss shall have a bottom chord pitch less than 2:12, and
iii. Required insulation depth is less than the bottom chord member depth.

Bottom chords of trusses meeting the above criteria for limited storage shall be designed for the greater of actual imposed dead load or 10 psf, uniformly distributed over the entire span.

Reason: The purpose of the code change is to update the code language in the IBC by harmonizing it with the language currently in the IRC. Table R301.5, footnote g states:

For attics with limited storage and constructed with trusses, this live load need be applied only to those portions of the bottom chord where there are two or more adjacent trusses with the same web configuration capable of containing a rectangle 42 inches high or greater by 2 feet wide or greater, located within the plane of the truss. The rectangle shall fit between the top of the bottom chord and the bottom of any other truss member, provided that each of the following criteria is met.

1. The attic area is accessible by a pull-down stairway or framed in accordance with Section R807.1.
2. The truss has a bottom chord pitch less than 2:12.
3. Required insulation depth is less than the bottom chord member depth.

The bottom chords of trusses meeting the above criteria for limited storage shall be designed for the greater of the actual imposed dead load or 10 psf, uniformly distributed over the entire span.

Cost Impact: This proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS[g]
(No changes to the Table)

(No change to footnotes a through i)

j. For attics with limited storage and constructed with trusses, this live load need only be applied to those portions of the bottom chord where there are two or more adjacent trusses with the same web configuration capable of containing a rectangle 42 inches high by 2 feet wide or provided that each of the following criteria is met:
   i. The attic area is accessible by a pull-down stairway or framed opening in accordance with Section 1209.2 and
   ii. The truss shall have a bottom chord pitch less than 2:12.
   ~~iii.~~ Bottom chords of trusses meeting the above criteria for limited storage shall be designed ~~for the greater of actual imposed dead load or 10 psf, uniformly distributed over the entire span~~ in accordance with Section 1606.2.

(No change to footnotes l and l)

PART II – IRC BUILDING/ENERGY

Revise as follows:

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
(in pounds per square foot)

(Portions of table not shown remain unchanged)

(No change to footnotes a through f)

g. For attics with limited storage and constructed with trusses, this live load need be applied only to those portions of the bottom chord where there are two or more adjacent trusses with the same web configuration capable of containing a rectangle 42 inches high or greater by 2 feet wide or greater, located within the plane of the truss. The rectangle shall fit between the top of the bottom chord and the bottom of any other truss member, provided that each of the following criteria is met:
   1. The attic area is accessible by a pull-down stairway or framed opening in accordance with Section R807.1.
   2. The truss has a bottom chord pitch less than 2:12.
   3. Required insulation depth is less than the bottom chord member depth.

   The bottom chords of trusses meeting the above criteria for limited storage shall be designed ~~for the greater of the actual imposed dead load or 10 psf, uniformly distributed over the entire span.~~ in accordance with Section R301.4

(No change to footnotes h and i)

Reason:
PART I- The requirement for a minimum 10 pound load is contrary to Section 1606.2 which requires buildings to be designed for the actual dead load imposed.

1606.2 Design dead load. For purposes of design, the actual weights of materials of construction and fixed service equipment shall be used. In the absence of definite information, values used shall be subject to the approval of the building official.

Trusses should not be subject to different loading conditions than other building elements. Accepted engineering practice and the building code already stipulate that the use of the actual dead loads is appropriate.

PART II- The requirement for a minimum 10 pound load is unnecessary and places attics with limited storage and constructed with trusses at a competitive disadvantage with other framing methods. Section R301.4 requires the use of actual dead loads.

R301.4 Dead load. The actual weights of materials and construction shall be used for determining dead load with consideration for the dead load of fixed service *equipment*.

Trusses should not be subject to different loading conditions than other framing methods. Accepted engineering practice and the building code already stipulate the use of the actual dead loads is appropriate.

Cost Impact: This code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WAINRIGHT-S2-1607.1

S67–09/10

1602.1, 1607.4, 1607.7.1-1607.7.1.2, 1607.7.2, 1607.7.3, 1607.8, 1607.9.1, 1607.10, 1607.11.2.1, 1607.11.2.2, 1607.12.3, Table 1607.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

VEHICLE BARRIER SYSTEM. A system of ~~building~~ components near open sides of a garage floor or ramp or building walls that act as restraints for vehicles.

1607.4 Concentrated loads. Floors and other similar surfaces shall be designed to support the uniformly distributed live loads prescribed in Section 1607.3 or the concentrated load, in pounds (kilonewtons), given in Table 1607.1, whichever produces the greater load effects. Unless otherwise specified, the indicated concentration shall be assumed to be uniformly distributed over an area 2-1/2 feet by 2-1/2 feet ~~[6-1/4 square feet (0.58 m^2)]~~ (762 mm by 762 mm) and shall be located so as to produce the maximum load effects in the ~~structural~~ members.

1607.7.1 Handrails and guards. Handrails and guards shall be designed to resist a load of 50 pounds per linear foot (plf) (0.73 kN/m) applied in any direction ~~at the top~~ along the handrail or top rail and to transfer this load through the supports to the structure. Glass handrail assemblies and guards shall also comply with Section 2407.

Exceptions:

1. For one- and two-family dwellings, only the single concentrated load required by Section 1607.7.1.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an occupant load less than 50, the minimum load shall be 20 pounds per foot (0.29 kN/m).

1607.7.1.1 Concentrated load. Handrails and guards shall be ~~able~~ designed to resist a single concentrated load of 200 pounds (0.89 kN), applied in any direction at any point ~~along the top~~ on the handrail or top rail so as to produce the maximum load effects, and to transfer this load through the supports to the structure. This load need not be assumed to act concurrently with the loads specified in Section 1607.7.1.

1607.7.1.2 ~~Components~~ Intermediate rails. Intermediate rails (all those except the handrail and top rail), balusters and panel fillers shall be designed to withstand a horizontally applied normal load of 50 pounds (0.22 kN) on an area ~~equal to 1 square foot (0.093m^2)~~ not to exceed 12 inches by 12 inches (305 m by 305 m), including openings and space between rails, and located so as to produce the maximum load effects. Reactions due to this loading are not required to be superimposed with ~~those of~~ the loads specified in Section 1607.7.1 or 1607.7.1.1.

1607.7.2 Grab bars, shower seats and dressing room bench seats. Grab bars, shower seats and dressing room bench seat systems shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point on the grab bar or seat so as to produce the maximum load effects.

1607.7.3 Vehicle barrier systems. Vehicle barrier systems for passenger vehicles shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system and shall have anchorage or attachment capable of transmitting this load to the structure. For design of the system, two loading conditions shall be analyzed. The first condition shall apply the load at a height of 1 foot, 6 inches (457 mm) above the floor or ramp surface. The second loading condition shall apply the load at 2 feet, 3 inches (686 mm) above the floor or ramp surface. The more severe load condition shall govern the design of the barrier restraint system. The load shall be assumed to act on an area not to exceed ~~1 square foot (305 mm^2)~~ 12 inches by 12 inches (305 mm by 305 mm), and located so as to produce the maximum load effects. This load is not required to ~~be assumed to~~ act concurrently with any handrail or guard loadings specified in Section 1607.7.1. Garages accommodating trucks and buses shall be designed in accordance with an approved method that contains provision for traffic railings.

1607.8 Impact loads. The live loads specified in Section ~~1607.3~~ 1607.2 shall be assumed to include adequate allowance for ordinary impact conditions. Provisions shall be made in the structural design for uses and loads that involve unusual vibration and impact forces.

1607.9.1 General. Subject to the limitations of Sections 1607.9.1.1 through 1607.9.1.4, members for which a valueof $K_{LL}\ A_T$ is 400 square feet (37.16 m^2) or more are permitted to be designed for a reduced live load in accordance with the following equation:

$L = L_o\ [0.25 + 15 / (\sqrt{K_{LL}\ A_T})]$ **(Equation 16-22)**

In SI: $L = L_o\ [0.25 + 4.57 / (\sqrt{K_{LL}\ A_T})]$

where:

L = Reduced design live load per square foot (~~meter~~ m^2) of area supported by the member.
L_o = Unreduced design live load per square foot (~~meter~~ m^2) of area supported by the member (see Table 1607.1).
K_{LL} = Live load element factor (see Table 1607.9.1).
A_T = Tributary area, in square feet (~~square meters~~ m^2).

L shall not be less than 0.50 L_o for members supporting one floor and L shall not be less than 0.40 L_o for members supporting two or more floors.

1607.10 Distribution of floor loads. Where uniform floor live loads are involved in the design of structural members arranged so as to create continuity, the minimum applied loads shall be the full dead loads on all spans in combination with the floor live loads on spans selected to produce the greatest load effect at each location under consideration. It shall be permitted to reduce floor live loads in accordance with Section 1607.9.

1607.11.2.1 Flat, pitched and curved roofs. Ordinary flat, pitched and curved roofs, and awnings and canopies other than of fabric construction supported by a ~~lightweight rigid~~ skeleton structure~~s~~, are permitted to be designed for a reduced roof live load as specified in the following equations or other controlling combinations of loads as specified in Section 1605, whichever produces the greater load effect.

In structures such as greenhouses, where special scaffolding is used as a work surface for workers and materials during maintenance and repair operations, a lower roof load than specified in the following equations shall not be used unless approved by the building official. Such structures shall be designed for a minimum roof live load of 12 psf (0.58 kN/m^2).

$L_r = L_{ro}\ R_1\ R_2$ **(Equation 16-25)**

where: $12 \le L_r \le 20$

For SI: $L_r = L_{ro}\ R_1\ R_2$

where: $0.58 \le L_r \le 0.96$

L_{ro} = Unreduced roof live load per square foot (m^2) of horizontal projection supported by the member (see Table 1607.1).
L_r = Reduced roof live load per square foot (m^2) of horizontal projection ~~in pounds per square foot (kN/m^2)~~ supported by the member.

The reduction factors R_1 and R_2 shall be determined as follows:

R_1 = 1 for $A_t \le$ 200 square feet (18.58 m^2) **(Equation 16-26)**

$R_1 = 1.2 - 0.001\ A_t$ for 200 square feet $< A_t <$ 600 square feet **(Equation 16-27)**

For SI: $1.2 - 0.011\ A_t$ for 18.58 square meters $< A_t <$ 55.74 square meters

R_1 = 0.6 for $A_t \ge$ 600 square feet (55.74 m^2) **(Equation 16-28)**

where:

A_t = Tributary area (span length multiplied by effective width) in square feet (m^2) supported by ~~any structural~~ the member, and
R_2 = 1 for $F \le 4$ **(Equation 16-29)**

R_2 = 1.2 – 0.05 F for 4 < F < 12 **(Equation 16-30)**

R_2 = 0.6 for $F \geq 12$ **(Equation 16-31)**

where:

F = For a sloped roof, the number of inches of rise per foot (for SI: F = 0.12 x slope, with slope expressed as a percentage), and or for an arch or dome, rise-to-span ratio multiplied by 32.

1607.11.2.2 Special-purpose roofs. Roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes, and marquees, shall be designed for a minimum live load, L_o, as specified in Table 1607.1. Such live loads are permitted to ~~be~~ have their uniformly distributed live loads reduced in accordance with Section 1607.9. Live loads of 100 psf or more at areas of roofs classified as Group A occupancies shall not be reduced.

1607.12.3 Lateral force. The lateral force on crane runway beams with electrically powered trolleys shall be calculated as 20 percent of the sum of the rated capacity of the crane and the weight of the hoist and trolley. The lateral force shall be assumed to act horizontally at the traction surface of a runway beam, in either direction perpendicular to the beam, and shall be distributed ~~according~~ with due regard to the lateral stiffness of the runway beam and supporting structure.

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)

(Portions of table not show are unchanged)

a. Floors in garages or portions of buildings used for the storage of motor vehicles shall be designed for the uniformly distributed live loads of Table 1607.1 or the following concentrated loads: (1) for garages restricted to passenger vehicles accommodating not more than nine passengers, 3,000 pounds acting on an area of 4.5 inches by 4.5 inches; (2) for mechanical parking structures without slab or deck ~~which~~ that are used for storing passenger vehicles only, 2,250 pounds per wheel.

d. Other uniform loads in accordance with an approved method ~~which contains~~ containing provisions for truck loadings shall also be considered where appropriate.

f. The minimum concentrated load on stair treads ~~(~~shall be applied on an area of ~~4 square~~ 2 inches by 2 inches~~) is 300 pounds~~. This load need not be assumed to act concurrently with the uniform load.

(Footnotes not shown are unchanged)

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposals LLSC-LL6, LLSC-LL9 and LLSC-LL11, which were approved by the Live Load Subcommittee (LLSC) and are being balloted by the Main Committee (Items #1, #3, #5 and #6 of the Second Main Committee Ballot on Live/Dead Load Provisions). It is expected that the Main Committee will approve the proposals.

The proposed changes are seen as editorial. The addition of a definition for the symbol of unreduced roof live load in Section 1607.11.2.1, along with the current definition for the symbol of reduced roof live load, is done for consistency with the current definitions for the symbols of unreduced and reduced live load in Section 1607.9. In Table 1607.1, the addition of "for maintenance access" after "catwalks" and the addition of separate items for the first floor and other floor at "corridors" is done for consistency with the current text in Table 4-1 of ASCE 7-05, which will remain unchanged in ASCE 7-10.

The addition of footnote (c) to the 60 psf uniform load for fixed seats (fastened to the floor) in Item #4 on assembly areas for consistency with the same footnote at bleachers and fixed seats (fastened to the floor) in Item #34 on stadiums and arenas. This was suggested as an additional revision to Proposal LLSC-LL9 for the same item in Table 4-1 of ASCE 7. The LLSC considered the suggestion to have merit but it was determined to be a technical change and beyond the scope of what was intended to be an editorial proposal. In spite of this, The ICC Structural Committee may wish to consider adding it to IBC Table 1607.1.

A separate proposal also revises Section 1607.7.1.2. These revisions are not repeated in this proposal but, should both proposals be approved by the membership, the proponent intends that the addition of "and top rail" in Section 1607.7.1.2 of this proposal be disregarded.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Brazil-S50-1607.4

S68–09/10
1607.5, 1607.13, 1607.13.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1607.5 Partition loads. In office buildings ~~and in~~ or other buildings where partitions ~~locations are subject to change~~ will be erected or rearranged, provision~~s~~ for partition ~~weight~~ live load shall be made, whether or not partitions are shown on the construction documents, unless the specified live load exceeds 80 psf (3.83 kN/m^2). The partition live load shall not be less than a uniformly distributed live load of 15 psf (~~0.74~~ 0.72 kN/m^2).

1607.13 Interior walls and partitions. Interior walls and partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength to resist the loads to which they are subjected but not less than a uniformly distributed horizontal live load of 5 psf (0.24 kN/m^2) applied normal to the plane of the partition.

Exception: Fabric partitions complying with Section 1607.13.1 shall not be required to resist the minimum horizontal live load of 5 psf (0.24 kN/m^2).

1607.13.1 Fabric partitions. Fabric partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength to resist the following load conditions:

1. A uniformly distributed horizontal ~~distributed~~ live load of 5 psf (0.24 kN/m^2) applied to the partition framing. The total area used to determine the ~~distributed~~ live load shall be the area of the fabric face between the framing members to which the fabric is attached. The total ~~distributed~~ live load shall be ~~uniformly~~ applied to such framing members in proportion to the length of each member.
2. A concentrated live load of 40 pounds (0.176 kN) applied ~~to an 8-inch (203 mm) diameter area [50.3 square inches (32 452 mm^2)]~~ on an area of the fabric face a maximum of 8 inches in diameter (32.43 m^2) and at a minimum height of 54 inches (1372 mm) above the floor.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal SSC TC-2-CH4,5,11,12-01, which was approved by the Seismic Subcommittee on February 20, 2009 and is being balloted by the Main Committee (Item #1 of the Fourth Main Committee Ballot on Seismic Provisions). It is expected that the Main Committee will approve the proposal.
The proposed changes to Section 1607.5 are intended to reduce confusion over whether this load is a live load or a dead load and how it affects the determination of effective seismic weight. This load acts as a budget to account for partitions that may be installed during the life of the building or structure but are not typically installed when the building or structure is first constructed. The ASCE 7 proposal makes the same changes in Section 4.2.2 of ASCE 7 and also makes a correlating change in Item #2 of Section 12.7.2 in ASCE 7 by specifying the partition load as a live load.
The changes to Sections 1607.13 and 1607.13.1 are seen as editorial and are proposed for consistency with the format of similar provisions in ASCE 7.

Cost Impact: The code change proposal will not increase the cost of construction.

S69–09/10
1602.1, 1605.4, 1607.6 (New), Table 1607.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Add new definition as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

HELIPAD. A structural surface that is used for the landing, taking off, taxiing and parking of helicopters.

2. Revise as follows:

~~1605.4~~ 1607.6 ~~Heliports and helistops~~ Helipads. ~~Heliport and helistop landing areas~~ Helipads shall be designed for the following live loads~~, combined in accordance with Section 1605~~:

1. ~~Dead load, *D*, plus the gross weight of the helicopter, D_h, plus snow load, *S*.~~
2. ~~3~~ 1. ~~Dead load, *D*, plus~~ A uniform live load, *L*, ~~of:~~ as specified below. This load shall not be reduced.
   - 1.1. ~~100~~ 40 psf (~~4.79~~ 1.92 kN/m^2) where the design basis helicopter has a maximum take-off weight of 3,000 pounds (13.35 kN) or less.
   - 1.2. 60 psf (2.87 kN/m^2) where the design basis helicopter has a maximum take-off weight greater than 3,000 pounds (13.35 kN).
3. A single concentrated live load, *L*, of 3,000 pounds (13.35 kN) applied over an area of 4.5 inches by 4.5 inches (114 mm by 114 mm) and located so as to produce the maximum load effects on the structural elements under consideration. The concentrated load need not be assumed to act concurrently with other uniform or concentrated live loads.
4. ~~2~~ 3. ~~Dead load, *D*, plus~~ Two single concentrated ~~impact~~ live loads, *L*, ~~approximately~~ 8 feet (2438 mm) apart applied ~~anywhere~~ on the ~~touchdown~~ landing pad (representing ~~each of~~ the helicopter's two main landing gear, whether skid type or wheeled type), each having a magnitude of 0.75 times the ~~gross~~ maximum take-off weight of the helicopter, and located so as to produce the maximum load effects on the structural elements under consideration. ~~Both loads acting together total 1.5 times the gross weight of the helicopter.~~ The concentrated loads shall be applied over an area of 8 inches by 8 inches (203 mm by 203 mm) and need not be assumed to act concurrently with other uniform or concentrated live loads.

   ~~Exception:~~ Landing areas designed for a design basis helicopter~~s~~ with ~~gross~~ maximum take-off weight~~s~~ not exceeding 3,000 pounds (13.3~~5~~ kN) ~~in accordance with Items 1 and 2 shall be permitted to be designed using a 40 psf (1.92 kN/m^2) uniform live load in Item 3, provided the landing area is~~ shall be identified with a 3,000 pound (13.34 kN) weight limitation. ~~This 40 psf (1.92 kN/m^2) uniform live load shall not be reduced.~~ The landing area weight limitation shall be indicated by the numeral "3" (kips) located in the bottom right corner of the landing area as viewed from the primary approach path. The indication for the landing area weight limitation shall be a minimum 5 feet (1524 mm) in height.

(Renumber subsequent sections)

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
20. Helipads	See Section 1607.6	

(Portions of table not shown are unchanged)

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LLSC-LL-7, which has been approved by the Live Load Subcommittee and is being balloted by the Main Committee (Item #4 of the Second Main Committee Ballot on Live/Dead Load Provisions). It is expected that the Main Committee will approve the proposal.

The listing of loads other than live loads and the requirement in the charging text that the listed loads be combined in accordance with Section 1605 are deleted to eliminate conflicts with the load combinations of Section 1605. Current Items #1 through #3 appear to specify certain load combinations, not loads, and it is not clear whether these load combinations are in addition to, are intended to modify, or are intended to replace the load combinations of Section 1605. Sections 1605.1 through 1605.3.2.1 specify load combinations for buildings and other structures, and portions thereof, which would include helipads. If the current charging text intends to specify loads that shall be combined in accordance with Section 1605, the items listing loads should be limited to those loads unique to helipads. In this regard, references to the dead load, *D*, and snow load, *S*, serve no purpose. The loading provisions are also relocated to Section 1607.6 on live loads.

The change from “heliports and helistops” to “helipads” is for consistency with the same change being made in ASCE 7-10 and will have the effect of providing a term unique to the structural chapters of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

1607.6, 1607.6.1, 1607.6.2-1607.6.5 (New), Table 1607.6

Proponent: Edwin Huston, National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee

1. Delete and Substitute as follows:

~~**1607.6 Truck and bus garages.** Minimum live loads for garages having trucks or buses shall be as specified in Table 1607.6, but shall not be less than 50 psf (2.40 kN/m2), unless other loads are specifically justified and *approved* by the *building official*. Actual loads shall be used where they are greater than the loads specified in the table.~~

~~**1607.6.1 Truck and bus garage live load application.** The concentrated load and uniform load shall be uniformly distributed over a 10-foot (3048 mm) width on a line normal to the centerline of the lane placed within a 12-foot-wide (3658 mm) lane. The loads shall be placed within their individual lanes so as to produce the maximum stress in each structural member. Single spans shall be designed for the uniform load in Table 1607.6 and one simultaneous concentrated load positioned to produce the maximum effect. Multiple spans shall be designed for the uniform load in Table 1607.6 on the spans and two simultaneous concentrated loads in two spans positioned to produce the maximum negative moment effect. Multiple span design loads, for other effects, shall be the same as for single spans.~~

1607.6 Heavy Vehicle Loads. Structures or portions of structures which are subject to heavy vehicle loads shall be designed for the loads from Section 1607.6.1.

1607.6.1 Truck and bus loads. Where any structure does not have provisions to restrict access for trucks and buses that exceed the weight limitations set forth in Table 1607.1 footnote a, those portions of the structure subject to such loads shall be designed using the vehicular live loads, including consideration of impact and fatigue, in accordance with the codes and specifications required by the jurisdiction having authority for the design and construction of the roadways and bridges in the same location of the structure.

2. Add new text as follows:

1607.6.2 Fire truck loading. Where fire department access requires travel over or loading of a structure by fire department vehicles or similar emergency vehicles, the structure shall be designed for the greater of the following loads:

1607.6.2.1 Fire truck operational loads. The actual operational loads (including out rigger reactions and contact areas) of the vehicles as stipulated and / or approved by the local Fire Department or Building Official having jurisdiction for the structure.

1607.6.2.2 Truck and bus loads. The live loading required by section 1607.6.1.

1607.6.3 Truck and bus garages. Garages designed specifically to allow trucks or buses that exceed the weight limitations for passenger vehicles as set forth in Table 1607.1 footnote a, shall be designed using the vehicular live loads, per the Codes and Specifications required by the jurisdiction having authority for the design and construction of the roadways and bridges in the same location of the structure. (Note: design for impact and fatigue in a garage is not required).

Exception: The design live loads and load placement are allowed to be determined using the actual vehicle weights for the vehicles allowed onto the garage floors, provided such loads and placement are based on rational engineering principles and are approved by the Building Official, but shall not be less than 50 psf (this live load shall not be reduced).

1607.6.4 Forklifts and moveable equipment. Where a structure is intended to have forklifts or other moveable equipment present, the structure shall be designed for the total vehicle load and the individual wheel loads for the anticipated vehicles as specified by the owner of the facility. These loads shall be posted per Section 1607.6.5.

1607.6.4.1 Impact and fatigue. Due to the nature of the operations of a facility with forklifts and other moveable equipment, impact loads and fatigue loading must be considered in the design of the supporting structure. This must include consideration for relative stiffness and differential deflections between adjacent framing members; positive and negative moments induced by a moving live load; effects of multiple vehicle loads in the same vicinity; and the punching shear on a slab based on the actual contact area of the wheel loads for the specific vehicle to be used. For the purposes of design, the vehicle and wheel loads shall be increased by 30 percent to account for impact.

1607.6.5 Posting. The maximum weight of the vehicles allowed into or on a garage or other structure shall be conspicuously posted by the owner in accordance with Section 106.1.

3. Delete without substitution:

~~**TABLE 1607.6**~~
~~**UNIFORM AND CONCENTRATED LOADS**~~

~~LOADING CLASSa~~	~~UNIFORM LOAD (pounds/linear foot of lane)~~	~~CONCENTRATED LOAD (pounds)b~~	
		~~For moment design~~	~~For shear design~~
~~H20-44 and HS20-44~~	~~640~~	~~18,000~~	~~26,000~~
~~H15-44 and HS15-44~~	~~480~~	~~13,500~~	~~19,500~~

~~For SI: 1 pound per linear foot = 0.01459 kN/m, 1 pound = 0.004448 kN, 1 ton = 8.90 kN.~~

~~a. An H loading class designates a two-axle truck with a semitrailer. An HS loading class designates a tractor truck with a semitrailer. The numbers following the letter classification indicate the gross weight in tons of the standard truck and the year the loadings were instituted.~~

~~b. See Section 1607.6.1 for the loading of multiple spans.~~

Reason: The current Section 1607.6 Truck and bus garages, is addressing truck and bus loads in garages only and does not give direction for heavy vehicle loads in other conditions outside of a "garage". The current section lists loading criteria that appears to be extracted from the live load section from the AASHTO (American Association of State Highway and Transportation Officials) Code. AASHTO is not a referenced standard in the IBC. The current section however does not give other critical loading criteria such as spacing of the concentrated loads or impact requirements. Buildings designed for repair or storage may need to be designed for higher levels of loading than are currently prescribed by Table 1607.6 due to tighter spacing requirements This new section clarifies that for conditions where heavy highway type vehicles have access onto a structure, then that structure will need to be designed using the same code and requirements that the roadways in that jurisdiction are designed under. This loading may in fact be the loading from AASHTO, or the loading for other elements such as lids of large detention tanks or utility vaults. It will likely vary from one Jurisdiction to another. Thus the RDP should consult with the Jurisdiction for design loads for these special conditions. The new language also gives criteria for addressing other heavy vehicle loads (Fire trucks and forklifts), which is currently absent in the current code, and is only mentioned under Section 1607.2 Loads not specified.

Cost Impact: This code change proposal will not increase the cost of construction.

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Add new definitions as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

GRAB BAR SYSTEM. A bar and associated anchorages and attachments to the structural system for the support of body weight in locations such as toilets, showers and tub enclosures.

GUARDRAIL SYSTEM. A system of components, including anchorages and attachments to the structural system, near open sides of an elevated surface for the purpose of minimizing the possibility of a fall from the elevated surface by people, equipment or material.

HANDRAIL SYSTEM. A rail grasped by hand for guidance and support, and associated anchorages and attachments to the structural system.

2. Revise as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

VEHICLE BARRIER SYSTEM. A system of ~~building~~ components, including anchorages and attachments to the structural system, near open sides of a garage floor or ramp or building walls that act as restraints for vehicles.

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS[g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
19. Handrail, guardrail and grab bar systems ~~Handrails, guards and grab bars~~	See Section 1607.7	

(Portions of table not shown remain unchanged)

1607.7 Loads on handrail~~s~~, ~~guards~~ guardrail, grab bar~~s~~, seat~~s~~ and vehicle barrier systems. ~~Handrails~~ Handrail, ~~guards~~ guardrail, grab bar ~~bars~~, accessible seat ~~seats~~, accessible bench ~~benches~~ and vehicle barrier systems shall be designed and constructed to the structural loading conditions set forth in this section.

1607.7.1 Handrail~~s~~ and ~~guards~~ guardrail systems. Handrail ~~Handrails~~ and ~~guards~~ guardrail systems shall be designed to resist a load of 50 plf (0.73 kN/m) applied in any direction at the top ~~and to transfer this load through the supports to the structure~~. Glass handrail ~~assemblies~~ and ~~guards~~ guardrail systems shall also comply with Section 2407.

Exceptions:

1. For one- and two-family dwellings, only the single concentrated load required by Section 1607.7.1.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an occupant load less than 50, the minimum load shall be 20 pounds per foot (0.29 kN/m).

1607.7.1.1 Concentrated load. Handrail ~~Handrails~~ and ~~guards~~ guardrail systems shall be able to resist a single concentrated load of 200 pounds (0.89 kN), applied in any direction at any point along the top~~, and to transfer this load through the supports to the structure~~. This load need not be assumed to act concurrently with the loads specified in Section 1607.7.1.

1607.7.1.2 Components. Intermediate rails (all those except the handrail), balusters and panel fillers shall be designed to withstand a horizontally applied normal load of 50 pounds (0.22 kN) on an area equal to 1 square foot ($0.093 m^2$), including openings and space between rails. Reactions due to this loading are not required to be superimposed with those of Section 1607.7.1 or 1607.7.1.1.

1607.7.2 Grab bar~~s~~, shower seat~~s~~ and dressing room bench seat~~s~~ systems. Grab bar ~~bars~~, shower seat ~~seats~~ and dressing room bench seat systems shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point.

1607.7.3 Vehicle barrier systems. Vehicle barrier systems for passenger vehicles shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system ~~and shall have anchorage or attachment capable of transmitting this load to the structure~~. For design of the system, two loading conditions shall be analyzed. The first condition shall apply the load at a height of 1 foot, 6 inches (457 mm) above the floor or ramp surface. The second loading condition shall apply the load at 2 feet, 3 inches (686 mm) above the floor or ramp surface. The more severe load condition shall govern the design of the vehicle barrier ~~restraint~~ system. The load shall be assumed to act on an area not to exceed 1 square foot ($305 mm^2$), and is not required to be assumed to act concurrently with any handrail or guardrail system loadings specified in Section 1607.7.1. Garages accommodating trucks and buses shall be designed in accordance with an approved method that contains provision for traffic railings.

1012.1 Where required. *Handrails* for *stairways* and *ramps* shall be adequate in strength and attachment in accordance with Section 1607.7 for handrail systems. *Handrails* required for *stairways* by Section 1009.12 shall comply with Sections 1012.2 through 1012.9. *Handrails* required for *ramps* by Section 1010.8 shall comply with Sections 1012.2 through 1012.8.

1013.1 Where required. *Guards* shall be located along open-sided walking surfaces, including *mezzanine*s, *equipment platforms*, *stairs*, *ramps* and landings that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.7 for guardrail systems.

Exception: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including steps leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, ramps and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating where *guards* in accordance with Section 1028.14 are permitted and provided.

1013.1.1 Glazing. Where glass is used to provide a *guard* or as a portion of the *guard* system, the *guard* shall also comply with Section 2407. Where the glazing provided does not meet the strength and attachment requirements of Section 1607.7 for guardrail systems, complying *guards* shall also be located along glazed sides of open-sided walking surfaces.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LLSC-LL9, which was approved by the Live Load Subcommittee and is being balloted by the Main Committee (Item #5 of the Second Main Committee Ballot on Live/Dead Load Provisions). It is expected that the Main Committee will approve the proposal.

This proposal takes into account the definitions of "guard" and "handrail" in the IBC by limiting the applicability of the proposed definitions in this proposal to Chapter 16, whereas the definitions of "guard" and "handrail" apply throughout the IBC. The definitions in this proposal will establish grab bar, guardrail and handrail systems as structural systems that are required to resist structural design loads and transfer these loads to the supporting structure. This will contrast with guards and handrails whose definitions are primarily utilized in code provisions related to egress and accessibility.

All instances of "guard" in the structural chapters, and all references to Section 1607.7 in the nonstructural chapters, of the 2009 IBC are included in this proposal.

This proposal was prepared in conjunction with a proposal to editorially correlate IBC Section 1607 with Chapter 4 of ASCE 7-10 and is intended to further revise Section 1607 without any overlapping or conflicting changes between the two proposals.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S25-1607.7

S72–09/10
1607.7.1.2

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1607.7.1.2 Components. ~~Intermediate~~ Rails, ~~(all those except the handrail), balusters~~ other than handrails and the top rails of guards, and panel fillers shall be designed to withstand a horizontally applied normal load of 50 pounds (0.22 kN) on an area equal to 1 square foot (0.093m^2), including openings and space between rails. Reactions due to this loading are not required to be superimposed with those of Section 1607.7.1 or 1607.7.1.1.

Reason: This proposal serves two purposes. The first is to replace parenthetical text, which is often viewed as commentary, with mandatory text that is also more comprehensive. The current text is extracted from ASCE 7-05 and is the source of the parenthetical "all those except the handrails."

The second purpose is to revise text that is not comprehensive in that it requires intermediate rails, balusters and panel fillers to be designed for a load of 50 pounds and includes openings and space between the rails but not between the rails and balusters. This was brought to the attention of the Live Load Subcommittee, which chose to delete balusters rather than add them at the end of the first sentence after "rails." The

Subcommittee also chose to retain the parenthetical text. The proposal revises the charging text so that specifying balusters will not be necessary by specifying all rails except handrails and the top rails of guards.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S9-1607.7.1.2

S73-09/10
1607.7.3

Proponent: Philip Brazil, PE, SE, representing self

Revise as follows:

1607.7.3 Vehicle barrier systems. Vehicle barrier systems for passenger vehicles shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system and shall have anchorage or attachment capable of transmitting this load to the structure. For design of the system, ~~two loading conditions shall be analyzed. The first condition shall apply~~ the load shall be assumed to act at ~~a~~ heights of ~~1 foot, 6~~ 18 to 27 inches (457 to 686 mm) above the floor or ramp surface, located so as to produce the maximum load effects. ~~The second loading condition shall apply the load at 2 feet, 3 inches (686 mm) above the floor or ramp surface. The more severe load condition shall govern the design of the barrier restraint system.~~ The load shall be ~~assumed to act~~ applied on an area not to exceed ~~1 square foot (305 mm^2), and~~ 12 inches by 12 inches (305 mm by 305 mm). The load is not required to ~~be assumed to~~ act concurrently with any handrail or guard loadings specified in Section 1607.7.1. Garages accommodating trucks and buses shall be designed in accordance with an approved method that contains provision for traffic railings.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to an ASCE 7 Proposal LLSC-LL14, which has been approved by the Live Load Subcommittee. It is expected that the Main Committee will ballot and approve the proposal.

The proposed text will better define the design loads appropriate for vehicle barrier systems. The current text specifies the application of a horizontal load at two heights above the floor or ramp surface: 18 inches and 27 inches. These loads do not adequately account for the range of heights where passenger vehicles will impact a vehicle barrier system or the range of designs utilized for vehicle barrier systems, which include steel cables spanning horizontally between vertical supports. With the current text, it is possible for a vehicle barrier system to be designed with two horizontally spanning steel cables with heights above the floor or ramp surface of 18 inches and 27 inches, respectively. Such an arrangement does not adequately provide for vehicles whose impact with a vehicle barrier system will be between these heights. The proposed text will ensure that all heights between 18 and 27 inches are considered in the design of the vehicle barrier system and that each element of the system is designed for the maximum load effect.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: Brazil-S4-1607.7.3

S74–09/10
1607.7.3

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing self

Revise as follows:

1607.7.3 Vehicle barrier systems. Vehicle barrier systems for passenger vehicles shall be designed to resist a single service load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system and shall have anchorage or attachment to the structure that shall not fail at less than 2.5 times this load. ~~capable of transmitting this load to the structure.~~ For design of the system, two loading conditions shall be analyzed. The first condition shall apply the load at a height of 1 foot, 6 inches (457 mm) above the floor or ramp surface. The second loading condition shall apply the load at 2 feet, 3 inches (686 mm) above the floor or ramp surface. The more severe load condition shall govern the design of the barrier restraint system. The load shall be assumed to act on an area not to exceed 1 square foot (0.0929 m^2), and is not required to be assumed to act concurrently with any handrail or guard loadings specified in Section 1607.7.1. Garages accommodating trucks and buses shall be designed in accordance with an approved method that contains provision for traffic railings.

Reason: In the prior code cycle (IBC S73-07/08), significant and convincing evidence was presented by the Parking Consultants Council of the National Parking Association (PCCNPA) that demonstrated that vehicles are generally heavier than when the provisions for vehicle barriers were first introduced into the code and that nonductile failure of connections was a potential problem. Consequently, the existing requirement in the International Building Code is potentially unconservative.

This proposal addresses two issues:

First, this proposal clarifies that the design load of 6,000 pounds is a service load as opposed to an ultimate load. If an engineer is using strength design or load and resistance factor design, the load should be increased by the appropriate live load factor.

Second, this proposal requires that the design have significant overstrength in the connection design. As it is currently worded, the code only requires that the connections be able to transmit the 6,000 pound load to the structure, potentially resulting in designs that are more likely to fail at the connections. Last cycle's proposal (IBC S73-07/08) to add a requirement that the anchorages be ductile and extend and deform to absorb impact energy prior to ultimate failure was deemed by the Committee to be too vague and unworkable for code language. This proposal will require that the minimum factor of safety for the connections will be 2.5 and will make it more likely that the vehicle barrier will deform and fail within the body of the system, consequently increasing the likelihood that the failure will be ductile and will dissipate more energy than if the failure occurs in the connections of the system to the structure.

The prior code change proposal (S73-07/08 by PCCNPA) and the relevant technical back-up can be found here:
http://www.iccsafe.org/cs/codes/2007-08cycle/ProposedChanges/V1_S70-147.pdf

Cost Impact: There may be a small increase in the cost of construction of vehicle barrier systems if this proposal is approved

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Searer-S1-1607.2.3

S75-09/10
1607.8, 1607.8.1, 1607.8.2

Proponent: Philip Brazil, PE, SE, representing self

1. Revise as follows:

1607.8 Impact loads. The live loads specified in Sections 1607.3 through 1607.7 shall be assumed to include adequate allowance for ordinary impact conditions. Provisions shall be made in the structural design for uses and loads that involve unusual vibration and impact forces.

1607.8.1 Elevators. ~~Elevator loads~~ Members, elements and components subject to dynamic loads from elevators shall be ~~increased by 100 percent~~ designed for impact loads and ~~the structural supports shall be designed within the limits of~~ deflection limits prescribed by ASME A17.1.

1607.8.2 Machinery. For the purpose of design, the weight of machinery and moving loads shall be increased as follows to allow for impact: (1) ~~elevator machinery, 100 percent; (2)~~ light machinery, shaft- or motor-driven, 20 percent; ~~(3)~~ and (2) reciprocating machinery or power-driven units, 50 percent~~; (4) hangers for floors or balconies, 33 percent~~. Percentages shall be increased where specified by the manufacturer.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal LLSC-LL-10, which has been approved by the Live Load Subcommittee. It is expected that the Main Committee will ballot and approve the proposal. The changes in Section 1607.8 are for consistency with the corresponding Section 4.6 of ASCE 7-10.

The changes in Section 1607.8.1 clarify that the impact load from elevators applies specifically to members, elements and components subject to dynamic loading from the elevator mechanism and direct the code user to the elevator standard (ASME A17.1) to determine the increases.

In Section 1607.8.2, elevator machinery is deleted because it is covered by Section 1607.8.1. Hangers for floors or balconies are deleted because live loads should be determined based on their occupancy or use with due consideration for dynamic effects as specified in Section 1607.8. The 33 percent increase has been determined to be an archaic application for a23 perceived lack of redundancy in the structural system. Such an increase should not be imposed on the load side of design equations and, instead, should be a consideration in material standards (e.g., resistance side of design equations).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: Brazil-S6-1607.8

S76-09/10
1607.9-1607.9.2

Proponent: Philip Brazil, PE, SE, representing self

1. Revise as follows:

1607.9 Reduction in live loads. Except for uniform live loads at roofs, all other minimum uniformly distributed live loads, L_o, in Table 1607.1 are permitted to be reduced in accordance with Sections 1607.9.1 ~~or 1607.9.2~~ through 1607.9.6. Roof uniform live loads, other than special purpose roofs of Section 1607.11.2.2 are permitted to be reduced in accordance with Section 1607.11.2. Roof uniform live loads of special purpose roofs are permitted to be reduced in accordance with Sections 1607.9.1 ~~or 1607.9.2~~ through 1607.9.6.

1607.9.1 General. Subject to the limitations of Sections ~~1607.9.1.1~~ 1607.9.2 through ~~1607.9.1.4~~ 1607.9.6, members for which a value of $K_{LL}\,A_T$ is 400 square feet (37.16 m^2) or more are permitted to be designed for a reduced live load in accordance with the following equation:

$$L = L_o\left(0.25 + \frac{15}{\sqrt{K_{LL}A_T}}\right) \qquad \textbf{Equation 16-22)}$$

$$\text{For SI: } L = L_o\left(0.25 + \frac{4.57}{\sqrt{K_{LL}A_T}}\right)$$

where:

L = Reduced design live load per square foot (meter) of area supported by the member.
L_o = Unreduced design live load per square foot (meter) of area supported by the member (see Table1607.1).
K_{LL} = Live load element factor (see Table 1607.9.1).
A_T = Tributary area, in square feet (square meters).

L shall not be less than 0.50 L_o for members supporting one floor and L shall not be less than 0.40 L_o for members supporting two or more floors.

~~**1607.9.1.1**~~ **1607.9.2 One-way slabs.** The tributary area, A_T, for use in Equation 16-22 for one-way slabs shall not exceed an area defined by the slab span times a width normal to the span of 1.5 times the slab span.

~~**1607.9.1.2**~~ **1607.9.3 Heavy live loads.** Live loads that exceed 100 psf (4.79 kN/m^2) shall not be reduced.

Exceptions:

1. The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section 1607.9.1.
2. For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.

~~**1607.9.1.3**~~ **1607.9.4 Passenger vehicle garages.** The live loads shall not be reduced in passenger vehicle garages.

Exception: The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section 1607.9.1.

~~**1607.9.1.4**~~ **1607.9.5 Group A occupancies.** Live loads of 100 psf (4.79 kN/m^2) and at areas where fixed seats are located shall not be reduced in Group A occupancies.

~~**1607.9.1.6**~~ **1607.9.6 Roofs members.** Live loads of 100 psf (4.79 kN/m^2) or less shall not be reduced for roof members except as specified in Section 1607.11.2.

2. Delete without substitution:

~~**1607.9.2 Alternate floor live load reduction.** As an alternative to Section 1607.9.1, floor live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.~~

~~1. A reduction shall not be permitted in Group A occupancies.~~
~~2. A reduction shall not be permitted when the live load exceeds 100 psf (4.79 kN/m^2) except that the design live load for members supporting two or more floors is permitted to be reduced by 20 percent.~~

~~**Exception:** For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.~~

~~3. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.~~
~~4. For live loads not exceeding 100 psf (4.79 kN/m^2), the design live load for any structural member supporting 150 square feet (13.94 m^2) or more is permitted to be reduced in accordance with the following equation:~~
~~5. For one-way slabs, the area, *A*, for use in Equation 16-23 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.~~

~~$R = 0.08 (A - 150)$~~ **~~(Equation 16-23)~~**
~~For SI: $R = 0.861 (A - 13.94)$~~

~~Such reduction shall not exceed the smallest of:~~

~~1. 40 percent for horizontal members,~~
~~2.~~ 60 percent for vertical members, or
~~3. *R* as determined by the following equation:~~

~~$R = 23.1 (1 + D / L_o)$~~ **~~(Equation 16-24)~~**

~~where:~~

~~A = Area of floor supported by the member, square feet (m^2).~~
~~D = Dead load per square foot (m^2) of area supported.~~
~~L_o = Unreduced live load per square foot (m^2) of area supported.~~
~~R = Reduction in percent.~~

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. Most of the provisions being deleted were the product of a legacy code. They have not appeared in recent editions of ASCE 7 nor are they likely to appear in the 2010 edition.
The provisions of IBC Sections 1607.9.1 for the basic procedures to reduce live load on floors and roofs serving an occupancy function are based on Section 4.8 of ASCE 7 (Reduction in Live Loads). The ASCE 7 Committee develops and maintains the provisions of Section 4.8 and has not chosen not to add alternative procedures for the reduction of live loads. The differences between the basic and alternative procedures are such that structural performance of buildings and other structures can be expected to differ depending on which set of procedures are utilized in the design. The ICC code development process does not provide the means for adequate deliberation over the merits of each set of procedures in providing adequate levels of public safety. This deliberation should be done by the ASCE 7 Committee.

A separate proposal further aligns IBC Section 1607 on roof live load reduction with Chapter 4 of ASCE 7-10. That proposal deletes Section 1607.9.1.5 and the last sentence of Section 1607.9 and revises the second sentence of Section 1607.9. The deletions and revisions are not repeated in this proposal but, should both proposals be approved by the membership, the proponent intends that the last sentence of Section 1607.9 be deleted, not revised as indicated in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: Brazil-S5-1607.9

1607.9, 1607.9.1.5, 1607.11.2, 1607.11.2.1, 1607.11.2.2, Table 1607.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Revise as follows:

1607.9 Reduction in live loads. Except for uniform live loads at roofs, all other minimum uniformly distributed live loads, L_o, in Table 1607.1 are permitted to be reduced in accordance with Section 1607.9.1 or 1607.9.2. ~~Roof~~ Uniform live loads~~, other than special purpose roofs of Section 1607.11.2.2~~ at roofs are permitted to be reduced in accordance with Section 1607.11.2. ~~Roof uniform live loads of special purpose roofs are permitted to be reduced in accordance with Section 1607.9.1 or 1607.9.2~~.

~~**1607.9.1.5 Roofs members.** Live loads of 100 psf (4.79 kN/m^2) or less shall not be reduced for roof members except as specified in Section 1607.11.2.~~

1607.11.2 ~~Reduction in roof live loads~~ General. The minimum uniformly distributed live loads of roofs and marquees, L_o, in Table 1607.1 are permitted to be reduced in accordance with Section 1607.11.2.1 or 1607.11.2.2.

1607.11.2.1 ~~Flat, pitched and curved~~ Ordinary roofs, awnings and canopies. Ordinary flat, pitched and curved roofs, and awnings and canopies other than of fabric construction supported by lightweight rigid skeleton structures, are permitted to be designed for a reduced uniformly distributed roof live load, L_r, as specified in the following equations or other controlling combinations of loads in Section 1605, whichever produces the greater load.

In structures such as greenhouses, where special scaffolding is used as a work surface for workers and materials during maintenance and repair operations, a lower roof load than specified in the following equations shall not be used unless approved by the building official. Such structures shall be designed for a minimum roof live load of 12 psf (0.58 kN/m^2).

$L_r = L_o R_1 R_2$ **(Equation 16-25)**

where: $12 \le L_r \le 20$

For SI: $L_r = L_o R_1 R_2$

where: $0.58 \le L_r \le 0.96$

L_r = Reduced live load per square foot (m^2) of horizontal projection in pounds per square foot (kN/m^2).

The reduction factors R_1 and R_2 shall be determined as follows:

$R_1 = 1$ for $A_t \le 200$ square feet (18.58 m^2) **(Equation 16-26)**

$R_1 = 1.2 - 0.001 A_t$ for 200 square feet $< A_t <$ 600 square feet **(Equation 16-27)**
For SI: $1.2 - 0.011 A_t$ for 18.58 square meters $< A_t <$ 55.74 square meters

$R_1 = 0.6$ for $A_t \ge 600$ square feet (55.74 m^2) **(Equation 16-28)**

where:

A_t = Tributary area (span length multiplied by effective width) in square feet (m^2) supported by any structural member, and

$R_2 = 1$ for $F \le 4$ **(Equation 16-29)**
$R_2 = 1.2 - 0.05 F$ for $4 < F < 12$ **(Equation 16-30)**
$R_2 = 0.6$ for $F \ge 12$ **(Equation 16-31)**

where:

F = For a sloped roof, the number of inches of rise per foot (for SI: F = 0.12 x slope, with slope expressed as a percentage), or for an arch or dome, rise-to-span ratio multiplied by 32.

1607.11.2.2 ~~Special-purpose roofs~~ Roof areas serving occupancy functions. Areas of roofs ~~used for promenade purposes,~~ that serve occupancy functions, such as roof gardens, or for assembly ~~purposes~~ or other ~~special~~ similar purposes, and marquees~~, shall be designed for a minimum live load, L_o, as specified in Table 1607.1. Such live loads~~ are permitted to ~~be~~ have their uniformly distributed live loads reduced in accordance with Section 1607.9. Live loads of 100 psf or more at areas of roofs classified as Group A occupancies shall not be reduced.

TABLE 1607.1

All other occupancies		300
All roof surfaces subject to maintenance workers		300

(Portions of Table not show, remain unchanged)

Reason This proposal was prepared in conjunction with a proposal to editorially correlate IBC Section 1607 with the provisions of Chapter 4 of ASCE 7-10 related to floor live load reduction. This proposal focuses on editorial correlation for roof live load reduction and is intended to further align IBC Section 1607 with Chapter 4 of ASCE 7-10 without any overlapping or conflicting changes between the two proposals. The changes in this proposal are seen as largely editorial.

The items under "roofs" in Table 1607.1 are reorganized to align them with Section 1607.11.2 on the reduction of live loads at roofs. Section 1607.11.2 permits reductions in uniform live loads at roofs and marquees "in accordance with Section 1607.11.2.1 or 1607.11.2.2." These sections, in turn, refer to items under "roofs" in Table 1607.1 except for marquees, which are separately listed in the table. The reorganization of the items under "roofs" is intended to reduce confusion over the applicability of roof live load reduction at "ordinary flat, pitched and curved roofs" in Section 1607.11.2.1, which applies to roofs that do not serve an occupancy function but are susceptible to loads from maintenance workers, and at roofs that serve an occupancy function in Section 1607.11.2.2, which are the structural equivalent of floors. Section 1607.11.2.1 also applies to awnings and canopies and the title of the section is changed accordingly. Table 1607.1 is reorganized so that it aligns with these sections.

The changes to Section 1607.9 and the deletion of Section 1607.9.1.5 eliminate superfluous text. Section 1607.9 provides the charging text for reduction of uniformly distributed live loads at floors. The changes retain the reference to Section 1607.11.2 on roof live load reduction but delete the text referring to special purpose roofs in favor of the charging text in Section 1607.11.2.

Section 1607.11.2.2 is changed to align it with the corresponding provisions in Section 4.8.2 of ASCE 7-10. Section 4.9.2 of ASCE 7-05 currently specifies roofs "that have an occupancy function" but the title of the section is "special purpose roofs." The proponent is requesting the title be changed to "roof areas serving an occupancy function" in Section 4.8.2 of ASCE 7-10 and IBC Section 1607.11.2.2 is changed accordingly. Section 4.8.2 of ASCE 7-10 specifies roof gardens and areas used for "assembly or other similar purposes" as examples of roof areas that serve occupancy functions. Section 4.9.2 of ASCE 7-05 is similar. Table 4-1 of ASCE 7-05, however, lists roofs used for promenade purposes along with roofs used for roof gardens or for assembly or other special purposes. This listing of roofs used for promenade purposes is deleted in Table 4-1 of ASCE 7-10 and IBC Table 1607.1 is changed accordingly.

The proponent is requesting "other special purposes" be changed to "other similar purposes" in Section 4.8.2 and Table 4-1 of ASCE 7-10 in conjunction with the requested change in the title of Section 4.8.2 from "special purpose roofs" to "roof areas serving an occupancy function." IBC Section 1607.11.2.2 and Table 1607.1 are changed accordingly. Note that the uniform live load at roofs used for other special purposes in Table 4-1 of ASCE 7-05 and 2009 IBC Table 1607.1, and at other similar areas of roofs serving an occupancy function in IBC Table 1607.1 of this proposal, is not specified in favor of a footnote specifying appropriate loads as approved by the authority having jurisdiction (ASCE 7) or building official (IBC) and is not affected by this proposal.

Footnotes (g) and (l) to Table 1607.1 are revised for consistency with the changes to Section 1607.11.2.2 above. The deletion in Footnote (g) also eliminates a superfluous cross-reference.

A separate proposal correlates the IBC with changes to the provisions of ASCE 7-10 where reduction of live loads at floors and occupied roofs is restricted or prohibited. That proposal adds Footnote (m) to "100 psf" at "roofs used for assembly purposes" in the item for roofs in Table 1607.1. The addition of the footnote is not repeated in this proposal but, should this proposal and the proposal adding the footnote be approved by the membership, the proponent intends that Footnote (m) be specified with "100 psf" at "assembly areas" under "roofs serving an occupancy function" in the item for roofs in Table 1607.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S14-1607.9

S78–09/10
1607.9.2

Proponent: Matt Rescorla, PE, Cubic Designs, Inc., representing self

Revise as follows:

1607.9.2 Alternate floor live load reduction. As an alternative to Section 1607.9.1, floor live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted in Group A occupancies.
2. A reduction shall not be permitted where the live load exceeds 100 psf (4.79 kN/m^2) except that the design live load for columns ~~members supporting 2 or more floors~~ is permitted to be reduced by a maximum of 20 percent where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.

Exception: For uses other than storage, where *approved*, additional live load reductions shall be permitted where shown by the *registered design professional* that a rational approach has been used and that such reductions are warranted.

3. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.
4. For live loads not exceeding 100 psf (4.79 kN/m^2), the design live load for any structural member supporting 150 square feet (13.94 m^2) or more is permitted to be reduced in accordance with Equation 16-23.
5. For one-way slabs, the area, *A*, for use in Equation 16-23 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.

$R = 0.08(A - 150)$ **(Equation 16-23)**
For SI: $R = 0.861(A - 13.94)$

Such reduction shall not exceed the smallest of:

1. 40 percent for horizontal members;
2. 60 percent for vertical members; or
3. *R* as determined by the following equation.

$R = 23.1(1 + D/L_o)$ **(Equation 16-24)**

where:

A = Area of floor supported by the member, square feet (m2).
D = Dead load per square foot (m^2) of area supported.
L_o = Unreduced live load per square foot (m^2) of area supported.
R = Reduction in percent.

Reason: Typical minimum uniformly distributed live loads for Mezzanine design are dictated by Table 1607.1, under the loads of "Light Storage" at 125 psf. Leeway should be given to professional judgment in regards to live load reduction. Twenty years of professional experience has shown, the standard mezzanine (used for storage and designed for 125 psf) experiences a load ranging from 75-90 psf. A mezzanine used for production and experiencing loads from permanent equipment greater than or equal to 125 psf would not receive a reduction to its load.

Cost Impact: The code change proposal will not increase the cost of construction

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

DEAD LOADS. The weight of materials of construction incorporated into the building, including but not limited to walls, floors, roofs, ceilings, stairways, built-in partitions, finishes, cladding, landscaping materials and other similarly incorporated architectural and structural items, and the weight of fixed service equipment, such as cranes, plumbing stacks and risers, electrical feeders, heating, ventilating and air-conditioning systems and automatic sprinkler systems.

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
29. Roofs		
All roof surfaces subject to maintenance workers		300
Awnings and canopies		
Fabric construction supported by a lightweight rigid skeleton structure	5 nonreduceable	
All other construction	20	
Ordinary flat, pitched, and curved roofs	20	
Primary roof members, exposed to a work floor		
Single panel point of lower chord of roof trusses or any point along primary structural members supporting roofs over manufacturing, storage warehouses, and repair garages		2,000
All other occupancies		300
Roofs used for other special purposes	Note l	Note l
Roofs used for promenade purposes	60	
Roofs used for roof gardens	60	
Roofs used for ~~roof gardens or~~ assembly purposes	100	

(Portions of Table not shown, remain unchanged. No changes to footnotes)

1607.11.3 Landscaped roofs. Where ~~roofs~~ areas of the roof are to be landscaped, the landscaped areas shall be designed to resist a uniform design live load ~~in the landscaped area shall be~~ of 20 psf (0.958 kN/m^2). The weight of the landscaping materials shall be considered as dead load and shall be computed on the basis of saturation of the soil. Adjacent areas without landscaping that are occupiable shall be designed to resist the live loads specified in Table 1607.1 for roof gardens.

Reason: The purpose for this proposal is to revise the IBC for consistency with an ASCE 7 proposal being considered by the Live Load Subcommittee. The proposed text will better define the design loads appropriate for roofs with landscaping. Such roofs typically consist of landscaped areas, which are not occupiable except by maintenance workers, and occupiable areas adjacent to the landscaped areas. Table 1607.1 does not currently distinguish between them except to specify a live load of 100 psf for roof gardens. A live load of 100 psf is not justified for landscaped areas. It is excessive for occupiable areas except where they are used for assembly purposes.

The proposal distinguishes between landscaped areas and adjacent areas without landscaping that are occupiable. A live load of 20 psf, the same as the unreduced live load for ordinary, flat, pitched and curved roofs, is currently specified in Section 1607.11.3 for roofs that are to be landscaped. The proposal revises this to areas of the roof that are to be landscaped. An entire roof devoted to landscaping should not be necessary before the structural demands due to landscaping areas are required to be considered. Section 1607.11.3 currently specifies the saturated weight of the landscaping materials as dead load. The proposal adds landscaping materials to the definition of "dead load" in Section 1602.1 for consistency.

For adjacent areas without landscaping that are occupiable, the proposal adds to Section 1607.11.3 the requirement that these areas be designed to resist the live loads specified in Table 1607.1 for roof gardens. The live load for roof gardens in Table 1607.1 is reduced to 60 psf. The listing in Table 1607.1 of 100 psf for assembly areas is retained to account for areas without landscaping that are used for assembly purposes.

Cost Impact: The code change proposal will not increase the cost of construction.

Table 1607.1, 1607.11.2, 1607.11.2.2, 1607.11.3

Proponent: Traxler, City of Seattle representing Seattle Dept of Planning & Development

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS~~g~~
(*No change to table)*

(No change to footnotes a through k)

l. Roofs used for other special purposes shall be designed for appropriate loads as approved by the building official. Unoccupied landscaped areas of roofs shall be designed in accordance with Section 1607.11.3.

1607.11.2 Reduction in roof live loads. The minimum uniformly distributed live loads of roofs and marquees, L_o, in Table 1607.1 are permitted to be reduced in accordance with Section 1607.11.2.1 ~~or 1607.11.2.2~~.

1607.11.3. ~~1607.11.2.2~~ Special-purpose roofs. Roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes, and marquees, shall be designed for a minimum live load, L_o, as specified in Table 1607.1. Such live loads are permitted to be reduced in accordance with Section 1607.9. Live loads of 100 psf (4.79 kN/m^2) or more at areas of roofs classified as Group A occupancies shall not be reduced.

1607.11.3.1 Landscaped roofs. ~~Where roofs are to be landscaped, the~~ The uniform design live load in ~~the~~ unoccupied landscaped areas on roofs shall be 20 psf (0.958 kN/m^2). The weight of ~~the~~ all landscaping materials shall be considered as dead load and shall be computed on the basis of saturation of the soil.

Reason: Roofs used for roof gardens, commonly referred to as "green roofs", have generated many questions as to the appropriate load requirements. There has been confusion over what live loads are to be used for the landscaped versus non-landscaped portions of the roofs, and about how the "roof garden" provisions of Table 1607.1 row 29 coordinate with Section 1607.11.3. We are proposing an amendment that separates "special purpose roofs", including roof gardens, from the section on reduction of roof loads, and clarifying that the provisions for landscaped roofs only applies to unoccupied areas; occupied areas should be designed for loads appropriate to the particular occupancy. Note that the last sentence of what becomes Section 1607.11.3.1 in this proposal could be relocated to Section 1606.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Traxler-S2-T1607.1

S81–09/10
1607.13

Proponent: Stephen Kerr, PE, SE, representing self

Revise as follows:

1607.13 Interior walls and partitions. Interior walls and partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength to resist the loads to which they are subjected but not less than a horizontal load of 5 psf (0.240 kN/m^2). For the purposes of calculating deflection, the loading of this section shall be treated as a wind load in accordance with Table 1604.3.

> **Exception:** Fabric partitions complying with Section 1607.13.1 shall not be required to resist the minimum horizontal load of 5 psf (0.240 kN/m^2).

Reason: Currently, Table 1604.3 does not have deflection limits for Live Loads on Interior walls. The 5.0 psf requirement in section 1607.13 is classified as a live load and would not require a deflection check. Under the legacy Uniform Building Code this load was treated as an "other load" and was required to meet the defection limits identical to those in IBC Table 1604.3. To avoid confusion for walls, and to require deflection checks on interior walls, the proposed code change is necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KERR-S3-1607.13

S82–09/10
1607.14 (New)

Proponent: Dennis Richardson PE, dbr group inc., representing self

Add new text as follows:

1607.14 Fire-resistance-rated exterior walls. Fire-resistance rated exterior walls required by Section 705.6 to have sufficient structural stability such that it will remain in place for the duration of time indicated by the required fire-resistance rating shall have adequate strength to resist the loads to which they are subjected but not less than a horizontal load of 10 psf (0.48 kN/m^2) applied perpendicular to the plane of the wall.

Reason: Design criteria do not exist for the current requirement found in Section 705.6 to justify the performance requirement for the out of plane structural support of fire-resistance rated exterior walls. A code change proposal has been submitted to provide proscriptive exceptions to the current performance related language found in the 2009 IBC. There needs to be some design criteria when the exceptions do not apply. Because of the uncertainty and dynamic nature of fire conditions, it is felt the interior partition wall load of 5 psf would be too low for the design of free standing exterior fire resistance rated walls expected to perform adequately during fire conditions. Because fires do have associated impact loads and air pressure associated with collapsing elements, a minimum out of plane loading of 10 psf is proposed as a lower bound when exterior fire resistance rated walls are required to be justified.

Cost Impact: Since this code change requires a minimum level of strength where the current code states vague performance objectives, this proposed change could increase construction cost.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Richardson-S1-1607.14

S83–09/10
1602.1, 1608.3 (New), 1611.2

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Add new definition as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

SUSCEPTIBLE BAY. A roof or portion thereof with (1) a slope less than 1/4-inch per foot (0.0208 rad), or (2) where water will be impounded upon it, in whole or in part, and the secondary drainage system is functional but the primary drainage system is not functional. A roof surface with a slope of 1/4-inch per foot (0.0208 rad) or greater towards points of free drainage is not a susceptible bay.

2. Add new text as follows:

1608.3 Ponding instability. Susceptible bays of roofs shall be evaluated for ponding instability in accordance with Section 7.11 of ASCE 7.

3. Revise as follows:

1611.2 Ponding instability. ~~For~~ Susceptible bays of roofs ~~with a slope less than 1/4 inch per foot [1.19 degrees (0.0208 rad)], the design calculations~~ shall ~~include verification of~~ be investigated by structural analysis to ensure that they possess adequate stiffness to preclude progressive deflection in accordance with Section 8.4 of ASCE 7.

Reason: The purpose for the proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to an ASCE 7 proposal on ponding instability, which was approved by the Snow/Rain Subcommittee and is being balloted by the Main Committee (Item #3 of the ASCE 7 Third Main Committee Ballot on Snow and Rain Provisions). It is expected that the Main Committee will approve the proposal.

Susceptible bays of roofs are required to meet the technical provisions of ASCE 7-10 for precluding progressive deflection. A "susceptible bay" is defined in Section 8.4 of ASCE 7-10 and this definition is being added to the IBC. Having a definition of "susceptible bay" in the IBC will provide a technical basis for determining which bays of a roof are susceptible bays and, thus, are required to meet the technical provisions of ASCE 7-10 for them. All bays of roofs other than susceptible bays are not required to meet these technical provisions.

Without the definition, the IBC will be without effective charging text. IBC Sections 1608.3 and 1611.2 rely on the determination of which bays are susceptible bays in order to determine the need to comply with the applicable provisions of ASCE 7. That determination is not possible unless a definition of "susceptible bay" is included in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

1. Add new text as follows:

SECTION 1602
DEFINITIONS AND NOTATIONS

NOTATIONS.

V_{asd} = nominal design wind speed (3-sec gust), miles per hour (mph) (km/hr) where applicable.

V_{ult} = ultimate design wind speeds (3-sec gust), miles per hour (mph) (km/hr) determined from Figures 1609A, 1609B, or 1609C or ASCE 7.

2. Revise as follows:

1603.1 General. Construction documents shall show the size, section and relative locations of structural members with floor levels, column centers and offsets dimensioned. The design loads and other information pertinent to the structural design required by Sections 1603.1.1 through 1603.1.9 shall be indicated on the *construction documents*.

Exception: *Construction documents* for buildings constructed in accordance with the *conventional light-frame construction* provisions of Section 2308 shall indicate the following structural design information:

1. Floor and roof live loads.
2. Ground snow load, P_g.
3. ~~Basic~~ Ultimate design wind speed, V_{ult} , (3-second gust), miles per hour (mph) (km/hr) and nominal design wind speed, V_{asd}, as determined in accordance with Section 1609.3.1 and wind exposure.
4. *Seismic design category* and *site class*.
5. Flood design data, if located in *flood hazard areas* established in Section 1612.3.
6. Design load-bearing values of soils.

1603.1.4 Wind design data. The following information related to wind loads shall be shown, regardless of whether wind loads govern the design of the lateral-force-resisting system of the building:

1. ~~Basic~~ Ultimate design wind speed, V_{ult}, (3-second gust), miles per hour (km/hr) and nominal design wind speed, V_{asd} , as determined in accordance with Section 1609.3.1.
2. Wind importance factor, *I*, and *occupancy category*.
3. Wind exposure. Where more than one wind exposure is utilized, the wind exposure and applicable wind direction shall be indicated.
4. The applicable internal pressure coefficient.
5. Components and cladding. The design wind pressures in terms of psf (kN/m2) to be used for the design of exterior component and cladding materials not specifically designed by the *registered design professional*

TABLE 1604.3
DEFLECTION LIMITS[a,b,c,h,i]
(No change to table)

(No change to footnotes a-e)

f. The wind load is permitted to be taken as 0.42 ~~0.7~~ times the "component and cladding" loads for the purpose of determining deflection limits herein.

(No change to footnotes g-i)

1605.2.1 Basic load combinations. Where strength design or *load and resistance factor design* is used, structures and portions thereof shall resist the most critical effects from the following combinations of factored loads:

1.4 (*D*+*F*) **(Equation 16-1)**

1.2(*D* + *F* + *T*) + 1.6(*L* + *H*) + 0.5 (L_r or *S* or *R*) **(Equation 16-2)**

1.2D+ 1.6(L_r or S or R) + (f_1L or ~~0.8W~~ 0.5W) **(Equation 16-3)**

1.2D+ ~~1.6~~ 1.0W+ f_1L + 0.5(L_r or S or R) **(Equation 16-4)**

1.2D+ 1.0E+ f_1L + f_2S **(Equation 16-5)**

0.9D+ ~~1.6~~ 1.0W+ 1.6H **(Equation 16-6)**
0.9D+ 1.0E+ 1.6H **(Equation 16-7)**

where:

f_1 = 1 for floors in places of public assembly, for live loads in excess of 100 pounds per square foot (4.79 kN/m^2), and for parking garage live load, and
= 0.5 for other live loads.
f_2 = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure, and
= 0.2 for other roof configurations.

Exception: Where other factored load combinations are specifically required by the provisions of this code, such combinations shall take precedence.

1605.3.1 Basic load combinations. Where *allowable stress design* (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

D+F **(Equation 16-8)**

D+H+F+ L + T **(Equation 16-9)**

D+H+F+ (L_r or S or R) **(Equation 16-10)**

D + H + F + 0.75(L + T) +
0.75 (L_r or S or R) **(Equation 16-11)**

D+H+F+(0.6W or 0.7E) **(Equation 16-12)**

D + H + F + 0.75(0.6W or 0.7E) +
0.75L + 0.75 (L_r or S or R) **(Equation 16-13)**

0.6D+ 0.6W+H **(Equation 16-14)**

0.6D+ 0.7E+H **(Equation 16-15)**

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.

1605.3.2 Alternative basic load combinations. In lieu of the basic load combinations specified in Section 1605.3.1, structures and portions thereof shall be permitted to be designed for the most critical effects resulting from the following combinations. When using these alternative basic load combinations that include wind or seismic loads, allowable stresses are permitted to be increased or load combinations reduced where permitted by the material chapter of this code or the referenced standards. For load combinations that include the counteracting effects of dead and wind loads, only two-thirds of the minimum dead load likely to be in place during a design wind event shall be used. Where wind loads are calculated in accordance with Chapters 26 through 31 ~~Chapter 6~~ of ASCE 7, the coefficient . in the following equations shall be taken as 0.78 ~~1.3~~. For other wind loads, shall be taken as 1. When using these alternative load combinations to evaluate sliding, overturning and soil bearing at the soil-structure interface, the reduction of foundation overturning from Section 12.13.4 in ASCE 7 shall not be used. When using these

alternative basic load combinations for proportioning foundations for loadings, which include seismic loads, the vertical seismic *load effect*, E_v, *i*n Equation 12.4-4 of ASCE 7 is permitted to be taken equal to zero.

$D + L + (L_r \text{ or } S \text{ or } R)$ **(Equation 16-16)**

$D + L + (\omega W)$ **(Equation 16-17)**

$D + L + \omega W + S/2$ **(Equation 16-18)**
$D + L + S + \omega W/2$ **(Equation 16-19)**

$D + L + S + E/1.4$ **(Equation 16-20)**

$0.9D + E/1.4$ **(Equation 16-21)**

Exceptions:

1. Crane hook loads need not be combined with roof live loads or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m^2) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m^2), 20 percent shall be combined with seismic loads.

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 ~~6~~ of ASCE 7 ~~or provisions of the alternate all-heights method in Section 1609.6~~. The type of opening protection required, the ~~basic~~ ultimate design wind speed, V_{ult}, and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas.
6. Wind tunnel tests in accordance with Chapter 31 ~~Section 6.6~~ of ASCE 7~~, subject to the limitations in Section 1609.1.1.2~~.

The wind speeds in Figure 1609A, 1609B and 1609C are ultimate design wind speeds, V_{ult}, and shall be converted in accordance with Section 1609.3.1 to nominal design wind speeds, V_{asd}, when the provisions of the standards referenced in Exceptions 1 through 5 are used.

4. Delete without substitution as follows:

~~**1609.1.1.2 Wind tunnel test limitations.** The lower limit on pressures for main wind-force-resisting systems and components and cladding shall be in accordance with Sections 1609.1.1.2.1 and 1609.1.1.2.2.~~

~~**1609.1.1.2.1 Lower limits on main wind-force-resisting system.** Base overturning moments determined from wind tunnel testing shall be limited to not less than 80 percent of the design base overturning moments determined in accordance with Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates it is the aerodynamic coefficient of the building, rather than shielding from other structures, that is responsible for the lower values. The 80-percent limit shall be permitted to be adjusted by the ratio of the frame load at critical wind directions as determined from wind tunnel testing without specific adjacent buildings, but including appropriate upwind roughness, to that determined in Section 6.5 of ASCE 7.~~

~~**1609.1.1.2.2 Lower limits on components and cladding.** The design pressures for components and cladding on walls or roofs shall be selected as the greater of the wind tunnel test results or 80 percent of the pressure obtained for Zone 4 for walls and Zone 1 for roofs as determined in Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates it is the aerodynamic coefficient of the building, rather than shielding from nearby structures, that is~~

~~responsible for the lower values. Alternatively, limited tests at a few wind directions without specific adjacent buildings, but in the presence of an appropriate upwind roughness, shall be permitted to be used to demonstrate that the lower pressures are due to the shape of the building and not to shielding.~~

5. Revise as follows:

1609.1.2 Protection of openings. In *wind-borne debris regions*, glazing in buildings shall be impact resistant or protected with an impact-resistant covering meeting the requirements of an *approved* impact-resistant standard or ASTM E 1996 and ASTM E 1886 referenced herein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the Large Missile Test of ASTM E 1996.
2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the small missile test of ASTM E 1996.

Exceptions:

1. Wood structural panels with a minimum thickness of $7/16$ inch (11.1 mm) and maximum panel span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings classified as Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding loads determined in accordance with the provisions of ASCE 7, with corrosion-resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 with corrosion-resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of 45 feet (13 716 mm) or less where V_{asd} determined in accordance with Section 1609.3.1 ~~wind speeds do~~ does not exceed 140 mph (63 m/s).
2. Glazing in *Occupancy Category* I buildings as defined in Section 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in *Occupancy Category* II, III or IV buildings located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected.

6. Add new text as follows:

1609.1.2.2. Modifications to ASTM E 1996. Section 6.2.2 of ASTM E 1996 shall be modified as follows:

6.2.2 Unless otherwise specified, select the wind zone based on the strength design wind speed, V_{ult}, as follows:
6.2.2.1 *Wind Zone 1* - 130 mph ≤ ultimate design wind speed, V_{ult} < 140 mph.
6.2.2.2 *Wind Zone 2* - 140 mph ≤ ultimate design wind speed, V_{ult} < 150 mph at greater than 1.6 km (one mile) from the coastline. The coastline shall be measured from the mean high water mark.
6.2.2.3 *Wind Zone 3* - ultimate design wind speed, V_{ult} ≥ 150 mph, or the ultimate design wind speed, V_{ult} ≥ 140 mph and within 1.6 km (one mile) of the coastline. The coastline shall be measured from the mean high water mark.

7. Revise as follows:

1609.2 Definitions. The following words and terms shall, for the purposes of Section 1609, have the meanings shown herein.

HURRICANE-PRONE REGIONS. Areas vulnerable to hurricanes defined as:

1. The U. S. Atlantic Ocean and Gulf of Mexico coasts where the ~~basic~~ ultimate design wind speed, V_{ult}, for Occupancy Category II buildings is greater than 115 ~~90~~ mph (40 m/s) and
2. Hawaii, Puerto Rico, Guam, Virgin Islands and American Samoa.

WIND-BORNE DEBRIS REGION. Areas within ~~Portions of~~ *hurricane- prone regions* located: ~~that are~~

1. W~~w~~ithin 1 mile (1.61 km) of the coastal mean high water line where the ~~basic~~ ultimate design wind speed V_{ult} is 130 ~~110 mph~~ (48 m/s) or greater; or
2. In areas ~~portions of *hurricane prone regions*~~ where the ~~basic~~ ultimate design wind speed is V_{ult} 140 ~~120~~ mph (53 m/s) or greater~~; or Hawaii.~~

For Occupancy Category II buildings and structures and Occupancy Category III buildings and structures, except health care facilities, the windborne debris region shall be based on Figure 1609b. For Occupancy Category IV buildings and structures and Occupancy Category III health care facilities, the windborne debris region shall be based on Figure 1609c.

8. Add new definitions as follows:

1609.2 Definitions.

WIND SPEED, V_{ult}. Ultimate design wind speeds.

WIND SPEED, V_{asd}. Nominal design wind speeds.

9. Revise as follows:

1609.3 Basic wind speed. The ~~basic~~ ultimate design wind speed V_{ult}, in mph, for the determination of the wind loads shall be determined by ~~Figure 1609~~ Figures 1609A, 1609B and 1609C. The ultimate design wind speed, V_{ult}, for use in the design of Occupancy Category II buildings and structures shall be obtained from Figure 1609A. The ultimate design wind speed, V_{ult}, for use in the design of Occupancy Category III and IV buildings and structures shall be obtained from Figure 1609B. The ultimate design wind speed, V_{ult}, for use in the design of Occupancy Category I buildings and structures shall be obtained from Figure 1609C. ~~Basic~~ The ultimate design wind speed, V_{ult}, for the special wind regions indicated, near mountainous terrain and near gorges shall be in accordance with local jurisdiction requirements. ~~Basic~~ The ultimate design wind speeds, V_{ult}, determined by the local jurisdiction shall be in accordance with Section 26.5.1 ~~6.5.4~~ of ASCE 7.

In nonhurricane-prone regions, when the ~~basic~~ ultimate design wind speed, V_{ult}, is estimated from regional climatic data, the ~~basic~~ ultimate design wind speed, V_{ult}, shall be ~~not less than the wind speed associated with an annual probability of 0.02 (50-year mean recurrence interval), and the estimate shall be adjusted for equivalence to a 3-second gust wind speed at 33 feet (10 m) above ground in Exposure Category C. The data analysis shall be performed~~ determined in accordance with Section 26.5.3 ~~6.5.4.2~~ of ASCE 7.

10. Delete and substitute as follows:

~~FIGURE 1609~~
~~BASIC WIND SPEED (3-SECOND GUST)~~

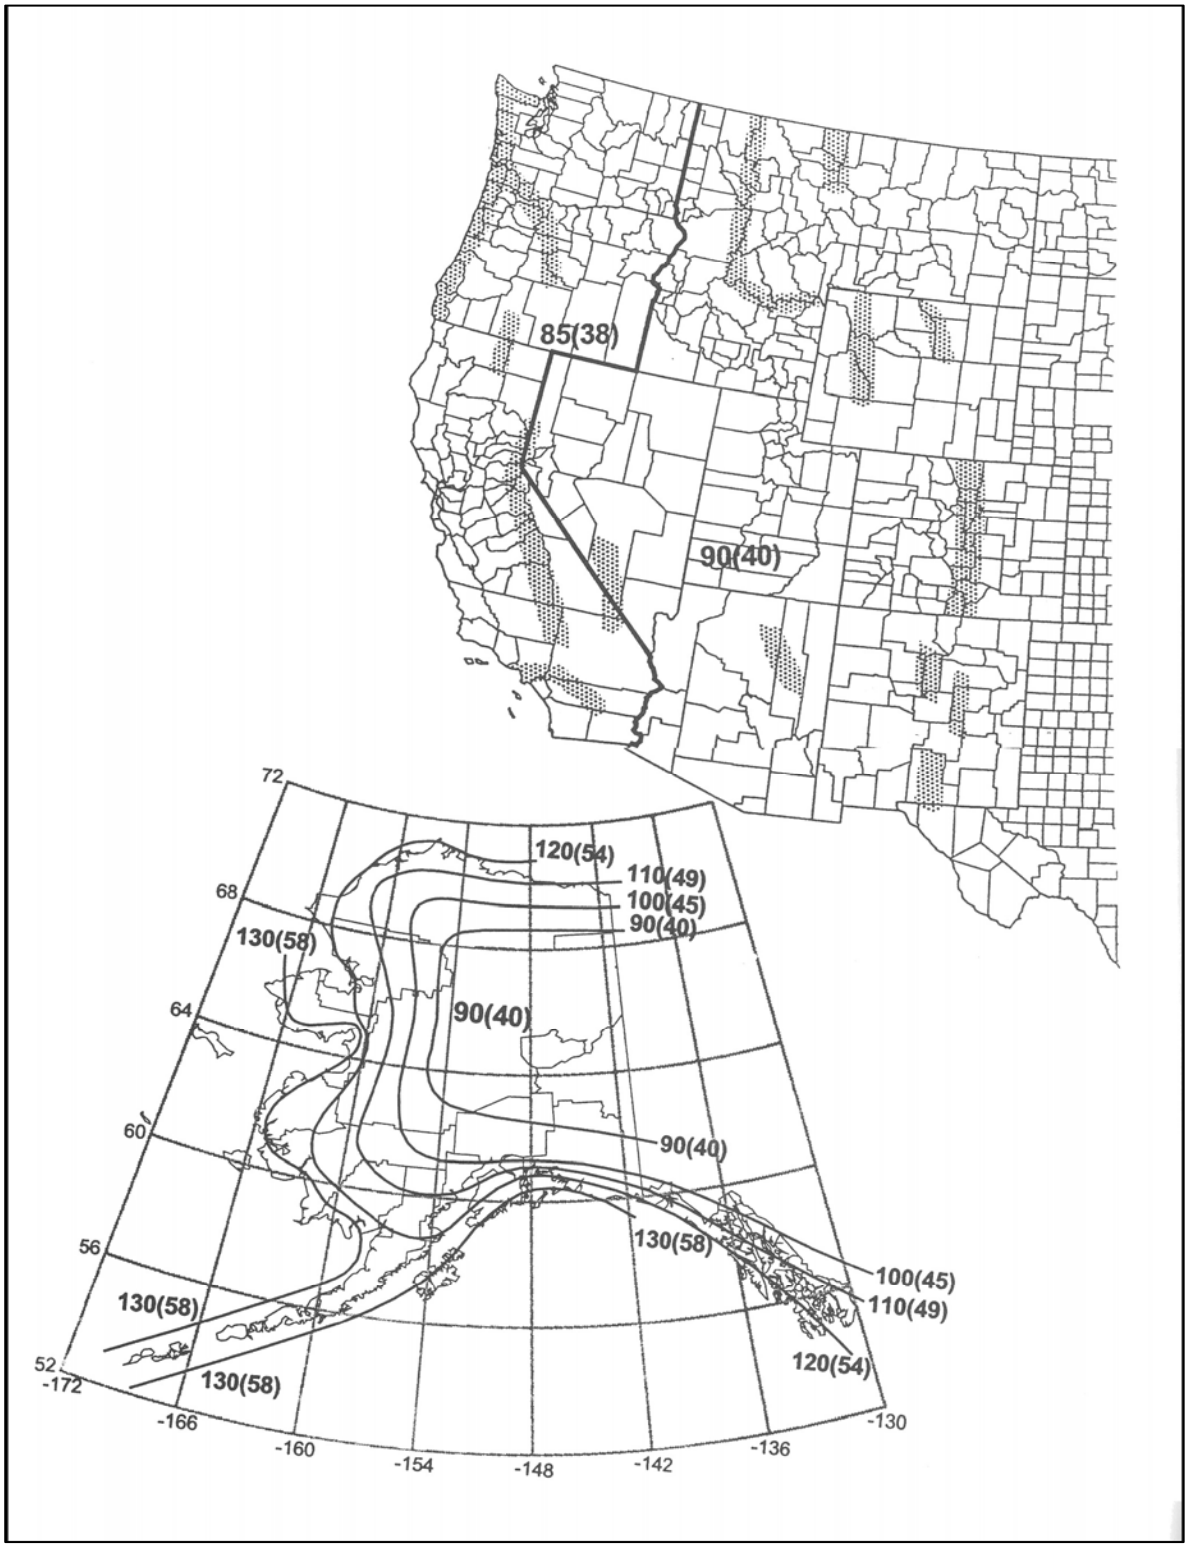

FIGURE 1609A
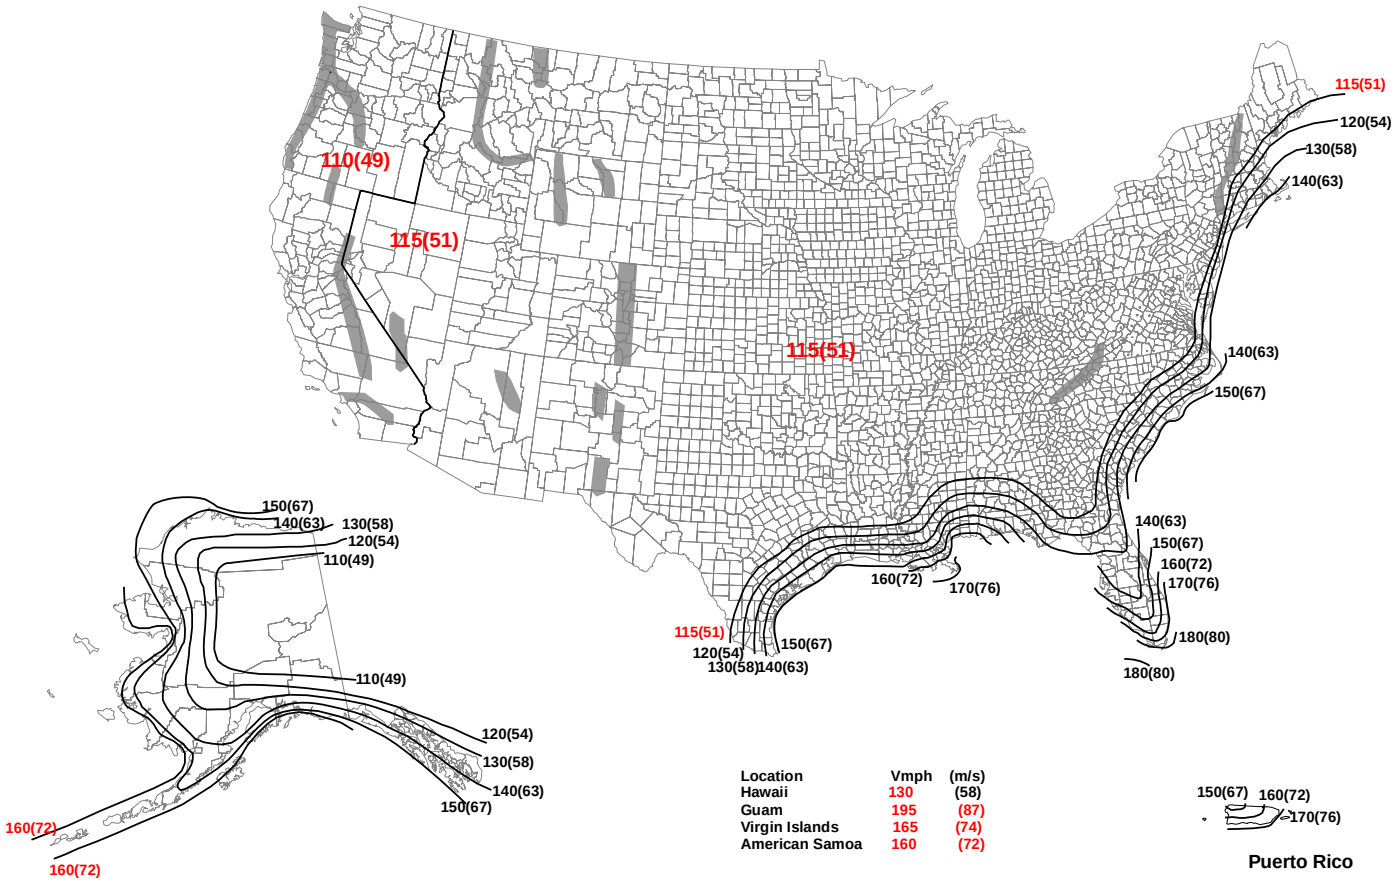
ULTIMATE DESIGN WIND SPEEDS, V_{ULT}, FOR OCCUPANCY CATEGORY II BUILDINGS AND OTHER STRUCTURES



Notes:

1. **Values are nominal design 3-second gust wind speeds in miles per hour (m/s) at 33 ft (10m) above ground for Exposure C category.**
2. **Linear interpolation between contours is permitted.**
3. **Islands and coastal areas outside the last contour shall use the last wind speed contour of the coastal area.**
4. **Mountainous terrain, gorges, ocean promontories, and special wind regions shall be examined for unusual wind conditions.**
5. **Wind speeds correspond to approximately a 7% probability of exceedance in 50 years.**

Location	V mph	(m/s)

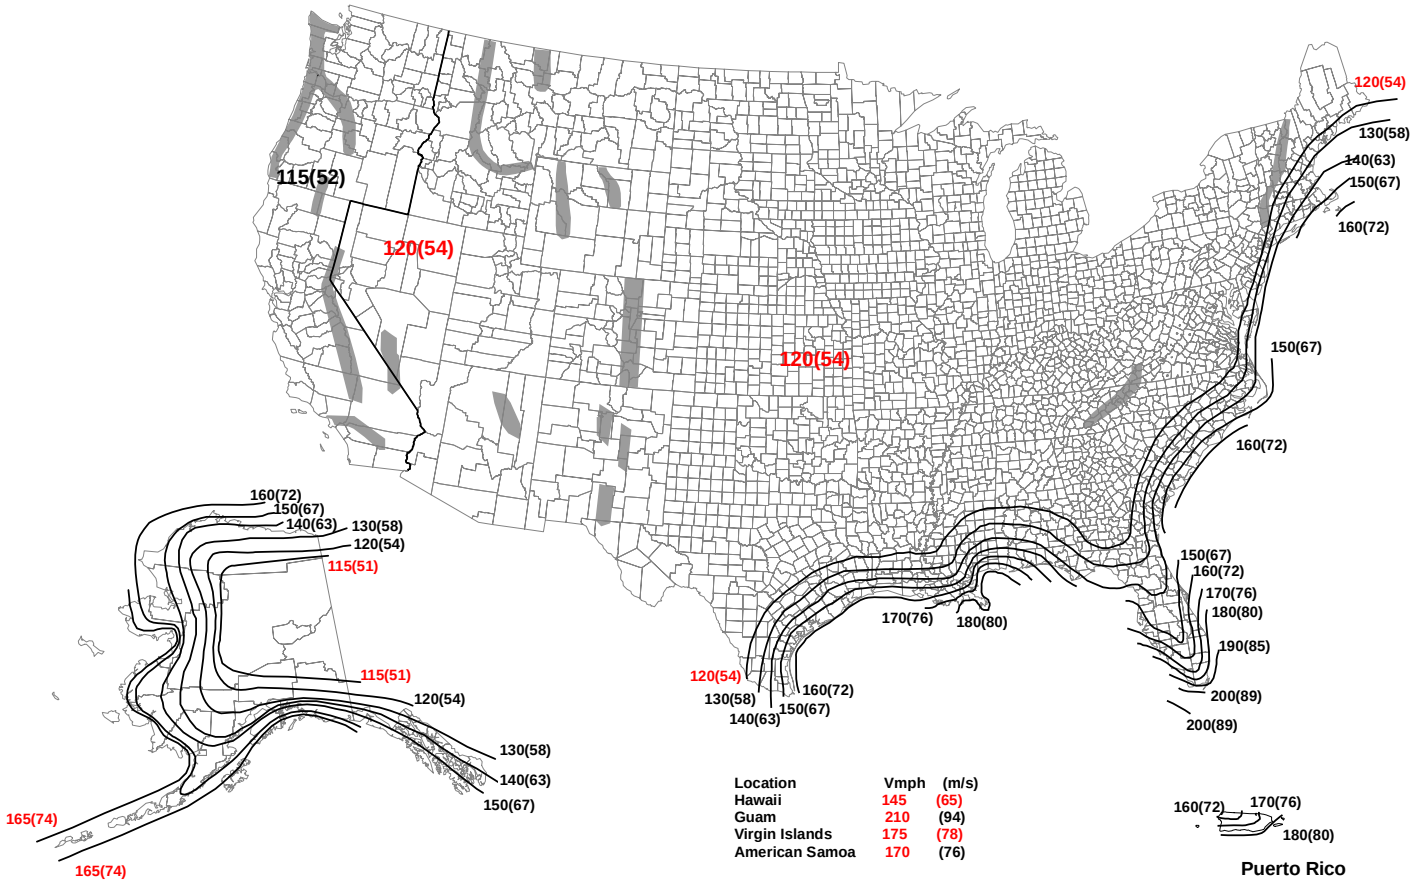
FIGURE 1609B
ULTIMATE DESIGN WIND SPEEDS, V_{ULT}, FOR OCCUPANCY CATEGORY III AND IV BUILDINGS AND OTHER STRUCTURES



Notes:

1. Values are nominal design 3-second gust wind speeds in miles per hour (m/s) at 33 ft (10m) above ground for Exposure C category.
2. Linear interpolation between contours is permitted.
3. Islands and coastal areas outside the last contour shall use the last wind speed contour of the coastal area.
4. Mountainous terrain, gorges, ocean promontories, and special wind regions shall be examined for unusual wind conditions.
5. Wind speeds correspond to approximately a 3% probability of exceedance in 50 years.

Location	V mph	(m/s)

Statewide		
Guam	180	(80)
Virgin Islands	150	(67)
American Samoa	150	(67)

11. Revise as follows:

1609.3.1 Wind speed conversion. When required, the ~~3-second gust basic~~ ultimate design wind speeds of Figure 1609A, B and C shall be converted to nominal design wind speeds, V_{asd}. ~~fastest-mile wind speeds, V_{fm}~~, using Table 1609.3.1 or Equation 16-32.

~~$V_{fm} = \frac{V_{ult} \sqrt{I_e}}{1.06}$~~ **(Equation 16-32)**

~~where:~~

~~V_{3S} = 3-second gust basic wind speed from Figure 1609.~~

$V_{asd} = V_{ult}\sqrt{0.6}$

Where:
V_{asd} = nominal design wind speed applicable to methods specified in Exceptions 1 through 5 of Section 1609.1.1
V_{ult} = ultimate design wind speeds determined from Figures 1609A, 1609B, or 1609C

12. Delete and substitute as follows:

~~TABLE 1609.3.1~~
~~EQUIVALENT BASIC WIND SPEEDS[a,b,c]~~

~~V_{3S}~~	~~85~~	~~90~~	~~100~~	~~105~~	~~110~~	~~120~~	~~125~~	~~130~~	~~140~~	~~145~~	~~150~~	~~160~~	~~170~~

~~For SI: 1 mile per hour = 0.44 m/s.~~
~~a. Linear interpolation is permitted.~~
~~b. *V3S* is the 3-second gust wind speed (mph).~~
~~c. *Vfm* is the fastest mile wind speed (mph).~~

TABLE 1609.3.1
WIND SPEED CONVERSIONS[a,b,c]

V_{ul}	100	110	120	130	140	150	160	170	180	190	200
V_{asd}	78	85	93	101	108	116	124	132	139	147	155

a. Linear interpolation is permitted
b. V_{asd} = nominal design wind speed applicable to methods specified in Exceptions 1 through 5 of Section 1609.1.1
c. V_{ult} = ultimate design wind speeds determined from Figures 1609A, 1609B, or 1609C

13. Revise as follows:

1609.4.2 Surface roughness categories. A ground surface roughness within each 45-degree (0.79 rad) sector shall be determined for a distance upwind of the site as defined in Section 1609.4.3 from the categories defined below, for the purpose of assigning an exposure category as defined in Section 1609.4.3.

Surface Roughness B. Urban and suburban areas, wooded areas or other terrain with numerous closely spaced obstructions having the size of single-family dwellings or larger.

Surface Roughness C. Open terrain with scattered obstructions having heights generally less than 30 feet (9144 mm). This category includes flat open country~~,~~ and grasslands~~, and all water surfaces in *hurricane-prone regions*~~.

Surface Roughness D. Flat, unobstructed areas and water surfaces ~~outside *hurricane-prone regions*~~. This category includes smooth mud flats, salt flats and unbroken ice.

1609.4.3 Exposure categories. An exposure category shall be determined in accordance with the following:

Exposure B. For buildings with a mean roof height of less than or equal to 30 feet, Exposure B shall apply where the ground surface roughness ~~condition~~, as defined by Surface Roughness B, prevails in the upwind direction for a distance of at least 1,500 feet (457 m). For buildings with a mean roof height greater than 30 feet, Exposure B shall apply where Surface Roughness B prevails in the upwind direction for a distance of at least 2,600 feet (792 m) or 20 times the height of the building, whichever is greater.

~~**Exception:** For buildings whose mean roof height is less than or equal to 30 feet (9144 mm), the upwind distance is permitted to be reduced to 1,500 feet (457 m).~~

Exposure C. Exposure C shall apply for all cases where Exposures B or D do not apply.

Exposure D. Exposure D shall apply where the ground surface roughness, as defined by Surface Roughness D, prevails in the upwind direction for a distance of at least 5,000 feet (1524 m) or 20 times the height of the building, whichever is greater. Exposure D shall also apply where the ground surface roughness immediately upwind of the site is B or C, and the site is within a distance of 600 feet (183 m) or 20 times the building height, whichever is

greater, from an exposure D condition as defined in the previous sentence. ~~Exposure D shall extend inland from the shoreline for a distance of 600 feet (183 m) or 20 times the height of the building, whichever is greater.~~

1609.5.3 Rigid tile. Wind loads on rigid tile roof coverings shall be determined in accordance with the following equation:

$$M_a = q_h C_L b L L_a [1.0 - G C_p] \qquad \textbf{(Equation 16-33)}$$

$$\text{For SI: } M_a = \frac{q_h C_L b L L_a [1.0 - G C_p]}{1{,}000}$$

where:

b = Exposed width, feet (mm) of the roof tile.
CL = Lift coefficient. The lift coefficient for concrete and clay tile shall be 0.2 or shall be determined by test in accordance with Section 1716.2.
GC_p = Roof pressure coefficient for each applicable roof zone determined from Chapter 30 ~~6~~ of ASCE 7. Roof coefficients shall not be adjusted for internal pressure.
L = Length, feet (mm) of the roof tile.
L_a = Moment arm, feet (mm) from the axis of rotation to the point of uplift on the roof tile. The point of uplift shall be taken at 0.76*L* from the head of the tile and the middle of the exposed width. For roof tiles with nails or screws (with or without a tail clip), the axis of rotation shall be taken as the head of the tile for direct deck application or as the top edge of the batten for battened applications. For roof tiles fastened only by a nail or screw along the side of the tile, the axis of rotation shall be determined by testing. For roof tiles installed with battens and fastened only by a clip near the tail of the tile, the moment arm shall be determined about the top edge of the batten with consideration given for the point of rotation of the tiles based on straight bond or broken bond and the tile profile.
Ma = Aerodynamic uplift moment, feet-pounds (N-mm) acting to raise the tail of the tile.
q_h = Wind velocity pressure, psf (kN/m_2) determined from Section 27.3.2 ~~6.5.10~~ of ASCE 7.

Concrete and clay roof tiles complying with the following limitations shall be designed to withstand the aerodynamic uplift moment as determined by this section.

1. The roof tiles shall be either loose laid on battens, mechanically fastened, mortar set or adhesive set.
2. The roof tiles shall be installed on solid sheathing which has been designed as components and cladding.
3. An underlayment shall be installed in accordance with Chapter 15.
4. The tile shall be single lapped interlocking with a minimum head lap of not less than 2 inches (51 mm).
5. The length of the tile shall be between 1.0 and 1.75 feet (305 mm and 533 mm).
6. The exposed width of the tile shall be between 0.67 and 1.25 feet (204 mm and 381 mm).
7. The maximum thickness of the tail of the tile shall not exceed 1.3 inches (33 mm).
8. Roof tiles using mortar set or adhesive set systems shall have at least two-thirds of the tile's area free of mortar or adhesive contact.

14. Delete without substitution:

~~**1609.6 Alternate all-heights method.** The alternate wind design provisions in this section are simplifications of the ASCE 7 Method 2—Analytical Procedure.~~

~~**1609.6.1 Scope.** As an alternate to ASCE 7 Section 6.5, the following provisions are permitted to be used to determine the wind effects on regularly shaped buildings, or other structures that are regularly shaped, which meet all of the following conditions:~~

~~1. The building or other structure is less than or equal to 75 feet (22 860 mm) in height with a height-to-leastwidth ratio of 4 or less, or the building or other structure has a fundamental frequency greater than or equal to 1 hertz.~~
~~2. The building or other structure is not sensitive to dynamic effects.~~
~~3. The building or other structure is not located on a site for which channeling effects or buffeting in the wake of upwind obstructions warrant special consideration.~~
~~4. The building shall meet the requirements of a simple diaphragm building as defined in ASCE 7 Section 6.2, where wind loads are only transmitted to the main wind-force-resisting system (MWFRS) at the diaphragms.~~

5. For open buildings, multispan gable roofs, stepped roofs, sawtooth roofs, domed roofs, roofs with slopes greater than 45 degrees (0.79 rad), solid free-standing walls and solid signs, and rooftop equipment, apply ASCE 7 provisions.

1609.6.1.1 Modifications. The following modifications shall be made to certain subsections in ASCE 7: in Section 1609.6.2, symbols and notations that are specific to this section are used in conjunction with the symbols and notations in ASCE 7 Section 6.3.

1609.6.2 Symbols and notations. Coefficients and variables used in the alternate all-heights method equations are as follows:

Cnet = Net-pressure coefficient based on *Kd* [(*G*) (*Cp*) – (*GCpi*)], in accordance with Table 1609.6.2(2).
G = Gust effect factor for rigid structures in accordance with ASCE 7 Section 6.5.8.1.
Kd = Wind directionality factor in accordance with ASCE 7 Table 6-4.
Pnet = Design wind pressure to be used in determination of wind loads on buildings or other structures or their components and cladding, in psf (kN/m2).
qs = Wind stagnation pressure in psf (kN/m2) in accordance with Table 1609.6.2(1).

1609.6.3 Design equations. When using the alternate all-heights method, theMWFRS,and components and cladding of every structure shall be designed to resist the effects of wind pressures on the building envelope in accordance with Equation 16-34.

Pnet = *qsKzCnet* [*IKzt*] **(Equation 16-34)**

Design wind forces for theMWFRSshall not be less than 10 psf (0.48 kN/m2) multiplied by the area of the structure projected on a plane normal to the assumed wind direction (see ASCE 7 Section 6.1.4 for criteria). Design net wind pressure for components and cladding shall not be less than 10 psf (0.48 kN/m2) acting in either direction normal to the surface.

1609.6.4 Design procedure. The MWFRS and the components and cladding of every building or other structure shall be designed for the pressures calculated using Equation 16-34.

1609.6.4.1 Main wind-force-resisting systems. The MWFRS shall be investigated for the torsional effects identified in ASCE 7 Figure 6-9.

1609.6.4.2 Determination of *Kz* and *Kzt*. Velocity pressure exposure coefficient, *Kz*, shall be determined in accordance with ASCE 7 Section 6.5.6.6 and the topographic factor, *Kzt*, shall be determined in accordance with ASCE 7 Section 6.5.7.

1. For the windward side of a structure, *Kzt* and *Kz* shall be based on height *z*.
2. For leeward and sidewalls, and for windward and leeward roofs, *Kzt* and *Kz* shall be based on mean roof height *h*.

1609.6.4.3 Determination of net pressure coefficients, *Cnet*. For the design of the MWFRS and for components and cladding, the sum of the internal and external net pressure shall be based on the net pressure coefficient, *Cnet*.

1. The pressure coefficient, *Cnet*, for walls and roofs shall be determined from Table 1609.6.2(2).
2. Where *Cnet* has more than one value, the more severe wind load condition shall be used for design.

1609.6.4.4 Application of wind pressures. When using the alternate all-heights method, wind pressures shall be applied simultaneously on, and in a direction normal to, all building envelope wall and roof surfaces.

1609.6.4.4.1 Components and cladding. Wind pressure for each component or cladding element is applied as follows using *Cnet* values based on the effective wind area, *A*, contained within the zones in areas of discontinuity of width and/or length "a," "2a" or "4a" at: corners of roofs and walls; edge strips for ridges, rakes and eaves; or field areas onwalls or roofs as indicated in figures in tables in ASCE 7 as referenced in Table 1609.6.2(2) in accordance with the following:

1. Calculated pressures at local discontinuities acting over specific edge strips or corner boundary areas.
2. Include "field" (Zone 1, 2 or 4, as applicable) pressures applied to areas beyond the boundaries of the areas of discontinuity.

~~3. Where applicable, the calculated pressures at discontinuities (Zones 2 or 3) shall be combined with design pressures that apply specifically on rakes or eave overhangs.~~

15. Revise as follows:

1405.14 Vinyl siding. Vinyl siding conforming to the requirements of this section and complying with ASTM D 3679 shall be permitted on exterior walls of buildings located in areas where ~~the~~ V_{asd} as determined in accordance with Section 1609.3.1 ~~basic wind speed specified in Chapter 16~~ does not exceed 100 miles per hour (45 m/s) and the *building height* is less than or equal to 40 feet (12 192 mm) in Exposure C. Where construction is located in areas where ~~the~~ V_{asd} as determined in accordance with Section 1609.3.1 ~~basic wind speed~~ exceeds 100 miles per hour (45 m/s), or building heights are in excess of 40 feet (12 192 mm), tests or calculations indicating compliance with Chapter 16 shall be submitted. Vinyl siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1504.5 Edge securement for low-slope roofs. Low-slope membrane roof system metal edge securement, except gutters, shall be designed and installed for wind loads in accordance with Chapter 16 and tested for resistance in accordance with ANSI/SPRI ES-1, except ~~the basic~~ V_{ult} wind speed shall be determined from Figure 1609A, 1609B, or 1609C as applicable.

TABLE 1504.8
MAXIMUM ALLOWABLE MEAN ROOF HEIGHT PERMITTED FOR BUILDINGS WITH AGGREGATE ON THE ROOF IN AREAS OUTSIDE A HURRICANE-PRONE REGION

V_{asd} determined in accordance with Section 1609.3.1 ~~BASIC WIND SPEED FROM FIGURE 1609 (mph)b~~	MAXIMUM MEAN ROOF HEIGHT (ft)a,c		
	Exposure category		
	B	C	D
85	170	60	30
90	110	35	15
95	75	20	NP
100	55	15	NP
105	40	NP	NP
110	30	NP	NP
115	20	NP	NP
120	15	NP	NP
Greater than 120	NP	NP	NP

a. Mean roof height as defined in ASCE 7.
b. For intermediate values of V_{asd} ~~basic wind speed~~, the height associated with the next higher value of V_{asd} ~~wind speed~~ shall be used, or direct interpolation is permitted.
c. NP = gravel and stone not permitted for any roof height.

TABLE 1507.2.7.1(1)
CLASSIFICATION OF ASPHALT ROOF SHINGLES PER ASTM D 7158[a]

V_{asd} determined in accordance with Section 1609.3.1 ~~MAXIMUM BASIC WIND SPEED FROM FIGURE 1609~~	CLASSIFICATION REQUIREMENT

(Portions of Table not shown, remain unchanged)

TABLE 1507.2.7.1(2)
CLASSIFICATION OF ASPHALT SHINGLES PER ASTM D 3161

V_{asd} determined in accordance with Section 1609.3.1 ~~MAXIMUM BASIC WIND SPEED FROM FIGURE 1609~~	CLASSIFICATION REQUIREMENT

(Portions of Table now shown, remain unchanged)

1507.2.8.1 High wind attachment. Underlayment applied in areas subject to high winds (V_{asd} greater than 110 mph as determined in accordance with Section 1609.3.1 ~~in accordance with Figure 1609~~) shall be applied with corrosion-resistant fasteners in accordance with the manufacturer's instructions. Fasteners are to be applied along the overlap at a maximum spacing of 36 inches (914 mm) on center.

TABLE 1507.3.7
CLAY AND CONCRETE TILE ATTACHMENT[a, b, c]

GENERAL — CLAY OR CONCRETE ROOF TILE

INTERLOCKING CLAY OR CONCRETE ROOF TILE WITH PROJECTING ANCHOR LUGS[d, e] (Installations on spaced/solid sheathing with battens or spaced sheathing)				
Maximum V_{asd} determined in accordance with Section 1609.3.1 ~~basic wind speed (mph)~~	**Mean roof height (feet)**	**Roof slope up to <5:12**	**Roof slope 5:12 < 12:12**	**Roof slope 12:12 and over**
INTERLOCKING CLAY OR CONCRETE ROOF TILE WITH PROJECTING ANCHOR LUGS (Installations on solid sheathing without battens)				
Maximum V_{asd} determined in accordance with Section 1609.3.1 ~~basic wind speed (mph)~~	**Mean roof height (feet)**	**All roof slopes**		

(Portions of Table not shown, remain unchanged)

1705.4 Wind resistance. The statement of special inspections shall include wind requirements for structures constructed in the following areas:

1. In wind Exposure Category B, where ~~the~~ V_{asd} as determined in accordance with Section 1609.3.1 ~~3-second-gust basic wind speed~~ is 120 miles per hour (mph) (52.8 m/s) or greater.
2. In wind Exposure Category C or D, where ~~the~~ V_{asd} as determined in accordance with Section 1609.3.1 ~~3-second- gust basic wind speed~~ is 110 mph (49 m/s) or greater.

1706.1 Special inspections for wind requirements. *Special inspections* itemized in Sections 1706.2 through 1706.4, unless exempted by the exceptions to Section 1704.1, are required for buildings and structures constructed in the following areas:

1. In wind Exposure Category B, where ~~the~~ V_{asd} as determined in accordance with Section 1609.3.1 ~~3-second-gust basic wind speed~~ is 120 miles per hour (52.8 m/sec) or greater.
2. In wind Exposure Categories C or D, where ~~the~~ V_{asd} as determined in accordance with Section 1609.3.1 ~~3-second-gust basic wind speed~~ is 110 mph (49 m/sec) or greater.

1710.3 Structural observations for wind requirements. Structural observations shall be provided for those structures sited where ~~the~~ V_{asd} as determined in accordance with Section 1609.3.1 ~~basic wind speed~~ exceeds 110 mph (49 m/sec) ~~determined from Figure 1609~~, where one or more of the following conditions exist:

1. The structure is classified as *Occupancy Category* III or IV in accordance with Table 1604.5.
2. The *building height* of the structure is greater than 75 feet (22 860 mm).
3. When so designated by the *registered design professional* responsible for the structural design.
4. When such observation is specifically required by the *building official*.

2109.1.1 Limitations. The use of empirical design of masonry shall be limited as noted in Section 5.1.2 of TMS 402/ACI 530/ASCE 5. The use of dry-stacked, surface-bonded masonry shall be prohibited in *Occupancy Category* IV structures. In buildings that exceed one or more of the limitations of Section 5.1.2 of TMS 402/ACI 530/ASCE 5, masonry shall be designed in accordance with the engineered design provisions of Section 2101.2.1, 2101.2.2 or 2101.2.3 or the foundation wall provisions of Section 1807.1.5.

Section 5.1.2.2 of TMS 402/ACI 530/ASCE 5 shall be modified as follows:

5.1.2.2 *Wind* – Empirical requirements shall not apply to the design or construction of masonry for buildings, parts of buildings, or other structures to be located in areas where V_{asd} as determined in accordance with Section 1609.3.1 of the *International Building Code* exceeds 110 mph.

TABLE 2304.6.1
MAXIMUM V_{asd} determined in accordance with Section 1609.3.1
~~BASIC WIND SPEED~~ (mph) (3-SECOND GUST) PERMITTED FOR
WOOD STRUCTURAL PANEL WALL SHEATHING USED TO RESIST WIND PRESSURESa,b,c

MINIMUM NAIL		MINIMUM WOOD STRUCTURAL PANEL SPAN RATING	MINIMUM NOMINAL PANEL THICKNESS (inches)	MAXIMUM WALL STUD SPACING (inches)	PANEL NAIL SPACING		MAXIMUM V_{asd} DETERMINED IN ACCORDANCE WITH SECTION 1609.3.1 ~~WIND SPEED (MPH)~~		
							Wind exposure category		
Size	Penetration (inches)				Edges (inches o.c.)	Field (inches o.c.)	B	C	D

(Portions of Table not shown, remain unchanged)

a. Panel strength axis shall be parallel or perpendicular to supports. Three-ply plywood sheathing with studs spaced more than 16 inches on center shall be applied with panel strength axis perpendicular to supports.
b. The table is based on wind pressures acting toward and away from building surfaces in accordance with Section 30.7 ~~6.4.2.2~~ ofASCE7. Lateral requirements shall be in accordance with Section 2305 or 2308.
c. Wood structural panels with span ratings ofwall-16 orwall-24 shall be permitted as an alternate to panels with a 24/0 span rating. Plywood siding rated 16 o.c. or 24 o.c. shall be permitted as an alternate to panels with a 24/16 span rating.Wall-16 and plywood siding 16 o.c. shall be used with studs spaced a maximum of 16 inches o.c.

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of *conventional light-frame construction*, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

1. Buildings shall be limited to a maximum of three *stories above grade plane*. For the purposes of this section, for buildings in *Seismic Design Category* D or E as determined in Section 1613, cripple stud walls shall be considered to be a *story*.

   Exception: Solid blocked cripplewalls not exceeding 14 inches (356 mm)in height need not be considered a *story*.

2. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches (3531 mm). Bearing wall height shall not exceed a stud height of 10 feet (3048 mm).
3. Loads as determined in Chapter 16 shall not exceed the following:
   3.1. Average dead loads shall not exceed 15 psf (718 N/m^2) for combined roof and ceiling, exterior walls, floors and partitions.

   Exceptions:

   1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m^2) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.
   2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.

   3.2. Live loads shall not exceed 40 psf (1916 N/m^2) for floors.
   3.3. Ground snow loads shall not exceed 50 psf (2395 N/m^2).

4. V_{asd} as determined in accordance with Section 1609.3.1 ~~Wind speeds~~ shall not exceed 100 miles per hour (mph) (44 m/s) (3-second gust).

Exception: V_{asd} as determined in accordance with Section 1609.3.1 ~~Wind speeds~~ shall not exceed 110 mph (48.4 m/s) (3-second gust) for buildings in Exposure Category B that are not located in a *hurricane-prone region*.

5. Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.
6. The use of the provisions for *conventional light-frame construction* in this section shall not be permitted for *Occupancy Category* IV buildings assigned to *Seismic Design Category* B, C, D, E or F, as determined in Section 1613.
7. *Conventional light-frame construction* is limited in irregular structures in *Seismic Design Category* D or E, as specified in Section 2308.12.6.

2308.2.1 Basic wind speed greater than 100 mph (3-second gust). Where the V_{asd} as determined in accordance with Section 1609.3.1 ~~basic wind speed~~ exceeds 100 mph (3-second gust), the provisions of either AF&PAWFCM, or the ICC 600 are permitted to be used. Wind speeds in Figure 1609A, 1609B, and 1609C shall be converted in accordance with Section 1609.3.1 for use with AF&PAWFCM or ICC 600.

TABLE 2308.10.1
REQUIRED RATING OF APPROVED UPLIFT CONNECTORS (pounds)[a,b,c,e,f,g,h,l]

V_{asd} determined in accordance with Section 1609.3.1 **~~BASIC WIND SPEED (3-second gust)~~**	**ROOF SPAN (feet)**							**OVERHANGS (pounds/feet)d** **OVERHANGS (pounds/feet)[d]**
	12	**20**	**24**	**28**	**32**	**36**	**40**	

(Portions of Table not shown, remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 1.61 km/hr, 1 pound = 0.454 Kg, 1 pound/foot = 14.5939 N/m.

a. The uplift connection requirements are based on a 30-foot mean roof height located in Exposure B. For ExposureC orD and for other mean roof heights, multiply the above loads by the adjustment coefficients below.

	Mean Roof Height (feet)									
EXPOSURE	**15**	**20**	**25**	**30**	**35**	**40**	**45**	**50**	**55**	**60**
B	**1.00**	**1.00**	**1.00**	**1.00**	**1.05**	**1.09**	**1.12**	**1.16**	**1.19**	**1.22**
C	**1.21**	**1.29**	**1.35**	**1.40**	**1.45**	**1.49**	**1.53**	**1.56**	**1.59**	**1.62**
D	**1.47**	**1.55**	**1.61**	**1.66**	**1.70**	**1.74**	**1.78**	**1.81**	**1.84**	**1.87**

b. he uplift connection requirements are based on the framing being spaced 24 inches on center. Multiply by 0.67 for framing spaced 16 inches on center and multiply by 0.5 for framing spaced 12 inches on center.

c. The uplift connection requirements include an allowance for 10 pounds of dead load.

d. The uplift connection requirements do not account for the effects of overhangs. The magnitude of the above loads shall be increased by adding the overhang loads found in the table. The overhang loads are also based on framing spaced 24 inches on center. The overhang loads given shall be multiplied by the overhang projection and added to the roof uplift value in the table.

e. The uplift connection requirements are based upon wind loading on end zones as defined in Figure 28.6.3 ~~6-2~~ of ASCE 7. Connection loads for connections located a distance of 20 percent of the least horizontal dimension of the building from the corner of the building are permitted to be reduced by multiplying the table connection value by 0.7 and multiplying the overhang load by 0.8.

f. For wall-to-wall and wall-to-foundation connections, the capacity of the uplift connector is permitted to be reduced by 100 pounds for each full wall above. (For example, if a 500-pound rated connector is used on the roof framing, a 400-pound rated connector is permitted at the next floor level down).

g. Interpolation is permitted for intermediate values of V_{asd} ~~basic wind speeds~~ and roof spans.

h. The rated capacity of approved tie-down devices is permitted to include up to a 60-percent increase for wind effects where allowed by material specifications.

CHAPTER 35
REFERENCED STANDARDS

ASCE/SEI
American Society of Civil Engineers/Structural Engineering Institute
1801 Alexander Bell Drive
Reston, VA 20191-440

7-10 ~~7-05~~ Minimum Design Loads for Buildings and Other Structures ~~including Supplements No. 1 and 2, excluding Chapter 14 and Appendix 11A~~

Reason: The purpose of ths proposal is to update and coordinate the provisions of the 2012 IBC with those of the 2010 edition of ASCE 7 for the determination of wind loads. Although consisting of 30 small parts, the underlying reason for this change is to adopt into the 2012 IBC the new wind speed maps that have been adopted into ASCE 7.

Over the past 10 years, new data and research has been performed that indicates that the hurricane wind speeds provided in the current maps of the IBC-09 and ASCE-05 are too conservative and need to be adjusted downward. Significantly more hurricane data have become available thereby allowing for substantial improvements in the hurricane simulation model that is used to create the wind speed maps.
These new data have resulted in an improved representation of the hurricane wind field, including the modeling of the sea-land transition and the hurricane boundary layer height; new models for hurricane weakening after landfall; and an improved statistical model for the Holland *B* parameter which controls the wind pressure relationship. The new hurricane hazard model yields hurricane wind speeds that are lower than those given in ASCE 7-05 and IBC-09 even though the overall rate of intense storms (as defined by central pressure) produced by the new model is increased compared to those produced by the hurricane simulation model used to develop previous maps.

In preparing the new maps, the ASCE 7 standards committee decided to use multiple ultimate event or strength design maps in conjunction with a wind load factor of 1.0 for strength design – for allowable stress design, the factor was reduced from 1.0 to 0.6. Several factors that are important to an accurate wind load standard led to this decision:

(i) An ultimate event or strength design wind speed map makes the overall approach consistent with that used in seismic design in that they both map ultimate events and use a load factor of 1.0 for strength design.

(ii) Utilizing different maps for the different Occupancy Categories eliminates the problems associated with using “importance factors” that vary with category. The difference in the importance factors in hurricane prone and non-hurricane prone regions for Category I structures prompted many questions and have been removed from ASCE 7-10.

(iii) The use of multiple maps eliminates the confusion associated with the recurrence interval associated with the existing map - the map was not a uniform fifty year return period map. This therefore created a situation where the level of safety provided for within the overall design was not consistent along the hurricane coast.

Utilizing the new wind speed maps and integrating their use into the IBC necessitated the introduction of the terms V_{ult} and V_{asd} to be associated with the “ultimate” design wind speed and the “nominal” design wind speed. Because of the number of different provisions which use the wind speed map to “trigger” different requirements it was necessary to modify the conversion section (1609.3.1) so that those provisions were not changed. The terms “ultimate design wind speed” and “nominal design wind speed” were incorporate in numerous locations to aid in drawing the users attention to the different types of wind speeds – similar to what was done with the change from fastest mile to 3-second gust wind speeds.

Beyond the adoption of the new strength design wind speed maps, the 2010 edition of ASCE 7 also includes a new simplified method for use in the determination of wind loads for buildings up to 160’ in height. In addition, the wind load calculation provisions have been removed from Chapter 6 of ASCE 7 and been reorganized into 6 separate chapters (26 thru 31) for the sake of clarity and ease of use. This of course necessitated multiple coordination revisions with the IBC text.

ASCE/SEI 7 has been a referenced standard of the IBC since its inception and as such it is well known to the building community. ASCE/SEI 7 is published and maintained by the Structural Engineering Institute of the American Society of Civil Engineers (SEI/ASCE). The document is a nationally recognized consensus standard developed in full compliance with the ASCE *Rules for Standards Committees*. The ASCE standards process is fully accredited by the American National Standards Institute (ANSI).

As of the submission date of this code change, the ASCE 7 Standards Committee is completing the committee balloting portion of the 2010 edition of ASCE/SEI 7. The document is designated ASCE/SEI 7-10 *Minimum Design Loads for Buildings and Other Structures* and it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in May of 2010 . Any person interested in obtaining a public comment copy of ASCE/SEI 7-10 may do so by contacting the proponent at jrossberg@asce.org .

Cost Impact: The overall, national cost impact is believed to be neutral.

Public Hearing: Committee:	AS	AM	D	
Assembly:	ASF	AMF	DF	

ICCFILENAME: ROSSBERG-S1-1602 NOTATIONS

S85–09/10
1609.1.1, 3108.1

Proponent: Scott Beard PE, SE, City of Tacoma, representing the Structural Engineers Association of Washington.

Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7 or provisions of the alternate all-heights method in Section 1609.6. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

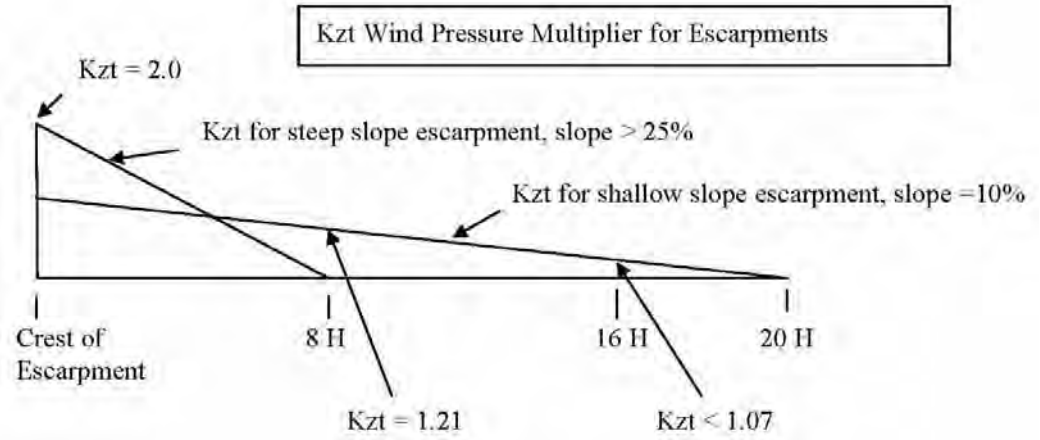
1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.

5. Designs using TIA-222 for antenna-supporting structures and antennas, provided the extent of Topographic Category 2, escarpments, in Section 2.6.6.2 of TIA-222 shall extend 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 1609.1.1.2.

3108.1 General. Towers shall be designed and constructed in accordance with the provisions of TIA-222. In Section 2.6.6.2 of TIA-222, the extent of Topographic Category 2, escarpments, shall extend 16 times the height of the escarpment

Exception: Single free-standing poles used to support antennas not greater than 75 feet (22 860 mm), measured from the top of the pole to grade, shall not be required to be noncombustible

Reason: The TIA 222-G standard attempted to simplify the Topographic Wind Speedup Effect.
They made a mistake in their application to escarpments. They missed a controlling condition:



TIA correctly found the worst case wind speed-up at the crest for a steep slope, but did not realize that lesser sloped escarpments create pressure increases that cannot be safely ignored, beyond the "steep slope" influence. TIA stopped considering the topographic wind speed-up effect at 8H from the crest. At this location, a shallow slope can still produce a 21% increase in wind pressure.

We checked with TIA, since there are several ways to address this situation. Their preference is to change the 8H value in the standard, to 16H. They say that they will address this in a future revision to the Standard, but in the meantime we need to cover this situation for safety reasons.

The reason that 16H was chosen, rather than 20H, is that there is an equivalent cutoff in the ASCE 7 formula on the face of the escarpment. The cutoff value is within a reasonable engineering value.

Per the TIA 222-G standard, a designer may use the full topographic wind speed-up method of ASCE 7, if they wish to avoid any conservatism created by the simplified method. This revision simply makes sure that the simplified method is safe in all cases.

I attached a copy of the correspondence between the SEAW Wind Committee and the TIA standards committee confirming that changing 8H to 16H would be the preferred way to modify the section.

Cost Impact: This will not increase costs if the designer makes use of all of the design options provided by the Standard It will increase costs in some situations, if the simplified method is used, but costs will still be less than when this mistake was introduced in the 2009 IBC.

1609.1.1, 1609.1.1.2, Chapter 35

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

1. Revise as follows:

1609.1.1 Determination of wind loads: Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7 or provisions of the alternate all-heights method in Section 1609.6. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI 230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA/EIA-222 for antenna-supporting structures and antennas.
6. Wind tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 1609.1.1.2.
7. Wind tunnel tests in accordance with ASCE/SEI 49, subject to the limitations in Section 1609.1.1.2.

1609.1.1.2 Wind tunnel test limitations. The lower limit on pressures for main wind-force-resisting systems and components and cladding shall be in accordance with Sections 1609.1.1.2.1 and 1609.1.1.2.2. The minimum design wind load shall not be less than the minimum prescribed in Chapter 6 of ASCE 7.

2. Add standard to Chapter 35 as follows:

American Society of Civil Engineers/Structural Engineering Institute
49-09 Wind Tunnel Testing for Buildings and Other Structures

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html Since its inception in April/2005, the CTC has held twelve meetings - all open to the public.

This proposed change is a follow-up to S81-07/08 which was a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:

Review the recommendations issued by NIST in its report entitled "Final Report on the Collapse of the World Trade Center Towers", issued September 2005, for applicability to the building environment as regulated by the I-Codes.

The reason this code change was not approved was due to the lack of completion/availability of the standard ASCE/SEI 49 entitled "Wind Tunnel Testing for Buildings and Other Structures". At the time this code change is submitted, the standard has gone through the requiste comment process and the standard is under appeal. As such, this proposal is submitted in anticipation of the standard being completed by the Final Action Hearings.

This proposal is intended to address NIST recommendation 2. For this specific proposed change, CTC is working in cooperation with the NIBS/MMC Committee to Translate the NIST World Trade Center Investigation Recommendations for the Model Codes. The CTC notes in their investigation that many of the recommendations contained in the NIST report require additional information for the CTC to further investigate. As such, CTC intends to continue to study the other NIST recommendations.

NIST Recommendation 2 recommends that nationally accepted performance standards be developed for: (1) conducting wind tunnel testing of prototype structures based on sound technical methods that result in repeatable and reproducible results among testing laboratories; and (2) estimating wind loads and their effects on tall buildings for use in design, based on wind tunnel testing data and directional wind speed data.

The IBC requires that wind loads be determined in accordance with Chapter 6 of ASCE 7, with specific exceptions depending on the size, configuration and location of the building. Section 6.1 of ASCE 7-05 provides three procedures to determine design wind loads: Method 1- Simplified Procedure; Method 2- Analytical Procedure; and Method 3- Wind Tunnel Procedure. Due to unique wind load considerations for certain building configurations and locations, Section 6.5.2 of ASCE 7 - 05 further mandates compliance with either the wind tunnel procedure of Section 6.6 of ASCE 7 or requires the design to be based on recognized literature documenting the wind load effects. Section 6.6 of ASCE does not currently prescribe specific wind tunnel test procedures. These are being developed by an ASCE Wind Tunnel Testing standard committee.

The purpose of this change is not to mandate wind tunnel testing in the IBC, but rather to achieve uniformity in results where the design involves wind tunnel testing – either as required by ASCE 7 or where the designer determines that wind tunnel testing is to be used to determine the wind loads.

The proposed revision that stipulates that the minimum design loads can not be less than the minimums of ASCE 7 (10 psf) is in response to the committees concern stated in the reason for disapproval of S16 -06/07. It is CTC's understanding that the standard will have been completed by the 2009 Baltimore Code Development Hearings.

1609.1.1, 1609.1.1.1, Chapter 35; IRC R301.1.1, R301.2.1.1, Chapter 44

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards and Phil Samblanet, The Masonry Society, representing The Masonry Society.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7 or provisions of the alternate all-heights method in Section 1609.6. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas.
6. Wind tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 1609.1.1.2.
7. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of TMS 404.

1609.1.1.1 Applicability. The provisions of ICC 600 are applicable only to buildings located within Exposure B or C as defined in Section 1609.4. The provisions of ICC 600, AF&PA WFCM, TMS 404, and AISI S230 shall not apply to buildings sited on the upper half of an isolated hill, ridge or escarpment meeting the following conditions:

1. The hill, ridge or escarpment is 60 feet (18 288 mm) or higher if located in Exposure B or 30 feet (9144 mm) or higher if located in Exposure C;
2. The maximum average slope of the hill exceeds 10 percent; and
3. The hill, ridge or escarpment is unobstructed upwind by other such topographic features for a distance from the high point of 50 times the height of the hill or 1 mile (1.61 km), whichever is greater.

2. Add standard to Chapter 35 as follows:

TMS
404-09 Standard for Masonry High Wind Residential Construction

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R301.1.1 Alternative provisions. As an alternative to the requirements in Section R301.1 the following standards are permitted subject to the limitations of this code and the limitations therein. Where engineered design is used in conjunction with these standards, the design shall comply with the *International Building Code*.

1. American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual* (WFCM).
2. American Iron and Steel Institute (AISI) *Standard for Cold-Formed Steel Framing—Prescriptive Method for One- and Two-Family Dwellings* (AISI S230).
3. ICC-400 *Standard on the Design and Construction of Log Structures*.

4. TMS 404 *Standard for Masonry High Wind Residential Construction*,

R301.2.1.1 Design criteria. In regions where the basic wind speeds from Figure R301.2(4) equal or exceed 100 miles per hour (45 m/s) in *hurricane-prone regions*, or 110 miles per hour (49 m/s) elsewhere, the design of buildings shall be in accordance with one of the following methods. The elements of design not addressed by those documents in Items 1 through ~~4~~5 shall be in accordance with this code.

1. American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual for One- and Two-Family Dwellings* (WFCM); or
2. International Code Council (ICC) *Standard for Residential Construction in High Wind Regions* (ICC-600); or
3. *Minimum Design Loads for Buildings and Other Structures* (ASCE-7); or
4. American Iron and Steel Institute (AISI), *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings* (AISI S230)~~.~~; or
5. The Masonry Society (TMS) *Standard for Masonry High Wind Residential Construction* (TMS 404).
6~~5~~. Concrete construction shall be designed in accordance with the provisions of this code.
7~~6~~. Structural insulated panel (SIP) walls shall be designed in accordance with the provisions of this code.

2. Add standard to Chapter 44 as follows:

TMS
404-09 Standard for Masonry High Wind Residential Construction

Reason: This modification proposes to introduce a standard for design and construction of masonry residential structures in high wind areas based on a new, mandatory language reference standard TMS 404, *Standard for Masonry High Wind Residential Construction*. The methodology used to develop the *Standard for Masonry High Wind Residential Construction* is based upon the strength design provisions of the 2005 and 2008 editions of the TMS 402/ACI 530/ASCE 5, *Building Code Requirements for Masonry Structures* and the factored combinations of dead and wind loads in accordance with the 2005 edition of ASCE 7, *Minimum Design Loads for Buildings and Other Structures*.

This new design standard is a corollary to the American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual for One- and Two-Family Dwellings* (WFCM) and the American Iron and Steel Institute (AISI), *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings (COFS/PM.* The Standard provides minimum requirements for structural component survivability during high wind events of masonry walled residential one and two-family structures up to and including 30 ft. in height for design wind speeds of 100 to 150 mph, 3 second gust as defined by ASCE 7-05. The standard is an alternative to the ICC-600 *Standard for Residential Construction in High Wind Regions* adopted in the 2009 Edition of the IBC. The TMS 404 Standard is also more flexible than the ICC-600 Standard in that it allows actual design of the masonry sections through a series of tables that determines applied loads that are then used in design tables to determine the size and spacing of reinforcement for walls, lintels, and bond beams. The ICC-600 is a prescriptive standard that lists reinforcement configurations based on wind zone and building size.

Those interested in reviewing a draft of the TMS 404 Standard for Masonry High Wind Residential Construction are encouraged to download a working draft of the document at the following link:
http://www.masonrysociety.org/html/resources/TMS-404/TMS404.htm

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, TMS404-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THOMPSON-SAMBLANET-S3-1609.1.1

S88–09/10
1609.1.2

Proponent: Kurt Roeper, representing Ingersoll Rand

Revise as follows:

1609.1.2 Protection of openings. In wind-borne debris regions, glazing in buildings shall be impact-resistant or protected with an impact-resistant covering meeting the impact requirements of ICC 500, an approved impact-resistant standard or ASTM E 1996 and ASTM E 1886 referenced herein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the large missile test of ASTM E 1996.
2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the small missile test of ASTM E 1996.

Exceptions:

1. Wood structural panels with a minimum thickness of 7/16 inch (11.1 mm) and maximum panel span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings classified as Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding loads determined in accordance with the provisions of ASCE 7, with corrosion-resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 with corrosion-resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of 45 feet (13 716 mm) or less where wind speeds do not exceed 140 mph (63 m/s).
2. Glazing in *Occupancy Category* I buildings as defined in Section 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in *Occupancy Category* II, III or IV buildings located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected.

Reason: The design provision for wall pier detailing was originally introduced by SEAOC in 1987 to legacy Uniform Building Code and was included in 1988 UBC through 1997 UBC. The wall pier detailing provision prescribed under Section 1908.1.4 was intended for high seismic zones equivalent to current SDC D, E or F. 1908.1.3 was added as a complement of wall pier detailing in SDC C (formerly seismic zones 2A and 2B under legacy model code.) ACI 318 Commentary R 21.1.1 emphasized "*it is essential that structures assigned to higher SDC's possess a higher degree of toughness*", and further encourages practitioners to use special structural wall system in regions of high seismic risk. ASCE 7 Table 12.2-1 permits intermediate precast structural wall system in SDC D, E or F. Current Section 1908.1.3 does not limit to just structures assigned to SDC C. The required shear strength under 21.3.3, referenced in current Sec. 21.4.5, is based on V_u under either nominal moment strength or two times the code prescribed earthquake force. The required shear strength in 21.6.5.1, referenced in Sec. 21.9.10.2 (IBC 1908.1.4), is based on the probable shear strength, V_e under the probable moment strength, M_{pr}. In addition, the spacing of required shear reinforcement is 8 inches on center under current 21.4.5 instead of 6 inches on center with seismic hooks at both ends under 21.9.10.2. Requirement of wall pier under 21.9.10.2 would enhance better ductility.

Current practice in commercial buildings constructed using precast panels wall system have large window and door openings and/or narrow wall piers. Wall panels varying up to three stories high with openings resembles wall frame which is not currently recognized under any of the defined seismic-force resisting systems other than consideration of structural wall system. Conformance to special structural wall system design and detailing of wall piers ensures minimum life safety performance in resisting earthquake forces for structures in SDC D, E or F. Proposed modification separates wall piers designed for structures assigned to SDC C from those assigned to SDC D, E or F.

Cost Impact: The code change proposal will not increase the cost of construction for typical tilt-up buildings in higher SDC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROEPER-S1-1609.1.2

S89–09/10
1609.1.2

Proponent: John Woestman, The Kellen Company representing the Door Safety Council (DSC)

Revise as follows:

1609.1.2 Protection of openings. In wind-borne debris regions, ~~glazing~~ openings in buildings shall be impact-resistant or protected with an impact-resistant covering meeting the requirements of an approved impact-resistant standard or ASTM E 1996 and ASTM E 1886 referenced herein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the large missile test of ASTM E 1996.
2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the small missile test of ASTM E 1996.

Exceptions:

1. Wood structural panels with a minimum thickness of 7/16 inch (11.1 mm) and maximum panel span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings classified as Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding loads determined in accordance with the provisions of ASCE 7, with corrosion-resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 with corrosion-resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of 45 feet (13 716 mm) or less where wind speeds do not exceed 140 mph (63 m/s).
2. Glazing in *Occupancy Category* I buildings as defined in Section 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in *Occupancy Category* II, III or IV buildings located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected.

Reason: This proposal clarifies that openings – and not just glazing – in buildings are to be impact-resistant or protected with impact-resistant coverings in wind-borne debris regions. Non-glazed openings are vulnerable to impact by wind-borne debris which could compromise the integrity of the building envelope in preventing damage or destruction by hurricane-strength wind. Thus, non-glazed openings should be held to the same impact-resistance performance requirements as glazed openings.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: John Woestman, The Kellen Company, representing the Door Safety Council (DSC)

1. Add new text as follows:

1609.1.2.2 Side-hinged doors. Side-hinged door glazed opening protection for wind-borne debris shall meet the requirements of an *approved* impact-resistant standard or ANSI A250.13.

(Renumber remaining sections)

2. Add standard to Chapter 35 as follows:

ANSI
A250.13-08 Testing and Rating of Severe Windstorm Resistant Components for Swinging Door Assemblies

Reason: This proposal helps resolve performance and code compliance issues when exterior side-hinged door openings are comprised of components from multiple sources and include interchangeable elements (ie: doors, frames, hinging and latching hardware, etc.).

This proposed change allows an alternative method to demonstrate performance to impact-resistant requirements for side-hinged door openings by requiring components to be tested to ANSI A250.13-2008. ANSI A250.13 contains language that prescribes how components are to be selected to create complete door openings expected to perform equivalently to door assemblies tested to ASTM E 1996 / E 1886 for impact resistance.

Through the ANSI standards development process stake-holders comprising most major manufacturing associations, testing and certification organizations, specifiers, code officials and end users, developed a national standard for a component-based approach to testing for windstorm resistance of swinging door openings. The test procedures used in this standard represent the most severe requirements found in the windstorm resistance standards referenced in today's building codes. These procedures are designed to isolate the loads, conditions and critical performance requirements that a particular component is subjected to in full assembly tests and duplicate these specific conditions. Using a combination of worst-case scenario design and safety factors, this standard is designed to provide a component rating that relates directly to the component's ability to withstand the conditions that occur in full assembly tests.

Prior to releasing the current revision of ANSI A250.13, validation tests of the large missile impact test specified by ASTM E1886/E1996 were conducted through Intertek Testing Services, a Nationally Recognized Test Laboratory. The study was conducted to quantify the energy that would tend to shear the latch bolt in assembly tests and compare it to the energy delivered to the latch bolt in the ANSI A250.13 component test procedure which uses a relatively rigid fixture and a pendulum type impactor. The impact energy applied to the test sample was varied and the actual energy imparted to the lock and hinge was measured. The component text fixture is more efficient at transferring the energy applied to the system into the test samples than the ASTM E1996 assembly test fixture. This results in higher impact energy at the lock or hinge. For example, only 4% of the impact energy applied in the ASTM E1996 test transfers to the lock. Whereas, 15% of the impact energy is delivered to the lock mounted in the A250.13 test fixture.

Results demonstrated that this test specified in ANSI A250.13 for latches was indeed much more severe (approximately 3.75 times more) than the exposure provided in door assembly tests conducted per ASTM E1996 and similar wind borne debris impact tests. The current impact test requirements of ANSI A250.13 were therefore adjusted to be two times more severe (maintaining a 2 times safety factor) to the current requirements of ASTM E1996.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI A250 13-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WOESTMAN-S1-1609.1.2.2

S91–09/10
1612.2; IEBC 202

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc.,

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

PART I- IBC STRUCTURAL

Revise as follows:

1612.2 Definitions. The following words and terms shall, for the purposes of this section, have the meanings shown herein.

SUBSTANTIAL DAMAGE. Damage of any origin sustained by a building or structure whereby the cost of restoring the building or structure to its ~~before-damaged~~ pre-damage condition would equal or exceed 50 percent of the ~~market~~ replacement value of the building or structure before the damage occurred.

SUBSTANTIAL IMPROVEMENT. Any repair, reconstruction, rehabilitation, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the ~~market~~ replacement value of the building or structure before the improvement or repair is started. If the building or structure has sustained substantial damage, any repaired are considered substantial improvement regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a building or structure required to correct existing health, sanitary or safety code violations identified by the building official and that are the minimum necessary to assure safe living conditions.
2. Any alteration of a historic building or structure provided that the alteration will not preclude the ~~structure's~~ continued designation ~~as a historic structure~~ of the building or structure as historic.

(Definitions not shown are unchanged)

PART II- EXISTING BUILDING

Revise as follows:

SECTION 202
GENERAL DEFINITIONS

SUBSTANTIAL DAMAGE. For the purposes of determining compliance with the flood provisions of this code, damage of any origin sustained by a building or structure whereby the cost of restoring the building or structure to its ~~before-damaged~~ pre-damage condition would equal or exceed 50 percent of the ~~market~~ replacement value of the building or structure before the damage occurred.

SUBSTANTIAL IMPROVEMENT. For the purposes of determining compliance with the flood provisions of this code, any repair, alteration, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the ~~market~~ replacement value of the building or structure~~,~~ before the improvement or repair is started. If the building or structure has sustained substantial damage, any repairs are considered substantial improvement regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a building or structure required to correct existing health, sanitary or safety code violations identified by the building official and that is the minimum necessary to assure safe living conditions, or
2. Any alteration of a historic building or structure~~,~~ provided that the alteration will not preclude the ~~structure's~~ continued designation of the building or structure as historic. ~~as a historic structure.~~

(Definitions not shown are unchanged)

Reason: This proposal does three things:
1. Adds the words "building or" and "or structure" to the definitions of substantial damage and substantial improvement.
2. Changes the term "before-damaged" to "pre-damage"
3. Changes the criteria for determining "substantial" from 50 percent of the market value to 50 percent of the replacement cost of the building or structure.

The first two changes are editorial and are intended to clarify the intended meaning of the definitions. The third change is intended to simplify the method by which substantial damage or substantial improvement are determined. Currently, the definitions require the determination as to the "market value" of a building or structure as it existed before the damage or alteration; this might arguably require the services of a real estate appraiser or real estate agent to determine the "market value". Instead, by linking the definitions to "replacement value", the engineer's job is made more simple because the replacement value can easily be determined using a nationally recognized cost estimation resource such as RS Means or National Construction Estimator.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Rebecca C Quinn, RCQuinn Consulting Inc., representing Department of Homeland Security, Federal Emergency Management Agency

THIS IS A 4 PART CODE CHANGE. ALL PARTS WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

PART I – IBC

Revise as follows:

801.5 Applicability. For buildings in flood hazard areas as established in Section 1612.3, interior finishes, trim and decorative materials that extend below the elevation required by Section 1612.4 ~~design flood elevation~~ shall be flood-damage-resistant materials.

1403.5 Flood resistance. For buildings in flood hazard areas as established in Section 1612.3, exterior walls extending below the elevation required by Section 1612.4 shall be constructed with flood damage resistant materials ~~design flood elevation shall be resistant to water damage~~. Wood shall be pressure-preservative treated in accordance with AWPA U1 for the species, product and end use using a preservative listed in Section 4 of APWA U1 or decay-resistant heartwood of redwood, black locust or cedar.

PART II – IPC

Revise as follows:

[B] 309.2 Flood hazard. For structures located in flood hazard areas, the following systems and equipment shall be located ~~at or above~~ and installed as required by Section 1612.4 of the *International Building Code* ~~the design flood elevation~~.

Exception: The following systems are permitted to be located below the ~~design flood elevation~~ the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment provided that the systems are designed and installed to prevent water from entering or accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to up to such ~~the design flood~~ elevation.

1. All water service pipes.
2. Pump seals in individual water supply systems where the pump is located below the design flood elevation.
3. Covers on potable water wells shall be sealed, except where the top of the casing well or pipe sleeve is elevated to at least 1 foot (305 mm) above the design flood elevation.
4. All sanitary drainage piping.
5. All storm drainage piping.
6. Manhole covers shall be sealed, except where elevated to or above the design flood elevation.
7. All other plumbing fixtures, faucets, fixture fittings, piping systems and equipment.
8. Water heaters.
9. Vents and vent systems.

PART III – IFGC

Revise as follows:

[B] 301.11 Flood hazard. For structures located in flood hazard areas, the appliance, equipment and system installations regulated by this code shall be located at or above the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation and shall comply with the flood-resistant construction requirements of the *International Building Code*~~.

Exception: The appliance, equipment and system installations regulated by this code are permitted to be located below the ~~design flood~~ elevation required by Section 1612.4 of the *International Building Code* for utilities and

attendant equipment provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to such elevation. ~~the design flood elevation shall comply with the flood-resistant construction requirements of the *International Building Code*.~~

PART IV – IMC

Revise as follows:

[B] 301.13 Flood hazard. For structures located in flood hazard areas, mechanical systems, equipment and appliances shall be located at or above the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~.

Exception: Mechanical systems, equipment and appliances are permitted to be located below the ~~design flood~~ elevation required by Section 1612.4 of the of the *International Building Code* for utilities and attendant equipment provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation. ~~to the design flood elevation in compliance with the flood-resistant construction requirements of the *International Building Code*.~~

401.4 Intake opening location. Air intake openings shall comply with all of the following:
4. Intake openings on structures in flood hazard areas shall be at or above the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~.

501.2.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings which are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious.
4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~.
5. For specific systems see the following sections:
   5.1. Clothes dryer exhaust, Section 504.4.
   5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.12, 506.4 and 506.5.
   5.3. Dust stock and refuse conveying systems, Section 511.
   5.4. Subslab soil exhaust systems, Section 512.4
   5.5. Smoke control systems, Section 513.10.3
   5.6. Refrigerant discharge, Section1105.7
   5.7. Machinery room discharge, Section 1105.6.1

[B] 602.4 Flood hazard. For structures located in flood hazard areas, plenum spaces shall be located above the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~ or shall be designed and constructed to prevent water from entering or accumulating within the plenum spaces during floods up to such ~~the design flood~~ elevation. If the plenum spaces are located below the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~, they shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such ~~to the design flood~~ elevation.

[B] 603.13 Flood hazard areas. For structures in flood hazard areas, ducts shall be located above the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~ or shall be designed and constructed to prevent water from entering or accumulating within the ducts during floods up to such ~~the design flood~~ elevation. If the ducts are located below the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~, the ducts shall be

capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such ~~the design flood~~ elevation.

1305.2.1 Flood hazard. All fuel oil pipe, equipment and appliances located in flood hazard areas shall be located above the elevation required by Section 1612.4 of the *International Building Code* for utilities and attendant equipment ~~design flood elevation~~ or shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such ~~the design flood~~ elevation.

Reason:
Part I – The purpose of this code change is to provide consistency between the elevations of buildings and structures that are specified in Section 1612.4 and the elevations below which flood damage-resistant materials are to be used. For specific elevation requirements for flood damage-resistant materials, Section 1612.4 refers to ASCE 24, *Flood Resistant Design and Construction*.
Part II - In the *International Building Code,* Section 1612.4 refers to ASCE 24, *Flood Resistant Design and Construction,* which specifies elevations as a function of flood zone and Structure Category. This proposal will result in consistency between the elevations of buildings and structures that are specified in ASCE 24 and the elevations of the plumbing systems and equipment that serve those buildings and structures, which are also specified in ASCE 24.
Part III – In the *International Building Code,* Section 1612.4 refers to ASCE 24, *Flood Resistant Design and Construction,* which specifies elevations as a function of flood zone and Structure Category and which specifies the performance under loads that needs to be provided if equipment is located below such elevations.. This proposal will result in consistency between the elevations of buildings and structures that are specified in ASCE 24 and the elevations of equipment that serve those buildings and structures, which are also specified in ASCE 24.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: QUINN-S2 4 parts

S93–09/10
1612.5

Proponent: Rebecca C. Quinn, RC Quinn Consulting, Inc. representing Department of Homeland Security, Federal Emergency Management Agency

Revise as follows:

1612.5 Flood hazard documentation. The following documentation shall be prepared and sealed by a registered design professional and shall be submitted to the building official:

1. For construction in flood hazard areas not subject to high-velocity wave action:
   1.1. The elevation of the lowest floor, including basement, as required by the lowest floor elevation inspection in Section 110.3.3.
   1.2. For fully enclosed areas below the design flood elevation where provisions to allow for the automatic entry and exit of floodwaters do not meet the minimum requirements in Section 2.6.2.1, ASCE 24, construction documents shall include a statement that the design will provide for equalization of hydrostatic flood forces in accordance with Section 2.6.2.2 of ASCE 24.

1.3. For dry floodproofed nonresidential buildings, construction documents shall include a statement that the dry floodproofing is designed in accordance with ASCE 24.

2. For construction in flood hazard areas subject to high-velocity wave action:
   2.1. The elevation of the bottom of the lowest horizontal structural member as required by the lowest floor elevation inspection in Section 110.3.3.
   2.2. Construction documents shall include a statement that the building is designed in accordance with ASCE 24, including that the pile or column foundation and building or structure to be attached thereto is designed to be anchored to resist flotation, collapse and lateral movement due to the effects of wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16.
   2.3. For breakaway walls designed to resist a nominal load of ~~less that 10 psf (0.48 kN/m^2) or~~ more than 20 psf (0.96 kN/m^2), construction documents shall include a statement that the breakaway wall is designed in accordance with ASCE 24.

Reason: In Section 4.6.1, ASCE 24, *Flood Resistant Design and Construction*, requires breakaway walls and their connections to be designed in accordance with the requirements of ASCE 7, *Minimum Design Loads for Buildings and Other Structures.* ASCE 7 does not allow such walls to be designed for less than 10 psf (see Section 5.3.2.3 in ASCE 7-02). Therefore, this code change is appropriate for consistency with both standards. In addition, the regulations of the National Flood Insurance Program do not provide for breakaway walls with a design safe loading resistance of less than 10 psf (see 44 C.F.R. §60.3(e)(5)).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: QUINN-S1-1612.5

S94–09/10
1612.6 (New), Chapter 35

Proponent: Michael Mahoney, Federal Emergency Management Agency, representing the National Tsunami Hazard Mitigation Program

1. Add a new text as follows:

1612.6 Tsunami-generated flood hazard. Construction within a Tsunami Hazard Inundation Zone shall be in accordance with this section.

1612.6.1 Definitions. The following words and terms shall, for the purposes of this section, have the meanings shown herein.

TSUNAMI HAZARD INUNDATION MAP. A map that designates the extent of inundation by a design event tsunami which is developed and provided to a community by either the State or the National Atmospheric and Oceanic Administration (NOAA) under the National Tsunami Hazard Mitigation Program, using NOAA mapping criteria.

TSUNAMI HAZARD INUNDATION ZONE. The area anticipated to be flooded or inundated by a design event tsunami as identified on a community's Tsunami Hazard Inundation Map.

1612.6.2 Establishment of Tsunami Hazard Inundation Zone. Where a community has adopted a Tsunami Hazard Inundation Map, that map shall be used to establish a community's Tsunami Hazard Inundation Zone.

1612.6.3 Construction within the Tsunami Hazard Inundation Zone. Buildings and structures designated Occupancy Category III or IV in accordance with Section 1604.5 shall be prohibited within a Tsunami Hazard Inundation Zone.

> **Exception:** A vertical evacuation tsunami refuge shall be permitted to be located in a Tsunami Hazard Inundation Zone provided it is constructed in accordance with FEMA P646.

2. Add standard to Chapter 35 as follows:

Federal Emergency Management Agency
P646- 08 *Guidelines for Design of Structures for Vertical Evacuation from Tsunamis*

Reason: For coastal communities subject to tsunami waves, where the either the State or the National Oceanic and Atmospheric Administration (NOAA) have provided a Tsunami Hazard Inundation Map and that community has adopted that Map, the Map specifies a Tsunami Hazard Inundation Zone. This Zone is subject to inundation in a design event tsunami, which can result in significant damage. Most of these maps are deterministic in nature, using historical and best available scientific data, and it is currently difficult to assign a specific probability to the design event used for mapping purposes. However, given the potentially serious life safety risk presented to structures within this zone, this is sufficient justification to limit the presence of high hazard and high occupancy structures within the Zone.

Cost Impact: The potential cost impact would be requiring new high hazard and high occupancy structures to be located outside the Tsunami Inundation Zone. Given that this land is further away from the shore and therefore normally less expensive, the cost impact is believed to be minimal.

Analysis: A review of the standard(s) proposed for inclusion in the code, FEMA P646-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAHONEY-S2-1612.6 NEW

S95–09/10
1613.1-1613.7

Proponent: Steven Winkel, FAIA, PE, and Kelly Cobeen, PE, SE, Building Seismic Safety Council (BSSC) of the National Institute of Building Sciences, representing the Federal Emergency Management Agency, BSSC Code Resource Support Committee

1. Revise as follows:

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE 7, excluding Chapters 14 and Appendix 11A. The *seismic design category* for a structure shall ~~is permitted to~~ be determined in accordance with Section 11.6 of ~~1613 or~~ ASCE 7.

Exceptions:

1. Detached one- and two-family dwellings, assigned to Seismic Design Category A, B or C, or located where the ~~mapped~~ short-period spectral response acceleration parameter, S_S, is less than 0.4g.
2. The seismic-force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified by this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.

1613.2 Definitions. The following words and terms shall, for the purpose of this section, have the meanings shown herein.

~~**DESIGN EARTHQUAKE GROUND MOTION.** The earthquake ground motion that buildings and structures are specifically proportioned to resist in Section 1613.~~

~~**MAXIMUM CONSIDERED EARTHQUAKE GROUND MOTION.** The most severe earthquake effects caused by this code.~~

MECHANICAL SYSTEMS. For the purposes of determining seismic loads in ASCE 7, mechanical systems shall include plumbing systems as specified herein.

~~**ORTHOGONAL.** To be in two horizontal directions, at 90 degrees (1.57 rad) to each other.~~

SEISMIC DESIGN CATEGORY. A classification assigned to a structure based on its occupancy category and the severity of the design earthquake ground motion at the site.

~~**SEISMIC-FORCE-RESISTING SYSTEM.** That part of the structural system that has been considered in the design to provide the required resistance to the prescribed seismic forces.~~

SITE CLASS. A classification assigned to a site based on the types of soils present and their engineering properties as defined in Secton1613.5.2.

SITE COEFFICIENTS. The values of F_a and F_v indicated in Tables 1613.5.3(1) and 1613.5.3(2) respectively.

2. Delete without substitution:

1613.3 Existing buildings. *Additions*, *alterations*, repairs or change of occupancy of existing buildings shall be in accordance with Chapter 34.

1613.4 Special inspections. Where required by Sections 1705.3 through 1705.3.5, the statement of special inspections shall include the *special inspections* required by Section 1705.3.6.

1613.5 Seismic ground motion values. Seismic ground motion values shall be determined in accordance with this section.

1613.5.1 Mapped acceleration parameters. The parameters S_s and S_1 shall be determined from the 0.2 and 1-second spectral response accelerations shown on Figures 1613.5(1) through 1613.5(14). Where S_1 is less than or equal to 0.04 and S_s is less than or equal to 0.15, the structure is permitted to be assigned to *Seismic Design Category* A.

1613.5.2 Site class definitions. Based on the site soil properties, the site shall be classified as either *Site Class* A, B, C, D, E or F in accordance with Table 1613.5.2. When the soil properties are not known in sufficient detail to determine the *site class*, *Site Class* D shall be used unless the *building official* or geotechnical data determines that *Site Class* E or F soil is likely to be present at the site.

TABLE 1613.5.2
SITE CLASS DEFINITIONS

SITE CLASS	SOIL PROFILE NAME	AVERAGE PROPERTIES IN TOP 100 feet, SEE SECTION 1613.5.5		
		Soil shear wave velocity, $\bar{v}_s$, (ft/s)	Standard penetration resistance, $\bar{N}$	Soil undrained shear strength, $\bar{s}_u$, (psf)
A	Hard rock	$\bar{v}_s > 5{,}000$	N/A	N/A
B	Rock	$2{,}500 < \bar{v}_s \leq 5{,}000$	N/A	N/A
C	Very dense soil and soft rock	$1{,}200 < \bar{v}_s \leq 2{,}500$	$\bar{N} > 50$	$\bar{s}_u \geq 2{,}000$
D	Stiff soil profile	$600 \leq \bar{v}_s \leq 1{,}200$	$15 \leq \bar{N} \leq 50$	$1{,}000 \leq \bar{s}_u \leq 2{,}000$
E	Soft soil profile	$\bar{v}_s < 600$	$\bar{N} < 15$	$\bar{s}_u < 1{,}000$
E	—	Any profile with more than 10 feet of soil having the following characteristics: 1. Plasticity index $PI > 20$, 2. Moisture content $w \geq 40\%$, and 3. Undrained shear strength $\bar{s}_u < 500$ psf		
F	—	Any profile containing soils having one or more of the following characteristics: 1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. 2. Peats and/or highly organic clays (H > 10 feet of peat and/or highly organic clay where H = thickness of soil) 3. Very high plasticity clays (H > 25 feet with plasticity index PI > 75) 4. Very thick soft/medium stiff clays (H > 120 feet)		

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929m^2, 1 pound per square foot = 0.0479 kPa. N/A = Not applicable

1613.5.3 Site coefficients and adjusted maximum considered earthquake spectral response acceleration parameters. The maximum considered earthquake spectral response acceleration for short periods, S_{MS}, and at 1-second period, S_{M1}, adjusted for *site class* effects shall be determined by Equations 16-36 and 16-37, respectively:

$S_{MS} = F_a S_s$ **(Equation 16-36)**

$S_{M1} = F_v S_1$ **(Equation 16-37)**

where:

F_a = Site coefficient defined in Table 1613.5.3(1).
F_v = Site coefficient defined in Table 1613.5.3(2).
S_S = The mapped spectral accelerations for short periods as determined in Section 1613.5.1.
S_1 = The mapped spectral accelerations for a 1-second period as determined in Section 1613.5.1.

TABLE 1613.5.3(1)

a. Use straight-line interpolation for intermediate values of mapped spectral response acceleration at short period, *Ss*.
b. Values shall be determined in accordance with Section 11.4.7 of ASCE 7.

TABLE 1613.5.3(2)
VALUES OF SITE COEFFICIENT F_V [a]

SITE CLASS	MAPPED SPECTRAL RESPONSE ACCELERATION AT 1-SECOND PERIOD				
	$S_1 \le 0.1$	$S_1 = 0.2$	$S_1 = 0.3$	$S_1 = 0.4$	$S_1 \ge 0.5$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.7	1.6	1.5	1.4	1.3
D	2.4	2.0	1.8	1.6	1.5
E	3.5	3.2	2.8	2.4	2.4
F	Note b	Note b	Note b	Note b	Note b

a. Use straight-line interpolation for intermediate values of mapped spectral response acceleration at 1-second period, *S1*.
b. Values shall be determined in accordance with Section 11.4.7 of ASCE 7.

1613.5.4 Design spectral response acceleration parameters. Five-percent damped design spectral response acceleration at short periods, *SDS*, and at 1-second period, *SD*1, shall be determined from Equations 16-38 and 16-39, respectively:

$$S_{DS} = \frac{2}{3} S_{MS}$$ **(Equation 16-38)**

$$S_{D1} = \frac{2}{3} S_{M1}$$ **(Equation 16-39)**

where:

S_{MS} = The maximum considered earthquake spectral response accelerations for short period as determined in Section 1613.5.3.
S_{M1} = The maximum considered earthquake spectral response accelerations for 1-second period as determined in Section 1613.5.3.

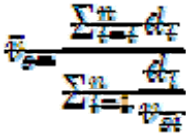
1613.5.5 Site classification for seismic design. Site classification for *Site Class* C, D or E shall be determined from Table 1613.5.5.

The notations presented below apply to the upper 100 feet (30 480 mm) of the site profile. Profiles containing distinctly different soil and/or rock layers shall be subdivided into those layers designated by a number that ranges

from 1 to *n* at the bottom where there is a total of *n* distinct layers in the upper 100 feet (30 480 mm). The symbol *i* then refers to any one of the layers between 1 and *n*.

where:

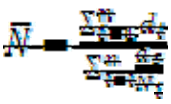
v_{si} = The shear wave velocity in feet per second (m/s).
d_i = The thickness of any layer between 0 and 100 feet (30 480 mm).



(Equation 16-40)

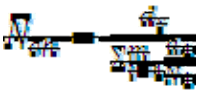
 = 100 feet (30 480 mm)

Ni is the Standard Penetration Resistance (ASTM D 1586) not to exceed 100 blows/foot (328 blows/m) as directly measured in the field without corrections. When refusal is met for a rock layer, *Ni* shall be taken as 100 blows/foot (328 blows/m).



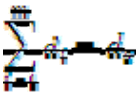
(Equation 16-41)

where *Ni* and *di* in Equation 16-41 are for cohesionless soil, cohesive soil and rock layers.

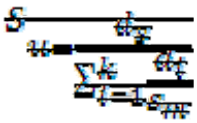


(Equation 16-42)

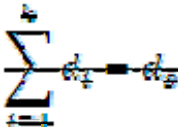
where:



Use d_i and N_i for cohesionless soil layers only in Equation 16-42.
d_s = The total thickness of cohesionless soil layers in the top 100 feet (30 480 mm).
m = The number of cohesionless soil layers in the top 100 feet (30 480 mm).
s_{ui} = The undrained shear strength in psf (kPa), not to exceed 5,000 psf (240 kPa), ASTM D 2166 or D



(Equation 16-43)



d_c = The total thickness of cohesive soil layers in the top 100 feet (30 480 mm).
k = The number of cohesive soil layers in the top 100 feet (30 480 mm).
P_I = The plasticity index, ASTM D 4318.
w = The moisture content in percent, ASTM D 2216.

TABLE 1613.5.5
SITE CLASSIFICATION[a]

SITE CLASS	$\bar{v}_s$	$\bar{N}$ or $\bar{N}_{ch}$	$\bar{s}_u$
E	< 600 ft/s	< 15	< 1,000 psf
D	600 to 1,200 ft/s	15 to 50	1,000 to 2,000 psf
C	1,200 to 2,500 ft/s	> 50	> 2,000

For SI: 1 foot per second = 304.8 mm per second, 1 pound per square foot = 0.0479kN/m^2.

a. If the s_u method is used and the N_{ch} and s_u criteria differ, select the category with the softer soils (for example, use Site Class E instead of D).

Where a site does not qualify under the criteria for *Site Class* F and there is a total thickness of soft clay greater than 10 feet (3048 mm) where a soft clay layer is defined by: s_u 500 psf (24 kPa), w _ 40 percent, and PI _ 20, it shall be classified as *Site Class* E.

The shear wave velocity for rock, *Site Class* B, shall be either measured on site or estimated by a geotechnical engineer or engineering geologist/seismologist for competent rock with moderate fracturing and weathering. Softer and more highly fractured and weathered rock shall either be measured on site for shearwave velocity or classified as *Site Class* C.

The hard rock category, *Site Class* A, shall be supported by shear wave velocity measurements either on site or on profiles of the same rock type in the same formation with an equal or greater degree of weathering and fracturing. Where hard rock conditions are known to be continuous to a depth of 100 feet (30 480 mm), surficial shear wave velocity measurements are permitted to be extrapolated to assess *vs* .

The rock categories, *Site Classes* A and B, shall not be used if there is more than 10 feet (3048 mm) of soil between the rock surface and the bottom of the spread footing or mat foundation.

1613.5.5.1 Steps for classifying a site.

1. Check for the four categories of *Site Class* F requiring site-specific evaluation. If the site corresponds to any of these categories, classify the site as *Site Class* F and conduct a site-specific evaluation.
2. Check for the existence of a total thickness of soft clay > 10 feet (3048 mm) where a soft clay layer is defined by: s_u < 500 psf (24 kPa), w ≥ 40 percent and PI > 20. If these criteria are satisfied, classify the site as *Site Class* E.
3. Categorize the site using one of the following three methods with v_s, N, and s_u and computed in all cases as specified.
   3.1. v_s for the top 100 feet (30 480 mm) (v_s method).
   3.2. N for the top 100 feet (30 480 mm) (N method).
   3.3. N_{ch} for cohesionless soil layers (PI < 20) in the top 100 feet (30 480 mm) and average, s_u for cohesive soil layers (PI > 20) in the top 100 feet (30 480 mm) (s_u method).

1613.5.6 Determination of seismic design category. Structures classified as *Occupancy Category* I, II or III that are located where the mapped spectral response acceleration parameter at 1-second period, S_1, is greater than or equal to 0.75 shall be assigned to *Seismic Design Category* E. Structures classified as *Occupancy Category* IV that are located where the mapped spectral response acceleration parameter at 1-second period, S_1, is greater than or equal to 0.75 shall be assigned to *Seismic Design Category* F. All other structures shall be assigned to a *seismic design category* based on their *occupancy category* and the design spectral response acceleration coefficients, S_{DS} and S_{D1}, determined in accordance with Section 1613.5.4 or the sitespecific procedures of ASCE 7. Each building and structure shall be assigned to the more severe *seismic design category* in accordance with Table 1613.5.6(1) or 1613.5.6(2), irrespective of the fundamental period of vibration of the structure, T.

TABLE 1613.5.6(1)
SEISMIC DESIGN CATEGORY BASED ON
SHORT-PERIOD RESPONSE ACCELERATIONS

VALUE OF S_{DS}	OCCUPANCY CATEGORY		
	I or II	III	IV
$S_{DS} < 0.167g$	A	A	A
$0.167g \le S_{DS} < 0.33g$	B	B	C
$0.33g \le S_{DS} < 0.50g$	C	C	D
$0.50g \le S_{DS}$	D	D	D

TABLE 1613.5.6(2)
SEISMIC DESIGN CATEGORY BASED ON
1-SECOND PERIOD RESPONSE ACCELERATION

VALUE OF S_{D1}	OCCUPANCY CATEGORY		
	I or II	III	IV
$S_{D1} < 0.067g$	A	A	A
$0.067g \le S_{D1} < 0.133g$	B	B	C
$0.133g \le S_{D1} < 0.20g$	C	C	D
$0.20g \le S_{D1}$	D	D	D

1613.5.6.1 Alternative seismic design category determination. Where S_1 is less than 0.75, the *seismic design category* is permitted to be determined from Table 1613.5.6(1) alone when all of the following apply:

1. In each of the two orthogonal directions, the approximate fundamental period of the structure, T_a, in each of the two orthogonal directions determined in accordance with Section 12.8.2.1 of ASCE 7, is less than 0.8 T_s determined in accordance with Section 11.4.5 of ASCE 7.
2. In each of the two orthogonal directions, the fundamental period of the structure used to calculate the story drift is less than T_s.
3. Equation 12.8-2 of ASCE 7 is used to determine the seismic response coefficient, C_s
4. The diaphragms are rigid as defined in Section 12.3.1 of ASCE 7 or, for diaphragms that are flexible, the distances between vertical elements of the seismic force-resisting system do not exceed 40 feet (12 192 mm).

(Renumber remaining sections)

Reason: In light of the changes to the ICC code development process and schedule, this code change is submitted as a possible last resort to avoid retention in the 2012 IBC of superseded earthquake ground motion maps and Seismic Design Category (SDC) provisions. The code change submittal schedule has made it problematic that the updated earthquake design maps developed for the 2009 *NEHRP Recommended Seismic Provisions* can be successfully moved through the full ASCE 7 consensus process in time for consideration for the 2012 IBC. Although the FEMA/BSSC Code Resource Support Committee (CRSC) would prefer that ground motion maps remain in the IBC, it has concluded that deletion of the maps from the code is a better approach than retaining maps that have been superseded. A companion FEMA/BSSC CRSC code change proposes the updated ground motion maps as currently being considered in the ASCE 7 process. It is our intention to withdrawal this proposal if ASCE 7-10 and the updated ground motion maps are approved for adoption into the IBC.

This code change proposes deletion of the earthquake ground motion maps and the associated SDC provisions, citing instead ASCE 7 for maps and SDC assignments. The definition of Seismic Design Category is retained as this term is used in Section 1613.1. The definition wording used is taken from ASCE 7-05 but the wording will be updated if needed to reflect ASCE 7-10 revisions. The definition of mechanical systems is retained. The balance of Section 1613.2 definitions are deleted as they are terms no longer used in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Jim Rossberg, Structural Engineering Institute of ASCE, representing self

Revise as follows:

1613.5.1 Mapped acceleration parameters. The parameters S_S and S_1 shall be determined from the 0.2 and 1 second spectral response accelerations shown on Figures ~~1613.5(1) through 1613.5(14)~~ 1613.5(1) and 1613.5(2). Where S_1, is less than or equal to 0.04 and S_S is less than or equal to 0.15, the structure is permitted to be assigned to Seismic Design Category A.

Delete Figures 1613.5(1) through 1613.5(14) and substitute as follows:

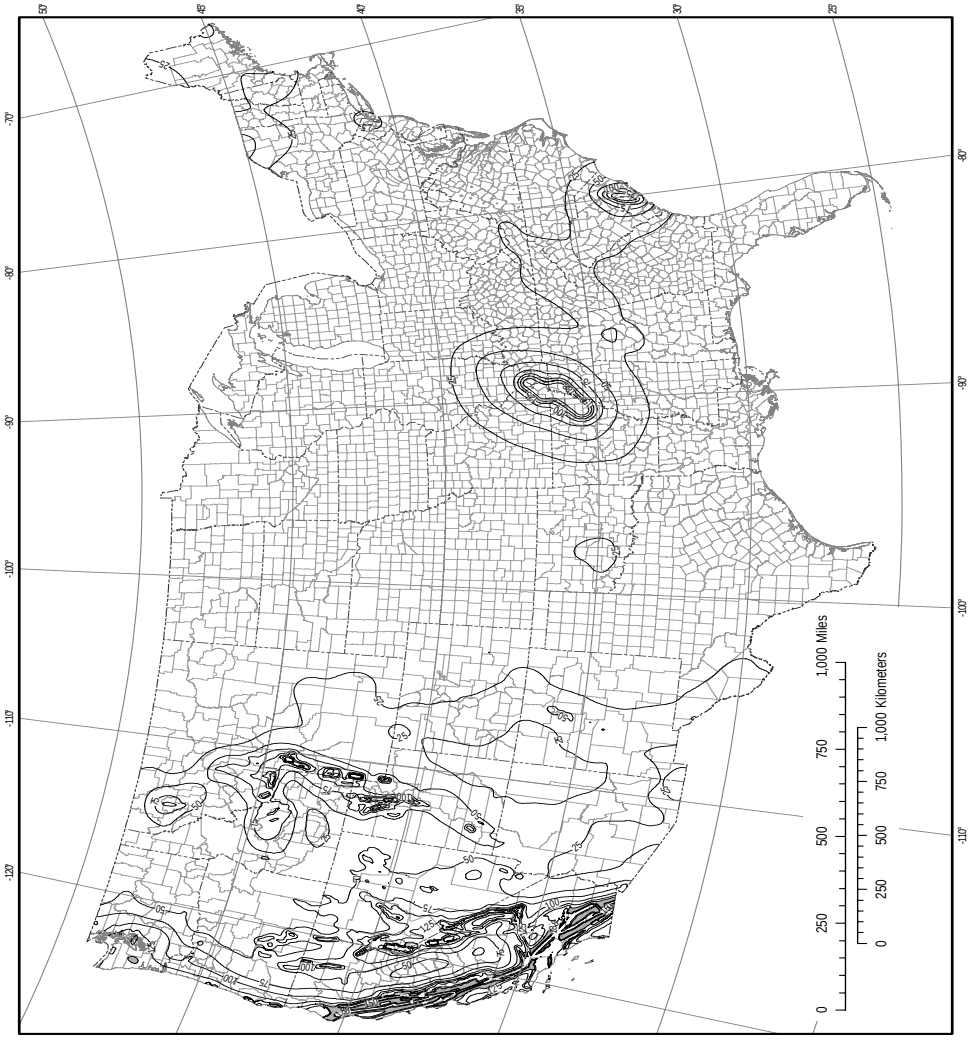

Figure 1613.5(1) Maximum Considered Earthquake (MCE) Ground Motion of 0.2 s Spectral Response Acceleration (5% of Critical Damping), Site Class B

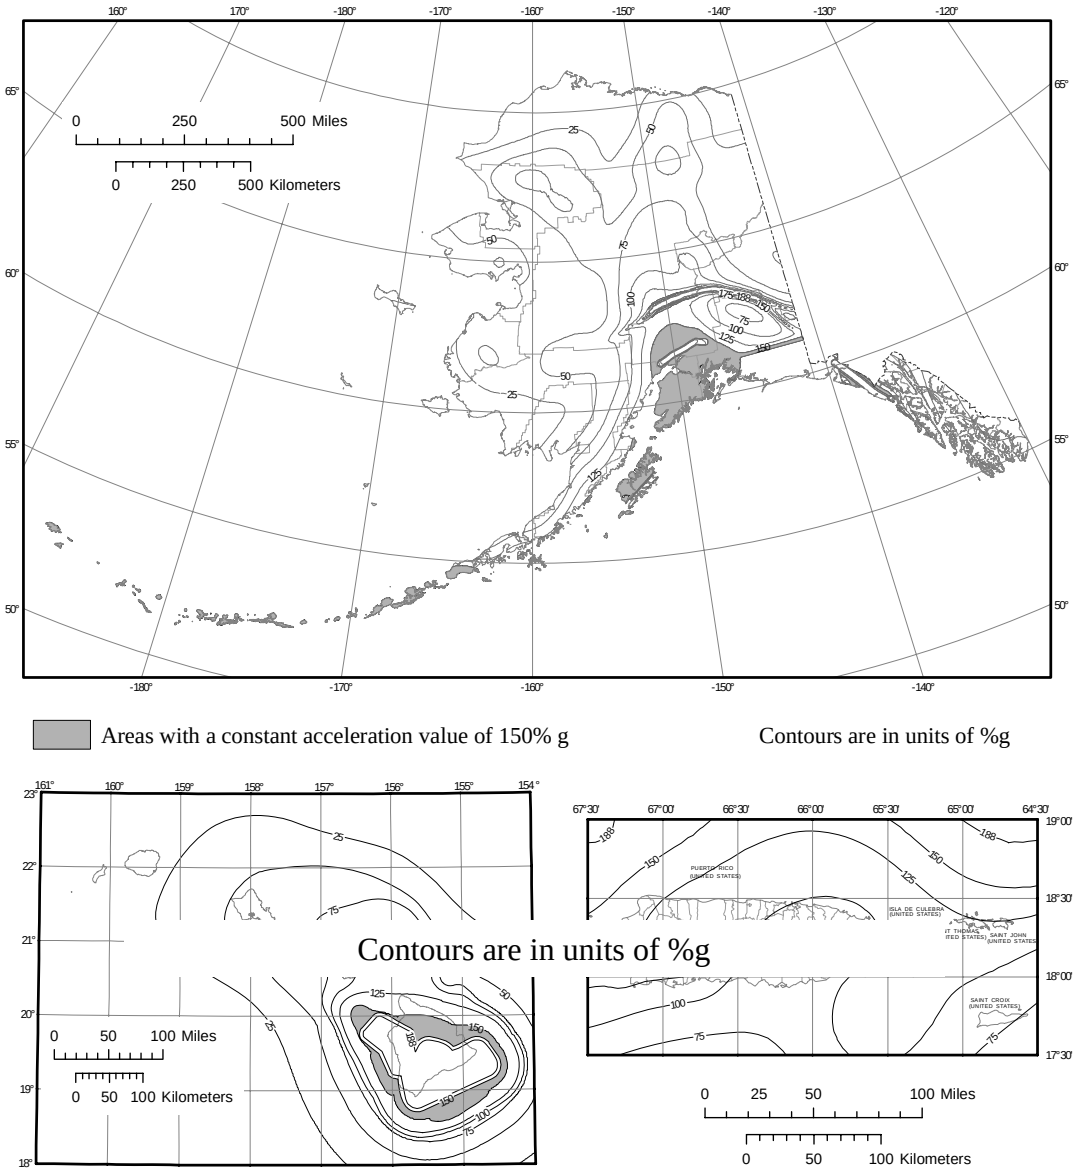

Notes:

Ground motion values contoured on these maps incorporate risk-targeted and deterministic ground motions, and a factor of 1.1 for the maximum direction of 0.2 s spectral response acceleration. As such, they are different from those on the uniform-hazard 2008 USGS National Seismic Hazard Maps posted at http://earthquake.usgs.gov/hazmaps.

Larger, more detailed versions of these maps are not provided because it is recommended that the corresponding USGS web tool (http://earthquake.usgs.gov/designmaps)be used to determine the mapped value for a specified location.

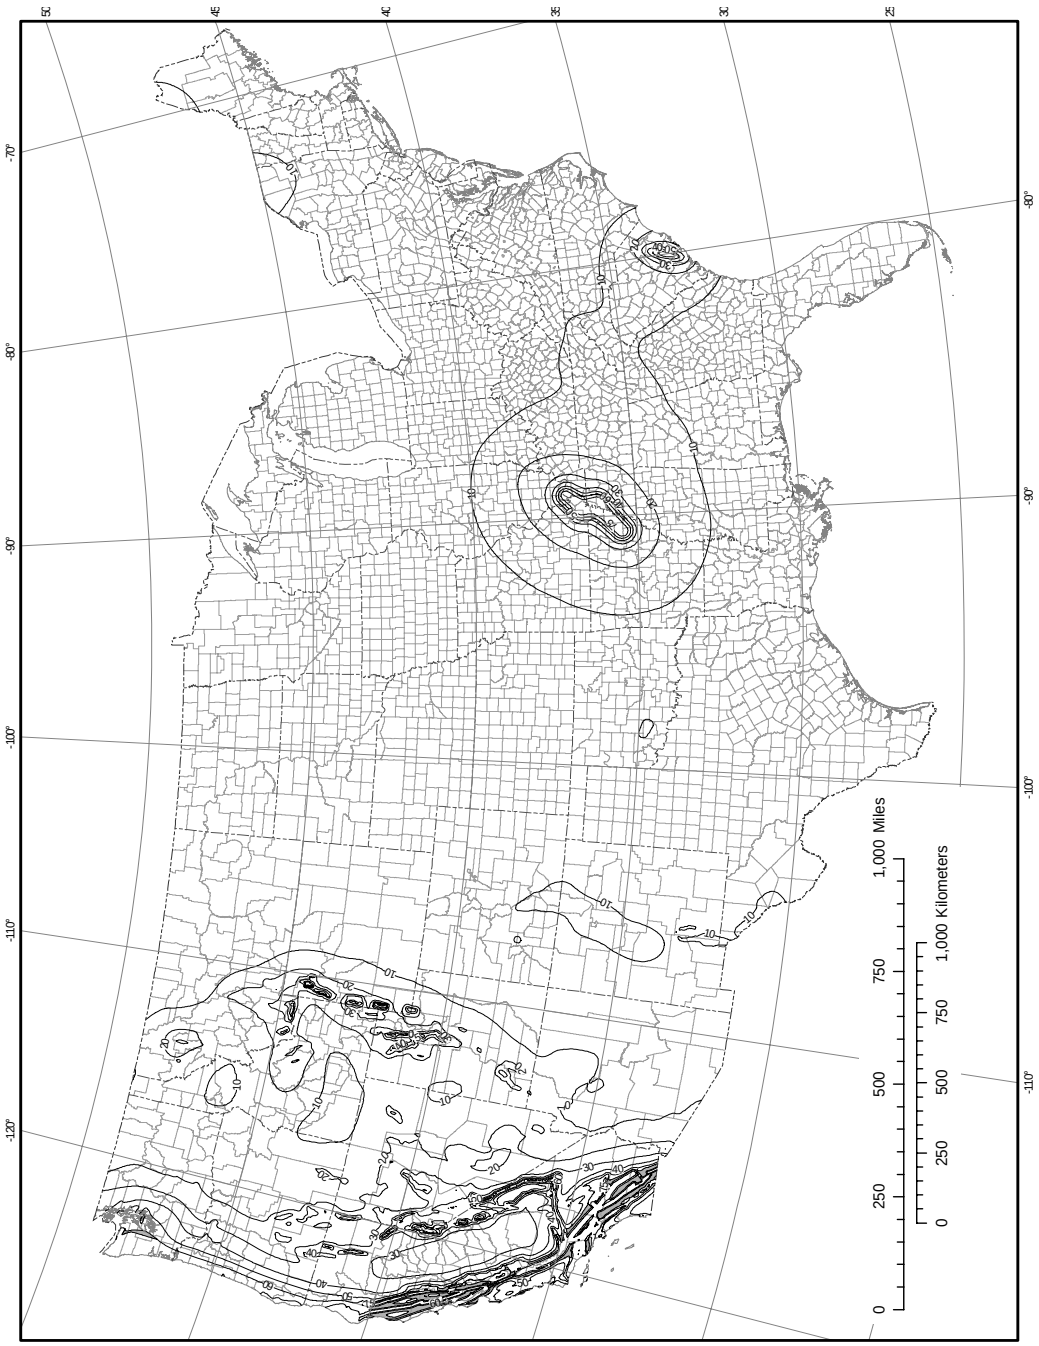

Figure 1613.5(2) Maximum Considered Earthquake (MCE) Ground Motion of 1 s Spectral Response Acceleration (5% of Critical Damping), Site Class B

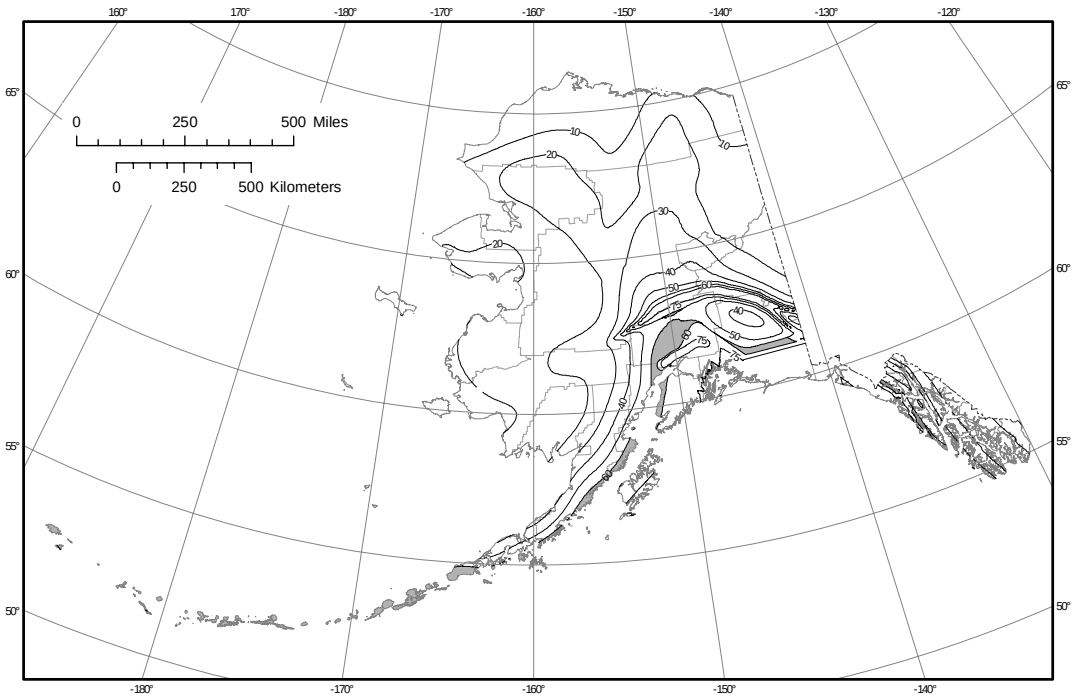

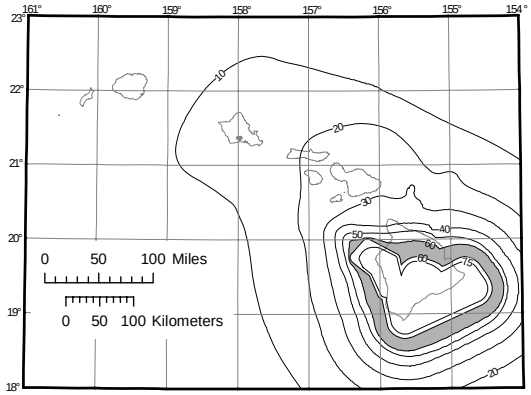

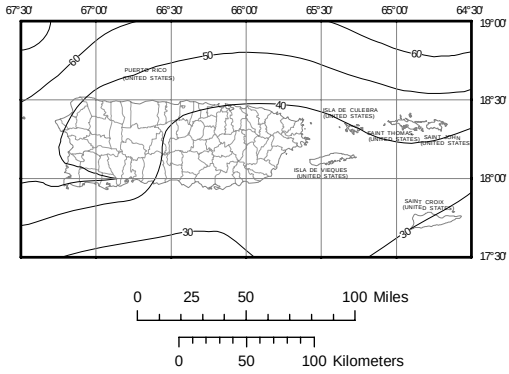

Notes:

Ground motion values contoured on these maps incorporate risk-targeted and deterministic ground motions, and a factor of 1.3 for the maximum direction of 1 s spectral response acceleration. As such, they are different from those on the uniform-hazard 2008 USGS National Seismic Hazard Maps posted at http://earthquake.usgs.gov/hazmaps.

Larger, more detailed versions of these maps are not provided because it is recommended that the corresponding USGS web tool (http://earthquake.usgs.gov/designmaps) be used to determine the mapped value for a specified location.

Figure 1613.5(2) (continued) Maximum Considered Earthquake (MCE) Ground Motion of 1 s Spectral Response Acceleration (5% of Critical Damping), Site Class B

Reason: The purpose of this proposal is to make the 2012 edition of the IBC consistent with the 2010 edition of ASCE 7. The 2010 edition of ASCE 7 adopted new spectral response seismic design maps and maps of the transition period for the long-period portion of a design response spectrum. These maps were prepared by the United States Geological Survey (USGS) through the support and encouragement of the Federal Emergency Management Agency (FEMA) and in collaboration with the ASCE 7 Seismic Subcommittee and the Building Seismic Safety Council (BSSC) Seismic Design Procedures Reassessment Group. The maps are being balloted upon for their adoption into the 2010 edition of ASCE 7. In preparing these maps, the USGS updated their seismic hazard data, incorporating new information on earthquake sources and ground motion prediction equations, such as the new Next Generation Attenuation (NGA) relations.

Another important change incorporated in these maps is the adoption of a uniform risk, as opposed to uniform hazard basis, eliminating inequities in the treatment of different regions of the conterminous U.S. inherent in the prior generation of maps. The affect of this new basis is to modestly reduce design ground motions in much of the United States, consistent with present scientific understanding of the risk associated with structures constructed in these regions. The new maps will result in a modst reduction in the cost of construction for seismic resistance in most parts of the U.S.

The USGS has also developed a companion software program that calculates spectral values for a specific site based on a site's longitude, latitude, and site soil classification. The calculated values are based on the data used to prepare these maps. The spectral values may be adjusted for Site Class effects using the Site Classifications Procedure contained in this section as well as in ASCE 7-10. The software program should be used for establishing spectral values for design because the maps proposed for adoption herein, and those found in ASCE 7, are at too large a scale to provide accurate spectral values for most sites. The software program be accessed at the USGS Web site at http://earthquake.usgs.gov/designmaps

These 2008 maps supersede versions released in 1996 and 2002. Updating the maps involved interactions with hundreds of scientists and engineers at regional and topical workshops. USGS also solicited advice from working groups, expert panels, State geological surveys, Federal agencies, and hazard experts from industry and academia. The Pacific Earthquake Engineering Research Center developed new "Next Generation Attenuation" (NGA) crustal ground-motion models; the Working Group on California Earthquake Probabilities revised the California earthquake rate model; the Western States Seismic Policy Council submitted recommendations for the Intermountain West; and three expert panels were assembled to provide advice on best available science.

The most significant changes to the 2008 maps fall into two categories, as follows:

1. Changes to earthquake source and occurrence rate models:
   In California, the source model was updated to account for new scientific information on faults. For example, models for the southern San Andreas Fault System were modified to incorporate new geologic data. The source model was also modified to better match the historical rate of magnitude 6.5 to 7 earthquakes.
   The Cascadia Subduction Zone lying offshore of northern California, Oregon, and Washington was modeled using a distribution of large earthquakes between magnitude 8 and 9. Additional weight was given to the possibility for a catastrophic magnitude-9 earthquake that ruptures, on average, every 500 years from northern California to Washington, compared to a model that allows for smaller ruptures.
   The Wasatch fault in Utah was modeled to include the possibility of rupture from magnitude 7.4 earthquakes on the fault.
   Fault steepness estimates were modified based on global observations of normal faults.
   Several new faults were included or revised in the Pacific Northwest, California, and the Intermountain West regions.
   The New Madrid Seismic Zone in the Central U.S. was revised to include updated fault geometry and earthquake information. In addition, the model was adjusted to include the possibility of several large earthquakes taking place within a few years or less, similar to the earthquake sequence of 1811–1812.
   Source models for the region near Charleston, S.C., have been modified to include offshore faults that are thought to be capable of generating earthquakes.
   A broader range of earthquake magnitudes was used for the Central and Eastern U.S.
   Earthquake catalogs and seismicity parameters were updated.

2. Changes to models of ground shaking (that show how ground motion decays with distance from an earthquake's source) for different parts of the U.S., based on new published studies:
   New NGA ground-motion prediction models developed by the Pacific Earthquake Engineering Research Center were adopted for crustal earthquakes beneath the Western U.S. These new models use shaking records from 173 global shallow crustal earthquakes to better constrain ground motion in western States.
   Several new and updated ground-shaking models for earthquakes in the Central and Eastern U.S. were implemented in the maps. One of the new ground-shaking models accounts for the possibility that ground motion decays more rapidly from the earthquake source than was previously considered.
   New ground-motion models were applied for earthquake sources along the Cascadia Subduction Zone.

The new National Seismic Hazard Maps show, with some exceptions, similar or lower ground motion compared with the 2002 edition. For example, ground motion in the Central and Eastern U.S. has been generally lowered by about 10–25 percent due to the modifications of the ground-motion models. Ground motion in the Western U.S. is as much as 30 percent lower for shaking caused by long-period (1-second) seismic waves, and ground motion is similar (within 10–20 percent) for shaking caused by short-period (0.2-second) waves.

The new 2008 maps represent the best available science as determined by the USGS from an extensive information-gathering and review process. Changes will be made in future versions of the maps as new information on earthquake sources and resulting ground motion is gathered and processed.

Cost Impact: The code change proposal will not increase the cost of construction.

Reason:
PART I- This proposal incorporates updated earthquake ground motion maps that reflect the 2008 maps developed by the United States Geological Survey (USGS) National Seismic Hazard Mapping Project as well as technical changes adopted for the 2009 *NEHRP Recommended Seismic Provisions for New Buildings and Other Structures* (FEMA P750), which was developed by the Building Seismic Safety Council with funding from the Federal Emergency Management Agency. Both projects are part of federal National Earthquake Hazard Reduction Program's (NEHRP) ongoing

efforts to make the most current earthquake hazard information available to the building codes. If this code change is not moved forward, the ground motion maps in the IBC will reflect superseded seismic hazard information.
The 2008 USGS seismic hazard maps incorporate new information on earthquake sources and ground motion prediction equations including the new Next Generation Attenuation (NGA) relations. The ground motion maps proposed for the IBC further incorporate technical changes adopted for the 2009 *NEHRP Provisions* that include use of: (1) risk-targeted ground motions, (2) maximum direction ground motions, and (3) near-source 84th percentile ground motions.

The proposed ground motion maps for the IBC also reflect a current draft proposal for change to the ASCE 7 (Minimum Design Loads for Buildings and other Structures) standard update process. Under normal circumstances, ASCE 7 would adopt ground motion map related changes drawn from the most current edition of the *NEHRP Recommended Seismic Provisions* prior to incorporation of the maps into the IBC*;* however, the recent changes to the ICC code development process and schedule have made it necessary to submit this working version of the ASCE 7 proposal in an effort to provide the regulatory community with the most up-to-date information available. It should be understood that, to the extent possible, this proposal will be updated to reflect any modifications to maps, maps titles or other Section 1613 content made during the ASCE 7 consensus standard process so the consistency between ASCE 7 and the IBC is maintained. In the NEHRP update process the title for these maps was revised from "Maximum Considered Earthquake (MCE) Ground Motions" to "Risk-Targeted Earthquake (RTE) Ground Motions." This proposal retains the MCE terminology because it is retained in the working version of the ASCE 7 proposal.

This proposal also reduces the number of printed maps to appear in the IBC from 14 to 2. Twelve of the maps included in earlier editions of the IBC provided enlargements of portions of two maps that covered the entire United States; this proposal eliminates the enlargements. This is being recommended because the maps printed in former editions of the IBC, while generally illustrative of the earthquake hazard, could not to be read clearly enough to provide exact design values for specific building sites. Those in need of precise design values can easily obtain them from a USGS web site (http://earthquake.usgs.gov/research/hazmaps/design/index.php) using the longitude and latitude of the building site, obtained from GPS mapping programs or web sites.

Detailed descriptions of changes made for the 2009 *NEHRP Recommended Seismic Provisions* are available at www.bssconline.org under the explanation of changes made for the 2009 edition of the *Provisions.*

PART II- This proposal reflects new seismic hazard data developed by the U.S. Geological Survey (USGS) as part of its National Seismic Hazard Mapping Project and related technical changes developed by the Building Seismic Safety Council's (BSSC) Seismic Design Procedures Reassessment Group (SDPRG) as part of its work for the Federal Emergency Management Agency (FEMA).

The USGS and the FEMA-funded SDPRG worked together to update the seismic design maps and procedures for the 2009 edition of the NEHRP (National Earthquake Hazards Reduction Program) Recommended Seismic Provisions for New Building and Other Structures. The products of this collaboration are new design maps that appear in the 2009 *Provisions* and a similar version that is proposed for inclusion in ASCE 7-10. Although the terminology used in the *Provisions* is slightly different from that proposed for ASCE 7-10, the substance of the mapping changes is the same for both. The new design maps are based on USGS updates to their seismic hazard data and ground motion attenuation formulas as well as the SDPRG's use of risk-targeted ground motions, maximum direction ground motions, and near-source 84th percentile ground motions.

Code updates to the seismic maps and seismic resistant design requirements normally are drawn from ASCE 7 (*Minimum Design Loads for Buildings and Other Structures*) which is, in turn, based on the *NEHRP Recommended Provisions*. This proposal reflects material developed under the 2009 *NEHRP Recommended Provisions* as presented in the current draft proposal for ASCE 7-10. The ICC code change submittal schedule makes it necessary to submit this working version with the understanding that it will be updated to the extent possible to reflect any modifications made by ASCE 7. Note that the maps included in this proposal are based on the maps proposed for inclusion in the IBC. If this code change is not moved forward, the IRC will retain superseded seismic hazard mapping information, thereby potentially being in conflict with the IBC.

These new IRC maps are different from earlier versions in that the division between Seismic Design Categories D2 and E has been changed from 118% g to 125% g. The 125% g contour would have been used in earlier maps but the mapping technology then available for drawing the IRC maps did not permit this to be done. The result of this change and the improved seismic hazard data generated by the USGS over the past 10 years is that the geographic region affected by the Seismic Design Category E designation is smaller. This occurs primarily in the region around Charleston, South Carolina, but is also evident in Seismic Design Category E regions in other parts of the United States. As noted above, maps developed on the same basis have been proposed for the IBC which will allow engineers to design components of the building that are outside of the scope of the IRC with compatible seismic loads.

Cost Impact: (IBC) The new maps may lower costs in some locations but may increase them in others. (IRC) This proposal will not increase the cost of construction and will reduce the cost in some regions.

1613.5.2, 1613.5.5, 1613.5.5.1, Table 1613.5.2, Table 1613.5.5

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Revise as follows:

1613.5.2 Site class definitions. Based on the site soil properties, the site shall be classified as ~~either~~ Site Class A, B, C, D, E or F in accordance with ~~Table 1613.5.2~~ Chapter 20 of ASCE 7. ~~When~~ Where the soil properties are not known

in sufficient detail to determine the site class, Site Class D shall be used unless the building official or geotechnical data determines ~~that~~ Site Class E or F soil<u>s</u> ~~is likely to be~~ <u>are</u> present at the site.

2. Delete without substitution:

~~TABLE 1613.5.2~~
~~SITE CLASS DEFINITIONS~~

~~SITE CLASS~~	~~SOIL PROFILE NAME~~	~~AVERAGE PROPERTIES IN TOP 100 feet, SEE SECTION 1613.5.5~~		
		~~Soil shear wave velocity, $\bar{v}_s$, (ft/s)~~	~~Standard penetration resistance, $\bar{N}$~~	~~Soil undrained shear strength, $\bar{s}_u$, (psf)~~
~~A~~	~~Hard rock~~	~~$\bar{v}_s > 5{,}000$~~	~~N/A~~	~~N/A~~
~~B~~	~~Rock~~	~~$2{,}500 < \bar{v}_s \leq 5{,}000$~~	~~N/A~~	~~N/A~~
~~C~~	~~Very dense soil and soft rock~~	~~$1{,}200 < \bar{v}_s \leq 2{,}500$~~	~~$\bar{N} > 50$~~	~~$\bar{s}_u \geq 2{,}000$~~
~~D~~	~~Stiff soil profile~~	~~$600 \leq \bar{v}_s \leq 1{,}200$~~	~~$15 \leq \bar{N} \leq 50$~~	~~$1{,}000 \leq \bar{s}_u \leq 2{,}000$~~
~~E~~	~~Soft soil profile~~	~~$\bar{v}_s < 600$~~	~~$\bar{N} < 15$~~	~~$\bar{s}_u < 1{,}000$~~
~~E~~	—	~~Any profile with more than 10 feet of soil having the following characteristics:~~ ~~1. Plasticity index $PI > 20$,~~ ~~2. Moisture content $w \geq 40\%$, and~~ ~~3. Undrained shear strength $\bar{s}_u < 500$ psf~~		
~~F~~	—	~~Any profile containing soils having one or more of the following characteristics:~~ ~~1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils.~~ ~~2. Peats and/or highly organic clays (H > 10 feet of peat and/or highly organic clay where H = thickness of soil)~~ ~~3. Very high plasticity clays (H > 25 feet with plasticity index PI > 75)~~ ~~4. Very thick soft/medium stiff clays (H > 120 feet)~~		

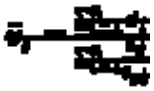
~~For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929m2, 1 pound per square foot = 0.0479 kPa. N/A = Not applicable~~

~~**1613.5.5 Site classification for seismic design.** Site classification for Site Class C, D or E shall be determined from Table 1613.5.~~

~~The notations presented below apply to the upper 100 feet (30 480 mm) of the site profile. Profiles containing distinctly different soil and/or rock layers shall be subdivided into those layers designated by a number that ranges from 1 to n at the bottom where there is a total of n distinct layers in the upper 100 feet (30 480 mm). The symbol i then refers to any one of the layers between 1 and n.~~

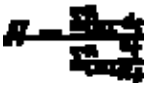
~~where:~~

~~v_{si} = The shear wave velocity in feet per second (m/s).~~
~~d_i = The thickness of any layer between 0 and 100 feet (30 480 mm).~~



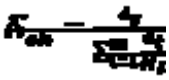
~~**(Equation 16-40)**~~

~~N_i is the Standard Penetration Resistance (ASTM D 1586) not to exceed 100 blows/foot (328 blows/m) as directly measured in the field without corrections. When refusal is met for a rock layer, N_i shall be taken as 100 blows/foot (328 blows/m).~~



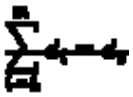
(Equation 16-41)

where N_i and d_i in Equation 16-41 are for cohesionless soil, cohesive soil and rock layers.



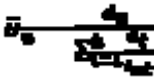
(Equation 16-42)

where:



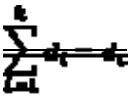
Use d_i and N_i for cohesionless soils layers only in Equation 16-42.

d_s = The total thickness of cohesionless soil layers in the top 100 feet (30 480 mm).
m = The number of cohesionless soil layers in the top 100 feet (30 480 mm).
s_{ui} = The undrained shear strength in psf (kPa), not to exceed 5,000 psf (240 kPa), ASTM D 2166 or D 2850.



(Equation 16-43)

where:



d_c = The total thickness of cohesive soil layers in the top 100 feet (30 480 mm).
k = The number of cohesive soil layers in the top 100 feet (30 480 mm).
PI = The plasticity index, ASTM D 4318.
w = The moisture content in percent, ASTM D 2216.

Where a site does not qualify under the criteria for Site Class F, and there is a total thickness of soft clay greater than 10 feet (3,048 mm) where a soft clay layer is defined by: s_u < 500 psf (25 kPa), w ≥ 40 percent and PI > 20, it shall be classified as Site Class E.

The shear wave velocity for rock, Site Class B, shall be either measured on site or estimated by a geotechnical engineer or engineering geologist/seismologist for competent rock with moderate fracturing and weathering. Softer and more highly fractured and weathered rock shall either be measured on site for shear wave velocity or classified as Site Class C.

The hard rock category, Site Class A, shall be supported by shear wave velocity measurements either on site or on profiles of the same rock type in the same formation with an equal or greater degree of weathering and fracturing. Where hard rock conditions are known to be continuous to a depth of 100 feet (30 480 mm), surficial shear wave velocity measurements are permitted to be extrapolated to assess v_s.

The rock categories, Site Classes A and B, shall not be used if there is more than 10 feet (3048 mm) of soil between the rock surface and the bottom of the spread footing or mat foundation.

TABLE 1613.5.5
SITE CLASSIFICATION [a]

SITE CLASS	v_s	N or N_{ch}	s_u
E	< 600 ft/s	< 15	< 1,000 psf
D	600 to 1,200 ft/s	15 to 50	1,000 to 2,000 psf
C	1,200 to 2,500 ft/s	> 50	> 2,000

For SI: 1 foot per second = 304.8 mm per second, 1 pound per square foot = 0.0479 kN/m^2.
a. If the s_u method is used and the N_{CH} and s_u criteria differ, select the category with the softer soils (for example, use Site Class E instead of D).

1613.5.5.1 Steps for classifying a site.

~~1. Check for the four categories of Site Class F requiring site-specific evaluation. If the site corresponds to any of these categories, classify the site as Site Class F and conduct a site-specific evaluation.~~

~~2. Check for the existence of a total thickness of soft clay > 10 feet (3048 mm) where a soft clay layer is defined by: s_u < 500 psf (25 kPa), $w \geq$ 40 percent, and PI > 20. If these criteria are satisfied, classify the site as Site Class E.~~

~~3. Categorize the site using one of the following three methods with v_s, N, and s_u computed in all cases as specified.~~

~~3.1. v_s for the top 100 feet (30 480 mm) (v_s method).~~

~~3.2. N for the top 100 feet (30 480 mm) (N method).~~

~~3.3. N_{ch} for cohesionless soil layers (PI < 20) in the top 100 feet (30 480 mm) and average, s_u, for cohesive soil layers (PI > 20) in the top 100 feet (30 480mm) (s_u method).~~

Reason: The purpose for this proposal is to delete text from the IBC related to site class definitions and site classifications in favor of referencing the applicable text in ASCE 7. This will have the benefit of eliminating from the IBC text that is duplicated in ASCE 7 and may also conflict with the corresponding text in ASCE 7.

IBC Section 1613.5.2 relies on Table 16.13.5.2 for classifying sites by site class based on the types of soils present and their properties. In ASCE 7-05 (and 7-10), however, this is accomplished by Chapter 20. This chapter includes Table 20.3-1, which corresponds roughly to IBC Table 16.13.5.2, but also contains additional information not contained in the IBC table. This information is found in Section 20.3 of ASCE 7-05. In Section 20.3.1 for Site Class F, there is an exception to Item #1, which is not found in IBC Table 1613.5.2. Also in Section 20.3.1, there is a second condition for Item 4 (s_u < 1000psf), that is not found in IBC Table 1613.5.2. Sections 20.3.2 and 20.3.4 on Site Classes E and B, respectively, contain criteria for classifying a site by site class but this information is not found in IBC Table 1613.5.2. The text from Section 20.3.3 on Site Classes C, D and E is not found in the IBC. Finally, Table 20.3-1 of ASCE 7-05 lists Site Class E soil as "soft clay soil" and includes N and N_{ch} for penetration resistance but IBC Table 1613.5.2 lists Site Class E soil as "soft soil" and only includes N.

IBC Section 1613.5.2 requires classification of sites based on the types of soils present and their properties as Site Class A, B, C, D, E or F in accordance with Table 1613.5.2. Section 161.3.5.5, however, requires classification of sites for Site Class C, D or E to be determined from Table 1613.5.5, which is a simplified version of Table 1613.5.2. The charging text of Section 1613.5.5 appears to limit the provisions in the section to Site Classes C, D and E but there are paragraphs at the end of Section 1613.5.5 for Site Classes A and B.

The classification of sites into site classes based on soil properties demands the expertise of a registered design professional qualified to practice the profession of geotechnical engineering and that profession is not well served by duplicative and potentially conflicting provisions in the IBC and ASCE 7.

In IBC Section 1613.5.2, editorial changes are also made for consistency with Section 11.4.2 of ASCE 7-10, which is the source of the provisions in the section.

Cost Impact: The code change proposal will not increase the cost of construction.

S99–09/10

1613.5.5, Chapter 35

Proponent: Ronald J. Ebelhar, HC NUTTING I A Terracon Company, representing self

1. Revise as follows:

1613.5.5 Site classification for seismic design. Site classification for Site Class C, D or E shall be determined from Table 1613.5.5. The notations presented below apply to the upper 100 feet (30 480 mm) of the site profile. Profiles containing distinctly different soil and/or rock layers shall be subdivided into those layers designated by a number that ranges from 1 to n at the bottom where there is a total of n distinct layers in the upper 100 feet (30 480 mm). The symbol i then refers to any one of the layers between 1 and n.

where:

v_{si} = The shear wave velocity in feet per second (m/s), <u>in accordance with ASTM D 4428 or ASTM D 7400.</u>
d_i = The thickness of any layer between 0 and 100 feet (30 480 mm)

where:

$$v_s = \frac{\sum_{i=1}^{n} d_i}{\sum_{i=1}^{n} \frac{d_i}{v_{si}}}$$ **(Equation 16-40)**

$$\sum_{i=1}^{n} d_i = 100 \text{ feet } (30\,480\text{mm})$$

(Remainder of section unchanged)

2. Add new standard to Chapter 35 as follows:

ASTM

D 4428/D 4428M-07	Standard Test Methods for Crosshole Seismic Testing
D 7400-08	Standard Test Methods for Downhole Seismic Testing

Reason: There is currently no guidance in the IBC for example methods or standards to measure the shear wave velocity in the field. There is guidance for measuring the Standard Penetration Resistance and the undrained shear strength.

Cost Impact: The code change proposal may potentially have a limited impact on the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ACSE49-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1. Delete without substitution:

~~**1613.6.1 Assumption of flexible diaphragm.** Add the following text at the end of Section 12.3.1.1 of ASCE 7.~~

~~Diaphragms constructed of wood structural panels or untopped steel decking shall also be permitted to be idealized as flexible, provided all of the following conditions are met:~~

1. ~~Toppings of concrete or similar materials are not placed over wood structural panel diaphragms except for nonstructural toppings no greater than 1-1/2 inches (38 mm) thick.~~
2. ~~Each line of vertical elements of the seismic-force-resisting system complies with the allowable story drift of Table 12.12-1.~~
3. ~~Vertical elements of the seismic-force-resisting system are light-framed walls sheathed with wood structural panels rated for shear resistance or steel sheets.~~
4. ~~Portions of wood structural panel diaphragms that cantilever beyond the vertical elements of the lateral-force-resisting system are designed in accordance with Section 4.2.5.2 of AF&PA SDPWS.~~

(Renumber subsequent sections)

2. Revise as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

Diaphragm flexible. A diaphragm is flexible for the purpose of distribution of story shear and torsional moment where so indicated in Section 12.3.1 of ASCE 7~~, as modified in Section 1613.6.1~~.

(Definitions not shown are unchanged)

Reason: This provision has been considered and approved by the Seismic Subcommittee of ASCE 7 for inclusion into the 2010 edition of ASCE 7 hence with the adoption of ASCE 7-10 by reference this provision becomes duplicative. As of the submission date of this code change, the ASCE 7 Standards Committee is completing the committee balloting portion of the 2010 edition of ASCE/SEI 7. The document is designated ASCE/SEI 7-10 *Minimum Design Loads for Buildings and Other Structures* and it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in May of 2010 . Any person interested in obtaining a public comment copy of ASCE/SEI 7-10 may do so by contacting the proponent at jrossberg@asce.org.

Cost Impact: The code change proposal will not increase the cost of construction.

Delete without substitution:

~~**1613.6.4 Autoclaved aerated concrete (AAC) masonry shear wall design coefficients and system limitations.** Add the following text at the end of Section 12.2.1 of ASCE 7:~~

~~For ordinary reinforced AAC masonry shear walls used in the seismic force-resisting system of structures, the response modification factor, R, shall be permitted to be taken as 2, the deflection application factor, C_d, shall be permitted to be taken as 2, and the system overstrength factor, Ω_o, shall be permitted to be taken as 2-1/2. Ordinary reinforced AAC masonry shear walls shall not be limited in height for buildings assigned to Seismic Design Category B , shall be limited in height to 35 feet (10 668 mm) for buildings assigned to Seismic Design Category C, and are not permitted for buildings assigned to Seismic Design Categories D, E and F.~~

~~For ordinary plain (unreinforced) AAC masonry shear walls used in the seismic-force-resisting system of structures, the response modification factor, R, shall be permitted to be taken as 1½, the deflection application factor, C_d, shall be permitted to be taken as 1-1/2, and the system overstrength factor, Ω_o, shall be permitted to be taken as 2-1/2. Ordinary plain (unreinforced) AAC masonry shear walls shall not be limited in height for buildings assigned to Seismic Design Category B and are not permitted for buildings assigned to Seismic Design Categories C, D, E and F.~~

(Renumber remaining sections)

Reason:
(Brazil)- The purpose for this proposal is to delete a revision to ASCE 7-05 that will no longer be needed because the revision will have been incorporated into the 2010 edition of ASCE 7. This is being accomplished by ASCE 7 Proposal TC-5-CH14-12, which is being balloted by the Main Committee (Item #12 of the Eighth Main Committee Ballot on Seismic Provisions). It is expected that the Main Committee will approve the proposal.
(Thompson-Samblanet) -This modification to ASCE 7-05 was added because ASCE 7 did not have time to adequately consider seismic design coefficients for Autoclaved Aerated Concrete masonry during its last revision cycle. Since that time, the Building Seismic Safety Council has approved similar seismic design coefficients and requirements for AAC masonry. Revisions to the 2010 edition of ASCE 7 that are technically identical to the modifications proposed for deletion here are under review by the ASCE 7 Committee. If adopted into ASCE 7-10, these modifications will no longer be necessary and as such are proposed for deletion from the IBC.
(Rossberg)- This provision is being considered for approval by the Seismic Subcommittee of ASCE 7 for inclusion into the 2010 edition of ASCE 7 hence with the adoption of ASCE 7-10 by reference this provision becomes duplicative. As of the submission date of this code change, the ASCE 7 Standards Committee is completing the committee balloting portion of the 2010 edition of ASCE/SEI 7. The document is designated ASCE/SEI 7-10 *Minimum Design Loads for Buildings and Other Structures* and it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in May of 2010 . Any person interested in obtaining a public comment copy of ASCE/SEI 7-10 may do so by contacting the proponent at jrossberg@asce.org.

~~**1613.6.8 HVAC Ductwork with I_p = 1.5.** Seismic supports are not required for HVAC ductwork with I_p = 1.5 if either of the following conditions is met for the full length of each duct run:~~

1. ~~HVAC ducts are suspended from hangers 12 inches (305 mm) or less in length with hangers detailed to avoid significant bending of the hangers and their attachments, or~~
2. ~~HVAC ducts have a cross-sectional area of less than 6 square feet (0.557 m^2).~~

Reason: This provision has been considered and approved by the Seismic Subcommittee of ASCE 7 for inclusion into the 2010 edition of ASCE 7 hence with the adoption of ASCE 7-10 by reference this provision becomes duplicative. As of the submission date of this code change, the ASCE 7 Standards Committee is completing the committee balloting portion of the 2010 edition of ASCE/SEI 7. The document is designated ASCE/SEI 7-10 *Minimum Design Loads for Buildings and Other Structures* and it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in May of 2010 . Any person interested in obtaining a public comment copy of ASCE/SEI 7-10 may do so by contacting the proponent at jrossberg@asce.org.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ROSSBERG-S4-1613.6.8

S107–09/10
1613.6.9 (New), CHAPTER 35

Proponent: Bonnie Manley, American Iron and Steel Institute representing American Iron and Steel Institute

1. Add new text as follows:

1613.6.9 Seismic design parameters for cold-formed steel special bolted moment frames. Add a new line, #C12 in ASCE 7, Table 12.2-1 for "Cold-formed Steel – Special Bolted Moment Frame" as follows:

Seismic Force Resisting System	ASCE 7 Section where Detailing Requirements are Specified	Response Modification Coefficient, R	System Overstrength Factor,	Deflection Amplification Factor, C_d	Structural System Limitations and Building Height (ft) Limit				
					Seismic Design Category				
					B	C	D	E	F
C12. Cold-Formed Steel – Special Bolted Moment Frame[b]	14.1	3.5	3.0[a]	3.5	35	35	35	35	35

a. Alternatively, the seismic load effect with overstrength, E_{mh}, can be based on the expected strength determined in accordance with AISI S110.
b. Cold-formed steel – special bolted moment frames shall be limited to one-story in height in accordance with AISI S110.

2. Add standard to Chapter 35 as follows:

AISI
S110-07 Standard for Seismic Design Of Cold-Formed Steel Structural Systems – Special Bolted Moment Frames.

Reason: This proposal introduces the seismic design parameters for a new system, "Cold-formed Steel – Special Bolted Moment Frame" or CFS-SBMFs. This system has been vetted through the BSSC process (Proposal 6-4R) and will be included in Part I of the 2009 NEHRP Provisions. Additionally, it has been introduced for consideration in the 2010 edition of ASCE 7 (Proposal TC-6-CH12-102-R3). Processing for ASCE 7-10 is not yet complete and, because of its shorten cycle, the ASCE 7 Main Committee may not be able to complete its action on the proposal. Consequently, the necessary modifications to ASCE 7 are being introduced here. If action is taken on Proposal TC-6-CH12-102-R3 in time for inclusion in the 2010 edition of ASCE 7, then this proposal will be withdrawn.

Please note, this proposal serves as a companion proposal to an IBC Chapter 22 modification which introduces a reference to the first edition of AISI S110, *Standard For Seismic Design Of Cold- Formed Steel Structural Systems – Special Bolted Moment Frames*. This document is based upon research conducted by Drs. Uang and Sato at UCSD (2007). Specifically, the CFS-SBMF system is expected to experience substantial inelastic deformation during significant seismic events. It is intended that most of the inelastic deformation will take place at the bolted connections, due to slip and bearing. In order to develop the designated mechanism, requirements based on capacity design principles are provided in AISI S110 for the design of the beams, columns and associated connections. Additionally, AISI S110 has specific requirements for the application of quality assurance and quality control procedures.

As a first pass, Appendix 1 of AISI S110 makes recommendations on the seismic design coefficients of the CFS-SBMF system. These parameters have been introduced for consideration in the ASCE 7-10 proposal. The Response Modification Coefficient, R, is set at 3.5. Cyclic testing has shown that CFS-SBMFs have very large ductility capacity and significant hardening. This justifies the use of a value of 3.5 for the R-factor. The derivation of the deflection amplification factor, C_d, can be found in the AISI S110 Commentary, Section D1.3. Furthermore, a capacity design procedure has been provided in Section D1.5 of AISI S110 Commentary so that the designer can explicitly calculate the seismic load effect with overstrength, E_{mh},. at the design story drift level. Alternatively, a conservative system overstrength factor, , is also provided to be compatible with the conventional approach to compute E_{mh} in ASCE 7. Finally the height limitation of 35 feet for all SDCs is based on practical use only and not from any limits on the CFS-SBMF system strength.

Cost Impact: There is no anticipated impact on the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, AISI S110-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Manley-S1-1613.6.9

S108–09/10

1613.8 (New), Appendix L (New)

Proponent: Robert E. Bachman, SE, Robert E Bachman Consulting Structural Engineers, representing The Consortium of Organizations for Strong-Motion Observation Systems

Add new text as follows:

1613.8 Earthquake-recording instrumentations. For earthquake-recording instrumentations, see Appendix L.

APPENDIX L

EARTHQUAKE RECORDING INSTRUMENTATIONS

SECTION L101
GENERAL

L101.1 General. Every building located where the 1-second spectral response acceleration, S_1, in accordance with Section 1613.5 is greater than 0.40 that either 1) exceeds six stories above grade plane with an aggregate floor area of 60,000 square feet (5574 m^2) or more, or 2) exceeds 10 stories above grade plane regardless of floor area, shall be provided with not less than three approved recording accelerographs.

The accelerographs shall be interconnected for common start and common timing.

L 101.2 Location. As a minimum, instruments shall be located at the lowest level, midheight, and near the top of the building. Each instrument shall be located so that access is maintained at all times and is unobstructed by room contents. A sign stating MAINTAIN CLEAR ACCESS TO THIS INSTRUMENT shall be posted in a conspicuous location.

L 101.3 Maintenance. Maintenance and service of the instrumentation shall be provided by the owner of the building, subject to the approval of the building official. Data produced by the instrument shall be made available to the building official on request.

Reason: Earthquake Recording Instrumentation measurements provide fundamental information needed to cost effectively improve the seismic performance of buildings. The wording of the added Section is taken from Section 1652 and Appendix Chapter 16, Division II of the 1997 UBC.

When the IBC was created, this section was apparently inadvertently not included. The code change proposal is intended to correct this oversight. The proposed change only covers instrumentation in newly constructed buildings. This proposal was submitted in the last cycle as a mandatory requirement in Chapter 1613. The Structural Committee suggested it be resubmitted as a non-mandatory Appendix during this cycle.

Cost Impact: Because this is an optional Appendix, this change will only have a cost impact in Jurisdictions in which it is adopted. In Jurisdictions where it is adopted, the cost impact will depend on whether similar ordinances are already in place. If ordinances are already in place, the cost impact will be negligible. For jurisdictions that adopt where ordinances are not in place, the cost impact, would be very small (less than 0.1% of the cost of the new construction) and only apply to very few structures in the high areas of seismic activity.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Bachman-S1-1613.8-App L

S109–09/10
1602.1, 1605.2.2, 1605.3.1.2, 1614 (New)

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Add new definition as follows:

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

ICE-SENSITIVE STRUCTURE: A structure for which the effect of an atmospheric ice load governs the design of a structure or portion thereof. This includes, but is not limited to, lattice structures, guyed masts, overhead lines, light suspension and cable-stayed bridges, aerial cable systems (e.g., for ski lifts or logging operations), amusement rides, open catwalks and platforms, flagpoles and signs.

2. Revise as follows:

NOTATIONS.

D	=	Dead load.
D_i	=	Weight of ice in accordance with Chapter 10 of ASCE 7.
E	=	Combined effect of horizontal and vertical earthquake induced forces as defined in Section 12.4.2 of ASCE 7.
F	=	Load due to fluids with well-defined pressures and maximum heights.
F_a	=	Flood load in accordance with Chapter 5 of ASCE 7.
H	=	Load due to lateral earth pressures, ground water pressure or pressure of bulk materials.
L	=	Live load, except roof live load, including any permitted live load reduction.
L_r	=	Roof live load including any permitted live load reduction.
R	=	Rain load.
S	=	Snow load.
T	=	Self-straining force arising from contraction or expansion resulting from temperature change, shrinkage, moisture change, creep in component materials, movement due to differential settlement or combinations thereof.
W	=	Load due to wind pressure.
W_i	=	Wind-on-ice in accordance with Chapter 10 of ASCE 7.

1605.2.2 ~~Flood~~ Other loads. Where flood loads, F_a, are to be considered in the design, the load combinations of Section 2.3.3 of ASCE 7 shall be used. Where an ice-sensitive structure is subjected to loads due to atmospheric icing, the load combinations of Section 2.3.4 of ASCE 7 shall be considered.

1605.3.1.2 ~~Flood~~ Other loads. Where flood loads, F_a, are to be considered in design, the load combinations of Section 2.4.2 of ASCE 7 shall be used. Where an ice-sensitive structure is subjected to loads due to atmospheric icing, the load combinations of Section 2.4.3 of ASCE 7 shall be considered.

3. Add new text as follows:

SECTION 1614
ATMOSPHERIC ICE LOADS

1614.1 General. Ice-sensitive structures shall be designed for atmospheric ice loads in accordance with Chapter 10 of ASCE 7.

(Renumber remaining sections)

Reason: The purpose for the proposal is to provide charging text in the IBC in conjunction with technical provisions of ASCE 7 for atmospheric ice loads. It is not expected that the ongoing balloting for the 2010 edition of ASCE 7 will affect this proposal.

Note that the statements being added to Sections 1605.2.2 and 1605.3.1.2 for ice-sensitive structures do not constitute charging text. They are cross references to Section 2.3.5 of ASCE 7-10 for Strength/LRFD load combinations and Section 2.4.4 of ASCE 7 for ASD load combinations, which only serve to modify the load combinations for strength design in Section 2.3.2 of ASCE 7-10 and the load combinations for allowable stress design in Section 2.4.4 of ASCE 7.

The statements in Sections 1605.2.2 and 1605.3.1.2 on flood loads, F_a, also do not constitute charging text but Section 1612.1 serves as the charging text for flood loads in the IBC in that it requires buildings, structures and portions thereof to be designed and constructed to resist the effects of flood loads in flood hazard areas. In that regard, Section 1614.1 is added to provide charging text for ice-sensitive structures in the same manner as is provided for flood load.

Section 10.1 of ASCE 7-10 requires atmospheric ice loads to be considered in the design of ice-sensitive structures. An "ice-sensitive structure" is defined in Section 10.2 of ASCE 7-10 and this definition is being added to the IBC. Having a definition of "ice-sensitive structure" in the IBC will provide a technical basis for determining which structures are ice-sensitive structures and, thus, are required to meet the technical provisions of ASCE 7-10 for them. All structures other than ice-sensitive structures are not required to meet these technical provisions. Without the definition, the IBC will be without effective charging text. IBC Section 1614.1 relies on the determination of which structures are ice-sensitive structures in order to determine the need to comply with the applicable provisions of ASCE 7. That determination is not possible unless a definition of "ice-sensitive structure" is included in the IBC.

Note that this proposal does not contain similar changes to the alternative basic load combinations in Section 1605.3.2. The references to the load combinations in Sections 2.3.5 and 2.4.4 of ASCE 7 are an essential part of this proposal but these sections are not compatible with the alternative basic load combinations of the IBC. Revisions to the alternative basic load combinations for compatibility with the requirements for ice-sensitive structures in ASCE 7-10 should be pursued by others. The deletion of the alternative basic load combinations is the subject of a separate proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S48-1605.2.2

S110–09/10
1614.3.1, 1614.4.1

Proponent: Matthew Senecal, PE, representing American Concrete Institute

Revise as follows:

1614.3.1 Concrete frame structures. Frame structures constructed primarily of reinforced or prestressed concrete, either cast-in-place or precast, or a combination of these, shall conform to the requirements of ACI 318 ~~Sections 7.13, 13.3.8.5, 13.3.8.6, 16.5 and 18.12.6, b18.12.7 and 18.12.8 as applicable~~. Where ACI 318 requires that nonprestressed reinforcing or prestressing steel pass through the region bounded by the longitudinal column reinforcement, that reinforcing or prestressing steel shall have a minimum nominal tensile strength equal to two-thirds of the required one-way vertical strength of the connection of the floor or roof system to the column in each direction of beam or slab reinforcement passing through the column.

Exception: Where concrete slabs with continuous reinforcing having an area not less than 0.0015 times the concrete area in each of two orthogonal directions are present and are either monolithic with or equivalently bonded to beams, girders or columns, the longitudinal reinforcing or prestressing steel passing through the column reinforcement shall have a nominal tensile strength of one-third of the required one-way vertical strength of the connection of the floor or roof system to the column in each direction of beam or slab reinforcement passing through the column.

1614.4.1 Concrete wall structures. Precast bearing wall structures constructed solely of reinforced or prestressed concrete, or combinations of these shall conform to the requirements of ~~Sections 7.13, 13.3.8.5 and 16.5 of~~ ACI 318.

Reason: ACI is in the process of completely reorganizing ACI 318, *Building Code Requirements for Structural Concrete*. This process was formally initiated in the spring of 2008 and was scheduled to be completed by January 1, 2014 so that it would be available for reference by the 2015 IBC. This 2015 IBC schedule was assumed to be the same as traditional ICC meeting schedules.

The reorganized ACI 318 will be significantly different in structure than 318-08. The code will include several new chapters that are based on member design. The 318-08 chapters will be significantly reworked to support the member chapters. Some provisions have been divided sometimes into several chapters and at other provisions combined.

The new schedules released in February 2009 by the ICC require that reorganized ACI 318 be completed by January 3, 2012 for changes to the IBC (Group A) that require textual changes to the body of the IBC. ACI committee 318 will likely not be done with the revisions by that time and thus not have a revised standard to submit for the 2015 IBC if it remains in Group A. ICC's CP 28-05 states that, if no textual changes are required and that the change to the code is in reference only, the revision may be considered by the administrative code committee prior to the Final Action Hearing in Group B.

In this code change proposal, ACI proposes to remove all references to specific sections in ACI 318 from the IBC, but not change the technical intent of any provision. This removal would allow ACI to submit an administrative change in Group B and give ACI Committee 318 one more year to complete their task of reorganization.

In some cases, the referenced section numbers that are removed are replaced with language from ACI 318 (usually the section heading) that will allow the user to easily locate the appropriate section. In some cases, the referenced information in ACI 318 is transcribed into the IBC. The use of words in place of section numbers may require some editorial revisions in the 2012/2013 ICC cycle, if the headings are changed through the reorganization.

The following explanations are given to for the revised Sections stated above:

1614.3.1 and 1614.4.1	The list of sections is the majority of the structural integrity requirements but not all that are related to these topics. A singular reference to ACI 318 is a more accurate statement. In addition, the provisions in ACI 318 apply to all concrete buildings; whereas, the scope of Section 1614 is limited to a few buildings. Therefore, some may interpret from Sections 1614.3.1 and 1614.4.1 as presently worded that the sections of ACI 318 that are cited only apply to the buildings within the scope of Section 1614. Deletion of the references to these specific sections will eliminate this potential incorrect interpretation.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: SENECAL-S1-1614.3.1

S111–09/10
1702.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1702.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

SPECIAL INSPECTION, CONTINUOUS. The ~~full-time~~ observation of construction or work requiring special inspection by an approved special inspector who is continuously present in the area when and where the construction or work is being performed.

SPECIAL INSPECTION, PERIODIC. The ~~part-time or intermittent~~ observation of construction or work requiring special inspection by an approved special inspector who is intermittently present in the area when and where the construction or work ~~has been or~~ is being performed ~~and at the completion of the work~~.

Reason: The purpose for this proposal is to adjust the definitions for "continuous special inspection" and "periodic special inspection" for consistency with the requirements for special inspection elsewhere in Chapter 17. These requirements typically specify special inspections as either continuous or periodic. The only means in the IBC for determining what is required of a special inspector to perform continuous or periodic special inspection is their respective definitions in Section 1702.1. The definitions should be such that the special inspector is able to arrive at the site in time to observe the construction or work sufficiently to enable a determination of whether the construction complies with applicable requirements in the building code and its reference standards and is in accordance with the approved construction documents.

The definitions need to account for two primary aspects of special inspection: extent and frequency. Frequency can be seen as the number of times a special inspector inspects; extent can be seen as the degree to which a special inspector inspects. Neither can be comprehensively accounted for in a definition and this proposal does not attempt to do so. However, adjustments to the definitions are proposed to improve their correlation with the extent and frequency assumed for the special inspections where continuous or periodic special inspection is specified.
In both definitions, "construction" is added before "work" for consistency with the same phrase in Section 110.1 on inspections by the building official. Also in both definitions, "when" is added before "where" to indicate that the special inspector is expected be in the area while the work is being performed, not before or after the work is being performed, which is possible with the current definitions.

In the definition of periodic special inspection, "has been" is deleted so that the definition is silent on whether performing special inspections after the construction or work is completed constitutes periodic special inspection. It is conceivable that certain special inspection are possible after completion of the construction or work but this should be agreed upon by all affected parties, including, but not limited to, the owner or owner's representative, contractor, special inspector and the building official. Retaining "has been" in the definition, however, implies that special inspection after the construction or work is completed always constitutes periodic special inspection and there are certain special inspections identified as periodic elsewhere in Chapter 17 for which such inspection may not be sufficient.

Also in the definition of periodic special inspection, "at the completion of work" is deleted. Where periodic special inspection is warranted, whether the special inspector is present "at the completion of work" is irrelevant. An intermittent presence permits time gaps between actions or observations by the special inspector, which includes a period of time between the last action or observation by the special inspector and the completion of the work. Where this is not considered to be a sufficient presence by the special inspector, periodic special inspection is not warranted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Brazil-S41-1702.1

S112–09/10
1702

Proponent: John England, MCO, England Enterprises Inc. representing self

Add new text as follows:

STATEMENT OF SPECIAL INSPECTIONS. A separate document presented to the building official at time of plan submittal, detailing the special inspections required on the project, with details on how and when the inspections are to be carried out and to what extent. The Building Official has the authority to approve, reject or ask for more information on any part of the *statement of special inspections*.

Reason: The code relates to the *statement of special inspections* but never defines it. A separate document from the specifications on large projects would make it easier for an inspection in the field to figure out who is doing what.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: England-S1-1702

S113–09/10
1702.1

Proponent: D. Kirk Harman, The Harman Group, representing The National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

Add new definition as follows:

1702.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

SPECIAL INSPECTOR. An individual qualified in accordance with Section 1704.1 of this code, employed or retained by the *approved agency* and assigned to execute the *special inspections* or tests required by the statement of special inspections.

Reason: The term Special Inspector is used many times throughout the chapter but is currently not defined. Approved Agency is defined as the entity that provides inspection but the inspections are actually accomplished by the "special inspector". Both should be defined.

Cost Impact: This proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Harman-S1-1702.1

S114-09/10
1702.1

Proponent: D. Kirk Harman, The Harman Group, representing The National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

Revise as follows:

1702.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

SPECIAL INSPECTION, CONTINUOUS. The full-time observation of work items that require ~~requiring~~ special inspection during their construction or installation process by an approved special inspector, in accordance with the statement of special inspections. ~~who is present in the area where the work is being performed.~~

SPECIAL INSPECTION, PERIODIC. The ~~part-time or~~ intermittent observation of work items that can be observed during or after installation that require ~~requiring~~ *special inspection* by an *approved* special inspector, in accordance with the statement of special inspections. ~~who is present in the area where the work has been or is being performed and at the completion of the work.~~

Reason: The current definitions are unclear and do not convey the intent of the difference between continuous and periodic special inspection. This proposal is intended to align the definitions with the requirements of the statement of special inspections. Continuous inspections are required for only those construction items that must be observed during the process of installation, such as multiple pass welds, or concrete placement. Periodic inspections are appropriate for most items that may or must be observed after they are in place, such as reinforcing placement or beam locations.

Also, it does not seem appropriate that the code should require the special inspector to just be "present in the area where the work is being performed". The revisions rely on the definition of *special inspection* and the requirements of Chapter 17 to define the activities of the s*pecial inspector*.

The word "items" is added ("work items") because the word work alone is too broad and there are many individual items that require different levels of inspection in what may be construed as the "work".

Cost Impact: This proposal will not increase the cost of construction.

Proponent: James A Carlson, Seismic Source Company

1. Revise as follows:

SECTION 202
DEFINITIONS

LABEL. An identification applied on a product by the manufacturer or certificate of compliance that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of an accredited ~~approved~~ agency ~~and~~ that indicates that the representative sample of the product or material has been ~~tested~~ qualified by test or analysis and evaluated to industry standards and the manufacturers quality program is accepted by an accredited ~~approved~~ agency ~~(see Section 1703.5 and "Inspection certificate," "Manufacturer's designation" and "Mark")~~(A logo is used as a label on documents and equipment information name plate tags).

2. Delete without substitution:

~~**MANUFACTURER'S DESIGNATION.** An identification applied on a product by the manufacturer indicating that a product or material complies with a specified standard or set of rules (see also "Inspection certificate," "Label" and "Mark").~~

~~**MARK.** An identification applied on a product by the manufacturer indicating the name of the manufacturer and the function of a product or material (see also "Inspection certificate," "Label" and "Manufacturer's designation").~~

3. Add new definitions as follows:

SECTION 1702
DEFINITIONS

ACCREDITED AGENCY. Accreditation refers to the formal recognition by a specialized body – an accreditation body.

ACCREDITED SPECIAL INSPECTIONS AGENCY. Agencies that perform field inspections of a building under construction.

ACCREDITED INSPECTION BODIES. Agencies that provide review of the manufacturers' quality process which entails a review of the quality program and onsite verification that records confirm the quality program is being implemented.

4. Delete without substitution:

~~**APPROVED AGENCY.** An established and recognized agency regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved.~~

~~**APPROVED FABRICATOR.** An established and qualified person, firm or corporation approved by the building official pursuant to Chapter 17 of this code.~~

~~**INSPECTION CERTIFICATE.** An identification applied on a product by an approved agency containing the name of the manufacturer, the function and performance characteristics, and the name and identification of an approved agency that indicates that the product or material has been inspected and evaluated by an approved agency (see Section 1703.5 and "Label," "Manufacturer's designation" and "Mark").~~

5. Delete and substitute as follows:

~~**1703.1 Approved agency.** An approved agency shall provide all information as necessary for the building official to determine that the agency meets the applicable requirements.~~

1703.1 Building official approval. Material, products, and reports are approved by the building official.

6. Delete without substitution:

~~**1703.1.1 Independent.** An approved agency shall be objective and competent. The agency shall also disclose possible conflicts of interest so that objectivity can be confirmed.~~

~~**1703.1.2 Equipment.** An approved agency shall have adequate equipment to perform required tests. The equipment shall be periodically calibrated.~~

~~**1703.1.3 Personnel.** An approved agency shall employ experienced personnel educated in conducting, supervising and evaluating tests and/or inspections.~~

7. Revise as follows:

1703.2 Written approval. Any material, appliance, equipment, system or method of construction meeting the requirements of this code shall be submitted for written approval by the building official during the plan check process ~~approved in writing after satisfactory completion of the required tests and submission of required test reports~~.

1703.4 Performance. Specific information ~~consisting of test reports conducted by an approved testing agency in accordance with standards referenced in Chapter 35, or other such information as necessary,~~ shall be provided for the building official to determine that the material meets the applicable code requirements and for approval.

8. Delete without substitution:

~~**1703.4.1 Research and investigation.** Sufficient technical data shall be submitted to the building official to substantiate the proposed use of any material or assembly. If it is determined that the evidence submitted is satisfactory proof of performance for the use intended, the building official shall approve the use of the material or assembly subject to the requirements of this code. The costs, reports and investigations required under these provisions shall be paid by the permit applicant.~~

~~**1703.4.2 Research reports.** Supporting data, where necessary to assist in the approval of materials or assemblies not specifically provided for in this code, shall consist of valid research reports from approved sources.~~

9. Revise as follows:

1703.5 Labeling. Where materials or assemblies are required by this code to be labeled, such materials and assemblies shall be labeled by an accredited ~~approved~~ agency ~~in accordance with Section 1703~~. Products and materials required to be labeled shall be labeled in accordance with the procedures set forth in Sections 1703.5.1 through 1703.5.3.

1703.5.1 Testing. ~~An approved agency~~ A test lab shall ~~test~~ verify a representative sample of the product or material being labeled to the relevant standard or standards. ~~The approved agency shall maintain a record of the tests performed.~~ The record shall provide sufficient detail to verify compliance with the test standard.

1703.5.2 Inspection and identification. The accredited ~~approved~~ agency shall periodically perform an inspection, which shall be in-plant if necessary, of the product or material that is to be labeled. The inspection shall verify that the labeled product or material is representative of the product or material tested.

1703.5.3 Label information. The label shall contain the manufacturer's or distributor's identification, model number, serial number or definitive information describing the product or material's performance characteristics and accredited ~~approved~~ agency's identification.

10. Add new text as follows:

1704.17 Special Inspection for force-resisting-systems and designated seismic systems. Special inspections shall be performed for force-resisting systems as identified in Sections 1705.3 and 1707.8 required by the building official. Special inspections shall be performed for designated seismic system as identified in Section 1707.9 as required by the building official. Inspection frequency shall be in accordance with Table 1704.17.

1704.17.1 Qualifications. Special inspection agencies shall have expertise in seismic restraint design as required by Chapter 13 of ASCE 7, knowledge of shake table testing qualification of equipment, and obtain special inspection accreditation.

TABLE 1704.17
REQUIRED VERIFICATION AND INSPECTION OF NONSTRUCTURAL COMPONENTS

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCE STANDARDS	IBC REFERENCE
1. Verification of seismic supports	-	X	-	1707.7
2. Verification of equipment anchorage and certification of compliance for designated seismic systems	-	X	-	1707.8
3. Verification of isolation systems	-	X	-	1707.9

11. Revise as follows:

1708.1 Testing and qualification for seismic resistance. The testing and qualification specified in Sections 1708.2 through 1708.5, unless exempted from *special inspections* by the exceptions of Section 1704.1, 1705.3 or 1705.3.1 are required as follows:

1. The seismic-force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F, as determined in Section 1613 shall meet the requirements of Sections 1708.2 and 1708.3, as applicable. Testing of systems or system components shall be performed in accordance with ASHRAE Standard 171 or standards approved by the building official.
2. Designated seismic systems in structures assigned to *Seismic Design Category* C, D, E or F subject to the special certification requirements of ASCE 7 Section 13.2.2 are required to be tested in accordance with Section 1708.4.
3. Architectural, mechanical and electrical components in structures assigned to *Seismic Design Category* C, D, E or F with an I_p = 1.0 are required to be tested in accordance with Section 1708.4 where the general design requirements of ASCE 7 Section 13.2.1, Item 2 for manufacturer's certification are satisfied by testing.
4. The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section 1708.5

1708.4 Seismic certification of nonstructural components. The *registered design professional* shall state the applicable seismic certification requirements for nonstructural components and designated seismic systems on the *construction documents*.

1. The manufacturer of each designated seismic system component subject to the provisions of ASCE 7 Section 13.2.2 shall test or analyze the component and its mounting system or anchorage and submit a *certificate of compliance* for review and acceptance by the *registered design professional* responsible for the design of the designated seismic system and for approval by the *building official*. Certification shall be based on an actual

test on a shake table, by three-dimensional shock tests, by an analytical method using dynamic characteristics and forces, by the use of experience data (i.e., historical data demonstrating acceptable seismic performance) or by more rigorous analysis providing for equivalent safety. Use of analysis for active or energized components is not permitted unless a comparison is made to components that have been otherwise deemed as rugged. For complex components, testing or experience may be the only practical way to ensure that the equipment will be operable following a design earthquake. Active simple products such as dampers of fans shall be permitted to be certified by analysis.

2. Manufacturer's certification of compliance for the general design requirements of ASCE 7 Section 13.2.1 shall be based on analysis, testing or experience data.

12. Add new text as follows:

1708.4.1 Hazardous applications. Components with hazardous contents shall be certified by the manufacturer as maintaining containment following the design earthquake by (1) analysis, (2) approved shake table testing, or (3) experience data in accordance. Evidence demonstrating compliance of this requirement shall be submitted to the building official after review and acceptance by the registered design professional.

1708.6 Anchors. For required anchorage testing, see ASCE 7.

13. Add reference standard to Chapter 35 as follows:

ASHRAE
Standard 171-08 Method of Testing Seismic Restraint Devices for HVAC&R Equipment

Reason: (***1702 Definitions)*** Definitions need to be changed to correlate with the current philosophy associated with the implementation of code requirements. In the late 90's, shop drawings used to be stamped with approval by the registered design professional. Now the stamp says reviewed by the design professional and the shop drawings are then approved by the building official. The term "approved agency" has been replaced with "accredited agency" as defined in the ISO standards. The building officials have approved the design and equipment to be installed in buildings, but the building official does not approve design agencies. Even the ES criteria have been updated to delete any reference to "approved agency".
I have performed significant research on this subject. I have yet to find an "approved agency". I have a temporary accreditation as an "accredited" Inspection Body by IAS awaiting final payment. IAS does not accredit fabrication agencies. I am pursuing the idea of becoming an accredited IBC special inspector to fulfill inspection requirements by New York City. This will require significant insurance implications. I am however, providing a listing service for seismic qualified equipment supported by the accredited inspection body services that review the QA program of the manufacturer and is accepted by OSHPD.

Based on the above discussion the following additional changes to the definitions are required.

Delete inspection certificate. The only references are from other definitions. Any certificate reference in the body of text in chapter 17 refers to a certificate of compliance. Special inspections are required and the end product of special inspection is a report not a certificate. Inspection certificate has no use.

Label has been modified to clearly discuss the current process for a certificate of compliance and approval by the building official. Testing of the product is not required by AC 156 to be an accredited test lab. There is an option to use an unaccredited test lab if the test is witnessed by an accredited inspection body. Also, analysis may be an acceptable method to qualify the product. So my listing agency does list Certified Seismic Qualification Agencies that perform analysis or arrange for testing by a subcontractor. My IB services verify that their quality system is acceptable to ISO 9001 standards to control the qualification of equipment. I certify the qualification agencies management system as defined by ISO, see appendix A.

Manufacturers' designation and mark definitions are no longer valid.

(1703 Approvals) All of 1703.1 deals with approved agency. From the discussion above, approved agency has been removed from chapter 17. Since this section is approvals, that 1703.1 was replaced with building official approval. This is a simple definition and can be expanded in later revisions of the IBC.
1703.2 and 1703.4 have been edited to reflect the current plan check process and approved by the building official. 1703.4 shall be combined into one paragraph. 1703.4.2 is no longer required. Research report requirements are provided in industry standards (AC 156, ASHRAE 171, and AHRI Seismic Qualification Standard - draft. I have a contract with AHRI to prepare the standard. A 90% draft is in review and will be completed by October 2009. These new standards reflect the state of art and replace the need for the code to provide criteria.

1703.5 has been updated to reflect the new term accredited agency.

1704 did not contain any requirements for non structural components. I added Section 1704.15 to address this issue and refer to 1707 where requirements are defined. Actually the requirements for special inspections of non structural components are included in 1705, 1707 and 1708. These requirements are duplicate in nature and need thorough review and update. But at a minimum, the addition of 1704.15 is the first step in the revision process. I would be happy to further evaluate this issue in detail and provide further proposals.

1708.1 and 1708.4 have been updated to use the language developed for ASCE 7. I am a member of the Seismic Subcommittee of ASCE 7 and specifically TS-8. I have successfully provided many changes to ASCE 7 that make the requirements clear and concise to resolve industry issues. One change represented changes to the requirements for equipment qualification. The changes to 1708 reflect the current accepted language changes to ASCE 7.

Cost Impact: The proposal will not increase the cost of construction.

Analysis: New wording in Section 1708.4 "For complex components, testing or experience may be the only practical way to ensure that the equipment will be operable following a design earthquake" should be rewritten as a mandatory requirement. A review of the standard(s) proposed for inclusion in the code, ASHRAE 171-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CARLSON-S1-1702

S116-09/10
1704, 1705, 1706, 1707, 1708, 1709, 1710

Proponent: D. Kirk Harman, The Harman Group representing The National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

Revise as follows:

1703.6.1 Follow-up inspection. The applicant shall provide for *special inspections* of fabricated items in accordance with Section ~~1704.2~~ 1704.2.3.

SECTION 1704
SPECIAL INSPECTIONS, CONTRACTOR RESPONSIBILITY AND STRUCTURAL OBSERVATIONS

1704.1 General. This section provides minimum requirements for special inspections, contractor responsibility and structural observations.

~~**1704.1 General.**~~ **1704.2 Special inspections.** Where application is made for construction as described in this section, the owner or the *registered design professional in responsible charge* acting as the owner's agent shall employ one or more *approved agencies* to perform inspections during construction on the types of work listed under Section ~~1704~~ 1705. These inspections are in addition to the inspections identified in Section 110. ~~The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the *building official*, for the inspection of the particular type of construction or operation requiring *special inspection*. The *registered design professional in responsible charge* and engineers of record involved in the design of the project are permitted to act as the *approved agency* and their personnel are permitted to act as the special inspector for the work designed by them, provided those personnel meet the qualification requirements of this section to the satisfaction of the *building official*. The special inspector shall provide written documentation to the building official demonstrating their competence and relevant experience or training. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of *special inspection* activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.~~

Exceptions:

1. *Special inspections* are not required for work of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.
2. *Special inspections* are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.
3. Unless otherwise required by the *building official*, *special inspections* are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

1704.2.1 Special inspector qualifications. The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the *building official*, for the inspection of the particular type of construction or operation requiring *special inspection*. The *registered design professional in responsible charge* and engineers of record involved in the design of the project are permitted to act as the *approved agency* and their personnel are permitted to act as the special inspector for the work designed by them, provided those personnel meet the qualification requirements of this section to the satisfaction of the *building official*. The special inspector shall provide written documentation to the building official demonstrating their competence and relevant experience or training. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of *special inspection* activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

~~**1704.1.1**~~ **1704.2.2 Statement of special inspections.** The applicant shall submit a statement of *special inspections* prepared by the *registered design professional in responsible charge* in accordance with Section 107.1 as a condition for issuance. This statement shall be in accordance with Section ~~1705~~ 1704.3.

Exceptions:

1. A statement of *special inspections* is not required for structures designed and constructed in accordance with the conventional construction provisions of Section 2308.
2. The statement of *special inspections* is permitted to be prepared by a qualified person *approved* by the *building official* for construction not designed by a *registered design professional*.

~~**1704.1.2**~~ **1704.2.3 Report requirement.** Special inspectors shall keep records of inspections. The special inspector shall furnish inspection reports to the *building official*, and to the *registered design professional in responsible charge*. Reports shall indicate that work inspected was or was not completed in conformance to *approved construction documents*. Discrepancies shall be brought to the immediate attention of the contractor for correction. If they are not corrected, the discrepancies shall be brought to the attention of the *building official* and to the *registered design professional in responsible charge* prior to the completion of that phase of the work. A final report documenting required *special inspections* and correction of any discrepancies noted in the inspections shall be submitted at a point in time agreed upon prior to the start of work by the applicant and the *building official*.

~~**1704.2**~~ **1704.2.4 Inspection of fabricators.** Where fabrication of structural load-bearing members and assemblies is being performed on the premises of a fabricator's shop, *special inspection* of the fabricated items shall be required by this section and as required elsewhere in this code.

~~**1704.2.1**~~ **1704.2.4.1 Fabrication and implementation procedures.** The special inspector shall verify that the fabricator maintains detailed fabrication and quality control procedures that provide a basis for inspection control of the workmanship and the fabricator's ability to conform to *approved construction documents* and referenced standards. The special inspector shall review the procedures for completeness and adequacy relative to the code requirements for the fabricator's scope of work.

Exception: *Special inspections* as required by Section ~~1704.2~~ 1704.2.4 shall not be required where the fabricator is *approved* in accordance with Section ~~1704.2.2~~ 1704.2.4.2.

~~**1704.2.2**~~ **1704.2.4.2 Fabricator approval.** *Special inspections* required by Section ~~1704~~ 1705 are not required where the work is done on the premises of a fabricator registered and *approved* to perform such work without *special inspection*. Approval shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an *approved special inspection* agency. At completion of fabrication, the *approved* fabricator shall submit a *certificate of compliance* to the *building official* stating that the work was performed in accordance with the *approved construction documents*.

~~SECTION 1705~~
~~STATEMENT OF SPECIAL INSPECTIONS~~

~~**1705.1 General.**~~ **1704.3 Statement of Special Inspections.** Where *special inspection* or testing is required by Section 1704, ~~1707~~ 1705.11 or ~~1708~~ 1705.12, the *registered design professional in responsible charge* shall prepare a statement of special inspections in accordance with Section ~~1705~~ 1704.3 for submittal by the applicant (see Section ~~1704.1.1~~ 1704.2.1).

~~**1705.2**~~ **1704.3.1Content of statement of special inspections.** The statement of special inspections shall identify the following:

1. The materials, systems, components and work required to have *special inspection* or testing by the *building official* or by the *registered design professional* responsible for each portion of the work.
2. The type and extent of each *special inspection*.
3. The type and extent of each test. .
4. Additional requirements for *special inspection* or testing for seismic or wind resistance as specified in Section ~~1705.3~~ 1704.3.2, ~~1705.4~~ 1704.3.3, ~~1707~~ 1705.11or ~~1708~~1705.12.4.
5. For each type of *special inspection*, identification as to whether it will be continuous *special inspection* or periodic *special inspection*.

~~**1705.3**~~ **1704.3.2 Seismic resistance.** The statement of special inspections shall include seismic requirements for cases covered in Sections ~~1705.3.1~~ 1704.3.2.1 through ~~1705.3.5~~ 1704.3.2.5.

Exception: Seismic requirements are permitted to be excluded from the statement of special inspections for structures designed and constructed in accordance with the following:

1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, S_{DS}, as determined in Section 1613.5.4, does not exceed 0.5g; and the height of the structure does not exceed 35 feet (10 668 mm) above *grade plane*; or
2. The structure is constructed using a reinforced masonry structural system or reinforced concrete structural system; the design spectral response acceleration at short periods, S_{DS}, as determined in Section 1613.5.4, does not exceed 0.5g, and the height of the structure does not exceed 25 feet (7620 mm) above *grade plane*; or
3. Detached one- or two-family dwellings not exceeding two *stories above grade plane*, provided the structure does not have any of the following plan or vertical irregularities in accordance with Section 12.3.2 of ASCE 7:
   3.1. Torsional irregularity.
   3.2. Nonparallel systems.
   3.3. Stiffness irregularity—extreme soft story and soft story.
   3.4. Discontinuity in capacity—weak story.

~~**1705.3.1**~~ **1704.3.2.1 Seismic-force-resisting systems.** The seismic force- resisting systems in structures assigned to *Seismic Design Category* C, D, E or F, in accordance with Section 1613.

Exception: Requirements for the seismic-force-resisting system are permitted to be excluded from the statement of special inspections for steel systems in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

~~**1705.3.2**~~ **1704.3.2.2 Designated seismic systems.** Designated seismic systems in structures assigned to *Seismic Design Category* D, E or F.

~~**1705.3.3**~~ **1704.3.2.3 Seismic Design Category C.** The following additional systems and components in structures assigned to *Seismic Design Category* C:

1. Heating, ventilating and air-conditioning (HVAC) ductwork containing hazardous materials and anchorage of such ductwork.
2. Piping systems and mechanical units containing flammable, combustible or highly *toxic* materials.
3. Anchorage of electrical equipment used for emergency or standby power systems.

~~**1705.3.4**~~ **1704.3.2.4 Seismic Design Category D.** The following additional systems and components in structures assigned to *Seismic Design Category* D:

1. Systems required for *Seismic Design Category* C.
2. Exterior wall panels and their anchorage.
3. Suspended ceiling systems and their anchorage.
4. Access floors and their anchorage.
5. Steel storage racks and their anchorage, where the importance factor is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.

~~**1705.3.5**~~ **1704.3.2.5 Seismic Design Category E or F.** The following additional systems and components in structures assigned to *Seismic Design Category* E or F:

1. Systems required for *Seismic Design Categories* C and D.
2. Electrical equipment.

~~**1705.3.6**~~ **1704.3.2.6 Seismic requirements in the statement of special inspections.** When Sections ~~1705.3~~ 1704.3.2 through ~~1705.3.5~~ 1704.3.2.5 specify that seismic requirements be included, the statement of special inspections shall identify the following:

1. The designated seismic systems and seismic force- resisting systems that are subject to *special inspections* in accordance with Sections ~~1705.3~~ 1704.3.2 through ~~1705.3.5~~ 1704.3.2.5.
2. The additional *special inspections* and testing to be provided as required by Sections ~~1707~~ 1705.11 and ~~1708~~ 1705.12 and other applicable sections of this code, including the applicable standards referenced by this code.

~~1705.4~~ **1704.3.3 Wind resistance.** The statement of special inspections shall include wind requirements for structures constructed in the following areas:

1. In wind Exposure Category B, where the 3-second-gust basic wind speed is 120 miles per hour (mph) (52.8m/s) or greater.
2. In wind Exposure Category C or D, where the 3-secondgust basic wind speed is 110 mph (49 m/s) or greater.

~~1705.4.1~~ **1704.3.3.1 Wind requirements in the statement of special inspections.** When Section ~~1705.4~~ 1704.3.3 specifies that wind requirements be included, the statement of special inspections shall identify the main wind-force-resisting systems and wind-resisting components subject to *special inspections* as specified in Section ~~1705.4.2~~ 1704.3.3.2.

~~1705.4.2~~ **1704.3.3.2 Detailed requirements.** The statement of special inspections shall include at least the following systems and components:

1. Roof cladding and roof framing connections.
2. Wall connections to roof and floor diaphragms and framing.
3. Roof and floor diaphragm systems, including collectors, drag struts and boundary elements.
4. Vertical wind-force-resisting systems, including braced frames, moment frames and shear walls.
5. Wind-force-resisting system connections to the foundation.
6. Fabrication and installation of systems or components required to meet the impact-resistance requirements of Section 1609.1.2.

   Exception: Fabrication of manufactured systems or components that have a *label* indicating compliance with the wind-load and impact-resistance requirements of this code.

~~**SECTION 1709**~~
~~**CONTRACTOR RESPONSIBILITY**~~

~~1709.1~~ **1704.4 Contractor responsibility.** Each contractor responsible for the construction of a main wind- or seismic-force-resisting system, designated seismic system or a wind- or seismic-resisting component listed in the statement of special inspections shall submit a written statement of responsibility to the *building official* and the owner prior to the commencement of work on the system or component. The contractor's statement of responsibility shall contain acknowledgement of awareness of the special requirements contained in the statement of *special inspection*.

~~**SECTION 1710**~~
~~**STRUCTURAL OBSERVATIONS**~~

~~**1710.1 General.**~~ **1704.5 Structural observations.** Where required by the provisions of Section ~~1710.2~~ 1704.5.1 or ~~1710.3~~ 1704.5.2, the owner shall employ a *registered design professional* to perform structural observations as defined in Section 1702.

Prior to the commencement of observations, the structural observer shall submit to the *building official* a written statement identifying the frequency and extent of structural observations. At the conclusion of the work included in the permit, the structural observer shall submit to the *building official* a written statement that the site visits have been made and identify any reported deficiencies which, to the best of the structural observer's knowledge, have not been resolved.

~~1710.2~~ **1704.5.1 Structural observations for seismic resistance.** Structural observations shall be provided for those structures assigned to *Seismic Design Category* D, E or F, as determined in Section 1613, where one or more of the following conditions exist:

1. The structure is classified as *Occupancy Category* III or IV in accordance with Table 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base.
3. The structure is assigned to *Seismic Design Category* E, is classified as *Occupancy Category* I or II in accordance with Table 1604.5, and is greater than two *stories above grade plane*.
4. When so designated by the *registered design professional* responsible for the structural design.
5. When such observation is specifically required by the *building official*.

~~1710.3~~ **1704.5.2 Structural observations for wind requirements.** Structural observations shall be provided for those structures sited where the basic wind speed exceeds 110 mph (49 m/sec) determined from Figure 1609, where one or more of the following conditions exist:

1. The structure is classified as *Occupancy Category* III or IV in accordance with Table 1604.5.
2. The *building height* of the structure is greater than 75 feet (22 860 mm).
3. When so designated by the *registered design professional* responsible for the structural design.
4. When such observation is specifically required by the *building official*.

SECTION 1705
REQUIRED VERIFICATION AND INSPECTION

1705.1 General. Verification and inspection of elements of buildings and structures shall be as required by this section.

~~1704.15~~ **1705.1.1 Special cases.** *Special inspections* shall be required for proposed work that is, in the opinion of the *building official*, unusual in its nature, such as, but not limited to, the following examples:

1. Construction materials and systems that are alternatives to materials and systems prescribed by this code.
2. Unusual design applications of materials described in this code.
3. Materials and systems required to be installed in accordance with additional manufacturer's instructions that prescribe requirements not contained in this code or in standards referenced by this code.

~~1704.3~~ **1705.2 Steel construction.** The *special inspections* for steel elements of buildings and structures shall be as required by Section ~~1704.3~~ 1705.2 and Table ~~1704.3~~ 1705.2.

Exceptions:

1. *Special inspection* of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, grade and mill test reports for the main stress-carrying elements are capable of being determined.
2. The special inspector need not be continuously present during welding of the following items, provided the materials, welding procedures and qualifications of welders are verified prior to the start of the work; periodic inspections are made of the work in progress and a visual inspection of all welds is made prior to completion or prior to shipment of shop welding.
   - 2.1. Single-pass fillet welds not exceeding 5/16 inch (7.9 mm) in size.
   - 2.2. Floor and roof deck welding.
   - 2.3. Welded studs when used for structural diaphragm.
   - 2.4. Welded sheet steel for cold-formed steel members.
   - 2.5. Welding of stairs and railing systems.

~~1704.3.1~~ **1705.2.1 Welding.** Welding inspection and welding inspector qualification shall be in accordance with this section.

~~1704.3.1.1~~ **1705.2.1.1 Structural steel.** Welding inspection and welding inspector qualification for structural steel shall be in accordance with AWS D1.1.

~~1704.3.1.2~~ **1705.2.1.2 Cold-formed steel.** Welding inspection and welding inspector qualification for cold-formed steel floor and roof decks shall be in accordance with AWS D1.3.

~~1704.3.1.3~~ **1705.2.1.3 Reinforcing steel.** Welding inspection and welding inspector qualification for reinforcing steel shall be in accordance with AWS D1.4 and ACI 318.

~~1704.3.2~~ **1705.2.2 Details.** The special inspector shall perform an inspection of the steel frame to verify compliance with the details shown on the *approved construction documents*, such as bracing, stiffening, member locations and proper application of joint details at each connection.

~~1704.3.3~~ **1705.2.3 High-strength bolts.** Installation of high-strength bolts shall be inspected in accordance with AISC 360.

~~1704.3.3.1~~ **1705.2.3.1General.** While the work is in progress, the special inspector shall determine that the requirements for bolts, nuts, washers and paint; bolted parts and installation and tightening in such standards are met. For bolts requiring pretensioning, the special inspector shall observe the preinstallation testing and calibration procedures when such procedures are required by the installation method or by project plans or specifications; determine that all plies of connected materials have been drawn together and properly snugged and monitor the installation of bolts to verify that the selected procedure for installation is properly used to tighten bolts. For joints required to be tightened only to the snug-tight condition, the special inspector need only verify that the connected materials have been drawn together and properly snugged.

~~1704.3.3.2~~ **1705.2.3.2 Periodic monitoring.** Monitoring of bolt installation for pretensioning is permitted to be performed on a periodic basis when using the turn-of-nut method with matchmarking techniques, the direct tension indicator method or the alternate design fastener (twist-off bolt) method. Joints designated as snug tight need be inspected only on a periodic basis.

~~1704.3.3.3~~ **1705.2.3.3 Continuous monitoring.** Monitoring of bolt installation for pretensioning using the calibrated wrench method or the turn-of-nut method without matchmarking shall be performed on a continuous basis.

~~1704.3.4~~ **1705.2.4 Cold-formed steel trusses spanning 60 feet or greater.** Where a cold-formed steel truss clear span is 60 feet (18 288 mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

(Portions of table not shown do not change)

a. Where applicable, see also Section ~~1707.1~~ 1705.11, Special inspection for seismic resistance.

~~1704.4~~ 1705.3 Concrete construction. The *special inspections* and verifications for concrete construction shall be as required by this section and Table ~~1704.4~~ 1705.3.

Exception: *Special inspections* shall not be required for:

1. Isolated spread concrete footings of buildings three stories or less above *grade plane* that are fully supported on earth or rock.
2. Continuous concrete footings supporting walls of buildings three stories or less above *grade plane* that are fully supported on earth or rock where:
   2.1. The footings support walls of light-frame construction;
   2.2. The footings are designed in accordance with Table 1809.7; or
   2.3. The structural design of the footing is based on a specified compressive strength, f'_c, no greater than 2,500 pounds per square inch (psi) (17.2 Mpa), regardless of the compressive strength specified in the *construction documents* or used in the footing construction.
3. Nonstructural concrete slabs supported directly on the ground, including prestressed slabs on grade, where the effective prestress in the concrete is less than 150 psi (1.03 Mpa).
4. Concrete foundation walls constructed in accordance with Table 1807.1.6.2.
5. Concrete patios, driveways and sidewalks, on grade.

~~1704.4.1~~ 1705.3.1 Materials. In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in Chapter 3 of ACI 318, the building official shall require testing of materials in accordance with the appropriate standards and criteria for the material in Chapter 3 of ACI 318. Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the requirements of Section 3.5.2 of ACI 318.

TABLE ~~1704.4~~ 1705.3
REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION
(No Change to Table)

a. Where applicable, see also Section ~~1707.1~~ 1705.11, Special inspection for seismic resistance.

~~1704.5~~ 1705.4 Masonry construction. Masonry construction shall be inspected and verified in accordance with the requirements of Sections ~~1704.5.1~~ 1705.4.1 through ~~1704.5.2~~ 1705.4.2, depending on the *occupancy category* of the building or structure.

Exception: *Special inspections* shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 7 or 6 of TMS 402/ACI 530/ASCE 5, respectively, when they are part of structures classified as *Occupancy Category* I, II or III in accordance with Section 1604.5.
2. Masonry foundation walls constructed in accordance with Table 1807.1.6.3(1), 1807.1.6.3(2),1807.1.6.3(3) or 1807.1.6.3(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.

~~1704.5.1~~ **1705.4.1 Empirically designed masonry, glass unit masonry and masonry veneer in Occupancy Category IV.** The minimum *special inspection* program for empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 7 or 6 of TMS 402/ACI ASCE 5, respectively, in structures classified as *Occupancy Category* IV, in accordance with Section 1604.5, shall comply with Table ~~1704.5.1~~ 1705.4.1.

~~1704.5.2~~ **1705.4.2 Engineered masonry in Occupancy Category I, II or III.** The minimum *special inspection* program for masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of TMS402/ACI 530/ASCE 5 in structures classified as *Occupancy Category* I, II or III, in accordance with Section 1604.5, shall comply with Table ~~1704.5.1~~ 1705.4.1.

~~1704.5.3~~ **1705.4.3 Engineered masonry in Occupancy Category IV.** The minimum *special inspection* program for masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of TMS402/ACI 530/ASCE 5 in structures classified as *Occupancy Category* IV, in accordance with Section 1604.5, shall comply with Table ~~1704.5.3~~ 1705.4.3.

~~1704.11~~ **1705.4.4 Vertical masonry foundation elements.** *Special inspection* shall be performed in accordance with Section ~~1704.5~~ 1705.4 for vertical masonry foundation elements.

TABLE ~~1704.5.1~~ 1705.4.1
LEVEL 1 REQUIRED VERIFICATION AND INSPECTION OF MASONRY CONSTRUCTION
(No Change to Table)

TABLE ~~1704.5.3~~ 1705.4.3
LEVEL 2 REQUIRED VERIFICATION AND INSPECTION OF MASONRY CONSTRUCTION
(No Change to Table)

~~1704.6~~ **1705.5 Wood construction.** *Special inspections* of the fabrication process of prefabricated wood structural elements and assemblies shall be in accordance with Section ~~1704.2~~ 1704.2.3. *Special inspections* of site-built assemblies shall be in accordance with this section.

~~1704.6.1~~ **1705.5.1 High-load diaphragms.** High-load diaphragms designed in accordance with Table 2306.2.1(2) shall be installed with *special inspections* as indicated in Section ~~1704.1~~ 1704.2. The special inspector shall inspect the wood structural panel sheathing to ascertain whether it is of the grade and thickness shown on the *approved* building plans. Additionally, the special inspector must verify the nominal size of framing members at adjoining panel edges, the nail or staple diameter and length, the number of fastener lines and that the spacing between fasteners in each line and at edge margins agrees with the *approved* building plans.

~~1704.6.2~~ **1705.5.2 Metal-plate-connected wood trusses spanning 60 feet or greater.** Where a truss clear span is 60 feet (18 288 mm)or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

~~1704.7~~ **1705.6 Soils.** *Special inspections* for existing site soil conditions, fill placement and load-bearing requirements shall be as required by this section and Table ~~1704.7~~ 1705.6. The *approved* geotechnical report, and the *construction documents* prepared by the *registered design professionals* shall be used to determine compliance. During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the *approved* geotechnical report.

> **Exception:** Where Section 1803 does not require reporting of materials and procedures for fill placement, the special inspector shall verify that the in-place dry density of the compacted fill is not less than 90 percent of the maximum dry density at optimum moisture content determined in accordance with ASTM D 1557.

~~1704.8~~ **1705.7 Driven deep foundations.** *Special inspections* shall be performed during installation and testing of driven deep foundation elements as required by Table ~~1704.8~~ 1705.7. The *approved* geotechnical report, and the *construction documents* prepared by the *registered design professionals*, shall be used to determine compliance.

~~1704.9~~ **1705.8 Cast-in-place deep foundations.** *Special inspections* shall be performed during installation and testing of cast-in-place deep foundation elements as required by Table ~~1704.9~~ 1705.8. The *approved* geotechnical report, and the *construction documents* prepared by the *registered design professionals*, shall be used to determine compliance.

~~1704.10~~ **1705.9 Helical pile foundations.** *Special inspections* shall be performed continuously during installation of helical pile foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque and other pertinent installation data as required by the *registered design professional in responsible charge*. The *approved* geotechnical report and the documents prepared by the *registered design professional* shall be used to determine compliance.

(Portions of table not shown are unchanged)

~~SECTION 1706~~
~~SPECIAL INSPECTIONS FOR WIND REQUIREMENTS~~

~~1706.1~~ **1705.10 Special inspections for wind ~~requirements~~ resistance.** *Special inspections* itemized in Sections ~~1706.2~~ 1705.10.1 through ~~1706.4~~ 1705.10.3, unless exempted by the exceptions to Section ~~1704.1~~ 1704.2, are required for buildings and structures constructed in the following areas:

1. In wind Exposure Category B, where the 3-second-gust basic wind speed is 120 miles per hour (52.8 m/sec) or greater.
2. In wind Exposure Categories C or D, where the 3-second- gust basic wind speed is 110 mph (49 m/sec) or greater.

~~1706.2~~ **1705.10.1 Structural wood.** Continuous special inspection is required during field gluing operations of elements of the main wind-force-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces and hold-downs.

Exception: *Special inspection* is not required for wood shearwalls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the main wind-force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center.

~~1706.3~~ **1705.10.2 Cold-formed steel light-frame construction.** Periodic special inspection is required during welding operations of elements of the main wind-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

Exception: *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

~~1706.4~~ 1705.10.3 **Wind-resisting components.** Periodic special inspection is required for the following systems and components:

1. Roof cladding.
2. Wall cladding.

~~**SECTION 1707**~~
~~**SPECIAL INSPECTIONS FOR SEISMIC RESISTANCE**~~

~~**1707.1**~~ **1705.11 Special inspections for seismic resistance.** *Special inspections* itemized in Sections ~~1707.2~~ 1705.11.1 through ~~1707.9~~ 1705.11.8, unless exempted by the exceptions of Section ~~1704.1~~ 1704.2, ~~1705.3~~ 1704.3.2, or ~~1705.3.1~~ 1704.3.2.1, are required for the following:

1. The seismic-force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F, as determined in Section 1613.
2. Designated seismic systems in structures assigned to *Seismic Design Category* D, E or F.
3. Architectural, mechanical and electrical components in structures assigned to *Seismic Design Category* C, D, E or F that are required in Sections ~~1707.6~~ 1705.11.5 and ~~1707.7~~ 1705.11.6.

~~**1707.2**~~ **1705.11.1 Structural steel.** *Special inspection* for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341.

Exceptions:

1. *Special inspections* of structural steel in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.
2. For ordinary moment frames, ultrasonic and magnetic particle testing of complete joint penetration groove welds are only required for demand critical welds.

~~**1707.3**~~ **1705.11.2 Structural wood.** Continuous special inspection is required during field gluing operations of elements of the seismic- force-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the seismic-force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, shear panels and hold-downs.

Exception: *Special inspection* is not required for wood shearwalls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the seismic-force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

~~**1707.4**~~ **1705.11.3 Cold-formed steel light-frame construction.** Periodic special inspection is required during welding operations of elements of the seismic-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the seismic-force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

Exception: *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) o.c.

~~**1707.5**~~ **1705.11.4 Storage racks and access floors.** Periodic *special inspection* is required during the anchorage of access floors and storage racks 8 feet (2438 mm) or greater in height in structures assigned to *Seismic Design Category* D, E or F.

~~1707.6~~ **1705.11.5 Architectural components.** Periodic *special inspection* during the erection and fastening of exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer in structures assigned to *Seismic Design Category* D, E or F.

Exceptions:

1. *Special inspection* is not required for exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer 30 feet (9144 mm) or less in height above grade or walking surface.
2. *Special inspection* is not required for exterior cladding and interior and exterior veneer weighing 5 psf (24.5 N/m^2) or less.
3. *Special inspection* is not required for interior nonbearing walls weighing 15 psf (73.5 N/m^2) or less.

~~1707.7~~ **1705.11.6 Mechanical and electrical components.** *Special inspection* for mechanical and electrical equipment shall be as follows:

1. Periodic special inspection is required during the anchorage of electrical equipment for emergency or standby power systems in structures assigned to *Seismic Design Category* C, D, E or F;
2. Periodic special inspection is required during the installation of anchorage of other electrical equipment in structures assigned to *Seismic Design Category* E or F;
3. Periodic special inspection is required during installation of piping systems intended to carry flammable, combustible or *highly toxic* contents and their associated mechanical units in structures assigned to *Seismic Design Category* C, D, E or F;
4. Periodic special inspection is required during the installation of HVAC ductwork that will contain hazardous materials in structures assigned to *Seismic Design Category* C, D, E or F; and
5. Periodic special inspection is required during the installation of vibration isolation systems in structures assigned to *Seismic Design Category* C, D, E or F where the *construction documents* require a nominal clearance of 1/4 inch (6.4 mm) or less between the equipment support frame and restraint.

~~1707.8~~ **1705.11.7 Designated seismic system verifications.** The special inspector shall examine designated seismic systems requiring seismic qualification in accordance with Section ~~1708.5~~ 1705.12.4 and verify that the *label*, anchorage or mounting conforms to the *certificate of compliance*.

~~1707.9~~ **1705.11.8 Seismic isolation system.** Periodic special inspection is required during the fabrication and installation of isolator units and energy dissipation devices that are part of the seismic isolation system.

~~**SECTION 1708**~~
~~**STRUCTURAL TESTING FOR SEISMIC RESISTANCE**~~

~~1708.1~~ **1705.12 Testing and qualification for seismic resistance.** The testing and qualification specified in Sections ~~1708.2~~ 1705.12.1 through ~~1708.5~~ 1705.12.4, unless exempted from *special inspections* by the exceptions of Section ~~1704.1~~ 1704.2, ~~1705.3~~ 1704.3.2, or ~~1705.3.1~~ 1704.3.2.1 are required as follows:

1. The seismic-force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F, as determined in Section 1613 shall meet the requirements of Sections ~~1708.2~~ 1705.12.1 and ~~1708.~~3 1705.12.2, as applicable.
2. Designated seismic systems in structures assigned to *Seismic Design Category* C, D, E or F subject to the special certification requirements of ASCE 7 Section 13.2.2 are required to be tested in accordance with Section ~~1708.4~~ 1705.12.3.
3. Architectural, mechanical and electrical components in structures assigned to *Seismic Design Category* C, D, E or F with an *Ip* = 1.0 are required to be tested in accordance with Section ~~1708.4~~ 1705.12.3 where the general design requirements of ASCE 7 Section 13.2.1, Item 2 for manufacturer's certification are satisfied by testing.
4. The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section ~~1708.5~~ 1705.12.4.

~~1708.2~~ **1705.12.1 Concrete reinforcement.** Where reinforcement complying with ASTM A 615 is used to resist earthquake-induced flexural and axial forces in special moment frames, special structural walls and coupling beams connecting special structural walls, in structures assigned to *Seismic Design Category* B, C, D, E or F as determined in Section 1613, the reinforcement shall comply with Section 21.1.5.2 of ACI 318. Certified mill test reports shall be provided for each shipment of such reinforcement. Where reinforcement complying with ASTM A 615 is to be welded, chemical tests shall be performed to determine weldability in accordance with Section 3.5.2 of ACI 318.

~~1708.3~~ **1705.12.2 Structural steel.** Testing for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341.

Exceptions:

1. Testing for structural steel in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.
2. For ordinary moment frames, ultrasonic and magnetic particle testing of complete joint penetration groove welds are only required for demand critical welds.

~~1708.4~~ **1705.12.3 Seismic certification of nonstructural components.** The *registered design professional* shall state the applicable seismic certification requirements for nonstructural components and designated seismic systems on the *construction documents*.

1. The manufacturer of each designated seismic system component subject to the provisions of ASCE 7 Section 13.2.2 shall test or analyze the component and its mounting system or anchorage and submit a *certificate of compliance* for review and acceptance by the *registered design professional* responsible for the design of the designated seismic system and for approval by the *building official*. Certification shall be based on an actual test on a shake table, by three-dimensional shock tests, by an analytical method using dynamic characteristics and forces, by the use of experience data (i.e., historical data demonstrating acceptable seismic performance) or by more rigorous analysis providing for equivalent safety.
2. Manufacturer's certification of compliance for the general design requirements of ASCE 7 Section 13.2.1 shall be based on analysis, testing or experience data.

~~1708.5~~ **1705.12.4 Seismically isolated structures.** For required system tests, see Section 17.8 of ASCE 7.

~~1704.12~~ **1705.13 Sprayed fire-resistant materials.** *Special inspections* for sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be in accordance with Sections ~~1704.12.1~~ 1705.13.1 through ~~1704.12.6~~ 1705.13.6. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* shall be performed after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, where applicable.

~~1704.12.1~~ **1705.13.1 Physical and visual tests.** The *special inspections* shall include the following tests and observations to demonstrate compliance with the listing and the fire-resistance rating:

1. Condition of substrates.
2. Thickness of application.
3. Density in pounds per cubic foot (kg/m3).
4. Bond strength adhesion/cohesion.
5. Condition of finished application.

~~1704.12.2~~ **1705.13.2 Structural member surface conditions.** The surfaces shall be prepared in accordance with the *approved* fire-resistance design and the written instructions of *approved* manufacturers. The prepared surface of structural members to be sprayed shall be inspected before the application of the sprayed fire-resistant material.

~~1704.12.3~~ **1705.13.3 Application.** The substrate shall have a minimum ambient temperature before and after application as specified in the written instructions of *approved* manufacturers. The area for application shall be ventilated during and after application as required by the written instructions of *approved* manufacturers.

~~1704.12.4~~ **1705.13.4 Thickness.** No more than 10 percent of the thickness measurements of the sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be less than the thickness required by the *approved* fire-resistance design, but in no case less than the minimum allowable thickness required by Section ~~1704.12.4.1~~ 1705.13.4.1.

~~1704.12.4.1~~ **1705.13.4.1 Minimum allowable thickness.** For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus 1/4 inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent.

Thickness shall be determined in accordance with ASTM E 605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections ~~1704.12.4.2~~ 1705.13.4.2 and ~~1704.12.4.3~~ 1705.13.4.5.

~~**704.12.4.2**~~ **1705.13.4.2 Floor, roof and wall assemblies.** The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E 605, making not less than four measurements for each 1,000 square feet (93 m2) of the sprayed area in each *story* or portion thereof.

~~**1704.12.4.2.1**~~ **1705.13.4.3 Cellular decks.** Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. A minimum of four measurements shall be made, located symmetrically within the square area.

~~**1704.12.4.2.2**~~ **1705.13.4.4 Fluted decks.** Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. A minimum of four measurements shall be made, located symmetrically within the square area, including one each of the following: valley, crest and sides. The average of the measurements shall be reported.

~~**1704.12.4.3**~~ **1705.13.4.5 Structural members.** The thickness of the sprayed fire-resistant material applied to structural members shall be determined in accordance with ASTM E 605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

~~**1704.12.4.3.1**~~ **1705.13.4.6 Beams and girders.** At beams and girders thickness measurements shall be made at nine locations around the beam or girder at each end of a 12-inch (305 mm) length.

~~**1704.12.4.3.2**~~ **1705.13.4.7 Joists and trusses.** At joists and trusses, thickness measurements shall be made at seven locations around the joist or truss at each end of a 12-inch (305 mm) length.

~~**1704.12.4.3.3**~~ **1705.13.4.8 Wide-flanged columns.** At wide-flanged columns, thickness measurements shall be made at 12 locations around the column at each end of a 12-inch (305 mm) length.

~~**1704.12.4.3.4**~~ **1705.13.4.9 Hollow structural section and pipe columns.** At hollow structural section and pipe columns, thickness measurements shall be made at a minimum of four locations around the column at each end of a 12-inch (305 mm) length.

~~**1704.12.5**~~ **1705.13.5 Density.** The density of the sprayed fire-resistant material shall not be less than the density specified in the *approved* fire-resistance design. Density of the sprayed fire-resistant material shall be determined in accordance with ASTM E 605. The test samples for determining the density of the sprayed fire-resistant materials shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet ($232 m^2$) or portion thereof of the sprayed area in each *story*.
2. From beams, girders, trusses and columns at the rate of not less than one sample for each type of structural member for each 2,500 square feet ($232 m^2$) of floor area or portion thereof in each *story*.

~~**1704.12.6**~~ **1705.13.6 Bond strength.** The cohesive/adhesive bond strength of the cured sprayed fire-resistant material applied to floor, roof and wall assemblies and structural members shall not be less than 150 pounds per square foot (psf) ($7.18 kN/m^2$). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E 736 by testing in-place samples of the sprayed fire-resistant material selected in accordance with Sections ~~1704.12.6.1~~ 1705.13.6.1 through ~~1704.12.6.3~~ 1705.13.6.3.

~~**1704.12.6.1**~~ **1705.13.6.1 Floor, roof and wall assemblies.** The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet ($232 m^2$) of the sprayed area in each *story* or portion thereof.

~~**1704.12.6.2**~~ **1705.13.6.2 Structural members.** The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from beams, girders, trusses, columns and other structural members at the rate of not less than one sample for each type of structural member for each 2,500 square feet ($232 m^2$) of floor area or portion thereof in each *story*.

~~**1704.12.6.3**~~ **1705.13.6.3 Primer, paint and encapsulant bond tests.** Bond tests to qualify a primer, paint or encapsulant shall be conducted when the sprayed fire-resistant material is applied to a primed, painted or

encapsulated surface for which acceptable bond-strength performance between these coatings and the fire-resistant material has not been determined. A bonding agent *approved* by the SFRM manufacturer shall be applied to a primed, painted or encapsulated surface where the bond strengths are found to be less than required values.

~~1704.13~~ 1705.14 Mastic and intumescent fire-resistant coatings. *Special inspections* for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be in accordance with AWCI 12-B. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*.

~~1704.14~~ 1705.15 Exterior insulation and finish systems (EIFS). *Special inspections* shall be required for all EIFS applications.

Exceptions:

1. *Special inspections* shall not be required for EIFS applications installed over a *water-resistive barrier* with a means of draining moisture to the exterior.
2. *Special inspections* shall not be required for EIFS applications installed over masonry or concrete walls.

~~1704.14.1~~ 1705.15.1 Water-resistive barrier coating. A *water-resistive barrier* coating complying with ASTM E 2570 requires *special inspection* of the *water-resistive barrier* coating when installed over a sheathing substrate.

[F] ~~1704.16~~ 1705.16 Special inspection for smoke control. Smoke control systems shall be tested by a special inspector.

[F] ~~1704.16.1~~ 1705.16.1 Testing scope. The test scope shall be as follows:

1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.
2. Prior to occupancy and after sufficient completion for the purposes of pressure difference testing, flow measurements and detection and control verification.

[F] ~~1704.16.2~~ 1705.16.2 Qualifications. *Special inspection* agencies for smoke control shall have expertise in fire protection engineering, mechanical engineering and certification as air balancers.

SECTION ~~1711~~ 1706
DESIGN STRENGTHS OF MATERIALS

~~1711.1~~ 1706.1 Conformance to standards. The design strengths and permissible stresses of any structural material that are identified by a manufacturer's designation as to manufacture and grade by mill tests, or the strength and stress grade is otherwise confirmed to the satisfaction of the *building official*, shall conform to the specifications and methods of design of accepted engineering practice or the *approved* rules in the absence of applicable standards.

~~1711.2~~ 1706.2 New materials. For materials that are not specifically provided for in this code, the design strengths and permissible stresses shall be established by tests as provided for in Section ~~1712~~ 1707.

SECTION ~~1712~~ 1707
ALTERNATIVE TEST PROCEDURE

~~1712.1~~ 1707.1 General. In the absence of *approved* rules or other *approved* standards, the *building official* shall make, or cause to be made, the necessary tests and investigations; or the *building official* shall accept duly authenticated reports from *approved agencies* in respect to the quality and manner of use of new materials or assemblies as provided for in Section 104.11. The cost of all tests and other investigations required under the provisions of this code shall be borne by the applicant.

SECTION ~~1713~~ 1708
TEST SAFE LOAD

~~1713.1~~ 1708.1 Where required. Where proposed construction is not capable of being designed by *approved* engineering analysis, or where proposed construction design method does not comply with the applicable material design standard, the system of construction or the structural unit and the connections shall be subjected to the tests prescribed in Section ~~1715~~ 1710. The *building official* shall accept certified reports of such tests conducted by an *approved* testing agency, provided that such tests meet the requirements of this code and *approved* procedures.

SECTION ~~1714~~ 1709
IN-SITU LOAD TESTS

~~1714.1~~ 1709.1 General. Whenever there is a reasonable doubt as to the stability or load-bearing capacity of a completed building, structure or portion thereof for the expected loads, an engineering assessment shall be required. The engineering assessment shall involve either a structural analysis or an in-situ load test, or both. The structural analysis shall be based on actual material properties and other as-built conditions that affect stability or load-bearing capacity, and shall be conducted in accordance with the applicable design standard. If the structural assessment determines that the load-bearing capacity is less than that required by the code, load tests shall be conducted in accordance with Section ~~1714.2~~ 1709.2. If the building, structure or portion thereof is found to have inadequate stability or load-bearing capacity for the expected loads, modifications to ensure structural adequacy or the removal of the inadequate construction shall be required.

~~1714.2~~ 1709.2 Test standards. Structural components and assemblies shall be tested in accordance with the appropriate material standards listed in Chapter 35. In the absence of a standard that contains an applicable load test procedure, the test procedure shall be developed by a *registered design professional* and *approved*. The test procedure shall simulate loads and conditions of application that the completed structure or portion thereof will be subjected to in normal use.

~~1714.3~~ 1709.3 In-situ load tests. In-situ load tests shall be conducted in accordance with Section ~~1714.3.1~~ 1709.3.1 or ~~1714.3.2~~ 1709.3.2 and shall be supervised by a *registered design professional*. The test shall simulate the applicable loading conditions specified in Chapter 16 as necessary to address the concerns regarding structural stability of the building, structure or portion thereof.

~~1714.3.1~~ 1709.3.1 Load test procedure specified. Where a standard listed in Chapter 35 contains an applicable load test procedure and acceptance criteria, the test procedure and acceptance criteria in the standard shall apply. In the absence of specific load factors or acceptance criteria, the load factors and acceptance criteria in Section ~~1714.3.2~~ 1709.3.2 shall apply.

~~1714.3.2~~ 1709.3.2 Load test procedure not specified. In the absence of applicable load test procedures contained within a standard referenced by this code or acceptance criteria for a specific material or method of construction, such *existing structure* shall be subjected to a test procedure developed by a *registered design professional* that simulates applicable loading and deformation conditions. For components that are not a part of the seismic-load-resisting system, the test load shall be equal to two times the unfactored design loads. The test load shall be left in place for a period of 24 hours. The structure shall be considered to have successfully met the test requirements where the following criteria are satisfied:

1. Under the design load, the deflection shall not exceed the limitations specified in Section 1604.3.
2. Within 24 hours after removal of the test load, the structure shall have recovered not less than 75 percent of the maximum deflection.
3. During and immediately after the test, the structure shall not show evidence of failure.

SECTION ~~1715~~ 1710
PRECONSTRUCTION LOAD TESTS

~~1715.1~~ 1710.1 General. In evaluating the physical properties of materials and methods of construction that are not capable of being designed by *approved* engineering analysis or do not comply with applicable material design standards listed in Chapter 35, the structural adequacy shall be predetermined based on the load test criteria established in this section.

~~1715.2~~ 1710.2 Load test procedures specified. Where specific load test procedures, load factors and acceptance criteria are included in the applicable design standards listed in Chapter 35, such test procedures, load factors and acceptance criteria shall apply. In the absence of specific test procedures, load factors or acceptance criteria, the corresponding provisions in Section ~~1715.3~~ 1710.3 shall apply.

~~1715.3~~ 1710.3 Load test procedures not specified. Where load test procedures are not specified in the applicable design standards listed in Chapter 35, the load-bearing and deformation capacity of structural components and assemblies shall be determined on the basis of a test procedure developed by a *registered design professional* that simulates applicable loading and deformation conditions. For components and assemblies that are not a part of the seismic-force-resisting system, the test shall be as specified in Section ~~1715.3.1~~ 1710.3.1. Load tests shall simulate the applicable loading conditions specified in Chapter 16.

~~1715.3.1~~ **1710.3.1Test procedure.** The test assembly shall be subjected to an increasing superimposed load equal to not less than two times the superimposed design load. The test load shall be left in place for a period of 24 hours. The tested assembly shall be considered to have successfully met the test requirements if the assembly recovers not less than 75 percent of the maximum deflection within 24 hours after the removal of the test load. The test assembly shall then be reloaded and subjected to an increasing superimposed load until either structural failure occurs or the superimposed load is equal to two and one-half times the load at which the deflection limitations specified in Section ~~1715.3.2~~ 1710.3.2 were reached, or the load is equal to two and one-half times the superimposed design load. In the case of structural components and assemblies for which deflection limitations are not specified in Section ~~1715.3.2~~ 1710.3.2, the test specimen shall be subjected to an increasing superimposed load until structural failure occurs or the load is equal to two and one-half times the desired superimposed design load. The allowable superimposed design load shall be taken as the lesser of:

1. The load at the deflection limitation given in Section ~~1715.3.2~~ 1710.3.2.
2. The failure load divided by 2.5.
3. The maximum load applied divided by 2.5.

~~1715.3.2~~ **1710.3.2 Deflection.** The deflection of structural members under the design load shall not exceed the limitations in Section 1604.3.

~~1715.4~~ **1710.4 Wall and partition assemblies.** *Load-bearing wall* and partition assemblies shall sustain the test load both with and without window framing. The test load shall include all design load components. Wall and partition assemblies shall be tested both with and without door and window framing.

~~1715.5~~ **1710.5 Exterior window and door assemblies.** The design pressure rating of exterior windows and doors in buildings shall be determined in accordance with Section ~~1715.5.1~~ 1710.5.1 or ~~1715.5.2~~ 1710.5.2.

Exception: Structural wind load design pressures for window units smaller than the size tested in accordance with Section ~~1715.5.1~~ 1710.5.1 or ~~1715.5.2~~ 1710.5.2 shall be permitted to be higher than the design value of the tested unit provided such higher pressures are determined by accepted engineering analysis. All components of the small unit shall be the same as the tested unit. Where such calculated design pressures are used, they shall be validated by an additional test of the window unit having the highest allowable design pressure.

~~1715.5.1~~ **1710.5.1 Exterior windows and doors.** Exterior windows and sliding doors shall be tested and labeled as conforming to AAMA/WDMA/CSA101/I.S.2/A440. The *label* shall state the name of the manufacturer, the *approved* labeling agency and the product designation as specified in AAMA/ WDMA/CSA101/I.S.2/A440. Exterior side-hinged doors shall be tested and *labeled* as conforming to AAMA/WDMA/CSA101/I.S.2/A440 or comply with Section ~~1715.5.2~~ 1710.5.2. Products tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3.

~~1715.5.2~~ **1710.5.2 Exterior windows and door assemblies not provided for in Section ~~1715.5.1~~ 1710.5.1.** Exterior window and door assemblies shall be tested in accordance with ASTM E 330. Structural performance of garage doors shall be determined in accordance with either ASTM E 330 or ANSI/DASMA 108, and shall meet the acceptance criteria of ANSI/DASMA 108. Exterior window and door assemblies containing glass shall comply with Section 2403. The design pressure for testing shall be calculated in accordance with Chapter 16. Each assembly shall be tested for 10 seconds at a load equal to 1.5 times the design pressure.

~~1715.6~~ **1710.6 Test specimens.** Test specimens and construction shall be representative of the materials, workmanship and details normally used in practice. The properties of the materials used to construct the test assembly shall be determined on the basis of tests on samples taken from the load assembly or on representative samples of the materials used to construct the load test assembly. Required tests shall be conducted or witnessed by an *approved agency*.

SECTION ~~1716~~ 1711
MATERIAL AND TEST STANDARDS

~~1716.1~~ **1711.1 Test standards for joist hangers and connectors.**

~~1716.1.1~~ **1711.1.1Test standards for joist hangers.** The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D 1761 using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AF&PA NDS for the joist and headers.

Exception: The joist length shall not be required to exceed 24 inches (610 mm).

~~1716.1.2~~ **1711.1.2 Vertical load capacity for joist hangers.** The vertical load capacity for the joist hanger shall be determined by testing a minimum of three joist hanger assemblies as specified in ASTM D 1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load of the joist hanger shall be the lowest value determined from the following:

1. The lowest ultimate vertical load for a single hanger from any test divided by three (where three tests are conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).
2. The average ultimate vertical load for a single hanger from all tests divided by three (where six or more tests are conducted).
3. The average from all tests of the vertical loads that produce a vertical movement of the joist with respect to the header of 1/8 inch (3.2 mm).
4. The sum of the allowable design loads for nails or other fasteners utilized to secure the joist hanger to the wood members and allowable bearing loads that contribute to the capacity of the hanger.
5. The allowable design load for the wood members forming the connection.

~~1716.1.3~~ **1711.1.3 Torsional moment capacity for joist hangers.** The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D 1761. The allowable torsional moment of the joist hanger shall be the average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is 1/8 inch (3.2 mm).

~~1716.1.4~~ **1711.1.4 Design value modifications for joist hangers.** Allowable design values for joist hangers that are determined by Item 4 or 5 in Section ~~1716.1.2~~ 1711.1.2 shall be permitted to be modified by the appropriate duration of loading factors as specified in AF&PA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section ~~1716.1.2~~ 1711.1.2. Allowable design values determined by Item 1, 2 or 3 in Section ~~1716.1.2~~ 1711.1.2 shall not be modified by duration of loading factors.

~~1716.2~~ **1711.2 Concrete and clay roof tiles.**

~~1716.2.1~~ **1711.2.1 Overturning resistance.** Concrete and clay roof tiles shall be tested to determine their resistance to overturning due to wind in accordance with SBCCI SSTD 11 and Chapter 15.

~~1716.2.2~~ **1711.2.2 Wind tunnel testing.** When roof tiles do not satisfy the limitations in Chapter 16 for rigid tile, a wind tunnel test shall be used to determine the wind characteristics of the concrete or clay tile roof covering in accordance with SBCCI SSTD 11 and Chapter 15.

Reason: The current chapter organization includes actual construction material inspection requirements (e.g. concrete inspection) sandwiched between sections related to the statement of special inspection and other procedural requirements. The result is difficulty in implementing a project specific special inspection program and potential for misinterpretation. This proposal relocates provisions contained in sections 1705, 1709, and 1710 into 1704 to increase clarity of intent and provide more ease of use. Note that current sections 1709 (Contractor Responsibility) and 1710 (Structural Observations) are included in the new 1704 since they are part of the overall program to assure that construction is in accordance with the design intent. The reorganization renames two sections to reflect updated content within the sections and renumbers sections following 1704, but does not make changes to tables or overall chapter content. This reorganization follows a more logical and consistent order as follows:

1701 GENERAL – unchanged
1702 DEFINITIONS – unchanged
1703 APPROVALS – unchanged
1704 SPECIAL INSPECTIONS, CONTRACTOR RESPONSIBILITY AND STRUCTURAL OBSERVATIONS – outlines the requirements for special inspection, the Statement of Special Inspections, Contractor Responsibility and Structural Observation, prior to the listing of the actual special inspections required by material. This Section now includes portions of old 1704, and all of old 1705, 1709 and 1710
1705 – REQUIRED VERIFICATION AND INSPECTION – outlines the material-specific inspections and testing requirements. It will include most of old Section1704 as well as all of old Sections 1706, 1707 and 1708.
1706 – DESIGN STRENGTHS OF MATERIALS – old Section 1711 unchanged
1707 – ALTERNATIVE TESTING PROCEDURE – old Section 1712 unchanged
1708 – TEST SAFE LOAD – old Section 1713 unchanged
1709 – IN-SITU LOAD TESTS - old Section 1714 unchanged
1710 - PRECONSTRUCTION LOAD TESTS - old Section 1715 unchanged
1711 – MATERIAL AND TEST STANDARDS - old Section 1716 unchanged

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: HARMAN-S6-CHAPTER 17

S117–09/10
1704.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1704.1 General. Where application is made for construction as described in this section, the owner or the registered design professional in responsible charge acting as the owner's agent shall employ one or more approved agencies to perform inspections during construction on the types of work listed under Section 1704. These inspections are in addition to the inspections specified in Section 109.

The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for the inspection of the particular type of construction or operation requiring special inspection. The registered design professional in responsible charge and engineers of record involved in the design of the project are permitted to act as the approved agency and their personnel are permitted to act as the special inspector for the work designed by them, provided those personnel meet the qualification requirements of this section to the satisfaction of the building official. The special inspector shall provide written documentation to the building official demonstrating his or her competence and relevant experience or training. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of special inspection activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

Exceptions:

1. Special inspections are not required for work of a minor nature or as warranted by conditions in the jurisdiction as approved by the building official.
2. ~~Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.~~
3. 2. Unless otherwise required by the building official, special inspections are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

.

Reason: Exception #2 of Section 1704.1 exempts from special inspection building components not designed by a registered design professional such as an architect or structural engineer. The exception is being deleted because "building component" is not defined, its meaning is vague and its application is subject to a wide variation in interpretation. If an exception for building components was warranted for which justification is not apparent, it would appear that building components designed by a registered design professional would be exempt due to the expertise provided by the registered design professional in its design; building components designed by other than a registered design professional would not be exempt. The need for special inspection of a building component should be determined based on the current requirements for special inspection in Sections 1704, 1706, 1707 and 1708. Special inspection for a building component may not be warranted but that determination should be made by applying Exception #1 of Section 1704.1 for work of a minor nature or as warranted by local conditions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S22-1704.1

S118–09/10
1704.1

Proponent: Gary J. Ehrlich, PE, representing National Association of Home Builders

Revise as follows:

1704.1 General. Where application is made for construction as described in this section, the owner or the *registered design professional in responsible charge* acting as the owner's agent shall employ one or more *approved agencies* to perform inspections during construction on the types of work listed under Section 1704. These inspections are in addition to the inspections identified in Section 110.

The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the *building official*, for the inspection of the particular type of construction or operation requiring *special inspection*. The *registered design professional in responsible charge* and engineers of record involved in the design of the project are permitted to act as the *approved agency* and their personnel are permitted to act as the special inspector for the work designed by them, provided those personnel meet the qualification requirements of this section to the satisfaction of the *building official*. The special inspector shall provide written documentation to the building official demonstrating their competence and relevant experience or training. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of *special inspection* activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

Exceptions:

1. *Special inspections* are not required for work of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.
2. *Special inspections* are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.
3. Unless otherwise required by the *building official*, *special inspections* are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
4. Special inspections are not required for portions of structures designed and constructed in accordance with the conventional light-frame construction provisions of Section 2308.

Reason: The purpose of this proposal is to add an exemption from third-party special inspections for portions of wood-frame dwellings or other simple wood-frame structures constructed under prescriptive provisions within the International Building Code (IBC). Without this exception, a building official may require a builder to contract with a third-party inspector, with the expense passed on to the homeowner.

A change made to the IBC during the 2006-07 Code Development Cycle (S31-06/07) struck the exemption for Residential R-3 structures, and now subjects one- and two-family dwellings and townhouses designed under the IBC to the requirements for special inspections. These inspections are in addition to the standard inspections performed by the building department. Also, other structures classified as R-3 occupancies (group homes, day care) will be subject to these special inspections for all elements of their construction. As justification for the original code change, the proponent claimed R 3 structures often contain complicated roof truss systems, structural steel framing, reinforced masonry and other complex elements or unusual construction materials and methods requiring the qualifications and experience of a special inspector.

But, IBC Section 1704.1.1 exempts the registered design professional from needing to prepare, and the permit applicant from needing to submit, a statement of special inspections for structures designed and constructed per Section 2308. This clearly implies that structures built under Section 2308 do not need special inspections for any element, including the wood wall framing, roof and floor trusses, concrete or masonry foundations, and any miscellaneous masonry or steel framing inside the structure. In a structure designed to the conventional construction provisions, these elements are not likely to be as complex as those in a fully-engineered structure.

Building departments are more than capable of reviewing and inspecting these simple structures. In the case of items such as trusses and miscellaneous steel framing that may occur in a structure otherwise designed using conventional construction provisions, shop drawings will be submitted to the building official for their review and use in inspections. The building department does not need a special inspector to do their work for them in reviewing and inspecting these structures and elements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ehrlich-S1-1704 1

S119–09/10
1704.1.1 (New)

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Add new text as follows:

1704.1.1 Access for special inspection. The construction or work for which special inspection is required shall remain accessible and exposed for special inspection purposes until completion of the required special inspections.

(Renumber subsequent sections)

Reason: Section 110.1 requires construction or work requiring inspection to remain accessible and exposed for inspection purposes until approved. The IBC does not have a comparable statement for special inspections and this proposal provides it.

For inspections by the building official, the requirement that the construction or work remain accessible and exposed until approved is derived from the powers and duties entrusted to building officials by the jurisdictions they serve and which are specified in Section 104. A special inspector, however, is typically not a public official but a private individual providing third-party special inspection services to an owner or owner's authorized

agent. A special inspector is typically not authorized to approve construction or work and relies on the building official for that authority. The lack of the authority by the special inspector to approve construction or work is why the requirement for construction or work to remain accessible and exposed is being proposed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S26-1704.1.1

S120–09/10
1704.1.1, 1705.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1704.1.1 Statement of special inspections. The applicant shall submit a statement of special inspections ~~prepared by the registered design professional in responsible charge~~ in accordance with Section 107.1 as a condition for permit issuance. This statement shall be in accordance with Section 1705.

Exceptions~~:~~

1. ~~1.~~ A statement of special inspections is not required for structures designed and constructed in accordance with the conventional construction provisions of Section 2308.
2. ~~2. The statement of special inspections is permitted to be prepared by a qualified person approved by the building official for construction not designed by a registered design professional.~~

1705.1 General. Where special inspection or testing is required by Section 1704, 1707 or 1708, the registered design professional in responsible charge shall prepare a statement of special inspections in accordance with Section ~~1705~~ 1705.2 for submittal by the applicant ~~(see~~ in accordance with Section 1704.1.1~~)~~.

Exception: The statement of special inspections is permitted to be prepared by a qualified person approved by the building official for construction not designed by a registered design professional.

Reason: The purpose for this proposal is to improve the scoping provisions applicable to the statement of special inspections. Section 1705.1 requires the statement of special inspections to be prepared by the registered design professional in responsible charge where special inspection or testing is required elsewhere in Chapter 17. Exception #2 of Section 1704.1.1, however, permits the statement to be prepared by a qualified person approved by the building official for construction not designed by a registered design professional. The charging text of Section 1704.1.1 requires submittal of a statement of special inspections prepared by the registered design professional in responsible charge "in accordance with Section 107.1." Section 107.1, however, contains requirements for submission of documents with each permit application.

The proposal deletes from the charging text of Section 1704.1.1 preparation of the statement of special inspections by the registered design professional in responsible charge because the requirements for preparation are in Section 1705 and Section 1704.1.1 references Section 1705. Section 1704.1.1, then, becomes a requirement for submittal of the statement of special inspections in accordance with Section 107.1. Exception #1 of Section 1704.1.1 is retained because it exempts structures designed and constructed in accordance with the conventional construction provisions of Section 2308 from the requirement for **submittal** (emphasis mine) of a statement of special inspections. Exception #2, however, is relocated to Section 1705.1 because it exempts structures not designed by a registered design professional from the requirement for **preparation** (emphasis mine) of a statement of special inspections by the registered design professional in responsible charge.

Cost Impact: The code change proposal will not increase the cost of construction.

S121–09/10
1704.3-1704.3.3.3, Table 1704.3

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

1. Revise as follows:

1704.3 Steel construction. The *special inspections* for steel elements of buildings and structures shall be as required in this Section ~~by Section 1704.3 and Table 1704.3~~.

Exceptions:

1. *Special inspection* of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, and grade and mill test reports for the main stress-carrying elements are capable of being determined. Mill test reports shall be identifiable to the main stress-carrying elements when required by the approved construction documents.
2. The special inspector need not be continuously present during welding of the following items, provided the materials, welding procedures and qualifications of welders are verified prior to the start of the work; periodic inspections are made of the work in progress and a visual inspection of all welds is made prior to completion or prior to shipment of shop welding.
   2.1. Single-pass fillet welds not exceeding 5/16 inch (7.9 mm) in size.
   2.2. Floor and roof deck welding.
   2.3. Welded studs when used for structural diaphragm.
   2.4. Welded sheet steel for cold-formed steel members.
   2.5. Welding of stairs and railing systems.

1704.3.1 Structural steel. Special inspection for structural steel shall be in accordance with the quality assurance inspection requirements of AISC 360.

1704.3.2 Steel construction other than structural steel. Special inspection for steel construction other than structural steel shall be in accordance with Table 1704.3 and this section.

1704.3.1 1704.3.2.1 Welding. Welding inspection and welding inspector qualification shall be in accordance with this section.

1704.3.1.1 Structural steel. Welding inspection and welding inspector qualification for structural steel shall be in accordance with AWS D1.1.

1704.3.1.2 1704.3.2.1.1 Cold-formed steel. Welding inspection and welding inspector qualification for cold-formed steel floor and roof decks shall be in accordance with AWS D1.3.

1704.3.1.3 1704.3.2.1.2 Reinforcing steel. Welding inspection and welding inspector qualification for reinforcing steel shall be in accordance with AWS D1.4 and ACI 318.

2. Delete without substitution:

1704.3.2 Details. The special inspector shall perform an inspection of the steel frame to verify compliance with the details shown on the *approved construction documents*, such as bracing, stiffening, member locations and proper application of joint details at each connection.

1704.3.3 High-strength bolts. Installation of high-strength bolts shall be inspected in accordance with AISC 360.

1704.3.3.1 General. While the work is in progress, the special inspector shall determine that the requirements for bolts, nuts,washers and paint; bolted parts and installation and tightening in such standards are met. For boltsrequiring pretensioning, the special inspector shall observe the preinstallation testing and calibration procedures when such procedures are required by the installation method or by project plans or specifications; determine that all plies of connected materials have been drawn together and properly snugged and monitor the installation of bolts to verify that the selected procedure for installation is properly used to tighten bolts. For joints required to be tightened only to the snug-tight condition, the special inspector need only verify that the connected materials have been drawn together and properly snugged.

1704.3.3.2 Periodic monitoring. Monitoring of bolt installation for pretensioning is permitted to be performed on a periodic basis when using the turn-of-nut method with matchmarking techniques, the direct tension indicator method or the alternate design fastener (twist-off bolt) method. Joints designated as snug tight need be inspected only on a periodic basis.

1704.3.3.3 Continuous monitoring. Monitoring of bolt installation for pretensioning using the calibrated wrench method or the turn-of-nut method without matchmarking shall be performed on a continuous basis.

3. Revise as follows:

~~1704.3.4~~ **1704.3.2.2 Cold-formed steel trusses spanning 60 feet or greater.** Where a cold-formed steel truss clear span is 60 feet (18 288 mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

a. Where applicable, see also Section 1707.1, Special inspection for seismic resistance.

Reason: The 2010 edition of ANSI/AISC 360, *Specification for Structural Steel Buildings,* incorporates a new Chapter N, which addresses comprehensive quality control and quality assurance requirements for all structural steel construction. These requirements are similar in nature to those that were incorporated into the 2005 edition of AISC 341, Appendix Q. Those AISC 341 requirements are currently referenced in the 2009 edition of the IBC, Sections 1707 and 1708 for special inspection requirements in high-seismic applications. AISC 360-10, Chapter N provisions provide the foundation for the quality control and quality assurance requirements for general structural steel construction, with AISC 341-10, Chapter I (previously contained in AISC 341-05, Appendix Q) extending specific requirements to high-seismic applications.

AISC 360, Chapter N covers quality control requirements on the part of the structural steel fabricator and erector, as well as quality assurance requirements on the part of the owners inspecting and or testing agents. While AISC 360 addresses the total quality aspects of the structural steel project, the inspection requirements of the Quality Assurance Inspector can be equated to those specified for the Special Inspector under IBC Chapter 17.

The present Section 1704.3 addresses all forms of steel construction. The majority of the requirements in this section and Table 1704.3 pertain to structural steel construction. However, there are a few items which refer to cold-formed steel construction and rebar welding, which are not covered by AISC 360. The current special inspection requirements for structural steel as covered in Section 1704.3 and Table 1704.3 are recommended for deletion by this proposal; and, instead, a direct reference is made to the more detailed requirements of AISC 360, Chapter N. Requirements for special inspection of other forms of steel construction are left in a separate section of Section 1704.3.2, and in a reduced Table 1704.3, *Steel Construction Other than Structural Steel*.

Specifically, the topics currently in IBC Section 1704.3 are covered in AISC 360, Chapter N as follows:

Section 1704.3, Exception 2: The structural steel items are covered in AISC 360, Section N5.5. As for the cold formed steel exception applicable to roof and floor deck, it really is not correct and is recommended for deletion. Shop welding is typically used for a multi-skin closed cell deck, which would be a violation of the AWS D1.3 requirement that arc spot is only valid for deck to underlying structural members (D1.3, Clause 1.5.4). Multi-skin deck within itself appears to fall outside of the code itself and requires direct qualification by the manufacturer of their processes, potentially through testing rather than calculations. In reality, cold formed steel deck is sufficiently covered in Section 1704.3.2.1.1, Table 1704.3, and the reference to AWS D1.3.

Section 1704.3.2: AISC 360, Section N5.8.

Section 1704.3.3: AISC 360, Section N5.7(3)

Additionally, the topics currently in IBC Table 1704.3 are covered as in AISC 360, Chapter N as follows:

Table 1704.3, Item 1: AISC 360, Section N5.7 and Table N5.7-1.

Table 1704.3, Item 2: AISC 360, Section N5.7

Table 1704.3, Item 3a: AISC 360, Section N3.2 requires that the MTRs, as well as numerous other documents be made available for EOR review.

Table 1704.3, Item 4: AISC 360, Section N5.5 and Table N5.5-1

Table 1704.3, Item 5: AISC 360, Section N5.5

Table 1704.3, Item 6: AISC 360, Section N5.8

Also, Section 1704.3, Exception 1 is retained and modified to clarify the requirements. Often in practice, the "representative mill test reports" are supplied as described in the AISC Code of Standard practice. The added sentence on mill test reports allows for traceability when required by the construction documents, and defers to AISC 360 in other cases.

Please note, public review drafts of the 2010 AISC documents can be found on the AISC website (www.aisc.org). The public review period for AISC 360-10 is currently scheduled for 8/14/09 through 9/28/09 and the public review period for AISC 341-10 is currently scheduled for 9/11/09 through 10/26/09. It is anticipated that the 2010 editions of both AISC 360 and AISC 341 will be technically complete by the end of October 2009, with ANSI approval in March 2010 and publication in August 2010.

Cost Impact: There is no anticipated impact on the cost of construction.

Revise as follows:

TABLE 1704.4
REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION

VERIFICATION AND INSPECTION	CONTIN-UOUS	PERIODIC	REFERENCED STANDARD [a]	IBC REFERENCE
3. Inspection of ~~bolts to be installed in concrete prior to and during placement of~~ anchors cast in concrete where allowable loads have been increased or where strength design is used.	~~X~~ —	— X	ACI 318; 8.1.3, 21.2.8	1911.5, 1912.1
4. Inspection of anchors ~~installed in~~ post-installed in hardened concrete members and designed in accordance with Section 1912. [b]	X	~~X~~ —	ACI 318; 3.8.6, 8.1.3, 21.2.8	1912.1
5. Inspection of anchors post-installed in hardened concrete members and qualified for installation through Section 104.11.	Note b	Note b		

(Portions of table not shown do not change)

a. Where applicable, see also Section 1707.1, Special inspection for seismic resistance.
b. Special inspection of anchors qualified for installation through Section 104.11 shall be conducted in accordance with the requirements specified in the report of qualification, such as an evaluation report issued by the ICC Evaluation Service.

Reason: The purpose for this proposal is to adjust the required extent of special inspection for concrete anchors to be more consistent with the access available for special inspectors to perform their duties. Anchors that are cast into concrete are visible for inspection from their installation until the concrete is placed. In this regard, their inspection is similar to that of concrete reinforcement for which Table 1704.3 currently specifies periodic special inspection. It is sufficient for special inspectors to be present intermittently during installation of the cast-in anchors, provided they are able to perform their inspections prior to placement of the concrete after which effective inspection is severely diminished.

Anchors that are post-installed into hardened concrete, however, require the presence of the special inspector during their installation to verify that the anchors are installed in accordance with the construction documents, the project specifications and installation instructions by the manufacturer of the anchors. In this regard, their inspection is similar to that of concrete placement for which Table 1704.3 currently specifies continuous special inspection. They may not need to be present continuously during installation of all the post-installed anchors but their presence is needed during the installation of a certain percentage of them and the extent and frequency of the special inspection should be agreed upon beforehand by all affected parties, including, but not limited to, the owner or owner's representative, contractor, special inspector and the building official.

Item #3 on bolts to be installed in concrete currently applies to bolts designed using (1) allowable stress design procedures and increases in allowable loads, which is primarily intended for increases permitted by IBC Section 1911.5, and (2) strength design procedures for which IBC Section 1912.1 requires compliance with Appendix D of ACI 318 as modified therein. The references to IBC Sections 1911.5 and 1912.1 at the column of IBC references account for this. Section 1912.1 governs the "strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other." Compliance with Appendix D of ACI 318 is required for anchors that are within its scope. For all other anchors, design "in accordance with an approved procedure" is required.

Item #3 is changed to "anchors cast in concrete" for consistency with similar terms used in IBC Sections 1911.5 and 1912.1 and Appendix D of ACI 318 and because it is seen as a more general term than "bolts to be installed in concrete." The requirement for continuous special inspection is changed to periodic special inspection as discussed in the first paragraph of this statement. Section D.1 in Appendix D of ACI 318 defines "cast-in anchor" as "a headed bolt, headed stud or hooked bolt installed before placing concrete" and Section D2.2 includes post-installed anchors in its scoping statement. Section D.1 of Appendix D also defines "anchor" as "a steel element either cast into concrete or post-installed into a hardened concrete member and used to transmit applied loads, including headed bolts, hooked bolts (J- or L-bolt), headed studs, expansion anchors or undercut anchors."

Item #4 on anchors installed in hardened concrete applies to anchors complying with IBC Section 1912 for which Section 1912.1 requires the use of strength design procedures in accordance with Appendix D of ACI 318 as modified therein. The reference to IBC Section 1912.1 at the column of IBC references accounts for this.

Item #4 is changed to "anchors post-installed in hardened concrete" for consistency with Appendix D of ACI 318 and to more clearly distinguish them from "anchors cast in concrete." The requirement for periodic special inspection is changed to continuous special inspection as discussed in the second paragraph of this statement. Section D.1 in Appendix D of ACI 318 defines "post-installed anchor" as "an anchor installed in hardened concrete" and Section D2.2 includes cast-in anchors in its scoping statement.

Item #4 is also revised by adding a reference to IBC Section 1912.1. Adding the reference would not be necessary if Section 1912.1 applied to all post-installed anchors designed with strength design procedures and continuous special inspection as defined in Section 1702.1 was sufficient to specify the frequency and extent to which special inspection is needed. This is considered necessary for anchors post-installed into hardened concrete that are designed and installed in accordance with IBC Section 1912.1 but it is not always considered necessary for anchors post-installed into hardened concrete that are qualified for use in accordance with Section 104.11 on alternative means and methods through nationally recognized evaluation services, such as the ICC Evaluation Service (ICC-ES).

The evaluation reports issued by ICC-ES frequently identify requirements for special inspection by referencing the requirements of IBC Chapter 17 for that purpose. Some evaluation reports, however, specify in detail what is required of a special inspector. Extent and frequency are often included. As long as this is limited to the evaluation report, it improves the process of special inspection. Many of these evaluation reports with

these detailed requirements, however, also specify periodic or continuous special inspection and reference IBC Chapter 17 in the process. When this is done, compliance with applicable special inspection requirements in the report and in IBC Chapter 17 are assumed and, presumably, expected. The threshold between continuous and periodic special inspection in the IBC versus these evaluation reports, however, is different. IBC Chapter 17 relies on the definitions of "continuous special inspection" and "periodic special inspection" to distinguish between them. The evaluation reports that specify detailed special inspection requirements rely on these detailed requirements. Where these reports also specify periodic or continuous special inspection and reference IBC Chapter 17, however, they create conflicts between the report and the IBC if the threshold between continuous and periodic special inspection is different in the evaluation report than it would be if the report did not exist and the anchor was designed and installed for compliance with the IBC without the benefit of an evaluation report.

Ideally, where detailed requirements for special inspection are included in an ICC-ES evaluation report, they would be specified insufficient detail that there would be no mention of continuous or periodic special inspection. The detailed requirements would effectively serve the same purpose as the distinction between continuous and periodic special inspection serves in the IBC.

Conflicts now exist between post-installed concrete anchors qualified by Section 104.11 through an ICC-ES evaluation report versus such anchors designed and installed to meet the requirements of the IBC without the benefit of an evaluation report. Consider concrete adhesive anchors as an example. Based on the definitions in Section 1702.1, continuous special inspection is considered necessary because an inspector must be present during the installation of the anchor to effectively perform an inspection. The typical evaluation report for a concrete adhesive anchor, however, specifies periodic special inspection. Where special inspection for the anchor is conducted in accordance with the detailed requirements in such a report, effective inspection can occur. But if special inspection for the anchor is conducted in accordance with Table 1704.4 of the 2009 IBC based on the definition of periodic inspection in Section 1702.1, effective inspection can not occur because it may be too late to effectively inspect a concrete adhesive anchor once installation has begun.

Item #5 is added to (1) account for post-installed anchors qualified for use in accordance with Section 104.11 through nationally recognized evaluation services, such as the ICC Evaluation Service (ICC-ES), and to (2) distinguish between the requirements for special inspection of anchors designed to comply with the IBC alone versus those qualified for use through evaluation services such as ICC-ES.

Cost Impact: The code change proposal will not increase the cost of construction.

For S

a. The specific standards referenced are those listed in Chapter 35.

Reason:
Synopsis: Remove IBC code requirements that are already specified in standards. TMS 402/ACI 530/ASCE 5 and TMS 602/ACI 530.1/ASCE 6 Building Code Requirements for Masonry Structures provides requirements for quality assurance of masonry construction.

Detailed Discussion: The basis for design and construction of masonry structures as provided in Chapter 21 of IBC is TMS 402/ACI 530/ASCE 5 and TMS 602/ACI 530.1/ASCE 6, Building Code Requirements for Masonry Structures. Therefore, this proposal seeks to provide the special inspection provided in these standards which is consistent with the design and construction procedures in the code. This proposal coordinates the special inspections with the design procedures that were adopted in the last code development cycle.

1. Section 1.18 of TMS 402/ACI 530/ASCE 5 Building *Code Requirements for Masonry Structures* and Article 1.6 of TMS 602/ACI 530/ASCE 6 *Specification for Masonry Structures* includes requirements for tests, inspections and verifications of masonry constructions. The tests, inspections and verifications within TMS 402 are inclusive of those tests, inspections and verifications in the current International Building Code.
2. Deletion of "or by Chapter 5, 7 or 6 of TMS 402/ACI 530/ASCE 5, respectively," referenced in the 1st exception and section 1704.5.1 is to avoid redundancy since any masonry designed in accordance with Chapters 5, 6 or 7 of TMS 402 is subject to a quality assuranceprogram specified in Section 1.18 of TMS 402.
3. Reference is made to Level B Quality Assurance requirements specified in TMS 402 for the list of tests, inspections and verifications required for masonry designed in accordance with IBC Sections 2109 2110 and Chapter 14.
4. Sections 1704.5.2 and 1704.5.3 are deleted in entirety since all masonry designed in accordance IBC Sections 2107 and 2108 must comply with Chapter 1 of TMS 402. TMS 402 Chapter 1 requires that masonry construction must be tested, inspected and verified.
5. Tables 1704.5.1 and 1704.5.3 are deleted because there is no reference to them and all tests, inspections and verifications are identified in TMS 402.

Cost Impact: This proposal does not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

FILENAME: Harman-S3-1704.5

S124–09/10

1704.6, Table 1704.6 (New), 1706.2, 1707.3, 1704.3.5 (New), Table 1704.3, 1706.3, 1707.4

Proponent: D. Kirk Harman, The Harman Group, representing The National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

1. Revise as follows:

1704.6 Wood construction. ~~Special inspections of the fabrication process of prefabricated wood structural elements and assemblies shall be in accordance with Section 1704.2.Special inspections of site-built assemblies shall be in accordance with this section.~~ Special Inspections for prefabricated and site built wood construction and assemblies including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs shall be as required by this section and Table 1704.6.

Exceptions:

1. *Special inspection* of wood construction for buildings and structures in Occupancy Category I shall not be required.
2. *Special inspection* of wood construction for buildings and structures in Occupancy Category II that are 3 or less stories in height shall not be required.

2. Add new Table as follows:

TABLE 1704.6
REQUIRED VERIFICATION AND INSPECTION OF WOOD CONSTRUCTION

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC
1. Verify that grade stamp on framing lumber, plywood and OSB panels conforms to the construction documents.		X
2. Verify that wood connections including nail quantity, size and spacing; bolt size and location anchor bolt size, spacing and location; tie down size location and configuration; beam hangers and framing anchors conform to the approved construction documents.		X
3. Inspect details of wood framing including framing layout, member sizes, blocking, bridging and bearing lengths.		X
4. Inspect diaphragms and shear walls to verify that		X

wood structural panel sheathing is of the grade and thickness indicated on the approved construction documents and the nominal size of framing members at adjoining panel edges, the nail or staple diameter and length, are as indicated on the approved construction documents.		

3. Revise as follows:

1706.2 Structural wood. Continuous special inspection is required during field gluing operations of elements of the main wind-force-resisting system. ~~Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces and hold-downs.~~

~~**Exception:** *Special inspection* is not required for wood shearwalls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the main wind-force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center.~~

1707.3 Structural wood. Continuous special inspection is required during field gluing operations of elements of the seismic-force-resisting system. ~~Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the seismic-force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, shear panels and hold-downs.~~

~~**Exception:** Special inspection is not required for wood shearwalls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the seismic-force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).~~

4. Add new text as follows:

1704.3.5 Cold-formed steel light-frame construction. Special Inspections for prefabricated and site built cold-formed steel light-frame construction and assemblies including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs shall be as required by this section and Table 1704.3.

Exceptions:

1. *Special inspection* of cold-formed steel light-frame construction for buildings and structures in Occupancy Category I shall not be required.
2. *Special inspection* of cold-formed steel light-frame construction for buildings and structures in Occupancy Category II that are 3 or less stories in height shall not be required.

5. Revise as follows:

TABLE 1704.3
REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]	IBC REFERENCE
3. Material verification of structural steel, cold-formed steel light-frame construction and cold-formed steel deck:				
a. For structural steel, identification markings to conform to AISC 360	–	X	AISC 360, Section M5.5	
b. For other steel, identification markings to conform to ASTM standards specified in the approved construction documents.	–	X	Applicable ASTM material standards	
c. Manufacturer's certified test reports.	–	X		
5. Inspection of welding:				
a. Structural steel, cold-formed steel light-frame construction and cold-formed steel deck:				
1) Complete and partial joint penetration groove welds.	X	–	AWS D1.1	1704.3.1
2) Multipass fillet welds	X	–		
3) Single-pass fillet welds > 5/16"	X	–		
4) Plug and slot welds	X	–		

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]	IBC REFERENCE
5) Single-pass fillet welds ≤ 5/16"	–	X		
6) Floor and roof deck welds.	–	X	AWS D1.3	
7) Cold-formed steel light-frame construction welds		X	AWS D1.3	
6. Inspection of steel frame joint details for compliance with approved construction documents:				
a. Details such as bracing, drag struts and stiffening.	–	X	–	1704.3.2
b. Member locations.	–	X		
c. Application of joint details at each connection.	–	X		
d. Mechanical connections for cold-formed steel light-frame construction including screws, powder actuated fasteners, bolts, anchor bolts, tie downs, anchors and other fastening components		X	Applicable ASTM material standards	

(Portions of table not shown remain unchanged)

6. Delete without substitution:

~~**1706.3 Cold-formed steel light-frame construction.** Periodic special inspection is required during welding operations of elements of the main wind-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.~~

~~**Exception:** *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:~~

1. ~~The sheathing is gypsum board or fiberboard.~~
2. ~~The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).~~

~~**1707.4 Cold-formed steel light-frame construction.** Periodic special inspection is required during welding operations of elements of the seismic-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the seismic-force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.~~

~~**Exception:** *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:~~

1. ~~The sheathing is gypsum board or fiberboard.~~
2. ~~The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) o.c.~~

Reason: NCSEA believes that light frame construction in wood and cold formed steel have become more commonly used for load bearing applications of significant height and in regions with moderate and high seismic and wind concerns. These types of construction should be subject to Special Inspections in a similar manner and to a comparable extent as other systems such as concrete, structural steel and masonry. The Code is vague in the requirements for these systems resulting in confusion as to what special inspections and to what extent special inspection is required. This proposal clarifies requirements to be consistent across both systems and to improve the consistency of special inspections across all the major structural materials.

The emphasis of the existing special inspection requirements for wood framed construction is on shop inspection of fabricated wood assemblies rather than the field assembly of wood framing. Quality control problems with wood construction are most pronounced in the field work rather than in prefabricated components. The proposed provisions focus on the areas of wood construction that would benefit most from more comprehensive inspections. Deletion of the exception under 1707.3 coordinates with this change.

Exceptions are provided to limit the applicability of these provisions to exclude single and two family dwellings, small commercial, agricultural and buildings of lesser occupancies.

Sections 1706.2, 1706.3, 1707.3 and 1707.4 are revised because the provisions deleted from these sections are now covered in the new or revised tables. The exceptions are deleted to be consistent with the proposal.

This proposal contains provisions addressing both wood frame and cold-formed steel light-frame construction together. This is an effort to address both systems in one change therefore avoiding any perception of one system having an advantage over the other regarding special inspection.

There will be some increase in construction cost due to the increased special inspection that will take place. However, the improved field quality assurance will improve safety and reduced field errors resulting in a savings in construction cost and schedule. The improved public safety far outweighs any minor increase there may be in construction cost.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Harman-S2-1704

S125–09/10
Table 1704.7

Proponent: Lori A. Simpson, Treadwell & Rollo, Inc., representing self

Revise as follows:

TABLE 1704.7
REQUIRED VERIFICATION AND INSPECTION OF SOILS

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. Verify materials below shallow foundations are adequate to achieve the design bearing capacity.	—	X
2. Verify excavations are extended to proper depth and have reached proper material.	—	X
3. Perform classification and testing of compacted fill materials.	—	X
4. Verify use of proper materials, densities and lift thicknesses during placement and compaction of compacted fill.	~~X~~	X
5. Prior to placement of compacted fill, observe subgrade and verify that site has been prepared properly.	—	X

Reason: The amount of time spent verifying use of proper materials, densities and lift thickness during placement and compaction of controlled fill should be at the discretion of the Geotechnical Engineer. Periodic visits can be sufficient to confirm relative compaction achieved on each lift. The amount of time spent on site and the number of visits will depend on the amount of fill placed per day. It is not necessary to be on site full time during grading, as part-time observation and periodic tests can sufficiently confirm the adequacy of the compaction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

S126–09/10
1704.15 (New), 1704.15.1 (New), 1704.15.2 (New), Chapter 35

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

1. Add new text as follows:

1704.15 Fire-resistant penetrations and joints. Special inspections for through penetrations, membrane penetrations, joints, and perimeter fire barrier systems of the types specified in Sections 713.3.1.2, 713.4.1.2, 714.3 and 714.4 shall be in accordance with Sections 1704.15.1 or 1704.15.2. Special inspections shall be based on the fire-resistance design or system as designated in the approved construction documents.

1704.15.1 Fire-resistant penetrations. Penetration firestop systems in fire-resistance-rated assemblies shall not be concealed from view until inspected and approved. Inspections of penetration firestop systems of the types specified in Sections 713.3.1.2 and 713.4.1.2 are permitted to be conducted by an approved inspection agency in accordance with ASTM E2174.

1704.15.2 Fire-resistive joints. Fire resistant joint systems within, or at the perimeter of, fire-resistance-rated assemblies shall not be concealed from view until inspected and approved. Inspection of joints of the types specified in Sections 714.3 and 714.4 are permitted to be conducted by an approved inspection agency in accordance with ASTM E2393.

2. Add standard to IBC Chapter 35 as follows.

ASTM
ASTM E2174-04 Standard Practice for On-site Inspection of Installed Fire Stops
ASTM E2393-04, Standard practice for On-Site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barriers

Reason: The purpose of this proposal adds a reference to two Consensus Standards developed at ASTM for inspection of installed penetration firestop systems, fire-resistive joints, and perimeter fire barriers. The Code already mandates proper installation of penetration firestops to maintain the integrity of vertical and horizontal fire or smoke separations. Section 1704 of the *International Building Code*® (IBC) provides for special inspection agencies. Under the IBC, final authority for recognition of special inspection agencies rests with the building official having jurisdiction. These Standards identify proper methods for the field inspection of these systems, and provides consistent procedures needed to conduct and document the on-site assessment of the installations.

Substantiation: Firestop and joint system designs and materials are increasing in number and variety. The current code relies heavily on Installers, Designers, and Code Officials to verify proper system selection and installation. In response to this reality, a standard practice was developed within the ASTM process to allow inspections of through-penetration firestops, joints, and perimeter fire barrier systems to be conducted in a thorough and consistent manner, with standardized report formats, regardless of the Trade or individual conducting the inspection. Part of the impetus for the development of that standard was the recognition that jurisdictions sometimes do not have sufficient resources themselves to ensure that all penetrations and joints are firestopped properly. In any project, the number of joints and penetrations can range from hundreds to a few thousand in a single building. The addition of these new Standards to the Code would provide and identify a means for authorities having jurisdiction to have effective tools to mandate standardized inspection thoroughness and quality third party inspection agencies are used for verification of these important systems. The inclusion of consensus standards would ensure that required inspections are conducted consistently, fairly, and adequately, while also standardizing inspection reports, so that they will be of a uniform high quality.

The proposed code change would provide the code official the option of having a third party (e.g. approved inspection agency) to conduct the inspection of joints and penetrations in conformance with these Standards, while preserving the option to utilize other policies and procedures consistent with the intent of the Code.

Cost Impact: The proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM E2174-04 and ASTM E2393-04, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1704.15 (New), Chapter 35

Proponent: William E. Koffel, Koffel Associates, Inc., representing Glazing Industry Code Committee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

1. Add new text as follows:

1704.15 Fire-resistant penetrations and joints. In buildings assigned an Occupancy Category of III or IV in accordance with Section 1604.5, special inspections for through penetrations, membrane penetration firestops, fire resistant joint systems, and perimeter fire barrier systems of the types specified in Sections 713.3.1.2, 713.4.1.2, 714.3 and 714.4 shall be in accordance with Sections 1704.15.1 or 1704.15.2.

1704.15.1 Penetration firestops. Inspections of penetration firestop systems of the types specified in Sections 713.3.1.2 and 713.4.1.2 shall be conducted by an approved inspection agency in accordance with ASTM E 2174.

1704.15.2 Fire-resistant joint systems. Inspection of fire resistant joint systems of the types specified in Sections 714.3 and 714.4 shall be conducted by an approved inspection agency in accordance with ASTM E 2393.

2. Add standards to Chapter 35 as follows:

ASTM International

E 2174-09 Standard Practice for On-Site Inspection of Installed Fire Stops

E 2393-09 Standard Practice for On-Site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barrier

Reason: Through penetration and joint firestop systems are critical to maintaining the fire resistance rating of fire resistance rated construction, including fire barriers, smoke barriers, and fire resistance rated horizontal assemblies. Every construction trade has very unique requirements that are specific to that trade, with technical knowledge built through cumulative continued work in the trade. Firestopping is no different. The concept has been proposed in the past and some felt the scope was too broad. Therefore, the scope of the proposed requirement has been limited to those buildings that represent a substantial hazard to human life in the event of a system failure or that are considered to be essential facilities in accordance with Table 1604.5.

In order to meet the requirements of a listed firestop system from the UL Fire Resistance, Intertek, FM Approvals or other testing laboratory directories, a 'zero tolerance' systems installation protocol is needed, or a system can be violated and rendered ineffective. The violation can be as small as a minor annular space size variance, joint width exceeding system requirements, penetrating item size or type not as listed. There are no typical 'construction tolerances' allowed in firestopping for fire and life safety.

Firestop Systems must be selected from the listing directories, then applied in the correct manner, in the right place. With endless variations to penetrating items, hole sizes and shapes, plus the classified systems to restore the fire ratings, firestop systems selection looks easy to the untrained eye.

The UL Fire Resistance Directories have over 8,500 listed firestop systems, each with variations that multiplies possible systems for a building exponentially. Systems selection is not a 'generic process'. Systems selection is an exacting exercise by skilled contractors who submit appropriate systems for approval, then communicate these systems to the educated firestop – containment workers they employ….which becomes the inspection document for a qualified inspector of firestop systems to leading documents such as International Accreditation Services Accreditation Criteria, AC 291, section 6.11, Firestop Systems.

Should a penetration or joint condition in the field vary from the system design listing from the directories, the firestop system may not perform as intended, opening risk to the structure, and the occupants on the other side of the fire. Structurally, the floor, floor-ceiling or wall assemblies are not tested with unprotected holes with penetrating items or joints allowing fire attack to take place from both sides at once. They are tested with fire attack from one side, with all openings and penetrating items and joints firestopped.

On construction projects, there are three ways firestopping is installed currently. First, the 'he or she who pokes the hole fills it with firestopping' takes place, about 1/3 the time. A specialty firestop contractor installs for about another 1/3 of installations. The final 1/3 is a combination of specialty firestop contractors and the 'he or she who pokes the hole fills it' method. In other words, about ½ of the installations are installed by companies who most likely do not understand firestop systems selection nor the zero tolerance installation protocol. And, with the 20+ trades who potentially touch firestopping, many who perform the work as a 'sideline', the potential for a mistake increases exponentially when inexperienced companies install firestopping. However, firestopping is a complex operation, just like any other trade. Mastering more than one trade by attending a 30 minute to 16 hour class is nearly impossible for workers of any trade background.

In simple terms, inadequate firestopping makes the fire resistance rated floor or wall assembly become swiss cheese like, and not representative of testing. The risks of inadequate firestopping are apparent due to the many trades who install firestopping as a sideline…who just don't get the 'zero tolerance' systems oriented approach needed to get firestopping done right. Inspection to ASTM E 2174 and ASTM E 2393 brings a needed check to this important discipline, whether a FCIA Member specialty firestop contractor is installing or not.

Cost Impact: This will increase cost of construction when a contractor installing firestopping does not understand the zero tolerance protocol for firestopping. It will not increase the cost of construction when a contractor knowledgeable in the zero tolerance protocol for firestopping is used.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM E2174-09 and ASTME E2393-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1704.15 (New), Chapter 35

Proponent: William E. Koffel, Koffel Associates, Inc., representing Glazing Industry Code Committee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

1. Add new text as follows:

1704.15 Fire-resistant penetrations and joints. In buildings having occupied floors located more than 75 feet (22860 mm) above the lowest level of fire department vehicle access, special inspections for through penetrations, membrane penetration firestops, fire resistant joint systems, and perimeter fire barrier systems of the types specified in Sections 713.3.1.2, 713.4.1.2, 714.3 and 714.4 shall be in accordance with Sections 1704.15.1 or 1704.15.2.

1704.15.1 Penetration firestops. Inspections of penetration firestop systems of the types specified in Sections 713.3.1.2 and 713.4.1.2 shall be conducted by an approved inspection agency in accordance with ASTM E 2174.

1704.15.2 Fire-resistant joint systems. Inspection of fire resistant joint systems of the types specified in Sections 714.3 and 714.4 shall be conducted by an approved inspection agency in accordance with ASTM E 2393.

2. Add standards to Chapter 35 as follows:

ASTM International

E 2174-09	Standard Practice for On-Site Inspection of Installed Fire Stops
E 2393-09	Standard Practice for On-Site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barrier

Reason: Through penetration and joint firestop systems are critical to maintaining the fire resistance rating of fire resistance rated construction, including fire barriers, smoke barriers, and fire resistance rated horizontal assemblies. Every construction trade has very unique requirements that are specific to that trade, with technical knowledge built through cumulative continued work in the trade. Firestopping is no different. The concept has been proposed in the past and some felt the scope was too broad. Therefore, the scope of the proposed requirement has been limited to high-rise buildings.

In order to meet the requirements of a listed firestop system from the UL Fire Resistance, Intertek, FM Approvals or other testing laboratory directories, a 'zero tolerance' systems installation protocol is needed, or a system can be violated and rendered ineffective. The violation can be as small as a minor annular space size variance, joint width exceeding system requirements, penetrating item size or type not as listed. There are no typical 'construction tolerances' allowed in firestopping for fire and life safety.

Firestop Systems must be selected from the listing directories, then applied in the correct manner, in the right place. With endless variations to penetrating items, hole sizes and shapes, plus the classified systems to restore the fire ratings, firestop systems selection looks easy to the untrained eye.

The UL Fire Resistance Directories have over 8,500 listed firestop systems, each with variations that multiplies possible systems for a building exponentially. Systems selection is not a 'generic process'. Systems selection is an exacting exercise by skilled contractors who submit appropriate systems for approval, then communicate these systems to the educated firestop – containment workers they employ….which becomes the inspection document for a qualified inspector of firestop systems to leading documents such as International Accreditation Services Accreditation Criteria, AC 291, section 6.11, Firestop Systems.

Should a penetration or joint condition in the field vary from the system design listing from the directories, the firestop system may not perform as intended, opening risk to the structure, and the occupants on the other side of the fire. Structurally, the floor, floor-ceiling or wall assemblies are not tested with unprotected holes with penetrating items or joints allowing fire attack to take place from both sides at once. They are tested with fire attack from one side, with all openings and penetrating items and joints firestopped.

On construction projects, there are three ways firestopping is installed currently. First, the 'he or she who pokes the hole fills it with firestopping' takes place, about 1/3 the time. A specialty firestop contractor installs for about another 1/3 of installations. The final 1/3 is a combination of specialty firestop contractors and the 'he or she who pokes the hole fills it' method. In other words, about ½ of the installations are installed by companies who most likely do not understand firestop systems selection nor the zero tolerance installation protocol. And, with the 20+ trades who potentially touch firestopping, many who perform the work as a 'sideline', the potential for a mistake increases exponentially when inexperienced companies install firestopping. However, firestopping is a complex operation, just like any other trade. Mastering more than one trade by attending a 30 minute to 16 hour class is nearly impossible for workers of any trade background.

In simple terms, inadequate firestopping makes the fire resistance rated floor or wall assembly become swiss cheese like, and not representative of testing. The risks of inadequate firestopping are apparent due to the many trades who install firestopping as a sideline…who just don't get the 'zero tolerance' systems oriented approach needed to get firestopping done right. Inspection to ASTM E 2174 and ASTM E 2393 brings a needed check to this important discipline, whether a FCIA Member specialty firestop contractor is installing or not.

Cost Impact: This will increase cost of construction when a contractor installing firestopping does not understand the zero tolerance protocol for firestopping. It will not increase the cost of construction when a contractor knowledgeable in the zero tolerance protocol for firestopping is used.

S129–09/10

1613.4, 1705.1, 1705.2, 1705.3-1705.3.6, 1705.4-1705.4.2, 1707.1, 1708.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

1. Revise as follows:

1705.1 General. Where special inspection or testing is required by Section 1704, 1706, 1707 or 1708, the registered design professional in responsible charge shall prepare a statement of special inspections in accordance with Section 1705 for submittal by the permit applicant (see Section 1704.1.1).

1705.2 Content of statement of special inspections. The statement of special inspections shall identify the following:

1. The materials, systems, components and work required to have special inspection or testing by the building official or by the registered design professional responsible for each portion of the work.
2. The type and extent of each special inspection.
3. The type and extent of each test.
4 Additional requirements for special inspection or testing for seismic or wind resistance as specified in Sections ~~1705.3, 1705.4~~ 1706, 1707, ~~or~~ and 1708.
5. For each type of special inspection, identification as to whether it will be continuous special inspection or periodic special inspection.

2. Delete without substitution:

~~**1705.3 Seismic resistance.** The statement of special inspections shall include seismic requirements for cases covered in Sections 1705.3.1 through 1705.3.5.~~

~~**Exception:** Seismic requirements are permitted to be excluded from the statement of special inspections for structures designed and constructed in accordance with the following:~~

1. ~~The structure consists of light-frame construction; the design spectral response acceleration at short periods, S_{DS}, as determined in Section 1613.5.4, does not exceed 0.5 g; and the height of the structure does not exceed 35 feet (10 668 mm) above grade plane; or~~
2. ~~The structure is constructed using a reinforced masonry structural system or reinforced concrete structural system; the design spectral response acceleration at short periods, S_{DS}, as determined in Section 1613.5.4, does not exceed 0.5g, and the height of the structure does not exceed 25 feet (7620 mm) above grade plane; or~~
3. ~~Detached one- or two-family dwellings not exceeding two stories above grade plane, provided the structure does not have any of the following plan or vertical irregularities in accordance with Section 12.3.2 of ASCE 7:~~
   - ~~3.1. Torsional irregularity.~~
   - ~~3.2. Nonparallel systems~~
   - ~~3.3. Stiffness irregularity–extreme soft story and soft story.~~
   - ~~3.4. Discontinuity in capacity–weak story.~~

~~**1705.3.1 Seismic-force-resisting systems.** The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, in accordance with Section 1613.~~

~~**Exception:** Requirements for the seismic-force resisting system are permitted to be excluded from the statement of special inspections for steel systems in structures assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.~~

~~**1705.3.2 Designated seismic systems.** Designated seismic systems in structures assigned to Seismic Design Category D, E or F.~~

~~**1705.3.3 Seismic Design Category C.** The following additional systems and components in structures assigned to Seismic Design Category C:~~

1. ~~Heating, ventilating and air-conditioning (HVAC) ductwork containing hazardous materials and anchorage of such ductwork.~~
2. ~~Piping systems and mechanical units containing flammable, combustible or highly toxic materials.~~
3. ~~Anchorage of electrical equipment used for emergency or standby power systems.~~

~~**1705.3.4 Seismic Design Category D.** The following additional systems and components in structures assigned to Seismic Design Category D:~~

1. ~~Systems required for Seismic Design Category C.~~
2. ~~Exterior wall panels and their anchorage.~~
3. ~~Suspended ceiling systems and their anchorage.~~
4. ~~Access floors and their anchorage.~~
5. ~~Steel storage racks and their anchorage, where the importance factor is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.~~

~~**1705.3.5 Seismic Design Category E or F.** The following additional systems and components in structures assigned to Seismic Design Category E or F:~~

~~1. Systems required for Seismic Design Categories C and D.~~
~~2. Electrical equipment.~~

~~**1705.3.6 Seismic requirements in the statement of special inspections.** When Sections 1705.3 through 1705.3.6 specifies that seismic requirements be included, the statement of special inspections shall identify the following:~~

~~1. The designated seismic systems and seismic-force-resisting systems that are subject to special inspections in accordance with Sections 1705.3 through 1705.3.6.~~
~~2. The additional special inspections and testing to be provided as required by Sections 1707 and 1708 and other applicable sections of this code, including the applicable standards referenced by this code.~~

~~**1705.4 Wind resistance.** The statement of special inspections shall include wind requirements for all structures constructed in the following areas:~~

~~1. In wind Exposure Category B, where the 3-second-gust basic wind speed is 120 miles per hour (mph) (52.8 m/sec) or greater.~~
~~2. In wind Exposure Categories C or D, where the 3-second-gust basic wind speed is 110 mph (49 m/sec) or greater.~~

~~**1705.4.1 Wind requirements in the statement of special inspections.** When Section 1705.4 specifies that wind requirements be included, the statement of special inspections shall identify the main wind-force-resisting systems and wind-resisting components subject to special inspections as specified in Section 1705.4.2.~~

~~**1705.4.2 Detailed requirements.** The statement of special inspections shall include at least the following systems and components:~~

~~1. Roof cladding and roof framing connections.~~
~~2. Wall connections to roof and floor diaphragms and framing.~~
~~3. Roof and floor diaphragm systems, including collectors, drag struts and boundary elements.~~
~~4. Vertical wind-force-resisting systems, including braced frames, moment frames and shear walls.~~
~~5. Wind force-resisting system connections to the foundation.~~
~~6. Fabrication and installation of systems or components required to meet the impact-resistance requirements of Section 1609.1.2.~~

~~**Exception:** Fabrication of manufactured systems or components that have a label indicating compliance with the wind-load and impact-resistance requirements of this code.~~

3. Revise as follows:

1707.1 Special inspections for seismic resistance. Special inspections itemized in Sections 1707.2 through 1707.9, unless exempted by the exceptions of Section 1704.1~~, 1705.3 or 1705.3.1~~, are required for the following:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613.
2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F.
3. Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F that are required in Sections 1707.6 and 1707.7.

1708.1 Testing and qualification for seismic resistance. The testing and qualification specified in Sections 1708.2 through 1708.5, unless exempted from special inspection by the exceptions of Section 1704.1, ~~1705.3 or 1705.3.1~~ are required as follows:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613 shall meet the requirements of Sections 1708.2 and 1708.3, as applicable.
2. Designated seismic systems in structures assigned to Seismic Design Category C, D, E or F subject to the special certification requirements of ASCE 7 Section 13.2.2 are required to be tested in accordance with Section 1708.4.

3. Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F with an I_p = 1.0 are required to be tested in accordance with Section 1708.4 where the general design requirements of ASCE 7 Section 13.2.1, Item 2 for manufacturer's certification are satisfied by testing.
4. The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section 1708.5.

4. Delete without substitution:

~~**1613.4 Special inspections**. Where required by Sections 1705.3 through 1705.3.5, the statement of special inspections shall include the special inspections required by Section 1705.3.6.~~

Reason: The purpose for this proposal is to remove superfluous and conflicting text from Chapter 17. Section 1705.1 requires the registered design professional in responsible charge to prepare a statement of special inspections where special inspections or tests are required elsewhere in Chapter 17. Section 1705.2 specifies the required content of the statement of special inspections, including but not limited to: (1) the type and extent of each special inspection, (2) the type and extent of each test, (3) the additional requirements for special inspections and tests for seismic and wind resistance, and (4) for each type of special inspection, whether it is to be continuous or periodic.

Section 1704 specifies the required special inspections and tests for all structures. Sections 1707 and 1708 specify additional required special inspections and tests for structures on sites of high seismic hazard (assigned to Seismic Design Category C, D, E or F. Section 1706 specifies additional required special inspections and tests for structures on sites of high wind hazard (basic wind speed, V_{3S}, of 110 mph or greater for Exposure Categories C and D and 120 mph for Exposure Category B).

With the requirements described above, the text in Sections 1705.3 through 1705.4.2 serves no purpose other than to repeat much of what is already specified elsewhere in Chapter 17 but these sections also contain numerous conflicts. Section 1705.2 requires the type and extent of each special inspection and test to be specified in the statement of special inspections. Sections 1705.3 through 1705.4.2, however, specify numerous thresholds that must be met before certain special inspections or tests are specified and exempt several that Section 1705.2 requires to be specified in the statement. Sections 1705.3 through 1705.4.2 also create numerous potential conflicts with the required inspections in Sections 1704. 1706, 1707 and 1708 by not requiring an otherwise required special inspection or test to be included in the statement of special inspections. There are several instances where a special inspection or test is required by Section 1704. 1706, 1707 or 1708 to be performed and is required by Section 1705.2 to be included in the statement of special inspections but is not required to be included in the statement of special inspections by Section 1705.3 or 1705.4. Examples are noted below.

The charging text of Sections 1705.3 (seismic) and 1705.4 (wind) each requires the statement of special inspections to include seismic requirements and wind requirements, respectively. This can be nothing more than a requirement for what is to be specified in the statement of special inspections. It can not be a requirement for the actual special inspections or tests, which are specified in Sections 1704, 1706, 1707 and 1708.

Section 1613.4 requires the statement of special inspections to include the special inspections required by Section 1705.3.6 and Item #2 of this section requires the additional special inspections and tests of Sections 1707 and 1708 to be specified in the statement but this is superfluous in that the requirement is already specified in Item #4 of Section 1705.2.

Note that this proposal corrects inadvertent errors by adding Section 1706 to Section 1705.1 and to Item 4 of Section 1705.2.

Although Section 1705.3 is being deleted by this proposal, modifications to this section are the subject of a separate proposal. Should both proposals be approved by the ICC membership, it is the intent of the proponent to modify this section in accordance with the separate proposal, not to delete it in accordance with this proposal.

Although Sections 1705.3.6 and 1705.4.1 are being deleted by this proposal, modifications to these sections are the subject of a separate proposal. Should both proposals be approved by the ICC membership, it is the intent of the proponent to modify these sections in accordance with the separate proposal, not to delete them in accordance with this proposal.

The following are examples of conflicts between thresholds in Section 1705.3 or 1705.4 and Section 1704. 1706, 1707 or 1708:

1. Section 1705.1, Exception 1, exempts the seismic requirements of structures of light-frame construction with a maximum S_{DS} of 0.5 and a maximum height above grade plane of 35 feet from being included in the statement but Sections 1707.1(1) and 1708.1(2) exempt the seismic-force-resisting systems of all structures assigned to SDC A and B from special inspection and testing, respectively.
2. Section 1705.1, Exception 2, exempts the seismic requirements of reinforced concrete and masonry structural systems of structures with a maximum S_{DS} of 0.5 and a maximum height above grade plane of 25 feet from being included in the statement but Sections 1707.1(1) and 1708.1(2) exempt the seismic-force-resisting systems of all structures assigned to SDC A and B from special inspection and testing, respectively.
3. Section 1705.3.3(2) specifies seismic requirements for piping systems and mechanical units containing flammable, combustible or highly toxic materials be included in the statement but Section 1707.7(3) requires special inspection for piping systems and "**their associated**" (emphasis mine) mechanical units.
4. Section 1705.3.4(2) specifies seismic requirements for exterior wall panels and their anchorage be included in the statement but Section 1707.6 requires special inspection for exterior cladding, nonbearing walls and veneer greater than 30 feet above grade or a walking surface except for exterior cladding and veneer weighing 5 psf or less.
5. Section 1705.3 does not specify seismic requirements for interior wall panels be included in the statement but Section 1707.6 requires special inspection for interior nonbearing walls and veneer greater than 30 feet above grade or a walking surface except for interior veneer weighing 5 psf or less and interior nonbearing walls weighing 15 psf or less.
6. Section 1705.3.4(3) specifies seismic requirements for suspended ceiling systems and their anchorage be included in the statement but Sections 1704, 1707 1708 do not require special inspection or testing for them.
7. Section 1705.3.4(5) specifies seismic requirements for steel storage racks and their anchorage be included in the statement where the importance factor, *I*, is required by ASCE 7 Section 15.5.3 to be 1.5 (e.g., open to the public) but Section 1707.5 requires special inspection for storage rack 8 feet or greater in height.
8. Section 1705.3 does not specify seismic requirements for seismic isolation systems be included in the statement but Sections 1707.9 and 1708.5 require special inspection and testing, respectively.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S33-1613.4

S130–09/10
1705.3.1
Proponent: Bonnie Manley, representing American Iron and Steel Institute

Revise as follows:

1705.3.1 Seismic-force-resisting systems. The seismic force- resisting systems in structures assigned to *Seismic Design Category* C, D, E or F, in accordance with Section 1613.

> **Exception:** Requirements for the seismic-force-resisting system are permitted to be excluded from the statement of special inspections for steel systems in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 ~~or less~~, excluding cantilever column systems.

Reason: This slight modification corrects the statement to reflect only those buildings and structures designed as "Steel systems not detailed specifically detailed for seismic resistance, excluding cantilever column systems," per ASCE 7, Table 12.2-1, Line H. Similar modifications are recommended in Sections 1707.2 and 1708.3**.**

Cost Impact: There is no anticipated impact on the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Manley-S14-1705.3.1

S131–09/10
1705.3.4

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1705.3.4 Seismic Design Category D. The following additional systems and components in structures assigned to Seismic Design Category D:

1. Systems required for Seismic Design Category C.
2. Exterior wall panels and their anchorage.
3. ~~Suspended ceiling systems and their anchorage~~.
4. Access floors and their anchorage.
5. Steel storage racks and their anchorage, where the importance factor is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.

Reason: Based upon IBC Section 1613.1 that specifically states that the building code does not adopt ASCE 7-05 Appendix Chapter 11A, where the special inspection requirements for suspended ceilings are located, it appears reasonable to omit suspended ceiling systems from the list of items that should have special inspection. The very simple and straightforward seismic requirements in ASCE 7-05 Section 13.5.6.2.2 and the ASTM and CISCA standards for installation of suspended ceilings, can easily be inspected by the traditional local government building inspectors. Finally, ICC staff written responses to inquires on this matter have indicated that the building code does not require special inspection of suspended ceiling systems because it specifically does not adopt ASCE 7 Appendix Chapter 11A.

Cost Impact: This code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-S4-1705.3.4

S132–09/10
1705.3.6, 1705.4.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

~~1705.3.6~~ 1705.3 Seismic requirements in the statement of special inspections. ~~When Sections 1705.3 through 1705.3.5 specify that~~ Where Section 1707 or 1708 specifies special inspection, testing or qualification for seismic ~~requirements be included~~ resistance, the statement of special inspections shall identify the ~~following:~~

1. ~~The~~ designated seismic systems and seismic-force-resisting systems that are subject to special inspection~~s in accordance with Sections 1705.3 through 1705.3.5~~.
2. ~~The additional special inspections and testing to be provided as required by Sections 1707 and 1708 and other applicable sections of this code, including the applicable standards referenced by this code.~~

~~1705.4.1~~ 1705.4 Wind requirements in the statement of special inspections. ~~When Section 1705.4~~ Where Section 1706 specifies ~~that~~ special inspection for wind requirements ~~be included~~, the statement of special inspections shall identify the main wind-force-resisting systems and wind-resisting components subject to special inspection~~s as specified in Section 1705.4.2~~.

Reason: This proposal is being submitted in conjunction with a proposal to delete superfluous and conflicting text from Chapter 17. That proposal deletes Sections 1705.3 through 1705.4.2, which specify certain seismic and wind requirements to be included in the statement of special inspections. However, these sections overlap or conflict with Section 1705.2, which also specifies what is to be included in the statement of special inspections, and with Sections 1704, 1706, 1707 and 1708, which specify required special inspections and tests.

In spite of this, it appears that retaining the substance of Section 1705.3.6, which requires the seismic-force-resisting systems and designated seismic systems, and Section 1705.4.1, which requires the main wind-force-resisting systems and wind-resisting components, to be identified in the statement of special inspections will contribute to a better understanding of the portions of the structural system where special inspection, testing or qualification is required.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S18-1705.3

S133–09/10
1702.1, 1707.1, 1707.8, 1707.6, 1707.5, 1707.7, 1707.9

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1702.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

DESIGNATED SEISMIC SYSTEM. Those ~~architectural, electrical and mechanical systems and their~~ nonstructural components that require design in accordance with Chapter 13 of ASCE 7 and for which the component importance factor, I_p, is greater than 1 in accordance with Section 13.1.3 of ASCE 7.

1707.1 Special inspections for seismic resistance. Special inspections itemized in Sections 1707.2 through 1707.9, unless exempted by the exceptions of Section 1704.1, 1705.3 or 1705.3.1, are required for the following:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613, in accordance with Sections 1707.2 through 1707.4, as applicable.
2. Designated seismic systems in structures assigned to Seismic Design Category C, D, E or F in accordance with Section 1707.5.
3. Architectural, mechanical and electrical components ~~in structures assigned to Seismic Design Category C, D, E or F that are required~~ in accordance with Sections 1707.6 and 1707.7.
4. Storage racks in structures assigned to Seismic Design Category D, E or F in accordance with Section 1707.8.
5. Seismic isolation systems in accordance with Section 1707.9.

~~**1707.8**~~ **1707.5 Designated seismic system~~s~~ ~~verifications~~.** The special inspector shall examine designated seismic systems requiring seismic qualification in accordance with Section 1708.4 and verify that the label, anchorage or mounting conforms to the certificate of compliance.

~~**1707.5**~~ **1707.6.1 ~~Storage racks and~~ Access floors.** Periodic special inspection is required ~~during~~ for the anchorage of access floors ~~and storage racks 8 feet (2438 mm) or greater in height~~ in structures assigned to Seismic Design Category D, E or F.

1707.7 Mechanical and electrical components. Special inspection for mechanical and electrical ~~equipment~~ components shall be as follows:

1. Periodic special inspection is required during the anchorage of electrical equipment for emergency ~~or~~ and standby power systems in structures assigned to Seismic Design Category C, D, E or F;
2. Periodic special inspection is required during the installation of anchorage of other electrical equipment in structures assigned to Seismic Design Category E or F;
3. Periodic special inspection is required during installation of piping systems intended to carry flammable, combustible or highly toxic contents and their associated mechanical units in structures assigned to Seismic Design Category C, D, E or F;
4. Periodic special inspection is required during the installation of HVAC ductwork that will contain hazardous materials in structures assigned to Seismic Design Category C, D, E or F; and
5. Periodic special inspection is required during the installation of vibration isolation systems in structures assigned to Seismic Design Category C, D, E or F where the construction documents require a nominal clearance of 1/4 inch (6.4 mm) or less between the equipment support frame and restraint.

1707.8 Storage racks. Periodic special inspection is required for the anchorage of storage racks 8 feet (2438 mm) or greater in height in structures assigned to Seismic Design Category D, E or F.

1707.9 Seismic isolation system. Periodic special inspection ~~is required~~ shall be provided for seismic isolation systems during the fabrication and installation of isolator units and energy dissipation devices ~~that are part of the seismic isolation system~~.

Reason: The purpose for this proposal is to correlate IBC Section 1707 with ASCE 7-10. In Section 1702.1, the definition of "designated seismic system" is changed for consistency with the revised definition in Section 11.2 of ASCE 7-10.

In Item #2 of Section 1707.1 on special inspection of designated seismic systems, Seismic Design Category C is added for consistency with Item #2 of Section 1708.1 on testing of designated seismic systems, which specifies Seismic Design Category C, and references to the requirements for certification in Section 13.2.2 of ASCE 7, which also specifies Seismic Design Category C.

In Section 1707.1, Item #3 is revised to eliminate superfluous text and avoid potential conflicts. The reference to Seismic Design Category D, E or F is deleted in favor of the references to seismic design categories in Sections 1707.6 and 1707.7 and because these sections do not "require" the components as Item #3 currently states.

Section 1707.5 on storage racks and access floors is changed to Section 1707.6.1 on access floors and Section 1707.8 on storage racks because ASCE 7 identifies access floors as architectural components (Section 13.5.7) and steel storage racks as nonbuilding structures (Section 15.5.3). In Section 1707.1, Item #4 is added for storage racks, which are currently not accounted for in the items of Section 1707.1 except indirectly by Item #1 of Section 1707.1.

In Section 1707.1, Item #5 on seismic isolation systems is added because the other items do not clearly account for them. Section 1707.9 is revised because the current text is nonmandatory. It is also not clear with respect to the seismic design category and the changes will make it clear that periodic special inspection is required for seismic isolation systems in structures regardless of which seismic design category the structure is assigned.

In Section 1707.7, mechanical and electrical "equipment" is changed to "components" for consistency with Section 13.6 of ASCE 7 on mechanical and electrical components and because the items in the section are not limited to equipment but also include piping systems, HVAC ductwork and vibration isolation systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S27-1702.1

S134–09/10
1705.3, 1707.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1707.1 Special inspections for seismic resistance. *Special inspections* itemized in Sections 1707.2 through 1707.9, unless exempted by the exceptions of Section 1704.1, 1705.3, or 1705.3.1, are required for the following:

1. The seismic-force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F, as determined in Section 1613.
2. Designated seismic systems in structures assigned to *Seismic Design Category* D, E or F.
3. Architectural, mechanical and electrical components in structures assigned to *Seismic Design Category* C, D, E or F that are required in Sections 1707.6 and 1707.7.

~~**1705.3 Seismic resistance.** The statement of special inspections shall include seismic requirements for cases covered in Sections 1705.3.1 through 1705.3.5.~~

Exception: ~~Seismic requirements are permitted to be excluded from the statement of special inspections~~ Special inspections itemized in Sections 1707.2 through 1707.9 are not required for structures designed and constructed in accordance with one of the following:

1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, S_{DS}, as determined in Section 1613.5.4, does not exceed 0.5 ~~g~~; and the building height of the structure does not exceed 35 feet (10 668 mm) ~~above grade plane; or~~.
2. The seismic-force-resisting system of the structure ~~is constructed using a~~ consists of reinforced masonry ~~structural system~~ or reinforced concrete ~~structural system~~; the design spectral response acceleration at short periods, S_{DS}, as determined in Section 1613.5.4, does not exceed 0.5 ~~g~~; and the building height of the structure does not exceed 25 feet (7620 mm) ~~above grade plane; or~~.
3. The structure is a detached one- or two-family dwelling~~s~~ not exceeding two stories above grade plane~~,~~ ~~provided the structure~~ and does not have any of the following ~~plan~~ horizontal or vertical irregularities in accordance with Section ~~12.3.2~~ 12.3 of ASCE 7:
   - 3.1. Torsional or extreme torsional irregularity.
   - 3.2. Nonparallel systems irregularity.
   - 3.3. ~~Stiffness irregularity-extreme~~ Stiffness-soft story ~~and~~ or stiffness-extreme soft story irregularity.
   - 3.4. Discontinuity in ~~capacity~~ lateral strength-weak story irregularity.

Reason: This proposal is being submitted in conjunction with a proposal to delete superfluous and conflicting text from Chapter 17. That proposal deletes Sections 1705.3 through 1705.4.2, which specify certain seismic and wind requirements to be included in the statement of special inspections. However, these sections overlap or conflict with Section 1705.2, which also specifies what is to be included in the statement of special inspections, and with Sections 1704, 1706, 1707 and 1708, which specify required special inspections and tests.

In spite of this, it appears the exceptions to Section 1705.3, which exempt the seismic requirements of certain structures from being included in the statement of special inspections, are intended to be exemptions from the special inspections for seismic resistance in Section 1707. The purpose for this proposal is to relocate these exceptions to Section 1707 so that they will serve their apparent purpose.

The proposal includes several editorial revisions. In Exceptions #1 and #2, "height" is changed to "building height" for consistency with the definition of "building height" in Section 502.1 the charging text of which makes the defined term applicable throughout the IBC, including the structural chapters. With this change, the reference to "above grade plane" becomes superfluous because it is included in the definition of "building height" and is deleted.

In Exception #2, "structural system," which has no technical meaning, is replaced with "seismic-force-resisting system," which is defined in Section 1613.2. In Exception #3, several changes are made for consistency with Tables 12.3-1 and 12.3.2 of ASCE 7-10 on horizontal and vertical structural irregularities, respectively.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S35-1705.3

S135–09/10
1707.2

Proponent: Bonnie Manley, representing American Iron and Steel Institute

Revise as follows:

1707.2 Structural steel. *Special inspection* for structural steel shall be in accordance with the quality assurance ~~plan~~ requirements of AISC 341.

Exceptions:

1. *Special inspections* of structural steel in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 ~~or less~~, excluding cantilever column systems.
2. For ordinary moment frames, ultrasonic and magnetic particle testing of complete joint penetration groove welds are only required for demand critical welds.

Reason: The first editorial modification tightens up the reference to AISC 341 and the second modification in the exception corrects the requirement to reflect only those buildings and structures designed as "Steel systems not detailed specifically detailed for seismic resistance, excluding cantilever column systems," per ASCE 7, Table 12.2-1, Line H. Similar modifications are recommended in Sections 1705.3.1 and 1708.3.

Cost Impact: There is no anticipated impact on the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Manley-S6-1707.2

S136–09/10
1707.2

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

Revise as follows:

1707.2 Structural steel. *Special inspection* for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341.

Exception~~s~~:

1. ~~1.~~ *Special inspections* of structural steel in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.
2. ~~2. For ordinary moment frames, ultrasonic and magnetic particle testing of complete joint penetration groove welds are only required for demand critical welds.~~

Reason: This exception was new to the 2009 IBC and was added in the public comment on S128-07/08. Intended as a temporary solution, its purpose was to make 2009 IBC consistent with what had been proposed for the 2010 edition of AISC 341. A separate proposal recommends the adoption of the 2010 edition of AISC 341. Since AISC 341-10 now addresses this issue, the exception is no longer needed. A similar modification is recommended in Section 1708.3.

Please note, public review drafts of the 2010 AISC documents can be found on the AISC website (www.aisc.org). The public review period for AISC 360-10 is currently scheduled for 8/14/09 through 9/28/09 and the public review period for AISC 341-10 is currently scheduled for 9/11/09 through 10/26/09. It is anticipated that the 2010 editions of both AISC 360 and AISC 341 will be technically complete by the end of October 2009, with ANSI approval in March 2010 and publication in August 2010.

Cost Impact: There is no anticipated impact on the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Manley-S7-1707.2

1708, 1708.1, 1708.4, 1708.5

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

SECTION 1708
~~STRUCTURAL~~ TESTING AND QUALIFICATION FOR SEISMIC RESISTANCE

1708.1 Testing and qualification for seismic resistance. The testing and qualification specified in Sections 1708.2 through 1708.5, unless exempted from special inspection by the exceptions of Section 1704.1, 1705.3 or 1705.3.1, are required as follows:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613 shall meet the requirements of Sections 1708.2 and 1708.3, as applicable.
2. Designated seismic systems in structures assigned to Seismic Design Category C, D, E or F and subject to the ~~special~~ certification requirements of ASCE 7 Section 13.2.2 ~~are required to be tested in accordance~~ shall comply with Section 1708.4.
3. Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F ~~with an I_p = 1.0 are required to be tested in accordance with Section 1708.4~~ and where the ~~general design~~ requirements of ASCE 7 Section 13.2.1~~, Item 2 for~~ are met by submittal of manufacturer's certification ~~are satisfied by testing~~ in accordance with Item 2 therein shall comply with Section 1708.4.
4. The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section 1708.5.

1708.4 Seismic certification of nonstructural components. The registered design professional shall ~~state~~ specify on the construction documents the ~~applicable seismic certification~~ requirements for certification by analysis, testing or experience data for nonstructural components and designated seismic systems in accordance with Section 13.2 of ASCE 7, where such certification is required by Section 1708.1 ~~on the construction documents~~.

~~1. The manufacturer of each designated seismic system component subject to the provisions of ASCE 7 Section 13.2.2 shall test or analyze the component and its mounting system or anchorage and submit a certificate of compliance for review and acceptance by the registered design professional responsible for the design of the designated seismic system and for approval by the building official. Certification shall be based on an actual test on a shake table, by three-dimensional shock tests, by an analytical method using dynamic characteristics and forces, by the use of experience data (i.e., historical data demonstrating acceptable seismic performance) or by more rigorous analysis providing for equivalent safety.~~

~~2. Manufacturers certification of compliance for general design requirements of ASCE 7 Section 13.2.1 shall be based on analysis, testing or experience data.~~

1708.5 ~~Seismically isolated structures~~ Seismic isolation systems. ~~For required system tests, see~~ Seismic isolation systems shall be tested in accordance with Section 17.8 of ASCE 7.

Reason The purpose for this proposal is to correlate IBC Section 1708 with ASCE 7-10. The title of Section 1708 is changed for consistency with the title and charging text of Section 1708.1. Section 1708.5 is revised for consistency with Section 1707.9 on seismic isolation systems and because the current text is nonmandatory.

Section 1708.4 currently contains technical requirements for qualification (1) of certain architectural, mechanical and electrical components for which manufacturer's certification is utilized to comply with Section 13.2.1 of ASCE 7, and (2) of certain designated seismic systems for which manufacturer's certification is required by Section 13.2.2 of ASCE 7. Much of the IBC text, however, is duplicated in ASCE 7 and may also conflict with the corresponding text in ASCE 7. The technical requirements in ASCE 7 typically consist of analysis, shake table testing or experience data. It serves little purpose to duplicate these requirements in the IBC. The requirements for certification, however, should remain in the IBC and this proposal revises the text accordingly.

Items 2 and 3 of IBC Section 1708.1 are revised for consistency with Sections 13.2.2 and 13.2.1, respectively, of ASCE 7-10. Note that these sections have been revised in ASCE 7-10 by Proposals GPSC-5R2, SSC TC8-CH13-12-R3 and SSC TC9-CH13-01-R4.

Section 13.2.1 of ASCE 7 requires architectural, mechanical and electrical components, supports and attachments to comply with the provisions of the sections listed in Table 13.2-1 and to meet the requirements in Item 1 or Item 2 of Section 13.2.1. Item 2 requires the submittal of the manufacturer's certification that the component is seismically qualified.

Section 13.2.2 of ASCE 7 requires for certain designated seismic systems the submittal of the manufacturer's certification that the designated seismic system meets the specified requirements therein. According to its definition in IBC Section 1702.1 and Section 11.2 of ASCE 7-10, "designated seismic system" applies to architectural, mechanical and electrical components for which the component importance factor, I_p, is greater than 1.0. Designated seismic systems not required to comply with Section 13.2.2 will still be required to comply with Section 13.2.1.

The proposal was prepared in conjunction with a related proposal to correlate IBC Section 1707 with ASCE 7-10.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Brazil-S15-1708.1

S138–09/10
1708.3

Proponent: Bonnie Manley, representing American Iron and Steel Institute

Revise as follows:

1708.3 Structural steel. Testing for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341.

Exceptions~~:~~:

1. Testing for structural steel in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.
2. ~~For ordinary moment frames, ultrasonic and magnetic particle testing of complete joint penetration groove welds are only required for demand critical welds.~~

Reason: This exception was new to the 2009 IBC and was added in the public comment on S137-07/08. Intended as a temporary solution, its purpose was to make 2009 IBC consistent with what had been proposed for the 2010 edition of AISC 341. A separate proposal recommends the adoption of the 2010 edition of AISC 341. Since AISC 341-10 now addresses this issue, the exception is no longer needed. A similar modification is recommended in Section 1707.2.

Please note, public review drafts of the 2010 AISC documents can be found on the AISC website (www.aisc.org). The public review period for AISC 360-10 is currently scheduled for 8/14/09 through 9/28/09 and the public review period for AISC 341-10 is currently scheduled for 9/11/09 through 10/26/09. It is anticipated that the 2010 editions of both AISC 360 and AISC 341 will be technically complete by the end of October 2009, with ANSI approval in March 2010 and publication in August 2010.

Cost Impact: There is no anticipated impact on the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Manley-S9-1708.3

S139–09/10
1710.2, 1710.3

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1710.2 Structural observations for seismic resistance. Structural observations shall be provided for those structures assigned to Seismic Design Category D, E or F, as determined in Section 1613, where one or more of the following conditions exist:

1. The structure is classified as Occupancy Category III or IV in accordance with Section 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base.
3. The structure is assigned to Seismic Design Category E, is classified as Occupancy Category I or II in accordance with Section 1604.5 and is greater than two stories above grade plane.
4. ~~When so designated by the registered design professional responsible for the structural design.~~
5. ~~When such observation is specifically required by the building official.~~

1710.3 Structural observations for wind requirements. Structural observations shall be provided for those structures sited where the basic wind speed exceeds 110 mph (49 m/sec), determined from Figure 1609, where one or more of the following conditions exist:

1. The structure is classified as Occupancy Category III or IV in accordance with Table 1604.5.
2. The building height of the structure is greater than 75 feet (22 860 mm).
3. ~~When so designated by the registered design professional responsible for the structural design,~~
4. ~~When such observation is specifically required by the building official.~~

Reason: The IBC is a model code written with mandatory text that has the force of law when adopted by a jurisdiction. Violations are subject to penalties as prescribed by the laws of the jurisdiction and as specified in Section 114. In this regard, a requirement that the owner employ a registered design professional to perform structural observations should not be imposed based on a designation by the registered design professional responsible for the structural design. If the registered design professional responsible for the structural design believes that structural observation is warranted, they should convey their belief to their clients. The building code should not contain a requirement for what is primarily a private matter between registered design professionals and their clients.

A requirement that the owner employ a registered design professional to perform structural observations should also not be imposed where it is required by the building official. Sections 1710.2 and 1710.3 specify limits based on occupancy category or building height for which structural observation is required where the limits are exceeded. These requirements provide sufficient means for the building official to determine when structural observation is required. Additional authority on the part of the building official is not warranted. If it was warranted, the limits based on occupancy category or building height could be deleted and the determination could be solely based on the requirement of the building official without regard to occupancy category or building height.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S11-1710.2

S140–09/10
1715.5.1

Proponent: Thomas D. Culp, Ph.D. Birch Point Consulting LLC, representing Aluminum Extruders Council

Revise as follows:

1715.5.1 Exterior windows and doors. Exterior windows and sliding doors shall be tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440. The label shall state the name of the manufacturer, the approved labeling agency, and the product designation as specified in AAMA/WDMA/CSA101/I.S.2/A440. Exterior side-hinged doors shall be tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 or comply with Section 1715.5.2. Products <u>in buildings of Group R not more than three stories above grade plane</u> tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3.

Reason: Chapter 24 and ASTM E1300 require that glazing be firmly supported to prevent breakage under the design load by establishing maximum framing deflection limits. However, certain products are currently and inappropriately exempted from this requirement if they are labeled to the AAMA/WDMA/CSA 101/I.S.2/A440 standard. This proposal would remove that exemption to restore an appropriate safety margin of less than 8 in 1000 probability of glass breakage, consistent with ASTM E1300.

This proposal only applies to the IBC, and does not affect lighter products used when building to the IRC. However, in the last code cycle, the committee correctly pointed out that the IBC is also used for lowrise residential buildings, including both detached homes, townhomes, and apartments. Therefore, this proposal has been modified from last cycle to address the committee's concern by reinstating the exemption for low-rise residential buildings, but maintaining the structural deflection limit requirements for products in all other applications, as the top priority should be restoring a safety margin consistent with what is already in Chapter 24 and ASTM E1300.

Finally, the committee reason for disapproving the previous proposal stated that there is too much uncertainty to remove the exemption at this time. As the exemption increases the probability of glass breakage, we believe safety concerns would dictate that any exemption SHOULD be removed until any uncertainty is resolved.

Cost Impact: This proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CULP-S1-1714.5.1

S141–09/10
1715.5.1

Proponent: William E. Koffel, Koffel Associates, Inc., representing Glazing Industry Code Committee

Revise as follows:

1715.5.1 Exterior windows and doors. Exterior windows and sliding doors shall be tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440. The label shall state the name of the manufacturer, the approved labeling agency, and the product designation as specified in AAMA/WDMA/CSA101/I.S.2/A440. Exterior side-hinged doors shall be tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 or comply with Section 1715.5.2. Products installed in buildings of Group R not more than three stories above grade plane that are tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3.

Reason: The purpose of this proposal is to restrict the application of the exemption that fenestration products labeled to AAMA/WDMA/CSA 101/I.S.2/A440 do not have to meet the requirements of sections 2403.2 and 2403.3, which ensure safe performance through proper support of glass. Specifically, section 2403.3 requires that the deflection of framing members supporting glass may not exceed 1/175 of the glass edge length (or ¾ inch, whichever is less) when subjected to the design load. Chapter 24 of the IBC relies on glass design curves that are contained in ASTM E 1300. This ASTM standard recognizes the importance of limiting edge deflection of the glass and also recommends a limitation of 1/175 of the glass edge length. Prior to the IBC, the legacy codes required deflection limitations of 1/175 of the span for glass holding members. It was not until the IBC was published that this exemption was allowed.

AAMA/WDMA/CSA 101/I.S.2/A440 does require testing in accordance with ASTM E330 and measurement of deflection. However, AAMA/WDMA/CSA 101/I.S.2/A440 only places a limit on the frame and sash deflection for heavy commercial (HC) and architectural products (AW), and has no requirement on deflection for residential (R), light commercial (LC), and commercial (C) products. Excessive deflection of the frame or sash can have an adverse effect on stress in the glass and could result in glass breakage at or below design loads creating a safety concern. The single ASTM E330 load test required in AAMA/WDMA/CSA 101/I.S.2/A440 is not statistically significant in ensuring that the stress does not increase the probability of breakage beyond the industry standard of eight lites per thousand when the deflection limitation of 1/175 is exceeded. Although the deflection exemption remains in the IRC for residential buildings and as proposed in the IBC for low-rise residential, it is inappropriate to have an exemption for these products when used in more diverse and larger buildings built to the IBC. This proposal would ensure that an appropriate limit on frame deflection is placed on fenestration products from all performance classes. Because the deflection is already being measured for all these products (but not limited for R, LC, and C classes), there is no cost impact except for products which do not comply with this more conservative and appropriate requirement.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KOFFELL-S1-1714.5.1

S142-09/10
1715.5.2

Proponent: Joseph R. Hetzel, Thomas Associates Inc. representing the Door & Access Systems Manufacturers Association

Revise as follows:

1715.5.2 Exterior windows and door assemblies not provide for in Section 1715.5.1. Exterior window and door assemblies shall be tested in accordance with ASTM E 330. Structural performance of garage doors and rolling doors shall be determined in accordance with either ASTM E 330 or ANSI/DASMA 108, and shall meet the acceptance criteria of ANSI/DASMA 108. Exterior window and door assemblies containing glass shall comply with Section 2403. The design pressure for testing shall be calculated in accordance with Chapter 16. Each assembly shall be tested for 10 seconds at a load equal to 1.5 times the design pressure.

Reason: The purpose of the proposed code change is to expand the sentence on “garage doors” to include reference to “rolling doors”. The scope of ANSI/DASMA 108-2005, referenced in the 2009 IBC, encompasses both garage doors and rolling doors.

Cost Impact: The proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Hetzel-G1-1714.5.2

S143–09/10
1715.5.2, Chapter 35

Proponent: John Woestman, The Kellen Company, representing the Door Safety Council (DSC)

1. Add new text as follows:

1715.5.2 Exterior windows and door assemblies not provided for in Section 1715.5.1. Exterior window and door assemblies shall be tested in accordance with ASTM E 330. Structural performance of exterior side-hinged door assemblies shall be determined in accordance with either ASTM E330 or ANSI A250.13. Structural performance of garage doors shall be determined in accordance with either ASTM E 330 or ANSI/DASMA 108, and shall meet the acceptance criteria of ANSI/DASMA 108. Exterior window and door assemblies containing glass shall comply with Section 2403. The design pressure for testing shall be calculated in accordance with Chapter 16. Each assembly shall be tested for a minimum of 10 seconds at a load equal to 1.5 times the design pressure.

2. Add new standard to Chapter 35 as follows:

ANSI
ANSI A250.13-08 Testing and Rating of Severe Windstorm Resistant Components for Swinging Door Assemblies

Reason: This proposal helps resolve performance and code compliance issues when exterior side-hinged door openings are comprised of components from multiple sources and include interchangeable elements (ie; doors, frames, hinging and latching hardware, etc.).

Through the ANSI standards development process, stake-holders, comprising most major manufacturing associations, testing and certification organizations, specifiers, code officials and end users, developed a national standard for a component-based approach to testing for windstorm resistance of swinging door openings. The test procedures used in this standard represent the most severe requirements found in the windstorm resistance standards referenced in today's building codes. These procedures are designed to isolate the loads, conditions and critical performance requirements that a particular component is subjected to in full assembly tests and duplicate these specific conditions. Using a combination of worst-case scenario design and safety factors, this standard is designed to provide a component rating that relates directly to the component's ability to withstand the conditions that occur in full assembly tests.

This proposed change allows an alternative method to demonstrate structural performance for side-hinged door openings by requiring components to be tested per ANSI A250.13-2008. A250.13 contains language that prescribes how components are to be selected to create complete swinging door openings expected to perform equivalently to those tested to ASTM E 330. ANSI A250.13 has additional requirements that are more stringent than those in the current 1714.5.2, including testing for a minimum of 30 seconds at a load equal to 1.5 times the design pressure. Currently 1714.5.2 requires testing for 10 seconds at a load equal to 1.5 times the design pressure.

Prior to releasing the current revision, validation tests were performed at three design-load levels, using the A250.13 test protocol to establish performance ratings. The study confirmed that at the same design-load level, openings comprised of such components will perform in the same manner as those in assembly based test protocols. The validation tests also showed that where an element was identified as the weakest in an opening during component testing, it would perform similarly when tested as part of an assembly at the same design-load.

Building designers will use the performance based criteria of ANSI A250.13 to select appropriate components to construct swinging door openings by conducting the presently required opening-by-opening design analysis, verify code compliance, and submit the results through the normal plans review process. Code authorities will therefore need only to verify the design load calculations and compliance analysis are correct and that ANSI A250.13 compliant products are utilized and installed in accordance with the manufacturer's instructions during construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI A250 13-08 for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1715.6 (New), 202; IRC R308.6.1

Proponent: Julie Ruth, PE, JRuth Code Consulting, representing American Architectural Manufacturers Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows:

SECTION 202

SKYLIGHT, UNIT. A factory-assembled, glazed fenestration unit, containing one panel of glazing material that allows for natural lighting through an opening in the roof assembly while preserving the weather-resistant barrier of the roof. Unit skylights include, but are not limited to, tubular daylighting devices (TDDs).

2. Add new text as follows:

1715.6 Skylights and sloped glazing. Unit skylights shall comply with the requirements of Section 2405. All other skylights and sloped glazing shall comply with the requirements of Chapter 24.

(Renumber subsequent sections)

PART II – IRC BUILDING/ENERGY

Revise as follows:

R308.6.1 Definitions.

~~**UNIT SKYLIGHT**~~ **SKYLIGHT, UNIT.** A factory assembled, glazed fenestration unit, containing one panel of glazing material, that allows for natural daylighting through an opening in the roof assembly while preserving the weather-resistant barrier of the roof. Unit skylights include, but are not limited to, tubular daylighting devices (TDDs).

Reason:
PART I- This proposal clarifies that tubular daylighting devices (TDDs) are unit skylights and therefore subject to the testing and labeling requirements of Section 2405 for these devices. It also points the code user to the appropriate location in the IBC for the structural requirements for unit skylights, TDDs and all other types of sloped glazing.
PART II- This proposal clarifies that tubular daylighting devices (TDDs) are unit skylights and therefore subject to the testing and labeling requirements of the IRC for same.

Cost Impact: The code change will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

ICCFILENAME: RUTH-G1-202

S145–09/10
1716.1, 2303.1, 2303.5, 2304.9.3

Proponent: Randall Shackelford, PE, representing Simpson Strong-Tie Co.

1. Revise as follows:

2303.1 General. Structural sawn lumber; end-jointed lumber; prefabricated wood I-joists; structural glued-laminated timber; wood structural panels, fiberboard sheathing (when used structurally); hardboard siding (when used structurally); particleboard; preservative-treated wood; structural log members; structural composite lumber; round timber poles and piles; fire-retardant-treated wood; hardwood plywood; wood trusses; ~~joist hangers;~~ nails; and staples shall conform to the applicable provisions of this section.

2304.9.3 Joist hangers and framing anchors. Connections depending on joist hangers or framing anchors, ties and other mechanical fastenings not otherwise covered are permitted where approved. ~~The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with Section 1716.1.~~

2. Delete without substitution:

~~**1716.1 Test standards for joist hangers and connectors.**~~

~~**1716.1.1 Test standards for joist hangers.** The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D1761 using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AF&PA NDS for the joist and headers.~~

~~**Exception:** The joist length shall not be required to exceed 24 inches (610 mm).~~

~~**1716.1.2 Vertical load capacity for joist hangers.** The vertical load capacity for the joist hanger shall be determined by testing a minimum of three joist hanger assemblies as specified in ASTM D 1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load of the joist hanger shall be the lowest value determined from the following:~~

1. ~~The lowest ultimate vertical load for a single hanger from any test divided by three (where three tests are conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).~~
2. ~~The average ultimate vertical load for a single hanger from all tests divided by three (where six or more tests are conducted).~~
3. ~~The average from all tests of the vertical loads that produce a vertical movement of the joist with respect to the header of 0.125 inch (3.2 mm).~~
4. ~~The sum of the allowable design loads for nails or other fasteners utilized to secure the joist hanger to the wood members and allowable bearing loads that contribute to the capacity of the hanger.~~
5. ~~The allowable design load for the wood members forming the connection.~~

~~**1716.1.3 Torsional moment capacity for joist hangers.** The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D 1761. The allowable torsional moment of the joist hanger shall be the average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is 0.125 inch (3.2 mm).~~

~~**1716.1.4 Design value modifications for joist hangers.** Allowable design values for joist hangers that are determined by Item 4 or 5 in Section 1716.1.2 shall be permitted to be modified by the appropriate duration of loading factors as specified in AF&PA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section 1716.1.2. Allowable design values determined by Item 1, 2 or 3 in Section 1716.1.2 shall not be modified by duration of loading factors.~~

(Renumber subsequent sections)

~~**2303.5 Test standard for joist hangers and connectors.** For the required test standards for joist hangers and connectors, see Section 1716.1.~~

(Renumber subsequent sections)

Reason: The purpose of this code change is to delete current material that references outdated test standards.

Section 1716.1 was originally added into the code before there were ICC-ES acceptance criteria for joist hangers or other types of connectors. It was needed to give connector manufacturers guidance on how to load rate their products.

Now, however, there are several ICC-ES acceptance criteria for joist hangers and other types of connectors, so this language is no longer needed. For example, AC13 covers "joist hangers, framing anchors and similar devices".

In addition, this section references ASTM D 1761 as the test standard for joist hangers. This was the correct standard in the past. But in the 2009 IBC, ASTM D 1761 has been updated to the 2006 edition, which does not cover testing of joist hangers. Since this test standard no longer describes how to test a joist hanger, this section is not correct as written.

Joist hangers and framing anchors will still have to be approved by the Building Official per Section 2304.9.3.

Cost Impact: This proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHACKELFORD-S1-1716.1

S146–09/10
1801.1; IEBC 1202.2

Proponent: Patrick Vandergriff, Vandergriff Code Consulting Services representing Modular Building Institute

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE STRUCTURAL COMMITTEE.

PART I- IBC STRUCTURAL

Revise as follows:

1801.1 Scope. The provisions of this chapter shall apply to building and foundation systems.

Exception: Foundations and foundation connections for temporary structures shall comply with manufacturers design details or an engineered design.

PART II- IEBC

Revise as follows:

1202.2 Foundation. The foundation system of relocated buildings shall comply with the *International Building Code* or the *International Residential Code* as applicable.

Exception: Foundations for temporary structures shall be permitted to be of any material allowed by this code in accordance with manufacturers design details or an engineered design.

1202.2.1 Connection to the foundation. The connection of the relocated building to the foundation shall comply with the *International Building Code* or the *International Residential Code* as applicable.

Exceptions:

1. Helical pier tie downs rated for sufficient resistance to uplift shall be permitted to be used on temporary structures placed on temporary foundations as permitted in the exception to Section 1202.2.
2. Other methods as provided by engineered design.

Reason:
PART I- The code addresses temporary structures, but fails to determine the foundations for temporary structures.
PART II- The change in the language provides for an exception on methods of foundation construction for temporary buildings. The temporary foundation would be allowed in accordance with the provisions, and provide sufficient foundation support for the structure while maintaining the need to insure connections that resist uplift and other forces required by the code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IBC STRUCTURAL

S147–09/10
1803.2

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1803.2 Investigation required. Geotechnical investigations shall be conducted in accordance with Sections 1803.3 through 1803.5.

Exceptions:

1. The building official shall be permitted to waive the requirement for a geotechnical investigation where satisfactory data from adjacent areas is available that demonstrates an investigation is not necessary for any of the conditions in Sections 1803.5.1 through 1803.5.6 and Sections 1803.5.10 and 1803.5.11.
2. Unless there are known potential geologic or seismic hazards or as required by any of the conditions in Section 1803.5.2, 1803.5.3, 1803.5.8, 1803.5.9 or 1803.5.10, the building official shall be permitted to waive the requirement for a geotechnical investigation for additions to light-frame R-3 or U occupancies, that are no more than two stories in height and have no basement, when they use the same foundation system as the structure to which they are attached,

Reason: It is an unreasonable hardship and cost to require a geotechnical report for an addition where the existing foundation system has proved to be adequate. The building official can still require a report if he/she deems that one is necessary or if known hazards exist.

Cost Impact: This code change will reduce the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-S3-1803.2

S148–09/10
1803.5.11, 1803.5.12

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

1803.5.11 Seismic Design Categories C through F. For structures assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, a geotechnical investigation shall be conducted, and shall include an evaluation of all of the following potential geologic and seismic hazards:

1. Slope instability.
2. Liquefaction.
3. Total and differential settlement.
4. Surface displacement due to faulting or seismically induced lateral spreading or lateral flow.

1803.5.12 Seismic Design Categories D through F. For structures assigned to Seismic Design Category D, E or F in accordance with Section 1613, the geotechnical investigation required by Section 1803.5.11 shall also include all of the following, as applicable:

1. The determination of dynamic seismic lateral earth pressures on foundation walls and retaining walls due to design earthquake ground motions.
2. The potential for liquefaction and soil strength loss evaluated for site peak ground acceleration~~s~~, earthquake magnitude~~s~~, and source characteristics consistent with the ~~design~~ maximum considered earthquake ground motions. Peak ground acceleration shall be ~~permitted to be~~ determined based on:
   2.1 A site-specific study ~~taking into account soil amplification effects, as specified in Chapter 21~~ in accordance with Section 11.4.7 of ASCE 7; or

2.2 ~~in the absence of such a study, peak ground accelerations shall be assumed equal to S_{DS} / 2.5, where S_{DS} is determined~~ The maximum considered earthquake geometric mean peak ground acceleration adjusted for site class in accordance with Section ~~1613.5.4~~ 11.8.3 of ASCE 7.

3. An assessment of potential consequences of liquefaction and soil strength loss, including, but not limited to:
   - 3.1 Estimation of total and differential settlement;
   - 3.2 Lateral soil movement;
   - 3.3 Lateral soil loads on foundations;
   - 3.4 Reduction in foundation soil-bearing capacity and lateral soil reaction;
   - 3.5 Soil downdrag and reduction in axial and lateral soil reaction for pile foundations;
   - 3.6 Increases in soil lateral pressures on retaining walls; and
   - 3.7 Flotation of buried structures.
4. Discussion of mitigation measures such as, but not limited to~~, ground stabilization~~:
   - 4.1 Selection of appropriate foundation type and depths;
   - 4.2 Selection of appropriate structural systems to accommodate anticipated displacements and forces;
   - 4.3 Ground stabilization; or
   - 4.4 Any combination of these measures and how they shall be considered in the design of the structure.

Reason: The purpose for this proposal is to correlate the IBC with the 2010 edition of ASCE 7. The need for correlation is due to ASCE 7 Proposal SSC TC-1-CH11-103-R2, which was approved by the Seismic Subcommittee on 5/15/09 and is being balloted by the Main Committee (Item #4 of the Sixth Main Committee Ballot on Seismic Provisions). It is expected that the Main Committee will approve the proposal.

Section 11.8.3 of ASCE 7-10 is being modified to require evaluations of liquefaction potential be made for maximum considered earthquake (MCE) ground motions rather than design earthquake (DE) ground motions to ensure that the potential occurrence and effects of liquefaction during the MCE are considered in geotechnical and structural design. This change is consistent with the risk-based targets for collapse prevention as a performance goal and other evaluations for the MCE that are specified in ASCE 7 for the performance goal of collapse-prevention during MCE loading.

Section 11.8.3 of ASCE 7-10 is also being modified to require liquefaction potential evaluations be conducted using maximum considered earthquake geometric mean peak ground acceleration (PGA) adjusted for site effects rather than the current approximation for peak ground acceleration of dividing short-period spectral acceleration by a factor of 2.5. Maps provided in ASCE 7-10 for the purpose of determining the accelerations are substantially more accurate since they are based on PGA attenuation relationships. PGA is modified for site class effects by Eq. 11.8-1 of ASCE 7-10 where the site coefficient, F_{PGA}, is obtained from Table 11.8-1 of ASCE 7-10. The values of F_{PGA} are identical to the site coefficient, F_a, in Table 11.4-1 of ASCE 7-10 but are a function of PGA rather than the mapped MCE spectral response acceleration at short periods, S_s. Because PGA is a short-period parameter (equal to zero-period spectral acceleration), it is appropriate and consistent with current practice to use the same site coefficients for PGA and S_S. It is also consistent with the original development of F_a as a function of PGA.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S8-1803.5.11

S149–09/10
1803.5.12

Proponent: Ali M. Fattah, City of San Diego, representing SD Area Chapter ICC Code Committee

Revise as follows:

1803.5.12 Seismic Design Categories D through F. For structures assigned to *Seismic Design Category* D, E or F in accordance with Section 1613, the geotechnical investigation required by Section 1803.5.11, shall also include:

1. The determination of lateral earth pressures on foundation walls and retaining walls supporting more than 12 feet (3.66 m) of backfill height, due to earthquake motions.
2. The potential for liquefaction and soil strength loss evaluated for site peak ground accelerations, magnitudes and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be permitted to be determined based on a site-specific study taking into account soil amplification effects, as specified in Chapter 21 of ASCE 7, or, in the absence of such a study, peak ground accelerations shall be assumed equal to S_{DS}/2.5, where S_{DS} is determined in accordance with Section 1613.5.4.
3. An assessment of potential consequences of liquefaction and soil strength loss, including estimation of differential settlement, lateral movement, lateral loads on foundations, reduction in foundation soil-bearing capacity, increases in lateral pressures on retaining walls and flotation of buried structures.
4. Discussion of mitigation measures such as, but not limited to, ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements and forces, or any combination of these measures and how they shall be considered in the design of the structure.

Reason: The proposed code change deletes a current requirement. The current requirement is onerous on small structures and light framed structures as well as for retaining walls. The California Building Code has had an amendment that was added in the 1990's that addresses this issue and limits the requirement to retaining walls higher than 12 ft. The amendment only applies to hospitals projects, school projects and State owned buildings (See Section 1806A.1 General, http://www.bsc.ca.gov/default.htm).

Evidence from recent earthquakes and recent experimental research results, including work recently completed at the University of California, Berkeley, CA (Al Atik and Sitar, 2008) have demonstrated that the retaining walls structures would have to move in order to develop the failure wedge postulated in the so-called Mononobe and Okabe method. This method was developed by Okabe (1926) and Mononobe & Matsuo (1929) as an extension of Coulomb's static earth pressure theory to include the inertial forces due to the horizontal and vertical back-fill accelerations. The M-O method was developed for dry cohesionless backfill retained by a gravity wall and is mainly based on the following assumptions (Seed & Whitman 1970):

1. The wall yields sufficiently to produce minimum active pressure and the soil is assumed to satisfy the Mohr-Coulomb failure criterion;
2. When the minimum active pressure is attained, a soil wedge behind the wall is at the point of incipient failure, and the maximum shear strength is mobilized along the potential sliding surface; and
3. The soil wedge behaves as a rigid body, and accelerations are constant throughout the mass.

However, this condition can only occur when the wall has already failed due to other causes and the current body of field evidence does not provide any evidence of existence of this proposed mechanism of failure.

Retaining wall backfill is what imposes the inertial forces and is controlled backfill, usually not cohesionless and is compacted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Fattah-S2-1803.5.1.2

S150–09/10
1803.5.12

Proponent: Jim Rossberg, SEI of ASCE, representing self

Revise as follows:

1803.5.12 Seismic Design Categories D through F. For structures assigned to Seismic Design Category D, E or F in accordance with Section 1613, the geotechnical investigation required by Section 1803.5.11 shall also include:

1. The determination of lateral pressures on foundation and retaining walls due to earthquake motions.
2. The potential for liquefaction and soil strength loss evaluated for site peak ground accelerations, magnitudes, and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be permitted to be determined based on a site-specific study taking into account soil amplification effects, as specified in Chapter 21.5 of ASCE 7, or, in the absence of such a study, peak ground accelerations shall be ~~assumed equal to S_{DS} / 2.5, where S_{DS} is determined in accordance with Section 1613.5.4~~ taken equal to the value determined in accordance with Section 11.8.3 of ASCE 7.
3. An assessment of potential consequences of liquefaction and soil strength loss, including estimation of differential settlement, lateral movement, lateral loads on foundations, reduction in foundation soil-bearing capacity, increases in lateral pressures on retaining walls and flotation of buried structures.
4. Discussion of mitigation measures such as, but not limited to, ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements and forces, or any combination of these measures and how they shall be considered in the design of the structure.

Reason: This proposed change coordinates the provision of the IBC with those of the 2010 edition of ASCE 7. This provision has been considered and approved by the Seismic Subcommittee of ASCE 7 for inclusion into the 2010 edition of ASCE 7 hence with the adoption of ASCE 7-10 by reference this provision becomes duplicative. As of the submission date of this code change, the ASCE 7 Standards Committee is completing the committee balloting portion of the 2010 edition of ASCE/SEI 7. The document is designated ASCE/SEI 7-10 *Minimum Design Loads for Buildings and Other Structures* and it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in May of 2010 . Any person interested in obtaining a public comment copy of ASCE/SEI 7-10 may do so by contacting the proponent at jrossberg@asce.org.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROSSBERG-S2-1803.5.12

S151–09/10
1807.3.2.1

Proponent: Brian Johnson, PE, representing self

Revise as follows:

1807.3.2.1 Non-constrained. The following formula shall be used in determining the depth of embedment required to resist lateral loads where no lateral constraint is provided at the ground surface, such as by a rigid floor or rigid ground surface pavement, and where no lateral constraint is provided above the ground surface, such as by a structural diaphragm.

~~$d = 0.5A\{1 + [1 + (4.36h/A)]1/2\}$~~ $d = \frac{A}{2}\left(1 + \sqrt{1 + \frac{4.36h}{A}}\right)$ **(Equation 18-1)**

where:

The constant in (Equation 18-1) is dimensionless.

~~$A = 2.34P/S_1 b.$~~ $A = \frac{2.34P}{S_1 b}$, feet (m)

B = Diameter of round post or footing or diagonal dimension of square post or footing, feet (m).
d = Depth of embedment in earth in feet (m) ~~but not over 12 feet (3658 mm) for purpose of computing lateral pressure.~~
h = Distance in feet (m) from ground surface to point of application of ~~"P."~~ P.
P = Applied lateral force in pounds (kN).
S_1 = Allowable lateral soil-bearing pressure as set forth in Section 1806.2 based on a depth of one-third the depth of embedment in pounds per square foot (psf) (kPa) but not over 12 feet (3.66 m) for purpose of computing lateral pressure.

Reason: In the IBC 2006 formula for *A* it is unclear if *b* is a divisor or a multiplier. The formula needs parentheses or better formatting to answer this question. If it is a divisor, *A* is dimensionless and so *d* has no dimensions either. Consulting UBC 1997 revealed a properly formatted formula that should replace the one in IBC 2006, etc (*b* is a divisor). I added that *A* is in feet, thus equation 18-1 gives a result in feet. I added a clarification that 0.5 (1/2) carries no dimensions so equation 18-1 now clearly results in an answer in feet or meters based on the units entered.

The restriction on *d* doesn't make sense, the restriction should be on the soil pressure, the embedment depth can exceed 12 feet, it is the soil pressure that is to be limited. Note that 12 feet limit conflicts with IBC 1804.3.1 and I have not changed this.

Cost Impact: Decrease the cost of construction by clarifying formula.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JOHNSON-S1-1807.3.2.1.DOC

S152–09/10
1807.3.2.1, 1807.3.2.2

Proponent: Brian Johnson, PE, representing self

Revise as follows:

1807.3.2.1 Nonconstrained. The following formula shall be used in determining the depth of embedment required to resist lateral loads where no lateral constraint is provided at the ground surface, such as by a rigid floor or rigid ground surface pavement, and where no lateral constraint is provided above the ground surface, such as by a structural diaphragm.

$d = 0.5A\{1 + [1 + (4.36h/A)]^{1/2}\}$ **(Equation 18-1)**

where:

[formula is valid for SI and Imperial units]

A = $2.34P/S_1$ b.
b = Diameter of round post or footing or diagonal dimension of square post or footing, feet (m).
d = Depth of embedment in earth in feet (m) but not over 12 feet (3658 mm) for purpose of computing lateral pressure.
h = Distance in feet (m) from ground surface to point of application of "P."

P = Applied lateral force in pounds (kN).
S_1 = Allowable lateral soil-bearing pressure as set forth in Section 1806.2 based on a depth of one-third the depth of embedment in pounds per square foot (psf) (kPa).

1807.3.2.2 Constrained. The following formula shall be used to determine the depth of embedment required to resist lateral loads where lateral constraint is provided at the ground surface, such as by a rigid floor or pavement.

$$d = \sqrt{\frac{4.25Ph}{S_1 b}} \qquad \textbf{(Equation 18-2)}$$

or alternatively

$$d = \sqrt{\frac{4.25 M_g}{S_3 b}} \qquad \textbf{(Equation 18-3)}$$

where:

[formula is valid for SI and Imperial units]

M_g = Moment in the post at grade, in foot-pounds (kN-m).
S_3 = Allowable lateral soil-bearing pressure as set forth in Section 1806.2 based on a depth equal to the depth of embedment in pounds per square foot (kPa).

Reason: If formulas are valid for both Imperial and SI, I'd like it stated explicitly in the code. As near as I can tell, the units cancel in the formulas, so they're valid in both Imperial and SI.

Alternatively, it the above is not correct, all the metric equivalents should be deleted from the definitions following the formulas as follows:
b = Diameter of round post or footing or diagonal dimension of square post or footing, feet ~~(m)~~.
d = Depth of embedment in earth in feet ~~(m)~~ but not over 12 ~~(3658 mm)~~ feet for purpose of computing lateral pressure.
P = Applied lateral force in pounds ~~(kN)~~.
h = Distance in feet ~~(m)~~ from ground surface to point of application of ~~"~~P.~~"~~
S_1 = Allowable lateral soil bearing pressure as set forth in Section 1804.3 based on a depth of one-third the depth of embedment in pounds per square foot (psf) ~~(kPa)~~.
Mg = Moment in the post at grade, in foot-pounds ~~(kN-m).~~
*S*3 = Allowable lateral soil-bearing pressure as set forth in Section 1806.2 based on a depth equal to the depth of embedment in pounds per square foot ~~(kPa).~~

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JOHNSON-S4-1807.3.2.1-3.DOC

S153–09/10
1807.3.2.1, 1807.3.2.2

Proponent: Brian Johnson, PE, representing self

Revise as follows:

1807.3.2.1 Nonconstrained. The following formula shall be used in determining the depth of embedment required to resist lateral loads where no lateral constraint is provided at the ground surface, such as by a rigid floor or rigid ground surface pavement, and where no lateral constraint is provided above the ground surface, such as by a structural diaphragm.

$D = 0.5A\{1 + [1 + (4.36h/A)]^{1/2}\}$ **(Equation 18-1)**

where:

$A = 2.34P/S_1b$.
B = Diameter of round post or footing or diagonal dimension of square post or footing, feet (m).

d = Depth of embedment in earth in feet (m) but not over ~~12 (3658 mm)~~ 15 feet (4.57 m) for purpose of computing lateral pressure.
H = Distance in feet (m) from ground surface to point of application of "P."
P = Applied lateral force in pounds (kN).
S_1 = Allowable lateral soil-bearing pressure as set forth in Section 1806.2 based on a depth of one-third the depth of embedment in pounds per square foot (psf) (kPa).

1807.3.2.2 Constrained. The following formula shall be used to determine the depth of embedment required to resist lateral loads where lateral constraint is provided at the ground surface, such as by a rigid floor or pavement.

$$d = \sqrt{\frac{4.25Ph}{S_3 b}} \qquad \textbf{(Equation 18-2)}$$

or alternatively

$$d = \sqrt{\frac{4.25M}{S_3 b}} \qquad \textbf{(Equation 18-3)}$$

where:

d = depth of embedment in earth in feet (m) but not over 15 feet (4.57 m) for purpose of computing lateral pressure.
M_g = Moment in the post at grade, in foot-pounds (kN-m).
S_3 = Allowable lateral soil-bearing pressure as set forth in Section 1806.2 based on a depth equal to the depth of embedment in pounds per square foot (kPa).

Reason: To bring limitation to match section 1804.3.1. While we're at it, why not fix the metric dimension to something sensible. Who designs pole embedment to the millimeter?

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JOHNSON-S5-1807.3.2.1-4.DOC

S154–09/10
1807.3.2.2

Proponent: Brian Johnson, PE, representing self

Revise as follows:

1807.3.2.2 Constrained. The following formula shall be used to determine the depth of embedment required to resist lateral loads where lateral constraint is provided at the ground surface, such as by a rigid floor or pavement.

$$d = \sqrt{\frac{4.25Ph}{S_3 b}} \qquad \textbf{(Equation 18-2)}$$

or alternatively

$$d = \sqrt{\frac{4.25 M_g}{S_3 b}} \qquad \textbf{(Equation 18-3)}$$

where:

b = Diameter of round post or footing or diagonal dimension of square post or footing, feet (m).
d = Depth of embedment in earth in feet (m)
h = Distance in feet (m) from ground surface to point of application of P.

M_g = Moment in the post at grade, in foot-pounds (kN-m).
P = Applied lateral force in pounds (kN).
S_3 = Allowable lateral soil-bearing pressure as set forth in Section 1806.2 based on a depth equal to the depth of embedment in pounds per square foot (kPa) but not over 12 feet (3.66 m) for purpose of computing lateral pressure.

Reason: The restriction on *d* doesn't make sense [see section 1807.3.2.1 definition), the restriction should be on the soil pressure. Definitions of *b*, *d*, *h*, and *P* added to eliminate cross-reference and page flipping.

Cost Impact: Decrease the cost of construction by clarifying formula, simplifying formulas, and preventing cross-referencing.

ICCFILENAME: JOHNSON-S3-1807.3.2.2.DOC

S155–09/10
1810.3.3.1.5

Proponent: Lori A. Simpson, Treadwell & Rollo, Inc., representing self

Revise as follows:

1810.3.3.1.5 Uplift capacity of a single deep foundation element. Where required by the design, the uplift capacity of a single deep foundation element shall be determined by an *approved* method of analysis based on a minimum factor of safety of three or by load tests conducted in accordance with ASTM D 3689. The maximum allowable uplift load shall not exceed the ultimate load capacity as determined in Section 1810.3.3.1.2, using the results of load tests conducted in accordance withASTMD3689, divided by a factor of safety of two.

Exception: Where uplift is due to wind or seismic loading, the minimum factor of safety shall be two where capacity is determined by an analysis and one and one-half where capacity is determined by load tests. A factor of safety of one and one-half is allowed where uplift capacity is determined by an analysis and the local soil conditions are well understood, as substantiated in the geotechnical investigation.

Reason: It is the standard of practice in the San Francisco Bay Area to use a factor of safety of 1.5 for temporary uplift loads, such as wind or seismic. Although there can be cyclic degradation in the strength of the soil, it is offset by an increase in strength during rapid loading. With well known soil conditions, the uplift capacity is well-defined and should not be reduced by a factor of safety of 2 for temporary loading conditions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SIMPSON-S2-1810.3.3.1.5

S156–09/10
1810.3.3.1.6

Proponent: Lori A. Simpson, Treadwell & Rollo, Inc., representing self

Revise as follows:

1810.3.3.1.6 Uplift capacity of grouped deep foundation elements. For grouped deep foundation elements subjected to uplift, the allowable working uplift load for the group shall be calculated by an *approved* method of analysis. Where the deep foundation elements in the group are placed at a center-to-center spacing of at least 2.5 times the least horizontal dimension of the largest single element, the allowable working uplift load for the group is permitted to be calculated as the lesser of:

1. The proposed individual uplift working load times the number of elements in the group.
2. Two-thirds of the effective weight of the group and the soil contained within a block defined by the perimeter of the group and the length of the element, plus two-thirds of the ultimate shear resistance along the soil block.

Reason: Allowing only the weight of the piles and soil in the block is unreasonably conservative; not only the weight but also the shear resistance will be developed during an uplift loading event.

Cost Impact: The code change proposal will not increase the cost of construction.

1810.3.9.7 (New)

Proponent: Michael Morgano, GRL Engineers, representing self

Add new text as follows:

1810.3.9.7 Pile integrity testing . The structural integrity of cast-in-place deep foundation elements shall be verified using pulse echo integrity testing.

Reason: Due to the installation methods required for cast-in-place piles, it is not possible to inspect the element after installation. Integrity testing via pulse echo methods is commonly available, the most economical and easily applied test.

The Federal Highway Administration "Geotechnical Engineering Circular (GEC) No. 8" specifically states in section 7.5.2 (page 184) "The most commonly available, economical, and easily applied type of integrity test is the sonic echo test. The advantage of the method is that a test can be performed rapidly, inexpensively, and without any internal instrumentation or tubes in the pile."

The Federal Highway Administration "Geotechnical Engineering Circular (GEC) No. 8" specifically states in section 8.3.12 (page 221) "Post-installation integrity tests shall be performed on a minimum of 20% of the production piles."

A copy of the Federal Highway Administration "Geotechnical Engineering Circular (GEC) No. 8"can be downloaded at no cost from the following site: www.fhwa.dot.gov/engineering/geotech/pubs/gec8.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME: MORGANO-S3-1810.3.9.7

S158–09/10
1810.4.8

Proponent: Michael Morgano, GRL Engineers, representing self

Revise as follows:

1810.4.8 Hollow-stem augered, cast-in-place elements. Where concrete or grout is placed by pumping through a hollow-stem auger, the auger shall be permitted to rotate in a clockwise direction during withdrawal. As the auger is withdrawn at a steady rate or in increments not to exceed 1 foot (305 mm), concreting or grouting pumping pressures shall be measured with Automated Monitoring equipment and maintained high enough at all times to offset hydrostatic and lateral earth pressures. Concrete or grout volumes shall be measured to ensure that the volume of concrete or grout placed in each element is equal to or greater than the theoretical volume of the hole created by the auger. Where the installation process of any element is interrupted or a loss of concreting or grouting pressure occurs, the element shall be redrilled to 5 feet (1524 mm) below the elevation of the tip of the auger when the installation was interrupted or concrete or grout pressure was lost and reformed. Augered cast-in-place elements shall not be installed within six diameters center to center of an element filled with concrete or grout less than 12 hours old, unless *approved* by the *building official*. If the concrete or grout level in any completed element drops due to installation of an adjacent element, the element shall be replaced.

Reason: Using current practice, it is not possible to measure and maintain the grouting pressures during the installation process. These pressures are typically measured with an analog pressure gage which is installed at the pump. These analog pressure gages provide very low resolution, poor frequency response, and have no ability to record and therefore verify that the pressure remained high enough at all times. The crane operator is the individual that needs to see these pressure readings as he has direct control over the installation process, yet with current practice the crane operator will never see these values. Furthermore, it is not possible for the crane operator (or any other individuals on site) to determine lift heights to an accuracy of 1 foot, as the standard practice is to mark the leads at approximately every 5 feet (with many rigs being totally unmarked). Without the use of Automated Monitoring Equipment, this lifting height is simply a rough estimate made by the crane operator. Additionally, as augered cast-in-place pile length increase, it is not possible for the crane operator to visually determine the lift heights accurately due to parallax.
The Federal Highway Administration "Geotechnical Engineering Circular (GEC) No. 8" specifically states in section 7.4.2 that in general, the simple manual observation and control system is not considered to provide sufficient control for transportation projects. The system that is recommended for transportation projects includes automated monitoring of the auger position; volume of grout/concrete that is delivered; pressure with which it is delivered; and rotation and lifting of the auger.

A copy of the Federal Highway Administration "Geotechnical Engineering Circular (GEC) No. 8"can be downloaded at no cost from the following site: www.fhwa.dot.gov/engineering/geotech/pubs/gec8.

Cost Impact: The code change proposal will increase the cost of construction.

As the auger is withdrawn at a steady rate or in increments not to exceed 1 foot (305 mm), concreting or grouting pumping pressures shall be measured and maintained high enough at all times to offset hydrostatic and lateral earth pressures. Concrete or grout volumes shall be measured with a magnetic flow meter as part of an Automated Monitoring system to ensure that the volume of concrete or grout placed in each element is equal to or greater than the theoretical volume of the hole created by the auger. This volume of concrete or grout shall be measured and recorded for every 2 feet (610 mm) of auger withdrawal. Where the installation process of any element is interrupted or a loss of concreting or grouting pressure occurs, the element shall be redrilled to 5 feet (1524 mm) below the elevation of the tip of the auger when the installation was interrupted or concrete or grout pressure was lost and reformed. Augered cast-in-place elements shall not be installed within six diameters center to center of an element filled with concrete or grout less than 12 hours old, unless *approved* by the *building official*. If the concrete or grout level in any completed element drops due to installation of an adjacent element, the element shall be replaced.

Reason: Manual control of the grout/concrete placement process involves counting pump strokes and assigning an approximate volume to each pump stroke. It is widely known that grout/concrete pumps do not maintain a constant volume for every pump stroke. These mechanical pumps a highly variable and it is not possible to determine with any degree of accuracy the volume associated with any particular pump stroke. Further, it is common for a mechanical pump to miss several pump strokes in succession, leaving the possibility for serious voids in the element. It is generally not possible for an individual counting pump strokes or for a mechanical stroke counter to discern when the mechanical pump operates normally and when it fails to deliver full theoretical grout/ concrete volume for any stroke. The only reliable method for determining grout/concrete volume is to measure it directly. According to the Federal Highway Administration "General Engineering Circular (GEC) No. 8" section 7.4.2 "In general, the simple manual observation and control system is not considered to provide sufficient control for transportation projects. The system recommended for transportation projects includes automated monitoring of the auger position; volume of concrete delivered (measured by an in-line flow meter that provides a reliable and accurate measure of the grout/concrete that is delivered in real time); pressure with which it is delivered; and rotation and lifting speed of the auger, with the entire process recorded as part of the documentation process.

Measuring the total volume for an element is not sufficient. There is a significant risk in only obtaining the overall volume placed as there can be voids throughout the element that can only be detected by measuring the incremental volume placed in the element. According to the Federal Highway Administration "General Engineering Circular (GEC) No. 8" section 8.3.6 " The volume of grout or concrete placed as a function of depth shall be measured at intervals not exceeding 2 ft (0.6m) using automated monitoring equipment."

A copy of the Federal Highway Administration "Geotechnical Engineering Circular (GEC) No. 8"can be downloaded at no cost from the following site: www.fhwa.dot.gov/engineering/geotech/pubs/gec8.

According to the Deep Foundation Institute's "AUGERED CAST-IN-PLACE PILE MANUAL" section 3.4.7 "The most desirable precautions that are available in the construction of ACIP piles are to: pump the specified initial grout head prior to the withdrawal of the auger, maintain grout pumping while installing the required incremental grout volume as the auger is being withdrawn, and observing grout return when the auger's depth below the ground surface is equal or greater than the specified initial grout head. The observation of these three conditions are the most useful quality control tools that can be utilized in ACIP pile construction."

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME: MORGANO-S2-1810.4.8

S160–09/10
1901.3 through 1901.4, 1904, 1905, 1906, 1907, 1909

Proponent: Matthew Senecal, PE, American Concrete Institute, representing American Concrete Institute

1. Delete without substitution:

~~**1901.3 Source and applicability.** The format and subject matter of Sections 1902 through 1907 of this chapter are patterned after, and in general conformity with, the provisions for structural concrete in ACI 318.~~

2. Revise as follows:

~~**1901.4**~~ **1901.3 Construction documents.** The *construction documents* for structural concrete construction shall include:

1. The specified compressive strength of concrete at the stated ages or stages of construction for which each concrete element is designed.
2. The specified strength or grade of reinforcement.
3. The size and location of structural elements, reinforcement and anchors.
4. Provision for dimensional changes resulting from creep, shrinkage and temperature.
5. The magnitude and location of prestressing forces.
6. Anchorage length of reinforcement and location and length of lap splices.
7. Type and location of mechanical and welded splices of reinforcement.
8. Details and location of contraction or isolation joints specified for plain concrete.
9. Minimum concrete compressive strength at time of posttensioning.
10. Stressing sequence for posttensioning tendons.
11. For structures assigned to *Seismic Design Category* D, E or F, a statement if slab on grade is designed as a structural diaphragm ~~(see Section 21.12.3.4 of ACI 318)~~.

(Renumber remaining sections)

3. Delete without substitution:

~~**1904.1 Water-cementitious materials ratio.** Where maximum water-cementitious materials ratios are specified in ACI 318, they shall be calculated in accordance with ACI 318, Section 4.1.~~

4. Revise as follows:

~~**1904.2**~~ **1904.1 Exposure categories and classes.** Concrete shall be assigned to exposure classes in accordance with the durability requirements of ACI 318~~, Section 4.2,~~ based on:

1. Exposure to freezing and thawing in a moist condition or deicer chemicals;
2. Exposure to sulfates in water or soil;
3. Exposure to water where the concrete is intended to have low permeability; and
4. Exposure to chlorides from deicing chemicals, salt, saltwater, brackish water, seawater or spray from these sources, where the concrete has steel reinforcement.

~~**1904.3**~~ **1904.2 Concrete properties.** Concrete mixtures shall conform to the most restrictive maximum water-cementitious materials ratios, maximum cementitious admixtures, minimum air-entrainment and minimum specified concrete compressive strength requirements of ACI 318~~, Section 4.3,~~ based on the exposure classes assigned in Section ~~1904.2~~ 1904.1.

Exception: For occupancies and appurtenances thereto in Group R occupancies that are in buildings less than four stories above grade plane, normal-weight aggregate concrete is permitted to comply with the requirements of Table ~~1904.3~~ 1904.2 based on the weathering classification (freezing and thawing) determined from Figure ~~1904.3~~ 1904.2 in lieu of the durability requirements of ACI 318~~, Table 4.3.1~~.

TABLE ~~1904.3~~ 1904.2
MINIMUM SPECIFIED COMPRESSIVE STRENGTH
No change to table

a. Concrete in these locations that can be subjected to freezing and thawing during construction shall be of air-entrained concrete in accordance with ~~1904.3~~ 1904.2 ~~Section 1904.4.1~~.
b. Concrete shall be air entrained in accordance with ACI 318 ~~Section 1904.4.1~~.
c. Structural plain concrete basement walls are exempt from the requirements for exposure conditions of Section ~~1904.3~~ 1904.2 (see Section 1909.6.1).
d. For garage floor slabs where a steel trowel finish is used, the total air content required by ACI 318 ~~Section 1904.4.1~~ is permitted to be reduced to not less than 3 percent, provided the minimum specified compressive strength of the concrete is increase to 4,000 psi.

FIGURE ~~1904.3~~ 1904.2
WEATHERING PROBABILITY MAP FOR CONCRETE [a, b, c]
(No changes to map and footnotes)

5. Delete without substitution:

~~**1904.4 Freezing and thawing exposures.** Concrete that will be exposed to freezing and thawing, in the presence of moisture, with or without deicing chemicals being present, shall comply with Sections 1904.4.1 and 1904.4.2.~~

~~**1904.4.1 Air entrainment.** Concrete exposed to freezing and thawing while moist shall be air entrained in accordance with ACI 318, Section 4.4.1.~~

~~**1904.4.2 Deicing chemicals.** For concrete exposed to freezing and thawing in the presence of moisture and deicing chemicals, the maximum weight of fly ash, other pozzolans, silica fume or slag that is included in the concrete shall not exceed the percentages of the total weight of cementitious materials permitted by ACI 318, Section 4.4.2.~~

~~**1904.5 Alternative cementitious materials for sulfate exposure.** Alternative combinations of cementitious materials for use in sulfate-resistant concrete to those listed in ACI 318, Table 4.3.1 shall be permitted in accordance with ACI 318, Section 4.5.1.~~

~~**SECTION 1905**~~
~~**CONCRETE QUALITY, MIXING AND PLACING**~~

~~**1905.1 General.** The required strength and durability of concrete shall be determined by compliance with the proportioning, testing, mixing and placing provisions of Sections 1905.1.1 through 1905.13.~~

~~**1905.1.1 Strength.** Concrete shall be proportioned to provide an average compressive strength as prescribed in Section 1905.3 and shall satisfy the durability criteria of Section 1904. Concrete shall be produced to minimize the frequency of strengths below f'_c as prescribed in Section 1905.6.3. For concrete designed and constructed in accordance with this chapter, f'_c shall not be less than 2,500 psi (17.22 MPa). No maximum specified compressive strength shall apply unless restricted by a specific provision of this code or ACI 318.~~

~~**1905.2 Selection of concrete proportions.** Concrete proportions shall be determined in accordance with the provisions of ACI 318, Section 5.2.~~

~~**1905.3 Proportioning on the basis of field experience and/or trial mixtures.** Concrete proportioning determined on the basis of field experience and/or trial mixtures shall be done in accordance with ACI 318, Section 5.3.~~

~~**1905.4 Proportioning without field experience or trial mixtures.** Concrete proportioning determined without field experience or trial mixtures shall be done in accordance with ACI 318, Section 5.4.~~

~~**1905.5 Average strength reduction.** As data become available during construction, it is permissible to reduce the amount by which the average compressive strength (f'_c) is required to exceed the specified value of f'_c in accordance with ACI 318, Section 5.5.~~

~~**1905.6 Evaluation and acceptance of concrete.** The criteria for evaluation and acceptance of concrete shall be as specified in Sections 1905.6.2 through 1905.6.5.~~

~~**1905.6.1 Qualified technicians.** Concrete shall be tested in accordance with the requirements in Sections 1905.6.2 through 1905.6.5. Qualified field testing technicians shall perform tests on fresh concrete at the job site, prepare specimens required for curing under field conditions, prepare specimens required for testing in the laboratory and record the temperature of the fresh concrete when preparing specimens for strength tests. Qualified laboratory technicians shall perform all required laboratory tests.~~

~~**1905.6.2 Frequency of testing.** The frequency of conducting strength tests of concrete and the minimum number of tests shall be as specified in ACI 318, Section 5.6.2.~~

> ~~**Exception:** When the total volume of a given class of concrete is less than 50 cubic yards (38m3), strength tests are not required when evidence of satisfactory strength is submitted to and approved by the building official.~~

~~**1905.6.3 Strength test specimens.** Specimens prepared for acceptance testing of concrete in accordance with Section 1905.6.2 and strength test acceptance criteria shall comply with the provisions of ACI 318, Section 5.6.3.~~

1905.6.4 Field-cured specimens. Where required by the building official to determine adequacy of curing and protection of concrete in the structure, specimens shall be prepared, cured, tested and test results evaluated for acceptance in accordance with ACI 318, Section 5.6.4.

1905.6.5 Low-strength test results. Where any strength test (see ACI 318, Section 5.6.2.4) falls below the specified value of f'_c, the provisions of ACI 318, Section 5.6.5, shall apply.

1905.7 Preparation of equipment and place of deposit. Prior to concrete being placed, the space to receive the concrete and the equipment used to deposit it shall comply with ACI 318, Section 5.7.

1905.8 Mixing. Mixing of concrete shall be performed in accordance with ACI 318, Section 5.8.

1905.9 Conveying. The method and equipment for conveying concrete to the place of deposit shall comply with ACI 318, Section 5.9.

1905.10 Depositing. The depositing of concrete shall comply with the provisions of ACI 318, Section 5.10.

1905.11 Curing. The length of time, temperature and moisture conditions for curing of concrete shall be in accordance with ACI 318, Section 5.11.

1905.12 Cold weather requirements. Concrete to be placed during freezing or near-freezing weather shall comply with the requirements of ACI 318, Section 5.12.

1905.13 Hot weather requirements. Concrete to be placed during hot weather shall comply with the requirements of ACI 318, Section 5.13.

SECTION 1906
FORMWORK, EMBEDDED PIPES AND CONSTRUCTION JOINTS

1906.1 Formwork. The design, fabrication and erection of forms shall comply with ACI 318, Section 6.1.

1906.2 Removal of forms, shores and reshores. The removal of forms and shores, including from slabs and beams (except where cast on the ground), and the installation of reshores shall comply with ACI 318, Section 6.2.

1906.3 Conduits and pipes embedded in concrete. Conduits, pipes and sleeves of any material not harmful to concrete and within the limitations of ACI 318, Section 6.3, are permitted to be embedded in concrete with approval of the registered design professional.

1906.4 Construction joints. Construction joints, including their location, shall comply with the provisions of ACI 318, Section 6.4.

SECTION 1907
DETAILS OF REINFORCEMENT

1907.1 Hooks. Standard hooks on reinforcing bars used in concrete construction shall comply withACI 318, Section 7.1.

1907.2 Minimum bend diameters. Minimum reinforcement bend diameters utilized in concrete construction shall comply with ACI 318, Section 7.2.

1907.3 Bending. The bending of reinforcement shall comply with ACI 318, Section 7.3.

1907.4 Surface conditions of reinforcement. The surface conditions of reinforcement shall comply with the provisions of ACI 318, Section 7.4.

1907.5 Placing reinforcement. The placement of reinforcement, including tolerances on depth and cover, shall comply with the provisions of ACI 318, Section 7.5. Reinforcement shall be accurately placed and adequately supported before concrete is placed.

1907.6 Spacing limits for reinforcement. The clear distance between reinforcing bars, bundled bars, tendons and ducts shall comply with ACI 318, Section 7.6.

~~**1907.7 Concrete protection for reinforcement.** The minimum specified concrete cover for reinforcement shall comply with Sections 1907.7.1 through 1907.7.8.~~

~~**1907.7.1 Cast-in-place concrete (nonprestressed).** Minimum specified concrete cover shall be provided for reinforcement in nonprestressed, cast-in-place concrete construction in accordance with ACI 318, Section 7.7.1.~~

~~**1907.7.2 Cast-in-place concrete (prestressed).** The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in cast-in-place prestressed concrete shall comply with ACI 318, Section 7.7.2.~~

~~**1907.7.3 Precast concrete (manufactured under plant control conditions).** The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in precast concrete manufactured under plant control conditions shall comply with ACI 318, Section 7.7.3.~~

~~**1907.7.4 Bundled bars.** The minimum specified concrete cover for bundled bars shall comply with ACI 318, Section 7.7.4.~~

~~**1907.7.5 Headed shear stud reinforcement.** For headed shear stud reinforcement, the minimum specified concrete cover shall comply with ACI 318, Section 7.7.5.~~

~~**1907.7.6 Corrosive environments.** In corrosive environments or other severe exposure conditions, prestressed and nonprestressed reinforcement shall be provided with additional protection in accordance with ACI 318, Section 7.7.6.~~

~~**1907.7.7 Future extensions.** Exposed reinforcement, inserts and plates intended for bonding with future extensions shall be protected from corrosion.~~

~~**1907.7.8 Fire protection.** When this code requires a thickness of cover for fire protection greater than the minimum concrete cover in Section 1907.7, such greater thickness shall be specified.~~

~~**1907.8 Special reinforcement details for columns.** Offset bent longitudinal bars in columns and load transfer in structural steel cores of composite compression members shall comply with the provisions of ACI 318, Section 7.8.~~

~~**1907.9 Connections.** Connections between concrete framing members shall comply with the provisions of ACI 318, Section 7.9.~~

~~**1907.10 Lateral reinforcement for compression members.** Lateral reinforcement for concrete compression members shall comply with the provisions of ACI 318, Section 7.10.~~

~~**1907.11 Lateral reinforcement for flexural members.** Lateral reinforcement for compression reinforcement in concrete flexural members shall comply with the provisions of ACI 318, Section 7.11.~~

~~**1907.12 Shrinkage and temperature reinforcement.** Reinforcement for shrinkage and temperature stresses in concrete members shall comply with the provisions of ACI 318, Section 7.12.~~

~~**1907.13 Requirements for structural integrity.** The detailing of reinforcement and connections between concrete members shall comply with the provisions of ACI 318, Section 7.13, to improve structural integrity.~~

(Renumber remaining sections)

6. Revise as follows:

~~**1909.1**~~ **1906.1 Scope**. The design and construction of structural plain concrete, both cast-in-place and precast, shall comply with the minimum requirements of ~~Section 1909 and~~ ACI 318, ~~Chapter 22,~~ as modified in Section ~~1908~~1905 .

~~**1909.4 Design.** Structural plain concrete walls, footings and pedestals shall be designed for adequate strength in accordance with ACI 318, Sections 22.4 through 22.8~~.

Exception: For Group R-3 occupancies and buildings of other occupancies less than two stories above grade plane of light-frame construction, the required ~~edge~~ footing thickness of ACI 318 is permitted to be reduced to 6 inches (152 mm), provided that the footing does not extend more than 4 inches (102 mm) on either side of the supported wall.

7. Delete without substitution:

~~**1909.1.1 Special structures**. For special structures, such as arches, underground utility structures, gravity walls and shielding walls, the provisions of this section shall govern where applicable.~~

~~**1909.2 Limitations.** The use of structural plain concrete shall be limited to:~~

~~1. Members that are continuously supported by soil, such as walls and footings, or by other structural members capable of providing continuous vertical support.~~
~~2. Members for which arch action provides compression under all conditions of loading.~~
~~3. Walls and pedestals.~~
~~The use of structural plain concrete columns and structural plain concrete footings on piles is not permitted. See Section 1908.1.8 for additional limitations on the use of structural plain concrete.~~

~~**1909.3 Joints.** Contraction or isolation joints shall be provided to divide structural plain concrete members into flexurally discontinuous elements in accordance with ACI 318, Section 22.3.~~

~~**1909.5 Precast members.** The design, fabrication, transportation and erection of precast, structural plain concrete elements shall be in accordance with ACI 318, Section 22.9.~~

~~**1909.6 Walls.** In addition to the requirements of this section, structural plain concrete walls shall comply with the applicable requirements of ACI 318, Chapter 22~~.

~~**1909.6.1 Basement walls.** The thickness of exterior basement walls and foundation walls shall be not less than 7-1/2 inches (191 mm).~~

~~**1909.6.2 Other walls**. Except as provided for in Section 1909.6.1, the thickness of bearing walls shall be not less than 1/24 the unsupported height or length, whichever is shorter, but not less than 5-1/2 inches (140 mm).~~

~~**1909.6.3 Openings in walls**. Not less than one No. 5 bar shall be provided around window, door and similar sized openings. The bar shall be anchored to develop f_y in tension at the corners of openings.~~

(Renumber remaining sections)

Reason: This code change proposal removes provisions in the IBC that do not add new code requirements but either inform the user where information is located in ACI 318 or repeats ACI 318 information. The change proposal is strictly editorial in nature. The current format requires users to thoroughly read these provisions to determine if the IBC modifies ACI 318. By removing these provisions, the IBC will be easier for users to understand. Additionally, by removing these provisions the job of coordination information between the IBC and ACI 318 is made much easier.

The following explanations are given to for the revised Sections stated above:

1901.3	Statement is no longer necessary due to the removal of most of this information.
1901.4	Section 21.12.3.4 states the same information that is given in Item 11. No need for additional referencing.
Section 1904	This section repeats or points to the information in ACI 318, except for the alternate durability map. This section was reduced to the minimum language that would still allow for the alternate.
Section 1905	This section repeats or points to the information in ACI 318 without exception. This section was removed.
Section 1906	This section repeats or points to the information in ACI 318 without exception. This section was removed.
Section 1907	This section repeats or points to the information in ACI 318 without exception. This section was removed.
Section 1909	This section repeats or points to the information in ACI 318. There is only one exception to the code. The section was reworked to state only the exception.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SENECAL-S6-TABLE 1704.4

S161-09/10
1903.3, Chapter 35

Proponent: Steve Heller, representing the Insulating Concrete Form Association

1. Revise as follows:

1903.3 Flat wall insulating concrete form (ICF) systems. Insulating concrete form material used for forming flat concrete walls shall conform to ASTM E 2634.

2. Add New Standard to Chapter 35 as follows:

ASTM International
E2634—08 Standard Specification for Flat Wall Insulating Concrete Form (ICF) Systems……..1903.3

Reason: This proposal adds ASTM E 2634 to the code to help users determine acceptance of Flat Wall ICF Form Systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM E2634-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

(No changes to footnotes)

1704.4.1 Materials. In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in ~~Chapter 3 of~~ ACI 318, the building official shall require testing of materials in accordance with the appropriate standards and criteria for the material in ~~Chapter 3 of~~ ACI 318. Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the steel reinforcement material requirements of ~~Section 3.5.2 of~~ ACI 318.

1708.2 Concrete reinforcement. Where reinforcement complying with ASTM A 615 is used to resist earthquake-induced flexural and axial forces in special moment frames, special structural walls and coupling beams connecting special structural walls, in structures assigned to *Seismic Design Category* B, C, D, E or F as determined in Section 1613, the reinforcement shall comply with deformed reinforcement material requirements ~~Section 21.1.5.2 of~~ ACI 318 for special moment frames and special structural walls. Certified mill test reports shall be provided for each shipment of such reinforcement. ~~Where reinforcement complying with ASTM A 615 is to be welded, chemical tests shall be performed to determine weldability in accordance with Section 3.5.2 of ACI 318.~~

1808.8.2 Concrete cover. The concrete cover provided for prestressed and nonprestressed reinforcement in foundations shall be no less than the largest applicable value specified in Table 1808.8.2. Longitudinal bars spaced less than 1½ inches (38 mm) clear distance apart shall be considered as bundled bars according to ACI 318 for ~~which~~ the determination of concrete cover ~~provided shall also be no less than that required by Section 7.7.4 of ACI 318~~. Concrete cover shall be measured from the concrete surface to the outermost surface of the steel to which the cover

requirements applies. Where concrete is placed in a temporary or permanent casing or a mandrel, the inside face of the casing or mandrel shall be considered the concrete surface.

TABLE 1808.8.2
MINIMUM SPECIFIED CONCRETE COVER

FOUNDATION ELEMENT OR CONDTITION	MINIMUM COVER
1. Shallow foundations	~~In accordance with Section 7.7 of~~ ACI 318
2. Precast nonprestressed deep foundation elements Exposed to seawater Not manufactured under plant conditions Manufactured under plant control conditions	 3 inches 2 inches ~~In accordance with Section 7.7.3 of~~ Cover requirements for precast concrete manufactured under plant controlled conditions per ACI 318
3. Precast prestressed deep foundation elements Exposed to seawater Other	 2.5 inches ~~In accordance with Section 7.7.3 of~~ Cover requirements for precast concrete manufactured under plant controlled conditions per ACI 318
4. Cast-in-place deep foundation elements not enclosed by a steel pipe, tube or permanent casing	2.5 inches
5. Cast-in-place deep foundation elements enclosed by a steel pipe, tube or permanent casing	1 inch
6. Structural steel core within a steel pipe, tube or permanent casing	2 inches
7. Cast-in-place drilled shafts enclosed by a stable rock socket	1.5 inches

For SI: 1 inch = 25.4 mm.

1808.8.5 Forming of concrete. Concrete foundations are permitted to be cast against the earth where, in the opinion of the *building official*, soil conditions do not require formwork. Where formwork is required, it shall be in accordance with ~~Chapter 6 of~~ ACI 318.

1808.8.6 Seismic requirements. See Section 1908 for additional requirements for foundations of structures assigned to *Seismic Design Category* C, D, E or F.

For structures assigned to *Seismic Design Category* D, E or F, provisions of ACI 318 for foundations resisting earthquake induced forces~~, Sections 21.12.1 through 21.12.4~~ shall apply where not in conflict with the provisions of Section 1808 through 1810.

Exceptions:

1. Detached one- and two-family dwellings of light-frame construction and two stories or less above *grade plane* are not required to comply with the provisions of ACI 318 for foundations resisting earthquake induced forces~~, Sections 21.12.1 through 21.12.4~~.
2. ~~Section 21.12.4.4(a) of~~ ACI 318 requirement for transverse reinforcement for foundations resisting earthquake induced forces at the top of piles, piers or caissons for at least five times the member cross-section dimension but not less than six feet below the bottom of the pile cap shall not apply.

1810.2.4.1 Seismic Design Categories D through F. For structures assigned to *Seismic Design Category* D, E or F, deep foundation elements on *Site Class* E or F sites, as determined in Section 1613.5.2, shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-foundations-structure interaction coupled with foundation element deformations associated with earthquake loads imparted to the foundation by the structure.

Exception: Deep foundation elements that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. Precast prestressed concrete piles detailed in accordance with Section 1810.3.8.3.3.
2. Cast-in-place deep foundation elements with a minimum longitudinal reinforcement ratio of 0.005 extending the full length of the element and with transverse reinforcement detailed in accordance with the requirements for special moment frame members subjected to bending and axial load per ~~Sections 21.6.4.2, 21.6.4.3 and 21.6.4.4 of~~ ACI 318 as required by Section 1810.3.9.4.2.2.

1810.3.2.1.2 ~~ACI 318 Equation (10-5).~~Minimum volumetric spiral ratio. Where this chapter requires ~~detailing of~~ transverse reinforcement in accordance with the requirements for special moment frame members subjected to bending and axial load per ACI 318 in concrete deep foundation elements ~~in accordance with Section 21.6.4.4 of ACI~~

~~318~~, ~~compliance with~~, the minimum volumetric spiral ratio shall be $0.12f'_c / f_{yt}$. ~~Equation (10-5) of ACI 318 shall not be required.~~

1810.3.8.3.3 Seismic reinforcement in Seismic Design Categories D through F. For structures assigned to *Seismic Design Category* D, E or F in accordance with Section 1613, precast prestressed piles shall have transverse reinforcement in accordance with the following

1. The earthquake-resistant structures ~~R~~requirements in ACI 318~~, Chapter 21,~~ need not apply, unless specifically referenced.
2. Where the total pile length in the soil is 35 feet (10 668 mm) or less, the lateral transverse reinforcement in the ductile region shall occur through the length of the pile. Where the pile length exceeds 35 feet (10 668 mm), the ductile pile region shall be taken as the greater of 35 feet (10 668 mm) or the distance from the underside of the pile cap to the point of zero curvature plus three times the least pile dimension.
3. In the ductile region, the center-to-center spacing of the spirals or hoop reinforcement shall not exceed one-fifth of the least pile dimension, six times the diameter of the longitudinal strand or 8 inches (203 mm), whichever is smallest.
4. Circular spiral reinforcement shall be spliced by lapping one full turn and bending the end of each spiral to a 90-degree hook or by use of a mechanical or welded splice complying with the general (non-seismic) splicing requirements of ~~Section 12.14.3 of~~ ACI 318.
5. Where the transverse reinforcement consists of circular spirals, the volumetric ratio of spiral transverse reinforcement in the ductile region shall comply with the following:

   $$P_s = 0.25(f'_c / f_{yh})(A_g / A_{ch} - 1.0) [0.5 + 1.4P/(f'_c A_g)] \quad \textbf{(Equation 18-6)}$$

   but not less than:

   $$P_s = 0.12(f'_c / f_{yh}) [0.5 + 1.4P/(f'_c A_g)] \geq 0.12 f'_c / f_{yh} \quad \textbf{\textit{(Equation 18-7)}}$$

   and need not exceed:

   $$P_s = 0.021 \quad \textbf{(Equation 18-8)}$$

   where:

   A_g = Pile cross-sectional area, square inches (mm^2).
   A_{ch} = Core area defined by spiral outside diameter, square inches (mm^2).
   f'_c = Specified compressive strength of concrete, psi (MPa)
   f_{yh} = Yield strength of spiral reinforcement ≤ 85,000 psi (586 MPa).
   P = Axial load on pile, pounds (kN), as determined from Equations 16-5 and 16-7.
   P_s = Volumetric ratio (vol. spiral/ vol. core).

   This required amount of spiral reinforcement is permitted to be obtained by providing an inner and outer spiral.

6. Where transverse reinforcement consists of rectangular hoops and cross ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region with spacing, s, and perpendicular dimension, h_c, shall conform to:

   $$A_{sh} = 0.3s\, h_c (f'_c / f_{yh})(A_g / A_{ch} - 1.0) [0.5 + 1.4P/(f'c\, A_g)] \quad \textbf{(Equation 18-9)}$$

   but not less than:

   $$A_{sh} = 0.12s\, h_c (f'_c / f_{yh}) [0.5 + 1.4P/(f'_c A_g)] \quad \textbf{(Equation 18-10)}$$

   where:

   f_{yh} = ≤70,000 psi (483 MPa).
   h_c = Cross-sectional dimension of pile core measured center to center of hoop reinforcement, inch (mm).
   s = Spacing of transverse reinforcement measured along length of pile, inch (mm).

A_{sh} = Cross-sectional area of tranverse reinforcement, square inches (mm2).
f'_c = Specified compressive strength of concrete, psi (MPa).

The hoops and cross ties shall be equivalent to deformed bars not less than No. 3 in size. Rectangular hoop ends shall terminate at a corner with seismic hooks. Outside of the length of the pile requiring transverse confinement reinforcing, the spiral or hoop reinforcing with a volumetric ratio not less than one-half of that required for transverse confinement reinforcing shall be provided.

1810.3.9.4.2.1 Site Classes A through D. For *Site Class* A, B, C or D sites, transverse ~~confinement~~ reinforcement shall be provided in the element in accordance with the requirements for special moment frame members subjected to bending and axial load per ~~Sections 21.6.4.2, 21.6.4.3 and 21.6.4.4 of~~ ACI 318 within three times the least element dimension of the bottom of the pile cap. ~~A~~ The minimum transverse spiral reinforcement ratio shall be $0.06f'_c / f_{yt}$. ~~of not less than one-half of that required in Section 21.6.4.4(a) of ACI 318 shall be permitted.~~

1810.3.9.4.2.2 Site Classes E and F. For *Site Class* E or F sites, transverse ~~confinement~~ reinforcement shall be provided in the element in accordance with the requirements for special moment frame members subjected to bending and axial load per ~~Sections 21.6.4.2, 21.6.4.3 and 21.6.4.4 of~~ ACI 318 within seven times the least element dimension of the pile cap and within seven times the least element dimension of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft- to medium-stiff clay.

1810.3.11.1 Seismic Design Categories C through F. For structures assigned to *Seismic Design Category* C, D, E or F in accordance with Section 1613, concrete deep foundation elements shall be connected to the pile cap by embedding the element reinforcement or field-placed dowels anchored in the element into the pile cap for a distance equal to their development length in accordance with ACI 318. It shall be permitted to connect precast prestressed piles to the pile cap by developing the element prestressing strands into the pile cap provided the connection is ductile. For deformed bars, the development length is the full development length for compression, or tension in the case of uplift, without reduction in development length for excess reinforcement in flexural members permitted by ~~in accordance with Section 12.2.5 of~~ ACI 318. Alternative measures for laterally confining concrete and maintaining toughness and ductile-like behavior at the top of the element shall be permitted provided the design is such that any hinging occurs in the confined regions.

The minimum transverse steel ratio for confinement shall not be less than one-half of that required for columns.

For resistance to uplift forces, anchorage of steel pipes, tubes or H-piles to the pile cap shall be made by means other than concrete bond to the bare steel section. Concrete-filled steel pipes or tubes shall have reinforcement of not less than 0.01 times the cross-sectional area of the concrete fill developed into the cap and extending into the fill a length equal to two times the required cap embedment, but not less than the development length in tension of the reinforcement.

1901.4 Construction documents. The *construction documents* for structural concrete construction shall include:

1. The specified compressive strength of concrete at the stated ages or stages of construction for which each concrete element is designed.
2. The specified strength or grade of reinforcement.
3. The size and location of structural elements, reinforcement and anchors.
4. Provision for dimensional changes resulting from creep, shrinkage and temperature.
5. The magnitude and location of prestressing forces.
6. Anchorage length of reinforcement and location and length of lap splices.
7. Type and location of mechanical and welded splices of reinforcement.
8. Details and location of contraction or isolation joints specified for plain concrete.
9. Minimum concrete compressive strength at time of posttensioning.
10. Stressing sequence for posttensioning tendons.
11. For structures assigned to *Seismic Design Category* D, E or F, a statement if slab on grade is designed as a structural diaphragm ~~(see Section 21.12.3.4 of ACI 318)~~.

1904.1 Water-cementitious materials ratio. Where maximum water-cementitious materials ratios are specified in ACI 318, they shall be calculated in accordance with ACI 318~~, Section 4.1~~.

1904.2 Exposure categories and classes. Concrete shall be assigned to exposure classes in accordance with ACI 318~~, Section 4.2,~~ based on:

1. Exposure to freezing and thawing in a moist condition or deicer chemicals;
2. Exposure to sulfates in water or soil;
3. Exposure to water where the concrete is intended to have low permeability; and
4. Exposure to chlorides from deicing chemicals, salt, saltwater, brackish water, seawater or spray from these sources, where the concrete has steel reinforcement.

1904.3 Concrete properties. Concrete mixtures shall conform to the most restrictive maximum water-cementitious materials ratios, and minimum specified concrete compressive strength requirements of ACI 318~~, Section 4.3,~~ based on the exposure classes assigned in Section 1904.2.

Exception: For occupancies and appurtenances thereto in Group R occupancies that are in buildings less than four stories above grade plane, normal-weight aggregate concrete is permitted to comply with the requirements of Table 1904.3 based on the weathering classification (freezing and thawing) determined from Figure 1904.3 in lieu of the requirements of ACI 318~~, Table 4.3.1~~.

…

1904.4.1 Air entrainment. Concrete exposed to freezing and thawing while moist shall be air entrained in accordance with ACI 318~~, Section 4.4.1~~.

1904.4.2 Deicing chemicals. For concrete exposed to freezing and thawing in the presence of moisture and deicing chemicals, the maximum weight of fly ash, other pozzolans, silica fume or slag that is included in the concrete shall not exceed the percentages of the total weight of cementitious materials permitted by ACI 318~~, Section 4.4.2~~.

1904.5 Alternative cementitious materials for sulfate exposure. Alternative combinations of cementitious materials for use in sulfate-resistant concrete to those listed in ACI 318~~, Table 4.3.1~~ shall be permitted in accordance with ACI 318~~, Section 4.5.1~~.

1905.2 Selection of concrete proportions. Concrete proportions shall be determined in accordance with the provisions of ACI 318~~, Section 5.2~~.

1905.3 Proportioning on the basis of field experience and/or trial mixtures. Concrete proportioning determined on the basis of field experience and/or trial mixtures shall be done in accordance with ACI 318~~, Section 5.3~~.

1905.4 Proportioning without field experience or trial mixtures. Concrete proportioning determined without field experience or trial mixtures shall be done in accordance with ACI 318~~, Section 5.4~~.

1905.5 Average strength reduction. As data become available during construction, it is permissible to reduce the amount by which the average compressive strength (f'_c) is required to exceed the specified value of f'_c in accordance with ACI 318~~, Section 5.5~~.

1905.6.2 Frequency of testing. The frequency of conducting strength tests of concrete and the minimum number of tests shall be as specified in ACI 318~~, Section 5.6.2~~.

Exception: When the total volume of a given class of concrete is less than 50 cubic yards ($38m^3$), strength tests are not required when evidence of satisfactory strength is submitted to and approved by the building official.

1905.6.3 Strength test specimens. Specimens prepared for acceptance testing of concrete in accordance with Section 1905.6.2 and strength test acceptance criteria shall comply with the provisions of ACI 318~~, Section 5.6.3~~.

1905.6.4 Field-cured specimens. Where required by the building official to determine adequacy of curing and protection of concrete in the structure, specimens shall be prepared, cured, tested and test results evaluated for acceptance in accordance with ACI 318~~, Section 5.6.4~~.

1905.6.5 Low-strength test results. Where any strength test ~~(see ACI 318, Section 5.6.2.4)~~ falls below the specified value of f'_c, the provisions of ACI 318~~, Section 5.6.5~~, shall apply.

1905.7 Preparation of equipment and place of deposit. Prior to concrete being placed, the space to receive the concrete and the equipment used to deposit it shall comply with ACI 318~~, Section 5.7~~.

1905.8 Mixing. Mixing of concrete shall be performed in accordance with ACI 318~~, Section 5.8~~.

1905.9 Conveying. The method and equipment for conveying concrete to the place of deposit shall comply with ACI 318~~, Section 5.9~~.

1905.10 Depositing. The depositing of concrete shall comply with the provisions of ACI 318~~, Section 5.10~~.

1905.11 Curing. The length of time, temperature and moisture conditions for curing of concrete shall be in accordance with ACI 318~~, Section 5.11~~.

1905.12 Cold weather requirements. Concrete to be placed during freezing or near-freezing weather shall comply with the requirements of ACI 318~~, Section 5.12~~.

1905.13 Hot weather requirements. Concrete to be placed during hot weather shall comply with the requirements of ACI 318~~, Section 5.13~~.

1906.1 Formwork. The design, fabrication and erection of forms shall comply with ACI 318~~, Section 6.1~~.

1906.2 Removal of forms, shores and reshores. The removal of forms and shores, including from slabs and beams (except where cast on the ground), and the installation of reshores shall comply with ACI 318~~, Section 6.2~~.

1906.3 Conduits and pipes embedded in concrete. Conduits, pipes and sleeves of any material not harmful to concrete and within the limitations of ACI 318~~, Section 6.3~~, are permitted to be embedded in concrete with approval of the registered design professional.

1906.4 Construction joints. Construction joints, including their location, shall comply with the provisions of ACI 318~~, Section 6.4~~.

1907.1 Hooks. Standard hooks on reinforcing bars used in concrete construction shall comply with ACI 318~~, Section 7.1~~.

1907.2 Minimum bend diameters. Minimum reinforcement bend diameters utilized in concrete construction shall comply with ACI 318~~, Section 7.2~~.

1907.3 Bending. The bending of reinforcement shall comply with ACI 318~~, Section 7.3~~.

1907.4 Surface conditions of reinforcement. The surface conditions of reinforcement shall comply with the provisions of ACI 318~~, Section 7.4~~.

1907.5 Placing reinforcement. The placement of reinforcement, including tolerances on depth and cover, shall comply with the provisions of ACI 318~~, Section 7.5~~. Reinforcement shall be accurately placed and adequately supported before concrete is placed.

1907.6 Spacing limits for reinforcement. The clear distance between reinforcing bars, bundled bars, tendons and ducts shall comply with ACI 318~~, Section 7.6~~.

1907.7.1 Cast-in-place concrete (nonprestressed). Minimum specified concrete cover shall be provided for reinforcement in nonprestressed, cast-in-place concrete construction in accordance with ACI 318~~, Section 7.7.1~~.

1907.7.2 Cast-in-place concrete (prestressed). The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in cast-in-place prestressed concrete shall comply with ACI 318~~, Section 7.7.2~~.

1907.7.3 Precast concrete (manufactured under plant control conditions). The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in precast concrete manufactured under plant control conditions shall comply with ACI 318~~, Section 7.7.3~~.

1907.7.4 Bundled bars. The minimum specified concrete cover for bundled bars shall comply with ACI 318~~, Section 7.7.4~~.

1907.7.5 Headed shear stud reinforcement. For headed shear stud reinforcement, the minimum specified concrete cover shall comply with ACI 318~~, Section 7.7.5~~.

1907.7.6 Corrosive environments. In corrosive environments or other severe exposure conditions, prestressed and nonprestressed reinforcement shall be provided with additional protection in accordance with ACI 318~~, Section 7.7.6~~.

1907.8 Special reinforcement details for columns. Offset bent longitudinal bars in columns and load transfer in structural steel cores of composite compression members shall comply with the provisions of ACI 318~~, Section 7.8~~.

1907.9 Connections. Connections between concrete framing members shall comply with the provisions of ACI 318~~, Section 7.9~~.

1907.10 Lateral reinforcement for compression members. Lateral reinforcement for concrete compression members shall comply with the provisions of ACI 318~~, Section 7.10~~.

1907.11 Lateral reinforcement for flexural members. Lateral reinforcement for compression reinforcement in concrete flexural members shall comply with the provisions of ACI 318~~, Section 7.11~~.

1907.12 Shrinkage and temperature reinforcement. Reinforcement for shrinkage and temperature stresses in concrete members shall comply with the provisions of ACI 318~~, Section 7.12~~.

1907.13 Requirements for structural integrity. The detailing of reinforcement and connections between concrete members shall comply with the provisions of ACI 318~~, Section 7.13,~~ to improve structural integrity.

1909.1 Scope. The design and construction of structural plain concrete, both cast-in-place and precast, shall comply with the minimum requirements of Section 1909 and the structural plain concrete requirements of ACI 318~~, Chapter 22,~~ as modified in Section 1908.

1909.3 Joints. Contraction or isolation joints shall be provided to divide structural plain concrete members into flexurally discontinuous elements in accordance with ACI 318~~, Section 22.3~~.

1909.4 Design. Structural plain concrete walls, footings and pedestals shall be designed for adequate strength in accordance with ACI 318~~, Sections 22.4 through 22.8~~.

> **Exception:** For Group R-3 occupancies and buildings of other occupancies less than two st*ories above grade plane* of light-frame construction, the required edge thickness of ACI 318 is permitted to be reduced to 6 inches (152 mm), provided that the footing does not extend more than 4 inches (102 mm) on either side of the supported wall.

1909.5 Precast members. The design, fabrication, transportation and erection of precast, structural plain concrete elements shall be in accordance with ACI 318~~, Section 22.9~~.

1909.6 Walls. In addition to the requirements of this section, structural plain concrete walls shall comply with the applicable requirements of ACI 318~~, Chapter 22~~.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R402.2 Concrete. Concrete shall have a minimum specified compressive strength of f'_c, as shown in Table R402.2. Concrete subject to moderate of severe weathering as indicated in Table R301.2(1) shall be air entrained as specified in Table R402.2. The maximum weight of fly ash, other pozzolans, silica fume, slag or blended cements that is included in concrete mixtures for garage floor slabs and for exterior porches, carport slabs and steps that will be exposed to deicing chemicals shall not exceed the percentages of the total weight of cementitious materials specified in the durability requirements ~~Section 4.2.3~~ of ACI 318. Materials used to produce concrete and testing thereof shall comply with the applicable standards listed in the material requirements ~~Chapter 3~~ of ACI 318 or ACI 332.

Reason:
PART I- ACI is in the process of completely reorganizing ACI 318, *Building Code Requirements for Structural Concrete*. This process was formally initiated in the spring of 2008 and was scheduled to be completed by January 1, 2014 so that it would be available for reference by the 2015 IBC. This 2015 IBC schedule was assumed to be the same as traditional ICC meeting schedules.

The reorganized ACI 318 will be significantly different in structure than 318-08. The code will include several new chapters that are based on member design. The 318-08 chapters will be significantly reworked to support the member chapters. Some provisions have been divided sometimes into several chapters and at other provisions combined.

The new schedules released in February 2009 by the ICC require that reorganized ACI 318 be completed by January 3, 2012 for changes to the IBC (Group A) that require textual changes to the body of the IBC. ACI committee 318 will likely not be done with the revisions by that time and

thus not have a revised standard to submit for the 2015 IBC if it remains in Group A. ICC's CP 28-05 states that, if no textual changes are required and that the change to the code is in reference only, the revision may be considered by the administrative code committee prior to the Final Action Hearing in Group B.

In this code change proposal, ACI proposes to remove all references to specific sections in ACI 318 from the IBC, but not change the technical intent of any provision. This removal would allow ACI to submit an administrative change in Group B and give ACI Committee 318 one more year to complete their task of reorganization.

In some cases, the referenced section numbers that are removed are replaced with language from ACI 318 (usually the section heading) that will allow the user to easily locate the appropriate section. In some cases, the referenced information in ACI 318 is transcribed into the IBC. The use of words in place of section numbers may require some editorial revisions in the 2012/2013 ICC cycle, if the headings are changed through the reorganization.

The following explanations are given to for the revised Sections stated above:

Table 1704.3 and Table 1704.4	Specific section references are removed.
Table 1704.4	Specific section references are removed.
1704.4.1	Reference to Chapter 3 is removed. "Materials" is the heading of Chapter 3 in ACI 318; therefore, no additional replacement language is needed. Section 3.5.2 is removed and replaced with language that would identify the source information in ACI 318.
1708.2	Replaced the referenced section with language that would identify the source information in ACI 318. The last sentence repeats the welding requirements of IBC 1704.4.1, therefore, it is being removed.
1808.8.2	Reference to Section 7.7.4 is removed and sentence is reworded to preserve the intent of the provision.
Table 1808.8.2	Replaced the referenced section with language that would identify the source information in ACI 318.
1808.8.5	Reference to Chapter 6 is removed. Formwork is the heading of Chapter 6 in ACI 318; therefore, no additional replacement language is needed.
1808.8.6	Replaced the referenced section with language that would identify the source information in ACI 318. Also, technical information from Section 21.14.4.4(a) of ACI 318 is transcribed to Exception 2 in order to remove the section reference.
1810.2.4.1	Replaced the referenced section with language that would identify the source information in ACI 318.
1810.3.2.1.2	Technical information from Section 21.6.4.4 of ACI 318 is transcribed to 1810.3.2.1.2 in order to remove the section reference.
1810.3.8.3.3	Reference to Chapter 21 is removed. Earthquake-Resistant Structures is the heading of Chapter 21 in ACI 318; therefore, no additional replacement language is needed. Section 12.14.3 is removed and replaced with language that would identify the source information in ACI 318.
1810.3.9.4.2.1	Replaced the referenced section with language that would identify the source information in ACI 318. Also, technical information from Section 21.14.4.4(a) of ACI 318 is transcribed to 1810.3.9.4.2.1 in order to remove the section reference.
1810.3.9.4.2.2	Replaced the referenced section with language that would identify the source information in ACI 318.
1810.3.11.1	Reference to section is removed. The sentence is self-explanatory without adding the section reference.
1901.4	Section 21.12.3.4 of ACI 318 states the same information that is given in Item 11. No need for additional referencing.
Section 1904	References to sections are removed. This chapter repeats headings and technical content directly from ACI 318. No additional language is necessary in order to remove the section reference.
Section 1905	References to sections are removed. This chapter repeats headings and technical content directly from ACI 318. No additional language is necessary in order to remove the section reference.
Section 1906	References to sections are removed. This chapter repeats headings and technical content directly from ACI 318. No additional language is necessary in order to remove the section reference.
Section 1907	References to sections are removed. This chapter repeats headings and technical content directly from ACI 318. No additional language is necessary in order to remove the section reference.
1909.1	Replaced the referenced chapter with language that would identify the source information in ACI 318.
1909.3, 1909.4, 1909.5 & 1909.6	References to sections are removed. These sections repeat headings and technical content directly from ACI 318. No additional language is necessary in order to remove the section reference.

PART II- ACI is in the process of completely reorganizing ACI 318, *Building Code Requirements for Structural Concrete*. This process was formally initiated in the spring of 2008 and was scheduled to be completed by January 1, 2014 so that it would be available for reference by the 2015 ICC Codes. This 2015 ICC schedule was assumed to be the same as traditional ICC meeting schedules.

The reorganized ACI 318 will be significantly different in structure than 318-08. The code will include several new chapters that are based on member design. The 318-08 chapters will be significantly reworked to support the member chapters. Some provisions have been divided sometimes into several chapters and at other provisions combined.

The new schedules released in February 2009 by the ICC require that reorganized ACI 318 be completed by January 3, 2012 for changes to the IBC (Group A) that require textual changes to the body of the IBC. ACI committee 318 will likely not be done with the revisions by that time and thus not have a revised standard to submit for the 2015 IBC if it remains in Group A. ICC's CP 28-05 states that, if no textual changes are required and that the change to the code is in reference only, the revision may be considered by the administrative code committee prior to the Final Action Hearing in Group B.

In this code change proposal, ACI proposes to remove all references to specific sections in ACI 318 from the IBC and IRC, but not change the technical intent of any provision. This removal would allow ACI to submit an Administrative Change in Group B and give ACI Committee 318 one more year to complete their task of reorganization.

In some cases, the referenced section numbers that are removed are replaced with language from ACI 318 (usually the section heading) that will allow the user to easily locate the appropriate section. In some cases, the referenced information in ACI 318 is transcribed into the ICC code. The use of words in place of section numbers may require some editorial revisions in the 2012/2013 ICC cycle, if the headings are changed through the reorganization.

The following explanations are given to for the revised Section stated above:

R402.2	Reference to Section 4.2.3 is removed and replaced with the chapter heading, "Durability Requirements," to aid the user in locating the source information in ACI 318. Note reference to Section 4.2.3 is incorrect in the current IRC. ACI 318 now uses a classification system from which the minimum cementitious material is determined. A more general reference to the chapter is more appropriate. Reference to Chapter 3 is removed and replaced with the chapter heading, "Materials ," to aid the user in locating the source information in ACI 318.

Cost Impact: This code change proposal will not increase the cost of construction.

S163–09/10
1908.1-1908.1.10, 1912.1

Proponent: Matthew Senecal, PE, American Concrete Institute, representing American Concrete Institute

Revise as follows:

1908.1 General. ~~The text of~~ ACI 318 shall be modified as indicated in Sections 1908.1.1 through 1908.1.10.

1908.1.1 ~~ACI 318, Section 2.2~~ Definitions. ~~Modify existing definitions and add the following definitions to ACI 318, Section 2.2.~~The following definitions either modify or are in addition to the definitions in ACI 318:

DESIGN DISPLACEMENT. Total lateral displacement expected for the design-basis earthquake*, as specified by Section 12.8.6 of ASCE 7*.

DETAILED PLAIN CONCRETE STRUCTURAL WALL. *~~A wall complying with the requirements of Chapter 22, including 22.6.7.~~ A structural plain concrete wall in accordance with ACI 318, including the requirements of Section 1908.1.7 of this code.*

ORDINARY PRECAST STRUCTURAL WALL. *~~A precast wall complying with the requirements of Chapters 1 through 18.~~ A precast wall complying with the requirements ACI 318, except the requirements for earthquake-resistant structures shall not apply.*

ORDINARY REINFORCED CONCRETE STRUCTURAL WALL. ~~A *cast-in-place* wall complying with the requirements of Chapters 1 through 18.~~ *A cast-in-place wall complying with the requirements ACI 318, except the requirements for earthquake-resistant structures shall not apply.*

ORDINARY STRUCTURAL PLAIN CONCRETE WALL. ~~A wall complying with the requirements of Chapter 22, excluding 22.6.7.~~*A structural plain concrete wall in accordance with ACI 318, excluding Section 1908.1.7 of this code.*

SPECIAL STRUCTURAL WALL. A cast-in-place or precast wall complying with the requirements for earthquake-resistant structures of ACI 318 ~~21.1.3 through 21.1.7, 21.9 and 21.10~~, as applicable, in addition to the requirements for ordinary reinforced concrete structural walls *or ordinary precast structural walls, as applicable. Where ASCE 7 refers to a "special reinforced concrete structural wall," it shall be deemed to mean a "special structural wall."*

WALL PIER. *A wall segment with a horizontal length-to-thickness ratio of at least 2.5, but not exceeding 6, whose clear height is at least two times its horizontal length.*

1908.1.2 ~~ACI 318, Section 21.1.1.~~ Structural systems. ~~Modify ACI 318 Sections 21.1.1.3 and 21.1.1.7 to read as follows:~~ Structural systems designated as part of the seismic-force-resisting system shall be restricted to those permitted by ASCE 7. Structural plain concrete is prohibited in structures assigned to Seismic Design Category C, D, E, or F, except as permitted by Section 1908.1.8 of this code.

~~21.1.1.3 – Structures assigned to Seismic Design Category A shall satisfy requirements of Chapters 1 to 19 and 22; Chapter 21 does not apply. Structures assigned to Seismic Design Category B, C, D, E or F also shall satisfy 21.1.1.4 through 21.1.1.8, as applicable. Except for structural elements of plain concrete complying with Section~~

~~*1908.1.8 of the International Building Code, structural elements of plain concrete are prohibited in structures assigned to Seismic Design Category C, D, E or F.*~~

~~*21.1.1.7 – Structural systems designated as part of the seismic-force-resisting system shall be restricted to those permitted by ASCE 7. Except for Seismic Design Category A, for which Chapter 21 does not apply, the following provisions shall be satisfied for each structural system designated as part of the seismic-force-resisting system, regardless of the Seismic Design Category:*~~

- ~~*(a) Ordinary moment frames shall satisfy 21.2.*~~
- ~~*(b) Ordinary reinforced concrete structural walls and ordinary precast structural walls need not satisfy any provisions in Chapter 21.*~~
- ~~*(c) Intermediate moment frames shall satisfy 21.3.*~~
- ~~*(d) Intermediate precast structural walls shall satisfy 21.4.*~~
- ~~*(e) Special moment frames shall satisfy 21.5 through 21.8.*~~
- ~~*(f) Special structural walls shall satisfy 21.9.*~~
- ~~*(g) Special structural walls constructed using precast concrete shall satisfy 21.10.*~~

~~*All special moment frames and special structural walls shall also satisfy 21.1.3 through 21.1.7.*~~

1908.1.3 ~~ACI 318, Section 21.4.~~ Intermediate precast structural walls. ~~Modify ACI 318, Section 21.4, by renumbering Section 21.4.3 to become 21.4.4 and adding new Sections 21.4.3, 21.4.5 and 21.4.6 to read as follows:~~ Intermediate precast structural walls shall satisfy the requirements for earthquake-resistant structures of ACI 318 and the following:

~~21.4.3~~ 1. Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.

~~21.4.4 – Elements of the connection that are not designed to yield shall develop at least 1.5 S_y.~~

~~21.4.6~~ 2. Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.

~~21.4.5~~ 3. Wall piers not designed as part of a moment frame shall have transverse reinforcement designed to resist the shear forces required to be resisted by intermediate moment frames ~~determined from 21.3.3~~. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).

Exceptions:

1. *Wall piers that satisfy ~~21.13~~ the requirements of ACI 318 for members not designated as part of the seismic-force-resisting system.*
2. *Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*

1908.1.4 ~~ACI 318, Section 21.9.~~ Special structural walls and coupling beams. ~~Modify ACI 318, Section 21.9, by adding new Section 21.9.10 to read as follows:~~ Special structural walls, coupling beams, wall piers and wall segments shall satisfy the requirements for earthquake-resistant structures of ACI 318 and the following:

~~*21.9.10 – Wall piers and wall segments.*~~

~~21.9.10.1 –~~ 1. Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in Item 2. ~~21.9.10.2.~~

Exceptions:

1. *Wall piers that satisfy ~~21.13~~ the requirements of ACI 318 for members not designated as part of the seismic-force-resisting system.*
2. *Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*

~~21.9.10.2 –~~ 2. Transverse reinforcement with seismic hooks at both ends shall be designed to resist the shear forces required to be resisted by special moment frames subjected to bending and axial load in accordance with ACI 318 ~~determined from 21.6.5.1~~. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).

~~21.9.10.3 –~~ 3. Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.

1908.1.5 ~~ACI 318, Section 21.10.~~ Special precast structural walls. ~~Modify ACI 318, Section 21.10.2, to read as follows:~~ Special structural walls constructed using precast concrete shall satisfy the requirements for earthquake-resistant structures of ACI 318. In addition, connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.

~~21.10.2 – Special structural walls constructed using precast concrete shall satisfy all the requirements of 21.9 for cast-in-place special structural walls in addition to Sections 21.4.2 *through* 21.4.4.~~

1908.1.6 ~~ACI 318, Section 21.12.1.1~~. Foundations resisting earthquake-induced forces. ~~Modify ACI 318, Section 21.12.1.1, to read as follows:~~ In structures assigned to Seismic Design Category D, E, or F, foundations resisting earthquake-induced forces or transferring earthquake-induced forces between a structure and ground shall satisfy the requirements for earthquake-resistant structures of ACI 318, unless modified by Chapter 18 of this code.

~~21.12.1.1 – Foundations resisting earthquake-induced forces or transferring earthquake-induced forces between a structure and ground shall comply with the requirements of Section 21.12 and other applicable provisions of ACI 318 *unless modified by Chapter 18 of the International Building Code*.~~

1908.1.7 ~~ACI 318, Section 22.6.~~ Detailed plain concrete structural walls. ~~Modify ACI 318, Section 22.6, by adding new Section 22.6.7 to read as follows:~~ Detailed plain concrete structural walls shall satisfy the requirements for an ordinary structural concrete wall in ACI 318 and the following:

~~22.6.7 – Detailed plain concrete structural walls.~~

~~22.6.7.1 – Detailed plain concrete structural walls are walls conforming to the requirements of ordinary structural plain concrete walls and 22.6.7.2.~~

~~22.6.7.2 – Reinforcement shall be provided as follows:~~

~~(a)~~ 1. Vertical reinforcement of at least 0.20 square inch (129 mm^2) in cross-sectional area shall be provided continuously from support to support at each corner, at each side of each opening and at the ends of walls. The continuous vertical bar required beside an opening is permitted to substitute for one of the two No. 5 bars required by Section 1909.6.3~~22.6.6.5~~.

~~(b)~~ 2. Horizontal reinforcement at least 0.20 square inch (129 mm^2) in cross-sectional area shall be provided:

1. *Continuously at structurally connected roof and floor levels and at the top of walls;*
2. *At the bottom of load-bearing walls or in the top of foundations where doweled to the wall; and*
3. *At a maximum spacing of 120 inches (3048 mm).*

Reinforcement at the top and bottom of openings, where used in determining the maximum spacing specified in Item 3 above, shall be continuous in the wall.

1908.1.8 ~~ACI 318, Section 22.10.~~ Structural plain concrete in earthquake-resisting structures. Delete the requirements for structural plain concrete in earthquake-resisting structures in ACI 318, ~~Section 22.10,~~ and ~~replace with~~ satisfy the following:

~~22.10 – Plain concrete in structures assigned to Seismic Design Category C, D, E or F.~~

~~22.10.1 –~~ 1. Structures assigned to Seismic Design Category C, D, E or F shall not have elements of structural plain concrete, except as follows:

(a) *Structural plain concrete basement, foundation or other walls below the base are permitted in detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls. In dwellings assigned to Seismic Design Category D or E, the height of the wall shall not exceed 8 feet (2438 mm), the thickness shall not be less than 7-1/2 inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with Section 1909.6.3. ~~22.6.6.5.~~*

(b) *Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.*

***Exception**: In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.*

(c) *Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.*

Exceptions:

1. *In detached one- and two-family dwellings three stories or less in height and constructed with stud-bearing walls, plain concrete footings without longitudinal reinforcement supporting walls are permitted.*
2. *For foundation systems consisting of a plain concrete footing and a plain concrete stemwall, a minimum of one bar shall be provided at the top of the stemwall and at the bottom of the footing.*
3. *Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.*

1908.1.9 ~~ACI 318, Section D.3.3.~~ Anchoring to concrete. ~~Modify ACI 318, Sections D.3.3.4 and D.3.3.5 to read as follows:~~ In structures assigned to Seismic Design Category C, D, E, or F, anchors to concrete shall satisfy the earthquake-resisting requirements for anchorage in ACI 318 and Section 1908.1.10 of this code.

~~D.3.3.4 – Anchors shall be designed to be governed by the steel strength of a ductile steel element as determined in accordance with D.5.1 and D.6.1, unless either D.3.3.5 or D.3.3.6 is satisfied.~~

Exceptions:

1. *Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy the anchor steel ductility or attachment ductility requirement of ACI 318 ~~Section D.3.3.4~~.*
2. *Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy the anchor steel ductility or attachment ductility requirement of ACI 318 ~~Section D.3.3.4~~*

~~D.3.3.5 – Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a force level corresponding to anchor forces no greater than the design strength of anchors specified in D.3.3.3.~~

~~Exceptions:~~

1. ***~~Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.~~***
2. ***~~Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.5.~~***

1908.1.10 ~~ACI 318, Section D.4.2.2~~. Anchor diameter and length limits. ~~Delete ACI 318, Section D.4.2.2, and replace with the following:~~ Delete the ACI 318, 2 inch diameter limit for computation of shear and tension breakout strength and 25 inch length limit for computation of tension breakout strength and replace with the following:

~~*D.4.2.2 — The concrete breakout strength requirements for anchors in tension shall be considered satisfied by the design procedure of D.5.2 provided Equation D-8 is not used for anchor embedments exceeding 25 inches. The concrete breakout strength requirements for anchors in shear with diameters not exceeding 2 inches shall be considered satisfied by the design procedure of D.6.2. For anchors in shear with diameters exceeding 2 inches, shear anchor reinforcement shall be provided in accordance with the procedures of D.6.2.9.*~~

1. Tension concrete breakout strength shall not be computed by the following equation where the anchor length exceeds 25 inches.

$$N_b = 16\lambda\sqrt{f'_c}\,h_{ef}^{\frac{5}{3}}$$

2. For anchors with diameters exceeding 2 inches, the anchor reinforcement shall be used to resist shear instead of the concrete breakout strength.

1912.1 Scope. The provisions of this section shall govern the strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other. Headed bolts, headed studs and hooked (J- or L-) bolts cast in concrete and expansion anchors and undercut anchors installed in hardened concrete shall be designed in accordance with the anchoring to concrete requirements ~~Appendix D~~ of ACI 318 as modified by Sections 1908.1.9 and 1908.1.10~~, provided they are within the scope of Appendix D~~.

The strength design of anchors that are not within the scope of ~~Appendix D of~~ ACI 318, and as amended in Sections 1908.1.9 and 1908.1.10, shall be in accordance with an approved procedure.

Reason: ACI is in the process of completely reorganizing ACI 318, Building Code Requirements for Structural Concrete. This process was formally initiated in the spring of 2008 and was scheduled to be completed by January 1, 2014 so that it would be available for reference by the 2015 IBC. This 2015 IBC schedule was assumed to be the same as traditional ICC meeting schedules.

The reorganized ACI 318 will be significantly different in structure than 318-08. The code will include several new chapters that are based on member design. The 318-08 chapters will be significantly reworked to support the member chapters. Some provisions have been divided sometimes into several chapters and at other provisions combined.

The new schedules released in February 2009 by the ICC require that reorganized ACI 318 be completed by January 3, 2012 for changes to the IBC (Group A) that require textual changes to the body of the IBC. ACI committee 318 will likely not be done with the revisions by that time and thus not have a revised standard to submit for the 2015 IBC if it remains in Group A. ICC's CP 28-05 states that, if no textual changes are required and that the change to the code is in reference only, the revision may be considered by the administrative code committee prior to the Final Action Hearing in Group B.

In this code change proposal, ACI proposes to remove all references to specific sections in ACI 318 from the IBC, but not change the technical intent of any provision. This removal would allow ACI to submit an administrative change in Group B and give ACI Committee 318 one more year to complete their task of reorganization.

In some cases, the referenced section numbers that are removed are replaced with language from ACI 318 (usually the section heading) that will allow the user to easily locate the appropriate section. In some cases, the referenced information in ACI 318 is transcribed into the IBC. The use of words in place of section numbers may require some editorial revisions in the 2012/2013 ICC cycle, if the headings are changed through the reorganization.

The following explanations are given to for the revised Sections stated above:

1908.1	Section 1908 is reworked to state the exception to ACI 318; in place of providing a textual edit of ACI 318 provisions.
1908.1.1	Replaced the referenced section with language that would identify the source information in ACI 318.
1908.1.2	In the revised section 21.1.1.3, the only additional requirement is the restriction on the use of structural plain concrete in SDC C. This restriction has been reworded. The statement that Chapter 21 does not apply to SDC A is explicitly stated in the Section 21.1.7 of ACI 318 and therefore is not an exception and may be deleted. In the revised section 21.1.7, ASCE 7 is identified as the standard that defines seismic-force-resisting systems. This statement has been reworded to introduce the section. Ordinary precast structural walls are defined in the definitions section and can be deleted at this location. The addition of the word "structural" in item d was addressed in errata to ACI 318.
1908.1.3	The section has been reworked, see explanation in 1908.1. Replaced referenced sections with language that would identify the source information in ACI 318.
1908.1.4	The section has been reworked, see explanation in 1908.1. Replaced referenced sections with language that would identify the source information in ACI 318.
1908.1.5	The section has been reworked, see explanation in 1908.1. The requirement from 1908.1.3 was added here for clarity.
1908.1.6	The section has been reworked, see explanation in 1908.1. Replaced referenced sections with language that would identify the source information in ACI 318.
1908.1.7	The section has been reworked, see explanation in 1908.1. Reference to 22.6.6.5 of ACI 318 was replaced by a reference to 1909.6.3 in the IBC.
1908.1.8	The section has been reworked, see explanation in 1908.1. Reference to 22.6.6.5 of ACI 318 was replaced by a reference to 1909.6.3 in the IBC.
1908.1.9	The section has been reworked, see explanation in 1908.1.
1908.1.10	Technical information from ACI 318 is transcribed to the IBC in order to remove the section reference
1912.1	Replaced the referenced section with language that would identify the source information in ACI 318.

Cost Impact: This code change proposal will not increase the cost of construction.

S164–09/10
1908.1.2

Proponent: Alan Robinson, SE, representing Structural Engineers Association of California

Revise as follows:

1908.1.2 ACI 318, Section 21.1.1. Modify ACI 318 Sections 21.1.1.3 and 21.1.1.7 to read as follows:

21.1.1.3 – Structures assigned to Seismic Design Category A shall satisfy requirements of Chapters 1 to 19 and 22; Chapter 21 does not apply. Structures assigned to Seismic Design Category B, C, D, E or F also shall satisfy 21.1.1.4 through 21.1.1.8, as applicable. Except for structural elements of plain concrete complying with Section 1908.1.8 of the International Building Code, structural elements of plain concrete are prohibited in structures assigned to Seismic Design Category C, D, E or F.

21.1.1.7 – Structural systems designated as part of the seismic-force-resisting system shall be restricted to those *permitted by ASCE 7*. Except for *Seismic Design Category* A, for which Chapter 21 does not apply, the following provisions shall be satisfied for each structural system designated as part of the seismic-force-resisting system, regardless of the *Seismic Design Category*:

(a) Ordinary moment frames shall satisfy 21.2.
(b) Ordinary reinforced concrete structural walls *and ordinary precast structural walls* need not satisfy any provisions in Chapter 21.
(c) Intermediate moment frames shall satisfy 21.3.
(d) Intermediate precast *structural* walls shall satisfy 21.4.
(e) Special moment frames shall satisfy 21.5 through 21.8.
(f) Special structural walls shall satisfy 21.9.
(g) Special structural walls constructed using precast concrete shall satisfy 21.10.
(h) *In Seismic Design Category D, E or F, concrete tilt-up wall panels that exceed the limitations of intermediate precast structural wall system shall satisfy 21.9 in addition to 21.4.2 and 21.4.3.*

All special moment frames and special structural walls shall also satisfy 21.1.3 through 21.1.7.

Reason: Concrete tilt-up wall panels is an alternative forming system of site-cast concrete wall panels which are tilted or lifted in place. They do not qualify for special precast structural wall system, which must meet the PRESSS test protocol or ACI ITG-5.2. Unlike earlier construction of box-liked industrial buildings, current practice in commercial buildings constructed using tilt-up panel wall system commonly consists of large window and door openings in consecutive panels. Wall panels varying up to three stories high with openings in consecutive panels tend to resemble wall frame, which is not currently recognized under any of the defined seismic-force resisting systems other than consideration as one of the precast structural wall systems. While special boundary elements are probably not required by calculation if there are a number of panels in one shear line, spandrel panels often should be investigated for requirements of coupling beams.

Large tilt-up buildings with flexible diaphragm also may include isolated interior structural wall panels, either cast-in-place or precast, which are designed to resist high required shear strength demand. These isolated structural wall panels must be investigated for special boundary elements. Based on the current code language, intermediate precast structural wall are exempt from requirements of ACI 318-08 section 21.9 and thus design for boundary element, coupling beam and ductile detailing will be absent. This proposal does not affect the selection of seismic response R-factor given in ASCE 7 Table 12.2-1. This proposal gives requirement under which design and detailing need to conform to special structural wall system provisions in ACI-318 section 21.9. This proposal further enhances minimum life safety building performance under earthquake forces in SDC D, E or F.

Cost Impact: The code change proposal will not increase the cost of construction for typical tilt-up buildings in higher SDC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROBINSON-S1-1908.1.2

S165–09/10
1908.1.3

Proponent: Alan Robinson, SE, representing Structural Engineers Association of California

Revise as follows:

1908.1.3 ACI 318, Section 21.4. Modify ACI 318, Section 21.4, by renumbering Section 21.4.3 to become 21.4.4 and adding new Sections 21.4.3, 21.4.5, ~~and~~ 21.4.6 and 21.4.7 to read as follows:

21.4.3 – Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.

21.4.4 – Elements of the connection that are not designed to yield shall develop at least 1.5 S_y.

21.4.5 - Wall piers in Seismic Design Category D, E or F shall comply with Section 1908.1.4 of the International Building Code.

~~21.4.5~~ 21.4.6– Wall piers not designed as part of a moment frame in buildings assigned to SDC C shall have transverse reinforcement designed to resist the shear forces determined from 21.3.3. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305mm).

Exceptions:

1. *Wall piers that satisfy 21.13.*
2. *Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*

~~21.4.6~~ 21.4.7 –Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.

Reason: The design provision for wall pier detailing was originally introduced by SEAOC in 1987 to legacy Uniform Building Code and was included in 1988 UBC through 1997 UBC. The wall pier detailing provision prescribed under Section 1908.1.4 was intended for high seismic zones equivalent to current SDC D, E or F. 1908.1.3 was added as a complement of wall pier detailing in SDC C (formerly seismic zones 2A and 2B under legacy model code.) ACI 318 Commentary R 21.1.1 emphasized "*it is essential that structures assigned to higher SDC's possess a higher degree of toughness*", and further encourages practitioners to use special structural wall system in regions of high seismic risk. ASCE 7 Table 12.2-1 permits intermediate precast structural wall system in SDC D, E or F. Current Section 1908.1.3 does not limit to just structures assigned to SDC C. The required shear strength under 21.3.3, referenced in current Sec. 21.4.5, is based on V_u under either nominal moment strength or two times the code prescribed earthquake force. The required shear strength in 21.6.5.1, referenced in Sec. 21.9.10.2 (IBC 1908.1.4), is based on the probable shear strength, V_e under the probable moment strength, M_{pr}. In addition, the spacing of required shear reinforcement is 8 inches on center under current 21.4.5 instead of 6 inches on center with seismic hooks at both ends under 21.9.10.2. Requirement of wall pier under 21.9.10.2 would enhance better ductility.

Current practice in commercial buildings constructed using precast panels wall system have large window and door openings and/or narrow wall piers. Wall panels varying up to three stories high with openings resembles wall frame which is not currently recognized under any of the defined seismic-force resisting systems other than consideration of structural wall system. Conformance to special structural wall system design and detailing of wall piers ensures minimum life safety performance in resisting earthquake forces for structures in SDC D, E or F. Proposed modification separates wall piers designed for structures assigned to SDC C from those assigned to SDC D, E or F.

Cost Impact: The code change proposal will not increase the cost of construction for typical tilt-up buildings in higher SDC.

	Assembly:	ASF	AMF	DF

ICCFILENAME: ROBINSON-S2-1908.1.3

S166–09/10
1908.1.8

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1908.1.8 ACI 318, Section 22.10. Delete ACI 318, Section 22.10, and replace with the following:

22.10 – Plain concrete in structures assigned to Seismic Design Category C, D, E or F.

22.10.1 – Structures assigned to Seismic Design Category C, D, E or F shall not have elements of structural plain concrete, except as follows:

(a) Structural plain concrete basement, foundation or other walls below the base are permitted in detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls. In dwellings assigned to Seismic Design Category D or E, the height of the wall shall not exceed 8 feet (2438 mm), the

thickness shall not be less than 71/2 inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with 22.6.6.5.

(b) Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.

Exception: In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.

(c) Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.

Exceptions:

1. In Group U occupancies ~~detached one-and two-family dwellings three stories or less in height~~ constructed with stud-bearing walls, plain concrete footings without longitudinal reinforcement supporting walls are permitted.
2. In structures assigned to Seismic Design Categories D, E and F, ~~For~~ foundation systems consisting of a plain concrete footing and a plain concrete stemwall, a minimum of one No. 4 bar shall be provided at the top of the stemwall and at the bottom of the footing.
3. Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.

Reason: If any occupancy warrants no reinforcing, it is a U occupancy. A three story dwelling in Seismic Design Category D, E or F should have at least 1 #4 bar at the top and bottom of the footing. Concrete cracks without reinforcing. A minimal amount of reinforcing will limit cracks during a seismic event.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-S5-1908.1.8

S167–09/10
1908.1.9

Proponent: Kevin Moore, PE, SE, SECB and Edwin Huston, PE, SE, SECB, representing National Council of Structural Engineers Associations

Revise as follows:

1908.1.9 ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.1, D3.3.4 and D3.3.5, and add Section D.3.3.7 to read as follows:

D.3.3.1 – The provisions of Appendix D do not apply to the design of anchors in plastic hinge zones of concrete structures under earthquake forces or to anchors that meet the requirements of Section D.3.3.7.

D.3.3.4 – Anchors shall be designed to be governed by the steel strength of a ductile steel element as determined in accordance with D.5.1 and D.6.1, unless either D.3.3.5 or D.3.3.6 is satisfied.

Exceptions:

1. Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.
2. Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.4.

D.3.3.5 – Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a force level corresponding to anchor forces no greater than the design strength of anchors specified in D.3.3.3.

Exceptions:

1. Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.
2. Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.5.

D.3.3.7 – For anchors installed in wood sill plates a maximum of 2 ½ inches (38 mm) in net thickness, the allowable lateral design values for shear in the cast-in-place anchor, parallel to the grain of the wood sill plate, are permitted to be determined in accordance with Section 2305 of the *International Building Code*, provided the anchor installation complies with all of the following:

1. Anchor nominal diameter is 5/8 inches (16 mm);
2. Anchors are embedded into concrete a minimum of 7 inches (178 mm);
3. Anchors are located a minimum of 2 ½ anchor diameters from the edge of the concrete parallel to the length of the wood sill plate; and
4. Anchors are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the wood sill plate

Reason: Current design provisions require calculation of the capacity of anchor bolt fastening wood sill plates to concrete foundations via methods promulgated in ACI 318, Appendix D. These methods result in significantly reduced capacities for this connection when compared to historical values and legacy code requirements. The state of knowledge regarding this connection is ambiguous and does not support such a large reduction for a common assembly.

Recent experimental testing and analysis indicates that actual capacities of the considered connection far exceed those historically used for design, supporting the use of wood dowel design values for the connection. The experimental data used to support this code change proposal indicates that concrete failure modes do not control the capacity of the connection, so the need to calculate the capacity of the bolt related to concrete strength for proper embedment and edge spacing is superfluous.

Reference:
W. Andrew Fennell, et al. *Report on laboratory testing of anchor bolts connecting wood sill plates to concrete with minimum edge distances.* March 29, 2009.

Cost Impact: The code change proposal will decrease the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MOORE-HUSTON-S1-1908.1.9 D.3.3.1

S168–09/10
1908.1.9

Proponent: Alan Robinson, SE, representing Structural Engineers Association of California

Revise as follows:

1908.1.9 ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.4 and D.3.3.5 delete and replace D.3.3.6 and add D.3.3.7 to read as follows:

D.3.3.4 - Anchors shall be designed to be governed by the steel strength of a ductile steel element as determined in accordance with D.5.1 and D.6.1, unless either D.3.3.5 or D.3.3.6 is satisfied.

Exceptions:

1. Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.
2. Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.4.

3. In light-frame wood construction, design of anchors in concrete shall be permitted to satisfy D.3.3.7.

D.3.3.5 - Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a force level corresponding to anchor forces no greater than the design strength of anchors specified in D.3.3.3.

Exceptions:

1. Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.
2. Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.5.

D.3.3.6 - As an alternative to D.3.3.4 and D.3.3.5, it shall be permitted to take the design strength of the anchors as 0.4 times the design strength determined in accordance with D.3.3.3.

D.3.3.7 – In light-frame wood structures, bearing or non-bearing walls, concrete anchors of sill plate to foundation or foundation stem wall need not satisfy D.3.3.5 and D.3.3.6 when the design strength of the anchors is determined in accordance with D.3.3.3.

Reason: Development of Appendix D was based primarily on tests of concrete anchor using steel plates with substantially larger edge distance than common practice in light-frame construction. There are insufficient tests of concrete anchors with wood sill plate at minimum side cover distance to justify the arbitrary assignment of 50 per cent reduction of the design strength stated in D.3.3.6. Additional limitation for anchorage of wood stud wall is removed from current ACI 318-08 D.3.3.6 (i.e. D.3.3.6 - As an alternative to D.3.3.4 and D.3.3.5, it shall be permitted to take the design strength of the anchors as 0.4 times the design strength determined in accordance with D.3.3.3. A new section D.3.3.7 is introduced under this proposal to further modify ACI code for concrete anchors used in light-framed wood construction.

In common construction practice of light-frame construction, bolts are centered on sill plates giving an side edge distance of $1^3/_4$ inches. Current code requirements under ACI 318 Appendix D lead to substantial reduction of design capacity based on breakout strength of a single anchor under Section D.6.2.1(c) or D.6.2.2. As an example, the design strength for 5/8 inch diameter anchor bolt strength under D.3.3.3 is 1116 lbs. Requirement under D.3.3.6 will further reduce the design strength to 558 lbs. for use in sill bolts. The ASD value would be 398 lbs. This is a substantial reduction from prior codes leading to impractical bolt spacing for most wood shear panel nail spacing range. A comparison between ACI Appendix D to IBC Table 1911.2, Allowable Service Loads on Embedded Bolts, shows the disparity of concrete anchor value.

The primary mode of failure of plywood sheathed panels attached to wood sill plate has been through nail slippage and yielding. This mode of failure together with bending of bolt offers the ductility and toughness of wood wall panels. Over-strength factor does not apply in the transfer of seismic forces from wood shear panel to concrete. Additional reduction factor is not warranted based on recent laboratory test conducted under SEAOC Seismology Committee purview. Result of the test is summarized below.

Attachment:
Excerpt from Report on laboratory testing of anchor bolts connecting wood sill plates to concrete with minimum edge distances

IBC-06 references ACI 318-05 Appendix D for the determination of anchor bolt capacity (in single-shear) when attaching wood sill plates to concrete foundations. Engineers have historically anticipated the controlling failure of this connection to occur between the anchor bolts and the wood sill plate. Under the IBC, the wind resistance values of anchor bolts are about the same as in historical practice. However, design capacities seismic forces based on break-out strength in shear determined in accordance with ACI 318-05 Appendix D are greatly reduced and less than the wood to concrete connection design capacity for small side edge distances. Many practicing engineers and building officials are mystified by the substantial reduction of anchor bolt capacities obtained from the application of Appendix D equations for wood framed construction in seismic design categories D, E and F. In the absence of available test data, members of SEAOC Seismology Committee undertook a study of typical anchor bolted connections to establish a basis for evaluating design capacities while better understanding the behavior of this traditional connection.

Test parameters and procedures were established. The testing consisted of typical anchor bolt connections found in wood framed shear walls using pressure treated wood 2x4, 3x4, 2x6 and 3x6 sill plates and 5/8 inch diameter by seven inches embedment anchor bolts with code prescribed washers. Side edge distance of 1-3/4 inches for 2x4 and 3x4 and 2-3/4 inches for 3x4 and 3x6 sill plates. This Testing Program was completed in December 2008 and the results can be downloaded on the SEAOC website: http://www.SEAOC.org/bluebook.

The load protocol adopted for the tests was a displacement-controlled load protocol. Peak loads from monotonic tests were used to establish the reference force, which was used to prescribe the load steps in the pseudo-cyclic testing. Monotonic tests were run at a sufficiently slow rate to pick up the internal flaws forming within the concrete by using impact-echo testing. The Pseudo-cyclic tests were based on the CUREE load protocol but with cycles added at low load levels. All tests were conducted without intentionally pre-cracked concrete.

Impact-echo method was used to detect concrete side break-out, if any, during the tests. When concrete deterioration was detected, the corresponding load and displacement were recorded for each specimen. It was observed that the first stage of deterioration is a series of cracks that form within the concrete propagated from the centerline of the anchor bolt and angling out towards the outer free face of the concrete. The cracks ultimately reach the outer face and became shallow spall shapes. It is important to note that the early stages of concrete deterioration are not always visually apparent. A strong correlation between the “peak” envelope values with the onset of concrete side break-out was, however, observed. Peak values were in the range of 7,200 lb to 8,500 lb.

All cyclic test data was analyzed in accordance with ASTM E 2126 Standard Test Methods for Cyclic (Reversed) Load Test for Shear Resistance of Walls for Buildings. Result of cycle test of specimen 296/ 302 is shown in Figure A-1. The positive and negative envelop curves for each specimens were combined to produce an average envelope curve used to establish peak load, displacement at peak load, ultimate load, and displacement at ultimate load and summarized in Figures A-2 and A-3.

Findings of the anchor bolt test program were as follows:

1. The results of the Anchor Bolt Testing Program has shown that wood components attached to concrete with minimum edge distances exhibited ductile behavior. The wood "yield" is the first material limit state.
2. The tests indicated that concrete cracks were not produced at service level loads. In the non-linear range of performance, delamination generally produced a decline in capacity corresponding to a wood displacement of about 0.60 inches, with the bolt experiencing considerable deformation.
3. Further excursion of the wood plate in some cases produced a complete concrete spall, however the bolt head remained intact and considerable residual strength was provided as the bolt remained in tension.
4. Cracking through the section did not occur at any point. For these reason, cracked section reduction appears overly conservative. It should also be noted that according to the available literature reductions are generally not required for shear anchorage applied perpendicular to a crack.
5. Test support design bolt values based on ACI 318 section D.3.3.3 using $0.75\Phi V_n$.

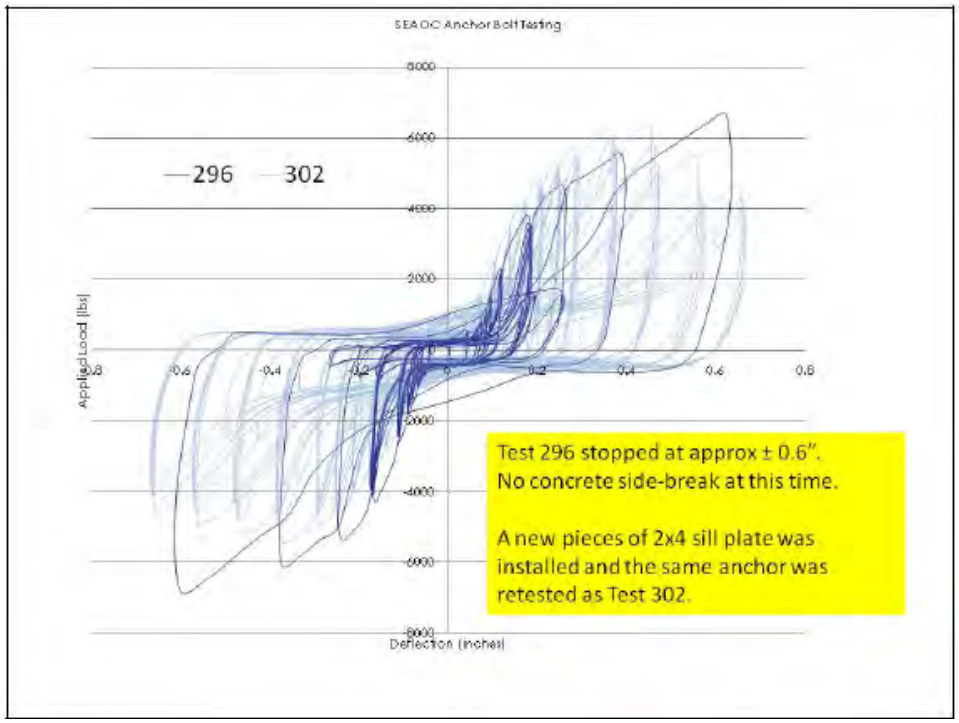

Figure A1 - Result of cycle test specimen 296 and 302

1910.2 (New)

Proponent: Daniel J. Walker, PE, Thomas Associates, Inc. representing the National Sunroom Association

Add new text as follows:

1910.2 Patio cover slab and footing requirements. In areas with a frost depth of zero, a *patio cover* shall be permitted to be supported on a concrete slab on grade without footings, provided the slab conforms to the provisions of Chapter 19 of this code, is not less than 3-1/2 inches (89 mm) thick and further provided that the columns do not support loads in excess of 750 pounds (3.36 kN) per column.

Reason: This language has long been included in Appendix I of the code. The requirements are specific to this section and therefore should be included here.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Walker-S2-1910.2

S170-09/10
1911.1

Proponent: Richard L. Hess, Hess Engineering Inc., representing self

Revise as follows:

1911.1 Scope. The provisions of this section shall govern the allowable stress design of headed bolts and headed stud anchors cast in normal-weight concrete for purposes of transmitting structural loads from one connected element to the other. These provisions do not apply to anchors installed in hardened concrete or where load combinations include earthquake loads or effects for structures other than buildings of light-frame construction that are no more than three stories above grade plane plus basement. The bearing area of headed anchors shall be not less than one and one-half times the shank area. Where strength design is used, or where load combinations include earthquake loads or effects for structures other than buildings of light-frame construction that are no more than three stories above grade plane plus basement, the design strength of anchors shall be determined in accordance with Section 1912. Bolts shall conform to ASTM A 307 or an approved equivalent.

Reason: Experience of over fifty years in earthquake-prone California has demonstrated that light frame buildings of three stories plus basement or less have not experienced any failure of the anchor bolts used to secure shearwalls in these buildings. In addition to this well-documented field experience, testing of light frame walls with cyclical lateral forces has shown that these connections are ductile because of yielding of the light frame sill plates before any failure of the concrete can occur.

Cost Impact: This code change proposal will substantially decrease unnecessary direct design and construction costs as well as plan checking costs due to the confusion that has been created among practicing engineers and building officials by the requirement that light frame anchor bolts be designed in accordance with provisions of ACE 318 Appendix D, which was not based on evidence of its applicability to this type of construction or on testing of anchorage of light frame elements to concrete foundations.

2101.2, 2101.2.7 (New), Chapter 35; IRC R606.1, R606.1.1, R606.12.1, R606.12.3.1, Chapter 44

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards and Phil Samblanet, The Masonry Society, representing The Masonry Society.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Add new text as follows:

2101.2.7 Direct design. Masonry designed by the direct design method shall comply with the provisions of TMS 403.

2. Revise as follows:

2101.2 Design methods. Masonry shall comply with the provisions of one of the following design methods in this chapter as well as the requirements of Sections 2101 through 2104. Masonry designed by the allowable stress design provisions of Section 2101.2.1, the strength design provisions of Section 2101.2.2, ~~or~~ the prestressed masonry provisions of Section 2101.2.3, or the direct design requirements of Section 2101.2.7 shall comply with Section 2105.

3. Add standard to Chapter 35 as follows:

TMS
403-09 Direct Design Handbook for Masonry Structures

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R606.1 General. Masonry construction shall be designed and constructed in accordance with the provisions of this section, TMS 403, or in accordance with the provisions of TMS 402/ACI 530/ASCE 5.

R606.1.1 Professional registration not required. When the empirical design provisions of TMS 402/ACI 530/ASCE 5 Chapter 5, the provisions of TMS 403, or the provisions of this section are used to design masonry, project drawings, typical details and specifications are not required to bear the seal of the architect or engineer responsible for design, unless otherwise required by the state law of the *jurisdiction* having authority.

R606.12.1 General. Masonry structures and masonry elements shall comply with the requirements of Sections R606.12.2 through R606.12.4 based on the seismic design category established in Table R301.2(1). Masonry structures and masonry elements shall comply with the requirements of Section R606.12 and Figures R606.11(1), R606.11(2) and R606.11(3) or shall be designed in accordance with TMS 402/ACI 530/ASCE 5, or TMS 403.

R606.12.3.1 Design requirements. Masonry elements other than those covered by Section R606.12.2.2.2 shall be designed in accordance with the requirements of Chapter 1 and Sections 2.1 and 2.3 of ACI TMS 402/ACI 530/ASCE 5 and shall meet the minimum reinforcement requirements contained in Sections R606.12.3.2 and R606.12.3.2.1. Otherwise, masonry shall be designed in accordance with TMS 403.

> **Exception:** Masonry walls limited to one *story* in height and 9 feet (2743 mm) between lateral supports need not be designed provided they comply with the minimum reinforcement requirements of Sections R606.12.3.2 and R606.12.3.2.1.

2. Add standard to Chapter 44 as follows:

TMS
403-09 Direct Design Handbook for Masonry Structures

Reason: This modification proposes to introduce a simplified design method for single story, concrete masonry buildings based on a new, mandatory language reference standard TMS 403, *Direct Design Handbook for Masonry Structures*. The methodology used to develop the *Direct Design Handbook for Masonry Structures* is based upon the strength design provisions of the 2005 and 2008 editions of the TMS 402/ACI 530/ASCE 5, *Building Code Requirements for Masonry Structures* and the factored combinations of dead, roof live, wind, seismic, snow, and rain loads in accordance with the 2005 edition of ASCE 7, *Minimum Design Loads for Buildings and Other Structures*.

The genesis of this new design standard was conceived in response to concerns from the design community that structural design and loading requirements have become too complicated, particularly for relatively small, non-complicated structures. The direct design procedure is a table-based structural design method that permits the user, following a specific series of steps, to design and specify relatively simple, single-story concrete masonry bearing-wall structures. While simpler to implement, the direct design method does limit a designer's flexibility to only those configurations addressed by the standard and does introduce slightly more conservatism compared to conventional design approaches as a result of the conditions and assumptions inherent to the design approach.

A few of the key design limitations include:

Snow – the ground snow load is limited to 60 lb/ft^2.

Wind – the 3-second gust basic wind speed is limited to 150 mph; wind exposure category is limited to B or C; and site topography is limited such that K_{zt} = 1.0.

Seismic – the mapped spectral acceleration for short and 1-second periods is limited to 3.0*g* and 1.25*g*, respectively and limited to site classes A, B, C, or D.

Construction – wall are limited to single story, single wythe, 8-inch concrete masonry with a maximum height of 30 feet.

Roof – while the design of roofs is not covered by the direct design method, roof diaphragms are required to be flexible, have rectangular dimensions with an aspect ratio not exceeding 4-to-1, with a maximum plan dimension of 200 feet.

Reinforcement – all reinforcing bars are limited to No. 5 Grade 60.

While the *Direct Design Handbook for Masonry Structures* cannot be used to design a masonry structure of any configuration, it is intended to capture many of the simple loadbearing masonry structures commonly designed today. Those interested in reviewing a draft of the Direct Design Handbook for Masonry Structures are encouraged to download a working draft of the document at the following link:
http://www.masonrysociety.org/html/resources/TMS-403/TMS403.htm

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, TMS 403-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: THOMPSON-SAMBLANET-S2-2101.2

S172–09/10
2101.3

Proponent: Jason Thompson, National Concrete Masonry Association, representing the Masonry Alliance for Codes and Standards

Revise as follows:

2101.3 Construction documents. The *construction documents* shall show all of the items required by this code including the following:

1. Specified size, grade, type and location of reinforcement, anchors and wall ties.
2. Reinforcing bars to be welded and welding procedure.
3. Size and location of structural elements.
4. Provisions for dimensional changes resulting from elastic deformation, creep, shrinkage, temperature and moisture.
5. Loads used in the design of masonry.
6. Specified compressive strength of masonry at stated ages or stages of construction for which masonry is designed, except where specifically exempted by this code.
7. Details of anchorage of masonry to structural members, frames and other construction, including the type, size and location of connectors.
8. Size and <u>permitted</u> location of conduits, pipes and sleeves.
9. The minimum level of testing and inspection as defined in Chapter 17, or an itemized testing and inspection program that meets or exceeds the requirements of Chapter 17.

Reason: During the 2007/2008 hearings where the above language was approved (S175-07/08), a valid point was raised regarding Item 8 that requires the location of conduits, pipes, and sleeves be indicated. Typically, plans show the general or permitted location of such items combined with typical details (in this case, the mechanical/electrical/plumbing plans) for the construction or installation of such items, which are often located on different sheets of the plans. While minor, the above modification will continue to allow the flexibility afforded by this long-standing practice used when generating plans.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: THOMPSON-S2-2101.3

S173–09/10
2102.1

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards and Phil Samblanet, The Masonry Society.

1. Revise as follows:

2102.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AREA.

~~**Bedded**. The area of the surface of a masonry unit that is in contact with mortar in the plane of the joint.~~

Gross cross-sectional. The area delineated by the out-to-out specified dimensions of masonry in the plane under consideration.

Net cross-sectional. The area of masonry units, grout and mortar crossed by the plane under consideration based on out-to-out specified dimensions.

2. Delete without substitution:

~~**CONNECTOR.** A mechanical device for securing two or more pieces, parts or members together, including anchors, wall ties and fasteners.~~

~~**COVER.** Distance between surface of reinforcing bar and edge of member~~

3. Revise as follows:

DIMENSIONS.

~~**Actual.** The measured dimension of a masonry unit or element.~~

Nominal. The specified dimension plus an allowance for the joints with which the units are to be laid. Thickness is given first, followed by height and then length.

Specified. The dimensions specified for the manufacture or construction of masonry, masonry units, joints or any other component of a structure.

4. Delete without substitution:

~~**GROUTED MASONRY.**~~

~~**Grouted hollow-unit masonry.** That form of grouted masonry construction in which certain designated cells of hollow units are continuously filled with grout.~~

~~**Grouted multiwythe masonry.** That form of grouted masonry construction in which the space between the wythes is solidly or periodically filled with grout.~~

~~**HEIGHT, WALLS.** The vertical distance from the foundation wall or other immediate support of such wall to the top of the wall.~~

5. Revise as follows:

MASONRY UNIT. Brick, tile, stone, glass block or concrete ~~block~~ masonry unit conforming to the requirements specified in Section 2103.

~~**Clay.** A building unit larger in size than a brick, composed of burned clay, shale, fired clay or mixtures thereof.~~

~~**Concrete.** A building unit or block larger in size than 12 inches by 4 inches by 4 inches (305 mm by 102 mm by 102 mm) made of cement and suitable aggregates.~~

Hollow. A masonry unit whose net cross-sectional area in any plane parallel to the load-bearing surface is less than 75 percent of its gross cross-sectional area measured in the same plane.

Solid. A masonry unit whose net cross-sectional area in every plane parallel to the load-bearing surface is 75 percent or more of its gross cross-sectional area measured in the same plane.

6. Delete without substitution:

~~**SHELL.** The outer portion of a hollow masonry unit as placed in masonry.~~

~~**TIE, LATERAL.** Loop of reinforcing bar or wire enclosing longitudinal reinforcement.~~

~~**TILE.** A ceramic surface unit, usually relatively thin in relation to facial area, made from clay or a mixture of clay or other ceramic materials, called the body of the tile, having either a "glazed" or "unglazed" face and fired above red heat in the course of manufacture to a temperature sufficiently high enough to produce specific physical properties and characteristics.~~

~~**WEB.** An interior solid portion of a hollow masonry unit as placed in masonry.~~

(Definitions not shown are unchanged)

Reason: The terms "actual dimension", "grouted hollow-unit masonry", "grouted multiwythe masonry", "wall height", "shell", "lateral tie", and "web" are not used in Chapter 21. Several of these terms, however, (such as "actual dimension", "shell" and "wall height"), are used in other IBC chapters and the definitions in Section 2102 may be inappropriate for such use and as such should be deleted from the masonry chapter. If needed for other chapters, they should be defined for the specific use intended.

The definitions of "connector" and "cover" are inappropriate for their current use in Chapter 21. These terms are used in other masonry standards, but conflict with the usage as given in Chapter 21. For example, the definition of connector conflicts with the usage in IBC Sections 2113.11, 2113.15 and 2113.17. Likewise the definition of cover conflicts with IBC section 2113.18. As such, these definitions should be deleted to avoid additional confusion. If needed, more appropriate definitions could be considered, but the use of these terms in the noted sections is appropriate and understandable without definitions.

The definitions for "clay masonry unit", "concrete masonry units", and "tile" are inappropriate and should be deleted as they do not include all such units permitted by IBC Section 2103. For example, concrete masonry units smaller than the size noted in the definition are permitted by ASTM standards. More appropriate definitions of these terms are found in the referenced standards that are cited where these terms are used in the IBC.

The term "bedded area" is used only in Section 2105.3.2 and is defined in the standard cited in that section for the determination of compressive strength and is thus not needed in the IBC.

The term concrete block in the definition of masonry unit is being updated to the more appropriate term concrete masonry unit.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

2102.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

BRICK.

Calcium silicate (sand lime brick). ~~A masonry unit made of sand and lime.~~ A pressed and subsequently autoclaved unit that consists of sand and lime, with or without the inclusion of other materials.

Clay or shale. ~~A masonry unit made of clay or shale, usually formed into a rectangular prism while in the plastic state and burned or fired in a kiln.~~ A solid or hollow masonry unit of clay or shale, usually formed into a rectangular prism, then burned or fired in a kiln; brick is a ceramic product.

Concrete. ~~A masonry unit having the approximate shape of a rectangular prism and composed of inert aggregate particles embedded in a hardened cementitious matrix.~~ A concrete masonry unit made from portland cement, water, and suitable aggregates, with or without the inclusion of other materials.

COLLAR JOINT. Vertical longitudinal ~~joint~~ space between wythes of masonry or between masonry wythe and backup construction that is permitted to be filled with mortar or grout~~.~~

DIMENSIONS.

Actual. The measured dimension of a masonry unit or element.

Nominal. The specified dimension plus an allowance for the joints with which the units are to be laid. Nominal dimensions are usually stated in whole numbers. Thickness is given first, followed by height and then length.

Specified. ~~The~~ Dimensions specified for the manufacture or construction of ~~masonry, masonry~~ a unit~~s~~, joint~~s~~ or ~~any other component of a structure~~ element.

MORTAR. A ~~plastic~~ mixture consisting of ~~*approved*~~ cementitious materials, fine aggregates, ~~and~~ water, with or without admixtures, that is used to ~~bond~~ construct unit masonry assemblies ~~or other structural units~~.

TIE, WALL. ~~A~~ Metal connector that connects wythes of masonry walls together.

WALL. A vertical element with a horizontal length-to-thickness ratio greater than three, used to enclose space.

Cavity wall. Awall built of masonry units or of concrete, or a combination of these materials, arranged to provide an airspace within the wall, and in which the inner and outer parts of the wall are tied together with metal ties.

Composite wall. A wall built of a combination of two or more masonry units bonded together, one forming the backup and the other forming the facing elements.

Dry-stacked, surface-bonded walls. A wall built of concrete masonry units where the units are stacked dry, without mortar on the bed or head joints, and where both sides of the wall are coated with a surface-bonding mortar.

Masonry-bonded hollow wall. A multiwythe wall built of masonry units ~~so~~ arranged ~~as~~ to provide an air space between the wythes ~~within the wall, and in which the facing and backing of the wall are~~ and with the wythes bonded together with masonry units.

Parapet wall. The part of any wall entirely above the roof line.

(Definitions not shown are unchanged)

Reason: The proposed modifications make these definitions consistent with those in ASTM Standards and the TMS 402 and TMS 602 standards and with their use in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THOMPSON-SAMBLANET-S5-2102 DEFINITIONS

S175–09/10
2103.5 (New), Chapter 35

Proponent: Jason Thompson, National Concrete Masonry Association, representing the Masonry Alliance for Codes and Standards

1. Add new text as follows:

2103.5 Architectural cast stone. Architectural cast stone shall conform to ASTM C1364.

(Renumber subsequent sections accordingly)

2. Add standard to Chapter 35 as follows:

ASTM
C1364-07 Standard Specification for Architectural Cast Stone

Reason: Architectural cast stone products have been used successfully in construction for decades. In 1997, ASTM published ASTM C1364, a specification covering the minimum physical requirements, sampling, testing, and visual inspection of the manufactured cast stone intended to replicate natural stone. To ensure that these products being specified and installed meet minimum established requirements for compressive strength, freeze thaw durability, aesthetics, shrinkage, etc., this modification proposes to introduce a reference to ASTM C1364 into the IBC to help ensure consistent and safe use of these products.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM C1364-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THOMPSON-S1-2103.5

S176–09/10
2107.1, 2107.2

Proponent: Tom Young, PE, Northwest Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

Revise as follows:

2107.1 General. The design of masonry structures using allowable stress design shall comply with Section 2106, Section 2107.2 and the requirements of Chapters 1 and 2 of TMS 402/ACI 530/ASCE 5 except as modified by Sections ~~2107.2~~ 2107.3 through 2107.5.

2107.2 ~~TMS 402/ACI 530/ASCE 5, Section 2.1.2,~~ Load combinations. ~~Delete Section 2.1.2.1.~~ Structures and portions thereof shall be designed to resist the most critical effects resulting from the load combinations of Section 1605.3. When using the alternative basic load combinations of Section 1605.3.2 that include wind or seismic loads, allowable stresses are permitted to be increased by one-third.

Reason: The IBC provides load combinations in Chapter 16 therefore there is no need to delete section 2.1.2.1 of TMS 402/ACI 530/ASCE 5. This code provision causes confusion for designers and is not necessary.

The additional language directs the code user to the allowable stress design load combinations in Chapter 16 and clarifies the permissible one-third increase in allowable stresses when using the alternative load combinations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: YOUNG-S1-2107.1

S177–09/10
2107.3, 2107.3.1 (New)

Proponent: Edwin Huston, National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee

Revise as follows:

2107.3 TMS 402/ACI 530/ASCE 5, Section 2.1.9.7.1.1, lap splices. ~~Modify~~ In lieu of Section 2.1.9.7.1.1, it shall be permitted to design lap splices in accordance with Section 2107.3.1 ~~as follows~~:

~~2.1.9.7.1.1~~ 2107.3.1 Lap splices, The minimum length of lap splices for reinforcing bars in tension or compression, l_d, shall be

$l_d = 0.002 d_b f_s$ **(Equation 21-1)**

For SI: $l_d = 0.29 d_b f_s$

but not less than 12 inches (305 mm). In no case shall the length of the lapped splice be less than 40 bar diameters.

where:

d_b = Diameter of reinforcement, inches (mm).

f_s = Computed stress in reinforcement due to design loads, psi (MPa).

In regions of moment where the design tensile stresses in the reinforcement are greater than 80 percent of the allowable steel tension stress, F_s, the lap length of splices shall be increased not less than 50 percent of the minimum required length. Other equivalent means of stress transfer to accomplish the same 50 percent increase shall be permitted. Where epoxy coated bars are used, lap length shall be increased by 50 percent.

Reason: The masonry industry testing of lap splices has progressed. Some testing is still on-going. In the meantime, engineers in some portions of the country would prefer to use the provisions of the TMS 402 document. This code change proposal removes the complete prohibition of section 2.9.1.7.1.1, and replaces it with two alternative design approaches. This dual path is already used in other portions of the IBC.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HUSTON-S4-2107.3

S178–09/10
2108.3

Proponent: Matthew Senecal, PE, representing American Concrete Institute

Revise as follows:

2108.3 TMS 402/ACI 530/ASCE 5, Section 3.3.3.4, splices. Modify items (b) and (c) of Section 3.3.3.4 as follows:

3.3.3.4 (b). A welded splice shall have the bars butted and welded to develop at least 125 percent of the yield strength, f_y, of the bar in tension or compression, as required. Welded splices shall be of ASTM A 706 steel reinforcement. Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls or special moment frames of masonry.

3.3.3.4 (c). Mechanical splices shall be classified as Type 1 or 2 according to ~~Section 21.2.6.1~~ in accordance with the requirements for mechanical splices in special moment frames and special structural walls of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special reinforced masonry shear walls or special moment frames. Type 2 mechanical splices are permitted in any location within a member.

Reason: ACI is in the process of completely reorganizing ACI 318, *Building Code Requirements for Structural Concrete*. This process was formally initiated in the spring of 2008 and was scheduled to be completed by January 1, 2014 so that it would be available for reference by the 2015 IBC. This 2015 IBC schedule was assumed to be the same as traditional ICC meeting schedules.

The reorganized ACI 318 will be significantly different in structure than 318-08. The code will include several new chapters that are based on member design. The 318-08 chapters will be significantly reworked to support the member chapters. Some provisions have been divided sometimes into several chapters and at other provisions combined.

The new schedules released in February 2009 by the ICC require that reorganized ACI 318 be completed by January 3, 2012 for changes to the IBC (Group A) that require textual changes to the body of the IBC. ACI committee 318 will likely not be done with the revisions by that time and thus not have a revised standard to submit for the 2015 IBC if it remains in Group A. ICC's CP 28-05 states that, if no textual changes are required and that the change to the code is in reference only, the revision may be considered by the administrative code committee prior to the Final Action Hearing in Group B.

In this code change proposal, ACI proposes to remove all references to specific sections in ACI 318 from the IBC, but not change the technical intent of any provision. This removal would allow ACI to submit an administrative change in Group B and give ACI Committee 318 one more year to complete their task of reorganization.

In some cases, the referenced section numbers that are removed are replaced with language from ACI 318 (usually the section heading) that will allow the user to easily locate the appropriate section. In some cases, the referenced information in ACI 318 is transcribed into the IBC. The use of words in place of section numbers may require some editorial revisions in the 2012/2013 ICC cycle, if the headings are changed through the reorganization.

The following explanations are given to for the revised Sections stated above:

2108.3	Replaced the referenced section with language that would identify the source information in ACI 318. Note that the ACI 318 reference section number is not correct since it should be Section 21.1.6.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SENECAL-S7-2108.3

S179–09/10
2109.1.1, 2308.2, 2308.2.1

Proponent: T. Eric Stafford, PE, representing Institute for Business and Home Safety

Revise as follows:

2109.1.1 Limitations. The use of empirical design of masonry shall be limited as noted in Section 5.1.2 of TMS 402/ACI 530/ASCE 5. Section 5.1.2.2 of TMS 402/ACI 530/ASCE 5 shall be modified as follows:

5.1.2.2 *Wind* – Empirical requirements shall not apply to the design or construction of masonry for buildings, parts of buildings, or other structures to be located in areas where the basic wind speed exceeds 130 mph (58 m/s) as given in ASCE 7.

The use of dry-stacked, surface-bonded masonry shall be prohibited in *Occupancy Category* IV structures. In buildings that exceed one or more of the limitations of Section 5.1.2 of TMS 402/ACI 530/ASCE 5, masonry shall be designed in accordance with the engineered design provisions of Section 2101.2.1, 2101.2.2 or 2101.2.3 or the foundation wall provisions of Section 1807.1.5.

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of *conventional light-frame construction*, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

1. Buildings shall be limited to a maximum of three *stories above grade plane*. For the purposes of this section, for buildings in *Seismic Design Category* D or E as determined in Section 1613, cripple stud walls shall be considered to be a *story*.

   Exception: Solid blocked cripplewalls not exceeding 14 inches (356 mm)in height need not be considered a *story*.

2. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches (3531 mm). Bearing wall height shall not exceed a stud height of 10 feet (3048 mm).
3. Loads as determined in Chapter 16 shall not exceed the following:
   3.1. Average dead loads shall not exceed 15 psf (718 N/m2) for combined roof and ceiling, exterior walls, floors and partitions.

   Exceptions:

   1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m2) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.
   2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.

   3.2. Live loads shall not exceed 40 psf (1916 N/m2) for floors.
   3.3. Ground snow loads shall not exceed 50 psf (2395 N/m2).

4. Wind speeds shall not exceed 130 ~~100~~ miles per hour (mph) (~~44~~ 58 m/s) (3-second gust).

   Exception: Wind speeds shall not exceed 140 ~~110~~ mph (~~48.4~~ 63 m/s) (3-second gust) for buildings in Exposure Category B that are not located in a *hurricane-prone region*.

5. Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.
6. The use of the provisions for *conventional light-frame construction* in this section shall not be permitted for *Occupancy Category* IV buildings assigned to *Seismic Design Category* B, C, D, E or F, as determined in Section 1613.
7. *Conventional light-frame construction* is limited in irregular structures in *Seismic Design Category* D or E, as specified in Section 2308.12.6.

2308.2.1 Basic wind speed greater than ~~100~~ 130 mph (3-second gust). Where the basic wind speed exceeds 130 ~~100~~ mph (58 m/s) (3-second gust), the provisions of either AF&PAWFCM, or the ICC 600 are permitted to be used. Wind speeds in Figure 1609A, 1609B, and 1609C shall be converted in accordance with Section 1609.3.1 for use with AF&PAWFCM or ICC 600.

Reason: The purpose of this code change is to correlate the prescriptive limits for empirical design of masonry and conventional wood frame construction with other proposals that are updating the wind speed maps in the IBC and the IRC. The wind speed maps in ASCE 7 are being updated to ultimate wind speeds as opposed to the ASD level wind speed maps that currently exist in ASCE 7 and in the IBC and IRC. See IBC code change for information on why the wind speed maps are being updated. While a way to convert the ultimate wind speeds to ASD level wind speeds is proposed in the IBC, the converted wind speeds do not match, from a geographic standpoint, the limitations the code previously imposed. Since the empirical provisions and conventional methods for wood frame construction, typically can't be calculated to equate to the lower level wind speeds at the current limit, including the fact that these provisions are missing some of the key wind resistant construction design methods (e.g. gable end wall bracing, bond beam reinforcement, vertical wall reinforcement, etc.), the proposed limitations will roughly, maintain the current limitations on empirical and conventional methods that currently exist in terms of geographic location on the wind speed map. While some areas of the country will see a reduction in areas where empirical design of masonry or conventional construction would be allowed, other areas will see in increase in areas where these methods would be allowed.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Stafford-S1-2109

S180–09/10
2113.1

Proponent: Jim Buckley, Buckley Rumford Co., representing the Masonry Alliance for Codes and Standards (MACS) & Clay Flue Lining Institute (CFLI)

Revise as follows:

2113.1 Definition. A masonry chimney is a chimney constructed of ~~concrete or masonry~~ solid masonry units, hollow masonry units grouted solid, stone or concrete, hereinafter referred to as "masonry." Masonry chimneys shall be constructed, anchored, supported and reinforced as required in this chapter.

Reason: To make language same as for fireplaces and smoke chambers and to be consistent with IRC Section R1003.1 and definitions in Chapters 3 and 4.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUCKLEY-S1-2113.1

S181–09/10
2113.20

Proponent: Jim Buckley, Buckley Rumford Co., representing the Masonry Alliance for Codes and Standards (MACS) & Clay Flue Lining Institute (CFLI)

Revise as follows:

2113.20 Chimney fireblocking. All spaces between chimneys and floors and ceilings through which chimneys pass shall be fireblocked with noncombustible material securely fastened in place. The fireblocking of spaces between wood joists, beams or headers shall be ~~to a depth of 1 inch (25 mm) and shall only~~ self-supporting or be placed on strips of metal or metal lath laid across the spaces between combustible material and the chimney.

Reason: To be consistent with IRC Section R1003.19.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUCKLEY-S4-2113.20

S182-09/10

2113.9.1 (New), 2113.9.3 (New); IRC R1003.9.1 (New), R1003.9.3 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Jim Buckley, Buckley Rumford Co., representing the Masonry Alliance for Codes and Standards (MACS) & Clay Flue Lining Institute (CFLI)

PART I – IBC STRUCTURAL

Add new text as follows:

2113.9.1 Chimney caps. Masonry chimneys shall have a concrete, metal or stone cap, sloped to shed water, a drip edge and a caulked bond break around any flue liners in accordance with ASTM C 1283.

~~**2113.9.1**~~ **2113.9.2 Spark arrestors.**

(No change to current text)

2113.9.3 Rain caps. Where a masonry or metal rain cap is installed on a masonry chimney, the net free area under the cap shall not be less than four times the net free area of the outlet of the chimney flue it serves.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R1003.9.1 Chimney caps. Masonry chimneys shall have a concrete, metal or stone cap, sloped to shed water, a drip edge and a caulked bond break around any flue liners in accordance with ASTM C 1283.

~~**R1003.9.1**~~ **R1003.9.2 Spark arrestors.** *(No change to current text)*

R1003.9.3 Rain caps. Where a masonry or metal rain cap is installed on a masonry chimney, the net free area under the cap shall not be less than four times the net free area of the outlet of the chimney flue it serves.

Reason: New language to include provision for commonly used chimney caps and rain caps. This language will reference and be consistent with ASTM C1283 and C315.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUCKLEY-S2-2113.9

S183–09/10
2113.12

Proponent: Jim Buckley, Buckley Rumford Co., representing the Masonry Alliance for Codes and Standards (MACS) & Clay Flue Lining Institute (CFLI)

Revise as follows:

2113.12 Clay flue lining (installation). Clay flue liners shall be installed in accordance with ASTM C 1283 and extend from a point not less than 8 inches (203 mm) below the lowest inlet or, in the case of fireplaces, from the top of the smoke chamber to a point above the enclosing walls. The lining shall be carried up vertically, with a maximum slope no greater than 30 degrees (0.52 rad) from the vertical.

Clay flue liners shall be laid in medium-duty non-water soluble refractory mortar conforming to ASTM C 199 with tight mortar joints left smooth on the inside and installed to maintain an air space or insulation not to exceed the thickness of the flue liner separating the flue liners from the interior face of the chimney masonry walls. Flue lining shall be supported on all sides. Only enough mortar shall be placed to make the joint and hold the liners in position.

Reason: To require non-water soluble refractory mortar which won't wash out of the joints in chimneys which are exposed to weather. Also to be consistent with IRC Section R1003.12

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUCKLEY-S3-2113.12

S184–09/10
2204.2.1

Proponent: Bonnie Manley, representing American Iron and Steel Institute

Revise as follows:

2204.2.1 Anchor rods. Anchor rods shall be set in accordance with the *construction documents*~~accurately to the pattern and dimensions called for on the plans~~. The protrusion of the threaded ends through the connected material shall ~~be sufficient to fully~~ engage the threads of the nuts, but shall not be greater than the length of the threads on the bolts.

Reason: The modifications to this section are intended to be editorial in nature. In the first sentence, the defined term “construction documents” replaces the undefined term “plans”. In the second sentence, vague language is eliminated.

Cost Impact: There is no anticipated impact on the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Manley-S2-2204.2.1

S185–09/10
2206.5 (New)

Proponent: Edwin Huston, representing National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee

Add new text as follows:

2206.5 Steel joist incidental loads. In addition to the loads required by Table 1607.1 and the loads required in Section 2206.2, steel joists shall be designed for an additional incidental load of 400 pounds (1.779 kN), of which one single concentrated load of up to 300 pounds (1.335 kN) shall be placed between any two top chord panel points and a single concentrated load of up to 100 pounds (0.445 kN) shall be placed between any two bottom chord panel points.

(Renumber subsequent sections)

Reason: Many, if not most, steel joist roof structures which are currently in service have miscellaneous incidental loads suspended from the joist's top or bottom chords. Some joist manufactures have an allowance for such loads, others do not. There are manufacturers of hardware specifically designed to allow for the suspension of such loads. This code change proposal is intended to provide an allowance for such incidental loads

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HUSTON-S3-2206.5

S186–09/10
2208.1

Proponent: Bonnie Manley, representing American Iron and Steel Institute

Revise as follows:

2208.1 Storage racks. The design, testing and utilization of industrial steel storage racks made of cold-formed or hot-rolled steel structural members, shall be in accordance with RMI/ANSI MH 16.1. Where required by ASCE 7, the seismic design of storage racks shall be in accordance with the additional provisions of Section 15.5.3 of ASCE 7~~, except that items (1), (2)and (3) of Section 15.5.3 of ASCE 7 do not apply when the rack design satisfies RMI/ANSI MH 16.1~~.

Reason: The exception recommended for deletion was inserted last cycle in Proposal S205-07/08 in order to coordinate the 2008 edition of RMI's ANSI/MH 16.1, *Specification for Design, Testing and Utilization of Industrial Steel Storage Racks,* with ASCE 7-05, which had originally adopted the 2002 edition of the RMI standard. The 2010 edition of ASCE 7 adopts and modifies the 2008 edition of ANSI/MH16.1. Consequently, the list of exceptions is no longer needed. Also, the word "additional" is added to emphasize that, for seismic design, steel storage racks must also be designed in accordance with the modifications contained in ASCE 7, Section 15.5.3.

Cost Impact: There is no anticipated impact on the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Manley-S4-2208.1

S187–09/10
2208.1, Chapter 35

Proponent: Bonnie Manley, American Iron and Steel Institute representing Rack Manufacturers Institute

1. Revise as follows:

2208.1 Storage racks. The design, testing and utilization of industrial steel storage racks made of cold-formed or hot-rolled steel structural members, shall be in accordance with the RMI/ANSI MH 16.1. Where required by ASCE 7, the seismic design of storage racks shall be in accordance with the additional provisions of Section 15.5.3 of ASCE 7~~,~~ except that items ~~(1),~~ (2) and (3) of Section 15.5.3 of ASCE 7 do not apply when the rack design satisfies RMI/ANSI MH 16.1.

2. Revise Chapter 35 standard as follows:

RMI
ANSI/MH 16.1-~~08~~ 11 Specification for Design, Testing and Utilization of Industrial Steel Storage Rack, 2011

Reason: This proposal updates the edition year of RMI's ANSI/MH 16.1, *Specification for Design, Testing and Utilization of Industrial Steel Storage Racks,* from 2008 to 2011. The document is expected to be completed in early 2010. The modification to the last sentence of Section 2208.1 coordinates the 2011 edition of the RMI standard with ASCE 7-10, which adopts the 2008 edition of the RMI standard. Also, the word "additional" is added to emphasize that, for seismic design, steel storage racks must also be designed in accordance with the applicable modifications contained in ASCE 7, Section 15.5.3.
Cost Impact: There is no anticipated impact on the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Manley-S5-2208.1

S188–09/10
1604.3.3, 2209.2.1

Proponent: Edwin Huston, representing National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee

1. Delete without substitution:

~~**2209.2.1 Composite slabs on steel decks.** Composite slabs of concrete and steel deck shall be designed and constructed in accordance with ASCE 3.~~

(Renumber subsequent sections)

2. Revise as follows:

1604.3.3 Steel. The deflection of steel structural members shall not exceed that permitted by AISC 360, AISI S100, ~~ASCE 3,~~ ASCE 8, SJI CJ-1.0, SJI JG-1.1, SJI K-1.1 or SJI LH/DLH-1.1, as applicable.

Reason: The referenced standard will be 21 years old by the time the 2012 IBC is available for use. We found no evidence of recent updates. We understand that the standard development organization, ASCE/SEI is beginning the process to update the standard. Until it is updated, it should be removed as a reference standard.

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HUSTON-S8-2209.2

S189–09/10
2209.1 through 2209.1.1.3, 2209.2 through 2209.3.6 (New)

Proponent: Bonnie Manley, American Iron and Steel Institute representing American Iron and Steel Institute

1. Revise as follows:

2209.1 General. The design of cold-formed carbon and low-alloy steel structural members shall be in accordance with AISI S100. The design of cold-formed stainless-steel structural members shall be in accordance with ASCE 8. Cold-formed steel light-frame construction shall also comply with Section 2210. Where required, the seismic design of cold-formed steel structures shall be in accordance with the additional provisions of Section 2209.2.

~~**2209.2**~~ **2209.1.1 Steel decks.** The design and construction of cold-formed steel decks shall be in accordance with this section.

~~**2209.2.1**~~ **2209.1.1.1 Composite slabs on steel decks.** Composite slabs of concrete and steel deck shall be designed and constructed in accordance with ASCE 3.

~~**2209.2.2**~~ **2209.1.1.2 Noncomposite steel floor decks.** Noncomposite steel floor decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-NC1.0, as modified in Section ~~2209.2.2.1~~ 2209.1.1.2.1.

~~**2209.2.2.1**~~ **2209.1.1.2.1 ANSI/SDI-NC1.0 Section 2.4B1.** Replace Section 2.4B1 of ANSI/SDI-NC1.0 with the following:

1. General: The design of the concrete slabs shall be done in accordance with the ACI *Building Code Requirements for Reinforced Concrete*. The minimum concrete thickness above the top of the deck shall be 11/2 inches (38 mm).

~~**2209.2.3**~~ **2209.1.1.3 Steel roof deck.** Steel roof decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-RD1.0.

2. Add new text as follows:

2209.2 Seismic requirements for cold-formed steel structures. Where a response modification coefficient, R, in accordance with ASCE 7, Table 12.2-1 is used for the design of cold-formed steel structures, the structures shall be designed and detailed in accordance with the requirements of AISI S100, ASCE 8, or AISI S110 as modified in Section 2209.3.

2209.3 Modifications to AISI S110. The text of AISI S110 shall be modified as indicated in Sections 2209.3.1 through 2209.3.6.

2209.3.1 AISI S110, Section D1. Modify AISI S110, Section D1 to read as follows:

D1 Cold-Formed Steel Special Bolted Moment Frames (CFS-SBMF). Cold-formed steel–special bolted moment frames (CFS-SBMF) systems shall withstand significant inelastic deformations through friction and bearing at their bolted connections. Beams, columns, and connections shall satisfy the requirements in this section. CFS-SBMF systems shall be limited to one-story structures, no greater than 35 feet in height, without column splices and satisfying the requirements in this section. The CFS-SBMF shall engage all columns supporting the roof or floor above. The single size beam and single size column with the same bolted moment connection detail shall be used for each frame. The frame is to be supported on a level floor or foundation.

2209.3.2 AISI S110, Section D1.1.1. Modify AISI S110, Section D1.1.1 to read as follows:

D1.1.1 Connection Limitations. Beam-to-column connections .in CFS-SBMF systems shall be bolted connections with snug-tight high-strength bolts. The bolt spacing and edge distance shall be in accordance with the limits of AISI S100, Section E3. The 8-bolt configuration shown in Table D1-1 shall be used. The faying surfaces of the beam and column in the bolted moment connection region shall be free of lubricants or debris.

2209.3.3 AISI S110, Section D1.2.1. Modify AISI S110, Section D1.2.1 to read as follows:

D1.2.1 Beam Limitations. In addition to the requirements of Section D1.2.3, beams in CFS-SBMF systems shall be ASTM A 653 galvanized 55 ksi (374 MPa) yield stress cold-formed steel C-sections members with lips, and designed in accordance with Chapter C of AISI S100. The beams shall have a minimum design thickness of 0.105 inches (2.67 mm). The beam depth shall be not less than 12 in (305 mm) or greater than 20 in (508 mm). The flat depth-to-thickness ratio of the web shall not exceed $6.18\sqrt{E/F_y}$.

2209.3.4 AISI S110, Section D1.2.2. Modify AISI S110, Section D1.2.2 to read as follows:

D1.2.2 Column Limitations. In addition to the requirements of D1.2.3, columns in CFS-SBMF systems shall be ASTM A 500 Grade B cold-formed steel hollow structural section (HSS) members painted with a standard industrial finished surface, and designed in accordance with Chapter C of AISI S100. The column depth shall be not less than 8 in (203 mm) or greater than 12 in (305 mm). The flat depth-to-thickness ratio shall not exceed $1.40\sqrt{E/F_y}$.

2209.3.5 AISI S110, Section D1.3. Modify AISI S110, Section D1.3 to read as follows:

D1.3 Design Story Drift. Where the applicable building code does not contain design coefficients for CSF-SBMF systems, the provisions of Appendix 1 shall apply. For structures having a period less than T_S, as defined in the applicable building code, alternate methods of computing Δ shall be permitted, provided such alternate methods are acceptable to the authority having jurisdiction.

2209.3.6 AISI S110, Section D1.5. Add a new Section D1.5 to read as follows:

D1.5 Period Determination. The fundamental period of the structure, T, in the direction under consideration shall be established in accordance with the applicable building code using the structural properties and deformational characteristics of the resisting elements in a properly substantiated analysis. Use of the approximate building period, T_a, as an alternative fundamental period shall not be permitted.

3. Add standard to Chapter 35 as follows:

AISI

S110-07 Standard for Seismic Design Of Cold-Formed Steel Structural Systems – Special Bolted Moment Frames.

Reason: This proposal introduces a reference to the first edition of AISI S110, *Standard For Seismic Design Of Cold-Formed Steel Structural Systems – Special Bolted Moment Frames*, which is based upon research conducted by Drs. Uang and Sato at UCSD (2007). Specifically, the standard focuses on providing design provisions for a newly defined seismic force resisting system entitled "Cold-formed Steel – Special Bolted Moment Frame" or CFS-SBMFs. This type of system is expected to experience substantial inelastic deformation during significant seismic events. It is intended that most of the inelastic deformation will take place at the bolted connections, due to slip and bearing. In order to develop the designated mechanism, requirements based on the capacity design principles are provided for the design of the beams, columns and associated connections. Additionally, AISI S110 has specific requirements for the application of quality assurance and quality control procedures.

This system has been vetted through the BSSC process (Proposal 6-4R) and will be included in Part I of the 2009 NEHRP Provisions. Additionally, it has been introduced for consideration in the 2010 edition of ASCE 7 (Proposal TC-6-CH12-102-R3). As a first pass, Appendix 1 of AISI S110 makes recommendations on the seismic design coefficients of the CFS-SBMF system. These parameters have been introduced for consideration in the ASCE 7-10 proposal. The Response Modification Coefficient, R, is set at 3.5. Cyclic testing has shown that CFS-SBMFs have very large ductility capacity and significant hardening. This justifies the use of a value of 3.5 for the R-factor. The derivation of the deflection amplification factor, C_d, can be found in the AISI S110 Commentary, Section D1.3. Furthermore, a capacity design procedure has been provided in Section D1.5 of AISI S110 Commentary so that the designer can explicitly calculate the seismic load effect with overstrength, E_{mh},. at the design story drift level. Alternatively, a conservative system overstrength factor, , is also provided to be compatible with the conventional approach to compute E_{mh} in ASCE 7. Finally the height limitation of 35 feet for all SDCs is based on practical use only and not from any limits on the CFS-SBMF system strength.

Modifications to AISI S110 (2007 edition) were developed primarily in the BSSC's NEHRP process and adopted by ASCE 7 in Chapter 14. Since ASCE 7, Chapter 14 is not adopted in the IBC, these modifications need to be included within this proposal. The reasons for the modifications are as follows:

In Section 2209.3.1, the language was modified to reflect that CFS-SBMF needs to use the same-size beams and same-size columns throughout. In addition, the system needs to engage all primary columns, which support the roof or floor above, and those columns need to be supported on a level floor or foundation.

In Section 2209.3.2, the modifications were made for consistency with the test database.

In Section 2209.3.3, the modifications were made to be consistent with the test database (Uang and Sato, 2007), and limitations on the beam depth, steel grade, and surface treatment are added in Section D1.2.1 of AISI S110.

In Section 2209.3.4 the language was modified to be consistent with the test database (Uang and Sato, 2007), and limitations on column depth, steel grade, and surface treatment are added in Section D1.2.2 of AISI S110. The width-thickness ratio was reduced based upon further review of the test specimens.

In Section 2209.3.5, AISI S110 is intended primarily for industrial platforms; however, the standard is not limited to these non-building structures and does not prohibit architectural attachments (such as partition walls). As approved by the BSSC PUC, Proposal 6-4R reduced the 0.05*h* drift limit in Section D1.3 of AISI S110 to 0.03*h* in order to more closely align with the 0.025*h* drift limit of ASCE 7. Also, the BSSC PUC inserted the sentence, "In no case shall the design story drift exceed 0.05h." to ensure an absolute upper bound on the drift limit. However, the ASCE 7 Seismic Subcommittee did not agree with the BSSC PUC and, instead, requested that ASCE 7, Section 12.12 not be overwritten by AISI S110. Therefore, the 0.05*h* drift limit in Section D1.3 of AISI S110 has been eliminated in deference to the design story drift limits found in ASCE 7, Section 12.12. In addition, the first sentence of the AISI S110, Section D1.3 was deleted because it was considered commentary.

Two additional modifications are presented in this proposal which are not being considered for inclusion in ASCE 7-10, Chapter 14, but were deemed important enough to be included in the IBC. These two items resulted from discussions with SEAOC. First in Section 2209.3.3, a minimum thickness for the beams was added to reflect the test database. Secondly, Section 2209.3.6 clarifies that the approximate fundamental period, T_a, in accordance with ASCE 7 Section 12.8.2.1, should not be used in the design of CFS-SBMF systems. Instead, the fundamental period of the structure, T, needs to be based upon the structural properties and deformational characteristics of the resisting elements. The approximate fundamental period in ASCE 7, Section 12.8.1 simply does not predict the period as accurately as needed for the variety of uses of this framing system.

Cost Impact: There is no anticipated impact on the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, AISI S110-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Manley-S3-2209

S190–09/10
2209.2.1

Proponent: Roy H. Reiterman, PE, representing Wire Reinforcement Institute, Inc, Technical Consultant for WRI

Revise as follows:

2209.2.1 Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be designed and constructed in accordance with ASCE 3 and ACI 318.

Reason: To eliminate confusion on whether steel reinforcement is required for the above elevated slab section. We are proposing the above add/change for the next 2012 Code edition and succeeding IBC Code sections. Section 2209.2.2 is all right as it appears in the current IBC Code and as it references 2209.2.2.1

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RETIERMAN-S1-2209

S191–09/10
2209.2.1, 2209.2.1.1 (New) Chapter 35

Proponent: Thomas Sputo, Ph.D., PE, SE, Steel Deck Institute, representing Steel Deck Institute

1. Revise as follows:

2209.2.1 Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be permitted to be designed and constructed in accordance with ~~ASCE 3~~ ANSI/SDI-C1.0, as modified in Section 2209.2.1.1.

2. Add new text as follows:

2209.2.1.1 ANSI/SDI-C1.0 Section 2.4B6a. Replace Section 2.4B6a of ANSI/SDI-C1.0 with the following:

a. Temperature and shrinkage reinforcement, consisting of welded wire fabric or reinforcing bars, shall have a minimum area of 0.00075 times the area of the concrete above the deck (per foot or meter of width), but shall not be less than the area provided by 6 x 6 – W1.4 x W1.4 welded wire fabric.

3. Add standard to Chapter 35 as follows:

SDI
C1.0-06 Standard for Composite Steel Floor Deck

Reason: ASCE 3-91 is proposed for deletion because it does not meet the criteria set forth in CP#28-05, revised 2/27/09 for referenced standards. Section 3.6.3.2 requires a reference standard to be maintained. This standard has not been reaffirmed since its approval by ANSI in 1992. The ASCE committee responsible for this standard has been inactive since approximately 1997 and has taken no action on this standard since then. "ASCE Rules for Standards Committees" (2006) require standards to be reaffirmed at intervals not to exceed 5 years (Section 5.8). Additionally, this standard is out-of-print and is therefore not readily available to code officials, designers, or users of the code.

ANSI/SDI C1.0 is proposed for inclusion because it is the current standard for the design of composite steel deck. This standard is readily available to code officials, designers, and other users of the code, both in print form and as a free download from the Steel Deck Institute website. Section 2.4B6a is modified to delete the option for the use of fibers because of lack of complete consensus among all interested parties on proper specification of fibers for the purpose of control of shrinkage and temperature fluctuation effects in concrete on composite steel deck.

Section 2.4B6a – Text as it appears in SDI-C1.0:

a. Temperature and shrinkage reinforcement, consisting of welded wire fabric or reinforcing bars, shall have a minimum area of 0.00075 times the area of the concrete above the deck (per foot or meter of width), but shall not be less than the area provided by 6 x 6 – W1.4 x W1.4 welded wire fabric.

Fibers shall be permitted as a suitable alternative to the welded wire fabric specified for temperature and shrinkage reinforcement. Cold-drawn steel fibers meeting the criteria of ASTM A820, at a minimum addition rate of 25 lb/cu yd (14.8 kg/cu meter), or macro synthetic fibers "Coarse fibers" (per ASTM Subcommittee C09.42), made from virgin polyolefin, shall have an equivalent diameter between 0.4 mm (0.016 in.) and 1.25 mm (0.05 in.), having a minimum aspect ratio (length/equivalent diameter) of 50, at a minimum addition rate of 4 lb./cu yd (2.4 kg/m^3) are suitable to be used as minimum temperature and shrinkage reinforcement.

Cost Impact: The code change proposal will not increase the cost of construction

Analysis: A review of the standard(s) proposed for inclusion in the code, SDI C1.0-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Sputo-S1-2209.2.1

S192–09/10
2209.2.1, 2209.2.1.1 (New) Chapter 35

Proponent: Thomas Sputo, Ph.D., PE, SE, Steel Deck Institute, representing Steel Deck Institute

1. Revise as follows:

2209.2.1 Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be permitted to be designed and constructed in accordance with ~~ASCE 3~~ ANSI/SDI-C1.0 as modified in Section 2209.2.1.1.

2209.2.1.1 ANSI/SDI-C1.0 Section 2.4B7a. Replace Section 2.4B7a of ANSI/SDI-C1.0 with the following:

a. Temperature and shrinkage effects in the concrete shall be controlled by one of the following alternatives:

1. Welded wire reinforcement or reinforcing bars with a minimum area of 0.00075 times the area of the concrete above the deck (per foot or meter of width), but not be less than the area provided by 6 x 6 – W1.4 x W1.4 (152 x 152 – MW9 x MW9) welded wire reinforcement. Reinforcing shall be properly supported and shall not rest in contact with the steel deck.

2. Add standard to Chapter 35 as follows:

SDI
C1.0-10 Standard for Composite Steel Floor Deck

Reason: ASCE 3-91 is proposed for deletion because it does not meet the criteria set forth in CP#28-05, revised 2/27/09 for referenced standards. Section 3.6.3.2 requires a reference standard to be maintained. This standard has not been reaffirmed since its approval by ANSI in 1992. The ASCE committee responsible for this standard has been inactive since approximately 1997 and has taken no action on this standard since then. "ASCE Rules for Standards Committees" (2006) require standards to be reaffirmed at intervals not to exceed 5 years (Section 5.8). Additionally, this standard is out-of-print and is therefore not readily available to code officials, designers, or users of the code.

ANSI/SDI C-2010 (currently under development as an update to ANSI/SDI C1.0) is proposed for inclusion because it is the current standard for the design of composite steel deck. This standard, once completed, will be readily available to code officials, designers, and other users of the code, both in print form and as a free download from the Steel Deck Institute website. Section 2.4B7a is modified to delete the option for the use of fibers because of lack of complete consensus among all interested parties on proper specification of fibers for the purpose of control of shrinkage and temperature fluctuation effects in concrete on composite steel deck.

Section 2.4B7a – Text as it appears in SDI-C-2010:

a. Temperature and shrinkage effects in the concrete shall be controlled by one of the following alternatives:

1. Welded wire reinforcement or reinforcing bars with a minimum area of 0.00075 times the area of the concrete above the deck (per foot or meter of width), but not be less than the area provided by 6 x 6 – W1.4 x W1.4 (152 x 152 – MW9 x MW9) welded wire reinforcement. Reinforcing shall be properly supported and shall not rest in contact with the steel deck.

2. Concrete specified in accordance with ASTM C1116, Type I, containing steel fibers meeting the criteria of ASTM A820, Type I , Type II, or Type V, at a minimum addition rate of 25 lb/cu yd (14.8 kg/cu meter)

3. Concrete specified in accordance with ASTM C1116, Type III, containing macrosynthetic fibers made from virgin polyolefin, having an equivalent diameter between 0.012 inches (0.3 mm) and 0.050 inches (1.25 mm), and having a minimum aspect ratio (length/equivalent diameter) of 50, at a minimum addition rate of 4 lb./cu yd (2.4 kg/m3).

Cost Impact: The code change proposal will not increase the cost of construction

Analysis: A review of the standard(s) proposed for inclusion in the code, SDI C1.0-10, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

202, 2302.1, 2304.11.2.3

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing self

Revise as follows:

SECTION 202
DEFINITIONS

NATURALLY DURABLE WOOD. ~~See Section 2302.1~~ The heartwood of the following species except for the occasional piece with corner sapwood, provided 90 percent or more of the width of each side on which it occurs is heartwood.

Decay resistant. ~~See Section 2302.1~~ Redwood, cedar, black locust and black walnut

Termite resistant. ~~See Section 2302.1~~ Redwood, Alaska yellow cedar, Eastern red cedar and both heartwood and all sapwood of Western red cedar.

2302.1 Definitions. The following words and terms, shall, for the purposes of this chapter, have the meanings shown herein.

~~**NATURALLY DURABLE WOOD.** The heartwood of the following species with the exception that an occasional piece with corner sapwood is permitted if 90 percent or more of the width of each side on which it occurs is heartwood.~~

~~**Decay resistant.** Redwood, cedar, black locust and black walnut.~~

~~**Termite resistant.** Redwood, Alaska yellow cedar, Eastern red cedar and both heartwood and all sapwood of Western red cedar.~~

2304.11.2.3 Exterior walls below grade. Wood framing members and furring strips attached directly to the interior of exterior masonry or concrete walls below grade shall be of ~~approved~~ naturally durable or preservative-treated wood.

Reason: The placement of the definition of "naturally durable wood" in Section 2302.1 limits its applicability to Chapter 23 as specified in Section 2302.1. Naturally durable wood, however, is also specified in Sections 1507.8.5 and 1507.9.8 as well as Tables 1507.8, 1507.8.5, 1507.8.7, 1507.9.6 and 1507.9.8. Relocating the definition of "naturally durable wood" from Section 2302.1 to Section 202 will expand its applicability to account for all instances of the term in the IBC. The definition is also revised editorially so that the text is nonmandatory.

In Section 2304.11.2.3, "approved" before "naturally durable" is deleted due to redundancy. Since the term is defined, meeting the definition is seen as sufficient since procedures for approval by the building official are specified in Chapter 1. The deletion will also make Section 2304.11.2.3 consistent with all other instances of "naturally durable" in the IBC of which none are preceded by "approved." In addition to the sections and tables noted above, refer to Sections 2304.11.1 through 2304.11.2.2, 2304.11.2.4 through 2304.11.4, 2304.11.4.2, 2304.11.5 and 2304.11.6.

References to "naturally durable" and "naturally durable wood" are also found in the 2009 IRC, including a definition for "naturally durable wood" in Section R202. According to Section R201.1, the definitions in Section R202 are applicable throughout the IRC in the same manner as the definitions in IBC Section 202 are applicable throughout the IBC. Thus, the changes in this proposal for the IBC are not needed in the IRC and will make the IBC consistent with the IRC with respect to naturally durable wood.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brazil-S38-2302.1

S196–09/10
2302.1

Proponent: Edward L. Keith, PE, APA - The Engineered Wood Association

1. Revise as follows:

STRUCTURAL COMPOSITE LUMBER. Structural members manufactured using wood elements bonded together with exterior adhesives. Examples of structural composite lumber are:

Laminated veneer lumber (LVL). A composite of wood veneer elements with wood fibers primarily oriented along the length of the member. Veneer thickness shall not exceed 0.25 inches (6.4 mm).

Parallel strand lumber (PSL). A composite of wood strand elements with wood fibers primarily oriented along the length of the member. The least dimension of the strands shall not exceed 0.25 inches (6.4 mm) and the average length shall be a minimum of 300 times the least dimension.

Laminated strand lumber (LSL). A composite of wood strand elements with wood fibers primarily oriented along the length of the member. The least dimension of the strands shall not exceed 0.10 inches (2.54 mm) and the average length shall be a minimum of 150 times the least dimension.

Oriented strand lLumber (OSL). A composite of wood strand elements with wood fibers primarily oriented along the length of the member. The least dimension of the strands shall not exceed 0.10 inches (2.54 mm) and the average length shall be a minimum of 75 times the least dimension.

Reason: ASTM Standard D5456 recognizes 4 types of structural composite lumber. This proposal adds the two types missing from the existing definition and makes them consistent with ASTM D5456

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-S2-2302.1 Definitions

S197–09/10
2302.1

Proponent: Harvey B. Manbeck, PE, Manbeck Engineering, Inc., representing the National Frame Building Association

Add new definition as follows:

2302.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

POST-FRAME BUILDING SYSTEM. A post-frame building system is characterized by primary structural frames of posts as columns and trusses or rafters as roof framing. The roof framing is attached to the posts, either directly or indirectly through structural headers. Posts are typically graded lumber, graded timbers, laminated lumber or fabricated of composite or hybrid material. Posts are embedded in the soil and supported on isolated footings, or are attached to the top of piers, concrete or masonry walls, slabs-on-grade, or other suitable foundations. Secondary framing members, purlins in the roof and girts in the walls, are attached to the primary framing members to provide lateral support and to transfer sheathing loads, both in-plane and out-of-plane, to the posts and roof framing. Structures are sheathed with a wide variety of materials, including metal and wood structural panels or other suitable materials.

Reason: Post-frame foundations, metal-clad, wood-framed diaphragm panels and design procedures, and mechanically laminated posts are referenced Section 2306.1 and Chapter 35 of the current edition of the IBC. However, nowhere are post-frame building systems defined in the IBC. This causes post-frame building systems to be confused with other wood framed building systems. Addition of the proposed definition would eliminate such confusion.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: MANBECK-S1-2302

S198–09/10
2303.1.1, 2303.1.1.1 (New), 2303.1.1.2 (New)

Proponent: Sam Francis, American Forest & Paper Association

Revise as follows:

2303.1.1 Sawn lumber. Sawn lumber used for load-supporting purposes, including end-jointed or edge-glued lumber, machine stress-rated or machine-evaluated lumber, shall be identified by the grade *mark* of a lumber grading or inspection agency that has been approved by an accreditation body that complies with DOC PS 20 or equivalent. Grading practices and identification shall comply with rules published by an agency approved in accordance with the procedures of DOC PS 20 or equivalent procedures.

2303.1.1.1 Certificate of Inspection. In lieu of a grade mark on the material, a certificate of inspection as to species and grade issued by a lumber grading or inspection agency meeting the requirements of this section is permitted to be accepted for precut, remanufactured or rough-sawn lumber and for sizes larger than 3 inches (76 mm) nominal thickness.

2303.1.1.2 End-jointed lumber. Approved end-jointed lumber is permitted to be used interchangeably with solid-sawn members of the same species and grade. End-jointed lumber used in an assembly required elsewhere in this code to have a fire resistance rating shall have the designation “Heat Resistant Adhesive” or “HRA” included in its grade mark.

Reason: The American Lumber Standards Committee (ALSC) recently added elevated-temperature performance requirements for end-jointed lumber adhesives intended for use in fire resistance-rated assemblies. End-jointed lumber manufactured with adhesives which meet the new requirements is being designated as "Heat Resistant Adhesive" or "HRA" on the grade stamp. Heat Resistant Adhesives are required to be qualified in accordance with one of two new ASTM standards, *D7374-08 Practice for Evaluating Elevated Temperature Performance of Adhesives Used in End-Jointed Lumber* and *D7470-08 Practice for Evaluating Elevated Temperature Performance of End-Jointed Lumber Studs*. End-jointed lumber manufactured with a Heat Resistant Adhesive under an auditing program of an ALSC-accredited grading agency is allowed to carry the HRA mark on the grade-stamp. End-jointed lumber manufactured with an adhesive not qualified as a Heat Resistant Adhesive will be designated as "Non-Heat Resistant Adhesive" or "non-HRA" on the grade stamp. Lumber carrying the HRA mark is permitted to be used interchangeably with solid-sawn members of the same species and grade in fire-rated applications.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

2303.1.4, 2304.6.2, Table 2306.3, Chapter 35; IRC R604.1, Table R703.4, Chapter 44

Proponent: Edward L. Keith, PE, representing APA – the Engineered Wood Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows:

2303.1.4 Wood structural panels. Wood structural panels, when used structurally (including those used for siding, roof and wall sheathing, subflooring, diaphragms and built-up members), shall conform to the requirements for their type in DOC PS 1, DOC ~~or~~ PS 2 or ANSI/APA PRP 210. Each panel or member shall be identified for grade and glue type by the trademarks of an approved testing and grading agency. Wood structural panel components shall be designed and fabricated in accordance with the applicable standards listed in Section 2306.1 and identified by the trademarks of an *approved* testing and inspection agency indicating conformance with the applicable standard. In addition, wood structural panels when permanently exposed in outdoor applications shall be of exterior type, except that wood structural panel roof sheathing exposed to the outdoors on the underside is permitted to be interior type bonded with exterior glue, Exposure 1.

2304.6.2 Interior paneling. Softwood wood structural panels used for interior paneling shall conform to the provisions of Chapter 8 and shall be installed in accordance with Table 2304.9.1. Panels shall comply with DOC PS 1, DOC ~~or~~ PS 2 or ANSI/APA PRP 210. Prefinished hardboard paneling shall meet the requirements of CPA/ANSI A135.5. Hardwood plywood shall conform to HPVA HP-1.

TABLE 2306.3

(Remainder of table and footnotes unchanged)

2. Add new standard to Chapter 35 as follows:

APA
ANSI/APA PRP 210-08 Standard for Performance-Rated Engineered Wood Siding

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R604.1 Identification and grade. Wood structural panels shall conform to DOC PS 1, ~~or~~ DOC PS 2 or ANSI/APA PRP 210; or, when manufactured in Canada, CSA 0437 or CSA 0325. All panels shall be identified by a grade mark or certificate of inspection issued by an approved agency.

2. Revise as follows:

TABLE R703.4
WEATHER–RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

				TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS [b,c,d]					
SIDING MATERIAL	NOMINAL THICKNESS[a] (INCHES)	JOINT TREATMENT	WATER-RESISTIVE BARRIER REQUIRED	Wood or wood structural panel sheathing	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to Studs	Number or spacing of fasteners
Wood structural panel[i], ANSI/APA PRP 210, siding[i] (exterior grade)	3/8 – 1/2	Note p	YES	0.099 NAIL–2"	0.113 NAIL–21/2"	0.113 NAIL–21/2"	0.113 nail[v]	0.099 NAIL–2"	6" PANEL EDGES, 12" INTER. SUP.

(Remainder of table and footnotes unchanged)

3. Add new standard to Chapter 44 as follows:

APA
ANSI/APA PRP 210-08 Standard for Performance-Rated Engineered Wood Siding

Reason:
PART I- This proposal recognized a new national consensus standard for wood structural panel siding products. Such products were formerly covered under several national standards such as APA PRP-108 and others. The industry developed this standard via the ANSI consensus process. Siding products manufactured to this standard have been developed specifically for wall covering/weather proofing applications, carry an Exterior exposure durability classification, and panels have equivalent shear performance on a thickness by thickness basis when nailed in accordance with Table 2306.3. Copies of this new ANSI standard have been provide to the committee and can be downloaded free of charge at the apawood.org website (Form number J350).
PART II- This proposal recognized a new national consensus standard for wood structural panel siding products. Such products were formerly covered under several industry standards such as APA PRP-108 and others. The industry developed this standard via the ANSI consensus process. Siding products manufactured to this standard have been developed specifically for wall covering/weather proofing applications and carry an Exterior exposure durability classification. Copies of this new ANSI standard have been provided to the committee and can be downloaded free of charge at the apawood.org website (Form number J350).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/APA PRP 210-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-S1-2303.1.4

S200–09/10
2303.1.4; IRC R503.2.1, R503.2.1.1, R602.3, R803.2.1

Proponent: Edward L. Keith, PE, APA - The Engineered Wood Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2303.1.4 Wood structural panels. Wood structural panels, when used structurally (including those used for siding, roof and wall sheathing, subflooring, diaphragms and built-up members), shall conform to the requirements for their type in DOC PS 1 or PS 2. Each panel or member shall be identified for grade, ~~and glue type~~ bond classification, and Performance Class by the trademarks of an *approved* testing and grading agency. The Performance Class value shall be used as the "nominal panel thickness" or "panel thickness" whenever referenced in this code. Wood structural panel components shall be designed and fabricated in accordance with the applicable standards listed in Section 2306.1 and identified by the trademarks of an *approved* testing and inspection agency indicating conformance with the applicable standard. In addition, wood structural panels when permanently exposed in outdoor applications shall be of ~~exterior~~ Exterior type, except that wood structural panel roof sheathing exposed to the outdoors on the underside is permitted to be ~~interior type bonded with exterior glue,~~ Exposure 1 type.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R503.2.1 Identification and grade. Wood structural panel sheathing used for structural purposes shall conform to DOC PS 1, DOC PS 2 or, when manufactured in Canada, CSA O437 or CSA O325. All panels shall be identified for grade, bond classification, and Performance Class by a grade mark of certificate or inspection issued by an approved agency. The Performance Class value shall be used as the "nominal panel thickness" or "panel thickness" whenever referenced in this code.

R503.2.1.1 Subfloor and combined subfloor underlayment. Where used as subflooring or combination subfloor underlayment, wood structural panels shall be of one of the grades specified in Table R503.2.1.1(1). When sanded plywood is used as combination subfloor underlayment, the grade, bond classification, and Performance Class shall be as specified in Table R503.2.1.1(2).

R602.3 Design and construction. Exterior walls of wood-frame construction shall be designed and constructed in accordance with the provisions of this chapter and Figures R602.3(1) and R602.3.(2) or in accordance with AF&PA's NDS. Components of exterior walls shall be fastened in accordance with Tables R602.3(1) through R602.3(4). Structural wall sheathing shall be fastened directly to structural framing members. Exterior wall coverings shall be capable of resisting the wind pressures listed in Table R301.2(2) adjusted for height and exposure using Table R301.2(3). Wood structural panel sheathing used for exterior walls shall conform to DOC PS 1, DOC PS 2 or, when manufactured in Canada, CSA O437 or CSA O325. All panels shall be identified for grade, bond classification, and Performance Class by a grade mark or certificate of inspection issued by an approved agency and shall conform to the requirements of Table R602.3(3).

R803.2.1 Identification and grade. Wood structural panels shall conform to DOC PS 1, DOC PS 2 or, when manufactured in Canada, CSA O437 or CSA O325, and shall be identified for grade, bond classification, and Performance Class by a grade mark or certificate of inspection issued by an approved agency. Wood structural panels shall comply with the grades specified in Table R503.2.1.1(1).

Reason: (IBC & IRC) This is a nomenclature change that reflects the newest versions of National Standards PS 1 and PS 2. Wood structural panels are required to be in conformance to DOC PS 1 and PS 2 in the code. The PS 1 and PS 2 consensus standard committees have revised both standards to include the terminologies of "bond classification" to reference glue type and "Performance Classes" to reference the thicknesses tolerance consistent with the nominal panel thicknesses in the IBC. This change proposal updates the code to the nomenclature that appears on the trademark of wood structural panels in the field in accordance with DOC PS 1 and PS 2. This is not a technical change.

(IRC)In Section R602.3, the description of wood structural panel was added as it shows up in Chapters 5 and 8 where wood structural panels are also specified. This was done to make the code read consistently between similar sections.

Cost Impact: This will **not** impact the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D

2303.2, 2303.2.1, 2303.2.2, 2303.2.3; IRC R802.1.3, R802.1.3.1, R802.1.3.2, R802.1.3.3

Proponent: Joe Holland and Dave Bueche, representing Hoover Treated Wood Products

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE STRUCTURAL COMMITTEE.

PART I- IBC STRUCTURAL

1. Revise as follows:

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* (FRTW) is a pressure treated ~~any~~ wood product ~~which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when~~ tested in accordance with ASTME 84 or UL723~~,~~.FRTW shall have a *listed* flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. ~~Additionally, t~~The flame front shall not progress more than 101/2 feet (3200 mm) beyond the centerline of the burners at any time during the test.

2. Delete without substitution:

~~**2303.2.1 Pressure process.** For wood products impregnated with chemicals by a pressure process, the process shall be performed in closed vessels under pressures not less than 50 pounds per square inch gauge (psig) (345 kPa).~~

~~**2303.2.2 Other means during manufacture.** For wood products produced by other means during manufacture, the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product.~~

~~**2303.2.3 Testing.** For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to test only the front and back faces.~~

(Renumber remaining sections)

PART II- IRC BUILDING/ENERGY

1. Revise as follows:

R802.1.3 Fire-retardant-treated wood. *Fire-retardant-treated wood* (FRTW) is a pressure treated ~~any~~ wood product ~~which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when~~ tested in accordance with ASTME 84~~,~~.FRTW shall have a *listed* flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. ~~Additionally, t~~The flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test

2. Delete without substitution:

~~**R802.1.3.1 Pressure process.** For wood products impregnated with chemicals by a pressure process, the process shall be performed in closed vessels under pressures not less than 50 pounds per square inch gauge (psig) (345 kPa).~~

~~**R802.1.3.2 Other means during manufacture.** For wood products produced by other means during manufacture, the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product.~~

~~**R802.1.3.3 Testing.** For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to test only the front and back faces.~~

(Renumber remaining sections)

Reason: Revision is more concise. Present section is wordy. In the fifty years of recognition of FRTW in the code there is no wood product meeting the requirement of FRTW where adding the fire retardant to the wood is done during manufacture. This provision creates interpretation problems in the field. Revision will improve enforcement of section. "Pressure process" and "other means during manufacturer" are no longer used; delete Sections 2303.2.1 through 2303.2.3.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II-IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

S202–09/10
2304.8.4.2, 2304.8.5.2

Proponent: Jeff Linville, PE, representing American Institute of Timber Construction

Revise as follows:

2304.8.4.2 Nailing. Each piece of decking shall be toenailed at each support with one 16d common nail through the tongue and face-nailed with one 16d common nail. Other nailing patterns are permitted where justified by an engineering analysis. Predrilled holes are permitted to be used to prevent splitting.

2304.8.5.2 Nailing. Each piece shall be toenailed at each support with one 40d common nail and face-nailed with one 60d common nail. Other nailing patterns are permitted where justified by an engineering analysis. Predrilled holes are permitted to be used to prevent splitting. Courses shall be spiked to each other with 8 inch (203 mm) spikes at maximum intervals of 30 inches (762 mm) through predrilled edge holes penetrating to a depth of approximately 4 inches (102 mm). One spike shall be installed at a distance not exceeding 10 inches (254 mm) from the end of each piece.

Reason: Sections 2304.8.4.2 and 2304.8.5.2 are proposed to be revised to allow other than the prescriptive nailing patterns if justified by engineering analysis. Additionally, these sections are further revised to allow predrilled holes to prevent splitting, such as when nails are placed near the ends of boards.

Cost Impact: The proposed code changes will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2304.9.5 Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners, including nuts and washers, and connectors in contact with *preservative-treated* and *fire-retardant-treated wood* shall be in accordance with Sections 2304.9.5.1 through 2304.9.5.4. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

2304.9.5.1 Fasteners and connectors for preservative-treated wood. Fasteners, including nuts and washers, in contact with *preservative-treated wood* shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum. Connectors that are used in exterior applications and in contact with *preservative-treated wood* shall have coating types and weights in accordance with the treated wood or connector manufacturer's recommendations. In the absence of manufacturer's recommendations, a minimum of ASTM A 653, type G185 zinc-coated galvanized steel, or equivalent, shall be used.

> **Exception:** Plain carbon steel fasteners, including nuts and washers, in SBX/DOT and zinc borate *preservative-treated wood* in an interior, dry environment shall be permitted.

2304.9.5.2 Fastenings for wood foundations. Fastenings, including nuts and washers, for wood foundations shall be as required in AF&PA PWF.

2304.9.5.3 Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners, including nuts and washers, for *fire-retardant-treated wood* used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

2304.9.5.4 Fasteners for fire-retardant-treated wood used in interior applications. Fasteners, including nuts and washers, for *fire-retardant-treated wood* used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of the manufacturer's recommendations, Section 2304.9.5.3 shall apply.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R317.3 Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners, including nuts and washers, and connectors in contact with preservative-treated wood and fire-retardant-treated wood shall be in accordance with this section. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

R317.3.1 Fasteners for preservative-treated wood. Fasteners, including nuts and washers, for preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Coating types and weights for connectors in contact with preservative-treated wood shall be in accordance with the connector manufacturer's recommendations. In the absence of manufacturer's recommendations, a minimum of ASTM A 653 type G185 zinc-coated galvanized steel, or equivalent, shall be used.

Exceptions:

1. One-half-inch (12.7 mm) diameter or greater steel bolts.
2. Fasteners other than nails and timber rivets shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.
3. Plain carbon steel fasteners in SBX/DOT and zinc borate preservative-treated wood in an interior, dry environment shall be permitted.

R317.3.2 Fastenings for wood foundations. Fastenings, including nuts and washers, for wood foundations shall be as required in AF&PA PWF.

R317.3.3 Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners, including nuts and washers, for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails and timber rivets shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

R317.3.4 Fasteners for fire-retardant-treated wood used in interior applications. Fasteners, including nuts and washers, for fire-retardant-treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of the manufacturer's recommendations, Section R317.3.3 shall apply.

Reason: The purpose of this proposal is to clarify the requirements for fasteners in treated wood. The nuts and washers that accompany a bolt (or other fastener) in pressure-treated or fire-retardant treated wood could also be exposed to the corrosive action of the treatments. It therefore makes sense for the nut and washer to have the same coating, or other approved coating or protection, as the fastener with which they are associated. Additionally, the language allowing carbon steel fasteners when borates are used in interior dry applications is added to the IRC. Similar language was successfully added to the IBC last cycle.

Cost Impact: The code change proposal will not increase the cost of construction.

2304.9.5.1, 2304.9.5.3

Proponent: Randall Shackelford, PE, representing Simpson Strong-Tie Co.

1. Revise as follows:

2304.9.5.1 Fasteners and connectors for preservative-treated wood. Fasteners in contact with *preservative-treated wood* shall be of hot dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, and timber rivets~~, wood screws and lag screws~~ shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum. Connectors that are used in exterior applications and in contact with *preservative-treated wood* shall have coating types and weights in accordance with the treated wood or connector manufacturer's recommendations. In the absence of manufacturer's recommendations, a minimum of ASTM A 653, type G185 zinc-coated galvanized steel, or equivalent, shall be used.

Exception: Plain carbon steel fasteners in SBX/DOT and zinc borate *preservative-treated wood* in an interior, dry environment shall be permitted.

2304.9.5.3 Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for *fire-retardant-treated wood* used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, and timber rivets~~, wood screws and lag screws~~ shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

Reason: The purpose of this code change is to permit wood screws and lag screws that are galvanized in accordance with ASTM B 695, Class 55 to be used in contact with fire-retardant and preservative-treated wood. This will bring the IBC into agreement with the fasteners in treated wood requirements of the IRC.

Mechanical galvanizing is very common for screws, and in fact is possibly the only way to deposit a thick zinc coating on them. Wood screws and lag screws are frequently installed in pre-drilled holes, so abrasion of the finish is not the same problem as for nails.

Currently, all fasteners in treated wood are permitted to be hot dipped galvanized with a coating weight in accordance with ASTM A 153. This results in a zinc coating weight on the fastener of one to 1.25 ounces of zinc per square foot, and a minimum thickness of 43 to 53 microns, depending on the diameter of the fastener. See Class C and D in copy of the standard below:

TABLE 1 Thickness or Weight [Mass] of Zinc Coating for Various Classes of Material

NOTE 1— Length of the piece, stated in Classes B-1, B-2, and B-3, refers to the finished dimension of the piece after fabrication.

Class of Material	Weight [Mass] of Zinc Coating, oz/ft²[g/m²] of Surface, Minimum		Coating Thickness, mils [microns], Minimum	
	Average of Specimens Tested	Any Individual Specimen	Average of Specimens Tested	Any Individual Specimen
Class A—Castings—Malleable Iron, Steel	2.00 [610]	1.80 [550]	3.4 [86]	3.1 [79]
Class B—Rolled, pressed, and forged articles (except those which would be included under Classes C and D):				
B-1—3/16 in. [4.76 mm] and over in thickness and over 15 in. [381 mm] in length	2.00 [610]	1.80 [550]	3.4 [86]	3.1 [79]
B-2—under 3/16 in. [4.76 mm] in thickness and over 15 in. [381 mm] in length	1.50 [458]	1.25 [381]	2.6 [66]	2.1 [53]
B-3—any thickness and 15 in. [381 mm] and under in length	1.30 [397]	1.10 [336]	2.2 [56]	1.9 [48]
Class C—Fasteners over 3/8 in. [9.52 mm] in diameter and similar articles. Washers 3/16 in. and 1/4 in. [4.76 and 6.35 mm] in thickness	1.25 [381]	1.00 [305]	2.1 [53]	1.7 [43]
Class D—Fasteners 3/8 in. [9.52 mm] and under in diameter, rivets, nails and similar articles. Washers under 3/16 in. [4.76 mm] in thickness	1.00 [305]	0.85 [259]	1.7 [43]	1.4 [36]

ASTM B 695, Class 55 will also provide a minimum thickness of 53 µm of zinc on the fastener. (See table below from ASTM B 695).

3. Classification

3.1 *Classes*—Zinc coatings are classified on the basis of thickness, as follows:

Class	Minimum Thickness, µm
110	107
80	81
70	69
65	66
55	53
50	50
40	40
25	25
12	12
8	8
5	5

Since the corrosion resistance of a galvanized coating is directly proportional to the amount of zinc on the fastener, providing an equivalent amount of zinc by mechanical galvanizing will provide an equivalent corrosion resistance to hot dip galvanizing to ASTM A 153. Therefore the alternative galvanizing standard should be accepted.

Further, Section X1 of the Appendix of ASTM B 695 states the following:

> "X1.2 Zinc coatings are usually applied to provide corrosion resistance. The performance of a zinc coating depends largely on its thickness, the supplementary treatment if any, and the kind of environment to which it is exposed. The seven heaviest classes of coatings offer suitable alternatives to hot-dip galvanizing."

Class 55 is the fifth heaviest so it certainly falls within the seven heaviest.

Cost Impact: This proposal will not increase costs. It could decrease costs where more economical mechanically galvanized fasteners can be used instead of hot dipped galvanized fasteners.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: SHACKELFORD-S2-2304.9.5.1

S205–09/10
2304.11.6

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

Section 2304.11.6 Termite protection. In geographical areas where hazard of termite damage is known to be very heavy, wood floor framing exposed to the ground in crawl spaces or unexcavated areas located within the periphery of

the building foundation and exposed framing of exterior decks or balconies, shall be of durable species (termite resistant) or preservative treated in accordance with AWPA U1 for the species, product preservative and end use or provided with approved methods of termite protection.

Reason: This change intends to clarify that the wood floor framing that needs to be durable species or preservative treated wood are limited to those interior floors with exposure to soil instead of all floors in the building. In addition exposed exterior decks or balcony framing are specifically added. Other provisions address wood in contact with concrete or close to grade for all termite hazard regions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-S1-2304.11.6

S206–09/10
2304.13 (New)

Proponent: Jason Thompson, National Concrete Masonry Association, representing the Masonry Alliance for Codes and Standards

Add new text as follows:

2304.13 Buildings with prefabricated wood I-joists or trusses for floor and roof systems. All buildings using prefabricated wood I-joists or trusses for the floor or roof system shall be marked in accordance with all of the following:

1. A placard shall be attached to the building on the front of the structure in the vicinity of the front entrance and in a visible location. Additional placards shall be applied to each side of the structure in a visible location.
2. Building placards shall be 8 inches (203 mm) high by 24 inches (610 mm) long with a white background, black letters and a black border. The letters and border shall be easily visible and readable at 10 feet (3048 mm).
3. The placard shall state: *"This building uses prefabricated wood I-joists or trusses for the floor or roof system. Proceed with caution if entering during a fire emergency"*

Reason: Section 2304 of the International Building Code outlines the general construction requirements for buildings using wood materials. This includes provisions applicable to engineered wood products such as wood I-joists and trusses. Though suitable for structural loads, buildings constructed of wood I-joist or trusses pose an inherent risk to the fire service when responding to a fire emergency. There have been numerous instances where fire conditions have brought on structural failure of the floor or roof systems sooner than that experienced with structures constructed of conventional wood framed construction. This early failure under fire conditions has the potential to trap fire fighters within the building while performing interior fire attacks. This proposal will require buildings constructed with wood I-joists and trusses for the floor or roof system to have placards placed on the building to warn emergency responders of these construction features and allow them to proceed with caution if entering the building during a fire emergency.

Cost Impact: The code change proposal will increase the cost of construction.

S207–09/10
2302.1, 2303.1, 2303.1.12 (New), 2304.13 (New), CHAPTER 35; IRC R317.4.1 (New)

Proponent: John Woestman, The Kellen Company representing the Composite Lumber Manufacturers Association (CLMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Add new definition as follows:

WOOD PLASTIC COMPOSITE. A composite material made primarily from wood or cellulose-based materials, and plastic.

2. Revise as follows:

2303.1 General. Structural sawn lumber; end-jointed lumber; prefabricated wood I-joists; structural glued laminated timber; wood structural panels, fiberboard sheathing (when used structurally); hardboard siding (when used structurally); particleboard; preservative-treated wood; structural log members; structural composite lumber; round timber poles and piles; fire-retardant-treated wood; hardwood plywood; wood trusses; wood plastic composite exterior deck components; joist hangers; nails; and staples shall conform to the applicable provisions of this section.

3. Add new text as follows:

2303.1.12 Wood plastic composite exterior deck, railing, and stairway components. Structural capacities for exterior wood plastic composite deck boards, stair treads, handrails and guardrail systems shall be determined in accordance with ASTM D 7032.

2304.13 Wood plastic composite exterior deck, railing, and stairway components. Exterior wood plastic composite deck boards, deck boards used as stair treads, handrails and guardrail systems shall meet the applicable requirements of ASTM D 7032, and bear a label indicating the required performance levels and demonstrating compliance with ASTM D 7032,

4. Add new standard to Chapter 35 as follows:

ASTM

D 7032-08	Standard Specification for Establishing Performance Ratings For Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails)

5. Add new text as follows:

2304.13.1 Labeling. Labels for deck boards and stair treads shall include the allowable maximum load and span. Labels for handrails and guardrail systems shall indicate the allowable maximum span.

6. Add new text as follows:

2304.13.2 Installation. Wood plastic composite deck components shall be installed in accordance with the manufacturer's instructions.

PART II – IRC BUILDING/ENERGY

1. Add new text as follows:

R317.4.1 Labeling. Labels for deck boards and stair treads shall include the allowable maximum load and span. Labels for handrails and guardrail systems shall indicate the allowable maximum span.

2. Revise as follows:

~~**R317.4.1**~~ **R317.4.2 Installation.** Wood/plastic composites shall be installed in accordance with the manufacturer's instructions.

Reason:
(Part I, items 1-4) The IBC is currently silent regarding requirements for wood plastic composite exterior deck components. The Composite Lumber Manufacturers Association (CLMA) seeks to make it easier for code officials to enforce the IBC and to make it easier for deck builders to comply with the code by incorporating requirements for wood plastic composite decking into the IBC.

This code change proposes to include requirements for wood plastic composite exterior deck components in Chapter 23 of the IBC, which is the most appropriate chapter of the IBC for these products. Section 2301.2 refers to elements or systems "constructed partially or wholly of wood or wood-based products". No other IBC chapter incorporates wood-based products of this type.

Wood plastic composite exterior deck components are constructed partially of wood-based material (as are particleboard and composite panels; included in Chapter 23), and partially of resin bonded by heat and pressure (as are several materials included in Chapter 23, such as particleboard). CLMA reviewed Chapter 26, Plastic, but concluded that wood plastic composite exterior deck components are much more closely aligned with the methods of distribution and application to the materials included in Chapter 23 than those in Chapter 26. Moreover, the ASTM standard governing wood plastic composite decking (ASTM D 7032) has been developed by and continues to be maintained by the ASTM D7 committee on wood. For these reasons, this proposal includes revisions to Chapter 23.

This CLMA proposal complements language in the 2009 IRC which defines "wood plastic composite" and requires wood plastic composite deck boards, stair treads, handrails and guardrail systems to bear a label indicating the required performance levels and demonstrating compliance to ASTM D 7032. This labeling requirement, by definition of "label" in the IBC, includes 3rd-party certification and ongoing quality assurance and will help to assure the code official that wood-plastic composite decking will meet the performance provisions in the IBC.

Complying with ASTM D 7032 verifies the wood plastic composite materials are appropriate for use as deck components and includes deck-related performance evaluations such as flexural tests, ultraviolet resistance tests, freeze-thaw resistance tests, bio-deterioration tests, fire performance tests, creep recovery tests, mechanical fastener holding tests, and slip resistance tests. The standard also includes consideration of the effects of temperature and moisture, concentrated loads, and fire propagation tests.

This code change for the IBC will make it faster and easier to verify that a deck constructed of wood plastic composite material complies with the code.

(Part I, items 5) This item adds a new subject matter in 2304.13.1. This new requirement specifies that the load and span information is required on the labels.

This item will make it faster and easier to verify that a deck constructed of wood plastic composite material complies with the code. The wood plastic composite deck boards and stair treads are to have a label indicating the span rating (i.e. 100 lbs/ft^2 at 16" O.C.). Handrails and guardrail systems will be similarly labeled. The load and span information will improve the ability to verify compliance to the code.

(Part I, items 6) This item adds a new subject matter in 2304.13.2 which requires that wood plastic composite deck components be installed per the manufacturer's instructions.

As with most engineered building components, wood plastic composite deck components should be required to be installed per the manufacturer's instructions. It's important that wood plastic composite deck components be installed as intended by the manufacturer.

(Part II, IRC) This CLMA proposal complements language proposed for IBC (see Part I, item 5).

This code change for the IRC will make it faster and easier to verify that a deck constructed of wood plastic composite material complies with the code. The wood plastic composite deck boards and stair treads are to have a label indicating the span rating (i.e. 100 lbs/ft^2 at 16" O.C.) in addition to confirming compliance to ASTM D7032. Handrails and guardrail systems will be similarly labeled with their span rating (distance between support posts).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM D7032-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D

ICCFILENAME: WOESTMAN-S7-2304.13.2

S208–09/10

2305, 2306, 2307, 2308.11.2, 2308.12.2, 1704.6.1

Proponent: Brad Douglas, American Forest & Paper Association

1. Revise as follows:

2305.1 General. Structures using wood-frame shear walls ~~and~~ or wood-frame diaphragms to resist wind, seismic ~~and~~ or other lateral loads shall be designed and constructed in accordance with AF&PA SDPWS and the applicable provisions of Sections 2305, 2306 and 2307.

2305.2 Diaphragm deflection. The deflection of wood-frame diaphragms shall be determined in accordance with AF&PA SDPWS. The deflection (Δ) of a blocked wood structural panel diaphragm uniformly fastened throughout with staples is permitted to be calculated by using ~~the following~~ Equation 23-1. If not uniformly fastened, the constant 0.188 (For SI: 1/1627) in the third term shall be modified ~~accordingly~~ by an approved method.

$$\Delta = \frac{5vL^3}{8EAb} + \frac{vL}{4Gt} + 0.188Le_n + \frac{\sum(\Delta_c X)}{2b}$$

$$For\ SI:\ \Delta = \frac{0.052vL^3}{EAb} + \frac{vL}{4Gt} + \frac{Le_n}{1627} + \frac{\Sigma(\Delta_c X)}{2b}$$

where:

A = Area of chord cross section, in square inches (mm^2).
B = Diaphragm width, in feet (mm).
E = Elastic modulus of chords, in pounds per square inch (N/mm^2).
e_n = Staple deformation, in inches (mm) [see Table 2305.2(1)].
Gt = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width or depth [see Table 2305.2(2)].
L = Diaphragm length, in feet (mm).
V = Maximum shear due to design loads in the direction under consideration, in pounds per linear foot (plf) *(N/mm).*
Δ = The calculated deflection, in inches (mm).
$\Sigma(\Delta_c X)$ = Sum of individual chord-splice slip values on both sides of the diaphragm, each multiplied by its distance to the nearest support.

2305.3 Shear wall deflection. The deflection of wood-frame shear walls shall be determined in accordance with AF&PA SDPWS. The deflection (Δ) of a blocked wood structural panel shear wall uniformly fastened throughout with staples is permitted to be calculated by the use of the following equation:

$$\Delta = \frac{8vh^3}{EAb} + \frac{vh}{Gt} + 0.75he_n + d_a\frac{h}{b}$$

$$For\ SI:\ \Delta = \frac{vh^3}{3EAb} + \frac{vh}{Gt} + \frac{he_n}{407.6} + d_a\frac{h}{b}$$

where:

A = Area of boundary element cross section in square inches (mm^2) (vertical member at shear wall boundary).
b = Wall width, in feet (mm).
d_a = Vertical elongation of overturning anchorage (including fastener slip, device elongation, anchor rod elongation, etc.) at the design shear load (v).
E = Elastic modulus of boundary element (vertical member at shear wall boundary), in pounds per square inch (N/mm^2).
e_n = Staple deformation, in inches (mm) [see Table 2305.2(1)].
Gt = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width or depth [see Table 2305.2(2)].
h = Wall height, in feet (mm).
v = Maximum shear due to design loads at the top of the wall, in pounds per linear foot (N/mm).
Δ = The calculated deflection, in inches (mm).

2306.1 Allowable stress design. The ~~structural analysis~~ design and construction of wood elements in structures using *allowable stress design* shall be in accordance with the following applicable standards:

(No change to list of allowable stress design standards)

2306.2 Wood-frame diaphragms. Wood-frame diaphragms shall be designed and constructed in accordance with AF&PA SDPWS. Where panels are fastened to framing members with staples, requirements and limitations of AF&PA SDPWS shall be met and the allowable shear values set forth in Table 2306.2(1) or 2306.2(2) shall be permitted. The allowable shear values in Tables 2306.2(1) and 2306.2(2) are permitted to be increased 40 percent for wind design.
2. Delete without substitution:

~~**2306.2.1 Wood structural panel diaphragms.** Wood structural panel diaphragms shall be designed and constructed in accordance with AF&PA SDPWS. Wood structural panel diaphragms are permitted to resist horizontal forces, using the allowable shear capacities set forth in Table 2306.2.1(1) or 2306.2.1(2). The allowable shear capacities in Tables 2306.2.1(1) and 2306.2.1(2) are permitted to be increased 40 percent for wind design.~~

~~**2306.2.2 Single diagonally sheathed lumber diaphragms.** Single diagonally sheathed lumber diaphragms shall be designed and constructed in accordance with AF&PA SDPWS.~~

~~2306.2.3 Double diagonally sheathed lumber diaphragms.~~ ~~Double diagonally sheathed lumber diaphragms shall be designed and constructed in accordance with AF&PA SDPWS.~~

3. Revise as follows:

~~2306.2.4~~ 2306.2.1 Gypsum board diaphragm ceilings. Gypsum board diaphragm ceilings shall be in accordance with Section 2508.5.

TABLE ~~2306.2.1(1)~~ 2306.2(1)

For SI: 1 inch =- 25.4 mm.

a. For framing of other species: (1) Find specific gravity for species of framing lumber in AF&PA NDS. (2) For staples, find shear value from table above for Structural I panels (regardless of actual grade) and multiply value by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species. ~~(3) For nails, find shear value from table above for nail size of actual grade and multiply value by the following adjustment factor: Specific Gravity Adjustment Factor = [1 - (0.5 - SG)], where SG = Specific gravity of the framing lumber. This adjustment factor shall not be greater than 1.~~

b. Fastening along intermediate framing members: Space fasteners a maximum of 12 inches on center, except 6 inches on center for spans greater than 32 inches.

c. Panels conforming to PS 1 or PS 2.

d. This table gives shear values for Cases 1 and 2 as shown in Table ~~2306.2.1(1)~~ 2306.2(1). The values shown are applicable to Cases 3, 4, 5 and 6 as shown in Table ~~2306.2.1(1)~~ 2306.2(1), provided fasteners at all continuous panel edges are spaced in accordance with the boundary fastener spacing.

e. The minimum nominal depth of framing members shall be 3 inches. The minimum nominal width of framing members not located at boundaries or adjoining panel edges shall be 2 inches.

f. Staples shall have a minimum crown width of 7/16 inch, and shall be installed with their crowns parallel to the long dimension of the framing members.

g. High load diaphragms shall be subject to special inspection in accordance with Section 1704.6.1.

h. For shear loads of normal or permanent load duration as defined by the AF&PA NDS, the values in the table above shall be multiplied by 0.63 or 0.56, respectively.

(No Change to Fastener Placement Figure)

4. Delete and substitute as follows:

~~2306.3 Wood structural panel shear walls.~~ ~~Wood structural panel shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Wood structural panel shear walls are permitted to resist horizontal forces, using the allowable capacities set forth in Table 2306.3. Allowable capacities in Table 2306.3 are permitted to be increased 40 percent for wind design.~~

2306.3 Wood-frame shear walls. Wood-frame shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Where panels are fastened to framing members with staples, requirements and limitations of AF&PA SDPWS shall be met and the allowable shear values set forth in Table 2306.3(1), 2306.3(2) or 2306.3(3) shall be

permitted. The allowable shear values in Tables 2306.3(1) and 2306.3(2) are permitted to be increased 40 percent for wind design.

5. Revise as follows:

TABLE ~~2306.3~~ 2306.3(1)

For SI: 1 inch =- 25.4 mm, 1 pound per foot = 14.59 N/m.

a. For framing of other species: (1) Find specific gravity for species of lumber in NDS. (2) For staples find shear value from table above for Structural I panels (regardless of actual grade) and multiply value by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species. ~~(3) For nails find shear value from table above for nail size for actual grade and multiply value by the following adjustment factor: Specific Gravity Adjustment Factor = [1 - (0.5 - SG)], Where SG = Specific Gravity of the framing lumber. This adjustment factor shall not be greater than 1.~~

b. Panel edges backed with 2-inch nominal or wider framing. Install panels either horizontally or vertically. Space fasteners maximum 6 inches on center along intermediate framing members for 3/8-inch and 7/16-inch panels installed on studs spaced 24 inches on center. For other conditions and panel thickness, space fasteners maximum 12 inches on center on intermediate supports.

c. 3/8-inch panel thickness or siding with a span rating of 16 inches on center is minimum recommended where applied direct to framing as exterior siding. For grooved panel siding, the nominal panel thickness is the thickness of the panel measured at the point of ~~nailing~~ fastening.

~~d. Allowable shear values are permitted to be increased to values shown for 15/32-inch sheathing with same nailing fastening provided (a) studs are spaced a maximum of 16 inches on center, or (b) if panels are applied with long dimension across studs.~~

~~e~~ d. Framing at adjoining panel edges shall be 3 inches nominal or wider~~, and nails at all panel edges shall be staggered where panel edge nailing is specified 2 inches on center or less~~.

~~f. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails at all panel edges shall be staggered where both of the following conditions are met: (1) 10d (3" x 0.148") nails having penetration into framing of more than 1-1/2 inches and (2) panel edge nailing is specified 3 inches on center or less.~~

~~g~~ e. Values apply to all-veneer plywood. Thickness at point of fastening on panel edges governs shear values.

~~h~~ f. Where panels are applied on both faces of a wall and ~~nail~~ fastener spacing is less than 6 inches o.c. on either side, panel joints shall be offset to fall on different framing members. Or framing shall be 3-inch nominal or thicker at adjoining panel edges~~ and nails at all panel edges shall be staggered~~.

~~i~~ g. In Seismic Design Category D, E or F, where shear design values exceed 350 pounds per lineal foot, all framing members receiving edge ~~nailing~~ fastening from abutting panels shall not be less than a single 3-inch nominal member, or two 2-inch nominal members fastened together in accordance with Section 2306.1 to transfer the design shear value between framing members. ~~Wood structural panel joint and sill plate nailing shall be staggered at all panel edges.~~ See ~~Sections 4.3.6.1 and 4.3.6.4.2 of~~ AF&PA SDPWS for sill plate size and anchorage requirements.

~~j. Galvanized nails shall be hot-dipped or tumbled.~~

~~k~~ h. Staples shall have a minimum crown width of 7/16 inch and shall be installed with their crowns parallel to the long dimension of the framing members.

~~l~~ i. For shear loads of normal or permanent load duration as defined by the AF&PA NDS, the values in the table above shall be multiplied by 0.63 or 0.56, respectively.

6. Delete without substitution:

For SI: 1 inch =- 25.4 mm, 1 foot = 304.8 mm, 1 pound per foot = 14.59N/m.

a. These shear walls shall not be used to resist loads imposed by masonry or concrete walls (see ~~Section 4.1.5 of~~ AF&PA SDPWS). Values shown are for short-term loading due to wind or seismic load. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7. Values shown shall be reduced 25 percent for normal loading.

b. Applies to fastening at studs, top and bottom plates and blocking.

~~c. Alternate fasteners are permitted to be used if their dimensions are not less than the specified dimensions Drywall screws are permitted to substitute for the 5d (1-5/8" x 0.086") and 6d (1-7/8" x 0.092") (cooler) nails listed above, and No. 6-1 1/4 inch Type S or W screws for 6d (1-7/8" x 0.092") (cooler) nails.~~

~~d. For properties of cooler nails, see ASTM C 514.~~

~~e~~ c. Except as noted, shear values are based on a maximum framing spacing of 16 inches on center.

~~f~~ d. Maximum framing spacing of 24 inches on center.

~~g~~ e. All edges are blocked, and edge fastening is provided at all supports and all panel edges.

~~h. First number denotes fastener spacing at the edges; second number denotes fastener spacing at intermediate framing members.~~

~~i. Screws are Type W or S.~~

~~j~~ f. Staples shall have a minimum crown width of 7/16 inch, measured outside the legs, and shall be installed with their crowns parallel to the long dimension of the framing members.

~~k~~ g. Staples for the attachment of gypsum lath and woven-wire lath shall have a minimum crown width of 3/4 inch, measured outside the legs.

8. Delete without substitution:

~~**2306.4 Lumber sheathed shear walls.** Single and double diagonally sheathed lumber shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Single and double diagonally sheathed lumber walls shall not be used to resist seismic forces in structures assigned to *Seismic Design Category* E or F.~~

~~**2306.5 Particleboard shear walls.** Particleboard shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Particleboard shear walls shall be permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.5. Allowable capacities in Table 2306.5 are permitted to be increased 40 percent for~~

~~wind design. Particleboard shall not be used to resist seismic forces in structures assigned to *Seismic Design Category* D, E or F.~~

~~**2306.6 Fiberboard shear walls.** Fiberboard shear walls shall be designed and constructed in accordance with AF&PASDPWS. Fiberboard shear walls are permitted to resist horizontal forces, using the allowable shear capacities set forth in Table 2306.6. Allowable capacities in Table 2306.6 are permitted to be increased 40 percent for wind design. Fiberboard shall not be used to resist seismic forces in structures assigned to *Seismic Design Category* D, E or F.~~

~~**2306.7 Shear walls sheathed with other materials.** Shear walls sheathed with portland cement plaster, gypsum lath, gypsum sheathing or gypsum board shall be designed and constructed in accordance with AF&PA SDPWS. Shear walls sheathed with these materials p~~ are permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.7. ~~Shear walls sheathed with portland cement plaster, gypsum lath, gypsum sheathing or gypsum board shall not be used to resist seismic forces in structures assigned to *Seismic Design Category* E or F.~~

9. Revise as follows:

2307.1 Load and resistance factor design. The ~~structural analysis~~ design and construction of wood elements and structures using *load and resistance factor design* shall be in accordance with AF&PA NDS and AF&PA SDPWS.

10. Delete without substitution:

~~**2307.1.1 Wood structural panel shear walls.** In *Seismic Design Category* D, E or F, where shear design values exceed 490 pounds per foot (7154 N/m), all framing members receiving edge nailing fastening from abutting panels shall not be less than a single 3-inch (76 mm) nominal member or two 2-inch (51 mm) nominal members fastened together in accordance with AF&PA NDS to transfer the design shear value between framing members. Wood structural panel joint and sill plate nailing shall be staggered at all panel edges. See Sections 4.3.6.1 and 4.3.6.4.3 of AF&PA SDPWS for sill plate size and anchorage requirements.~~

11. Revise as follows:

2308.11.2 Concrete or masonry. Concrete or masonry walls and stone or masonry veneer shall not extend above the basement.

Exceptions:

1. Stone and masonry veneer is permitted to be used in the first two stories above grade plane or the first three stories above grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B, provided that structural use panel wall bracing is used, and the length of bracing provided is 1.5 times the required length as determined in Table 2308.9.3(1).
2. Stone and masonry veneer is permitted to be used in the first story above grade plane or the first two stories above grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B or C.
3. Stone and masonry veneer is permitted to be used in both stories of buildings with two stories above grade plane in Seismic Design Categories B and C provided the following criteria are met:
   3.1. Type of brace per Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with ~~Table 2306.3~~ Section 2306.3 shall be a minimum of 350 plf (5108 N/m).
   3.2. Braced wall panels in the second story shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 25 percent of the braced wall line length. Braced wall panels in the first story shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 45 percent of the braced wall line length.
   3.3. Hold-down connectors shall be provided at the ends of each braced wall panel for the second story to first story connection with an allowable design of 2,000 pounds (907.0 kg). Hold-down connectors shall be provided at the ends of each braced wall panel for the first story to foundation connection with an allowable capacity of 3,900 pounds (1768 kg). In all cases, the hold down connector force shall be transferred to the foundation.
   3.4. Cripple walls shall not be permitted.

2308.12.2 Concrete or masonry. Concrete or masonry walls and stone or masonry veneer shall not extend above a basement.

Exception: Stone and masonry veneer is permitted to be used in the first story above grade plane in Seismic Design Category D provided the following criteria are met:

1. Type of brace in accordance with Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with ~~Table 2306.3~~ Section 2306.3 shall be a minimum of 350 plf (5108 N/m).
2. The bracing of the first story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 45 percent of the braced wall line.
3. Hold-down connectors shall be provided at the ends of braced walls for the first floor to foundation with an allowable capacity of 2,100 pounds (1768 kg).
4. Cripple walls shall not be permitted.

1704.6.1 High-load diaphragms. High-load diaphragms designed in accordance with ~~Table 2306.2.1(2)~~ Section 2306.2 shall be installed with special inspections as indicated in Section 1704.1. The special inspector shall inspect the wood structural panel sheathing to ascertain whether it is of the grade and thickness shown on the approved construction documents. Additionally, the special inspector must verify the nominal size of framing members at adjoining panel edges, the nail or staple diameter and length, the number of fastener lines and that spacing between fasteners in each line and at edge margins agrees with the approved construction documents.

Reason: This proposal coordinates provisions of the IBC with those in the AF&PA consensus standard, *Special Design Provisions for Wind and Seismic* (*SDPWS*).

Item 1 implements consistent use of the term "wood-frame" to describe shear walls and diaphragms in 2305 and adds a reference to *SDPWS* for determining deflection of wood-frame diaphragms and shear walls. Item 2 removes design information for nailed diaphragms and shear walls that is duplicated in *SDPWS*. Revised Sections 2306.2 and 2306.3 clarify that design and construction as well as limitations provided in *SDPWS* are applicable to use of allowable design values for stapled diaphragm and shear wall construction. Table numbers and footnotes are editorially revised to account for removal of allowable design values for nailed diaphragms and shear walls. Item 3, replaces references to a table with a reference to Section 2306.3 to address both stapled and nailed construction. Item 4, the reference to the allowable design value table is replaced by a reference to Section 2306.2 to address both stapled and nailed construction.

Cost Impact: No known impact.

	Assembly:	ASF	AMF	DF

ICCFILENAME: FRANCIS-S4-2305.1

S209–09/10
2305.1.2 (New)

Proponent: James E. Russell, City of Palo Alto, representing self

Add new text as follows:

2305.1.2 Sill plate anchor bolts. For sill plates of 2x or 3x nominal thickness, the allowable lateral design strength for shear parallel to grain of sill plate anchor bolts is permitted to be determined using the lateral design value for a bolt attaching a wood sill plate to concrete, as specified in AF&PA NDS Table 11E, provided the anchor bolts comply with all of the following:

1. The maximum anchor bolt diameter is 5/8 inches (16 mm).
2. The anchor bolt is cast-in-place and embedded at least 7 inches (178 mm) into concrete.
3. The anchor bolt is located a minimum of 2-1/2 anchor diameters from any concrete edge that is parallel to the sill plate; and
4. The anchor bolt is located a minimum of 15 anchor diameters from any concrete edge that is perpendicular to the sill plate.

Reason: To clarify that the Section 1908.1.9 modifications to ACI 318 Section D.3.3 establishing shear capacity applicable to small diameter sill plate anchor bolts installed in concrete with certain minimum embedment, edge and end distances, permit the use of the lateral design value of the bolt attaching a wood sill plate to concrete, specified in AF&PA NDS Table 11E. The proposal that adds this information in Section 1908.1.9 specifically refers back to Section 2305, but currently Section 2305 does not contain any information about design of sill plate anchor bolts. Therefore this change is intended to make Section 2305 compatible with 1908.1.9 and to aid the code user by specifically explaining what the change in 1908.1.9 will allow.

Current design provisions require calculation of the capacity of sill plate anchor bolts using the provisions of ACI 318 Appendix D, however, those methods result in shear capacities far smaller than historical values using provisions of earlier codes and standards. Recent experiments specifically focused on this connection have revealed that the actual capacities exceed those historically used and support a return to determining

the sill bolt shear capacity based upon its capacity in the wood sill plate member. The experimental data supporting this proposal and a similar proposal to change 2009 IBC Section 1908.1.9, indicate that concrete failure modes do not control the capacity of these connections when certain embedment, edge and end distances are maintained. Therefore, it is proposed that Section 2305 clearly state that the minimum design capacity be based upon the lateral design value of the bolt attaching a wood sill plate to concrete, as determined using AF&PA NDS.

Cost Impact: The code change proposal will not increase the cost of construction.

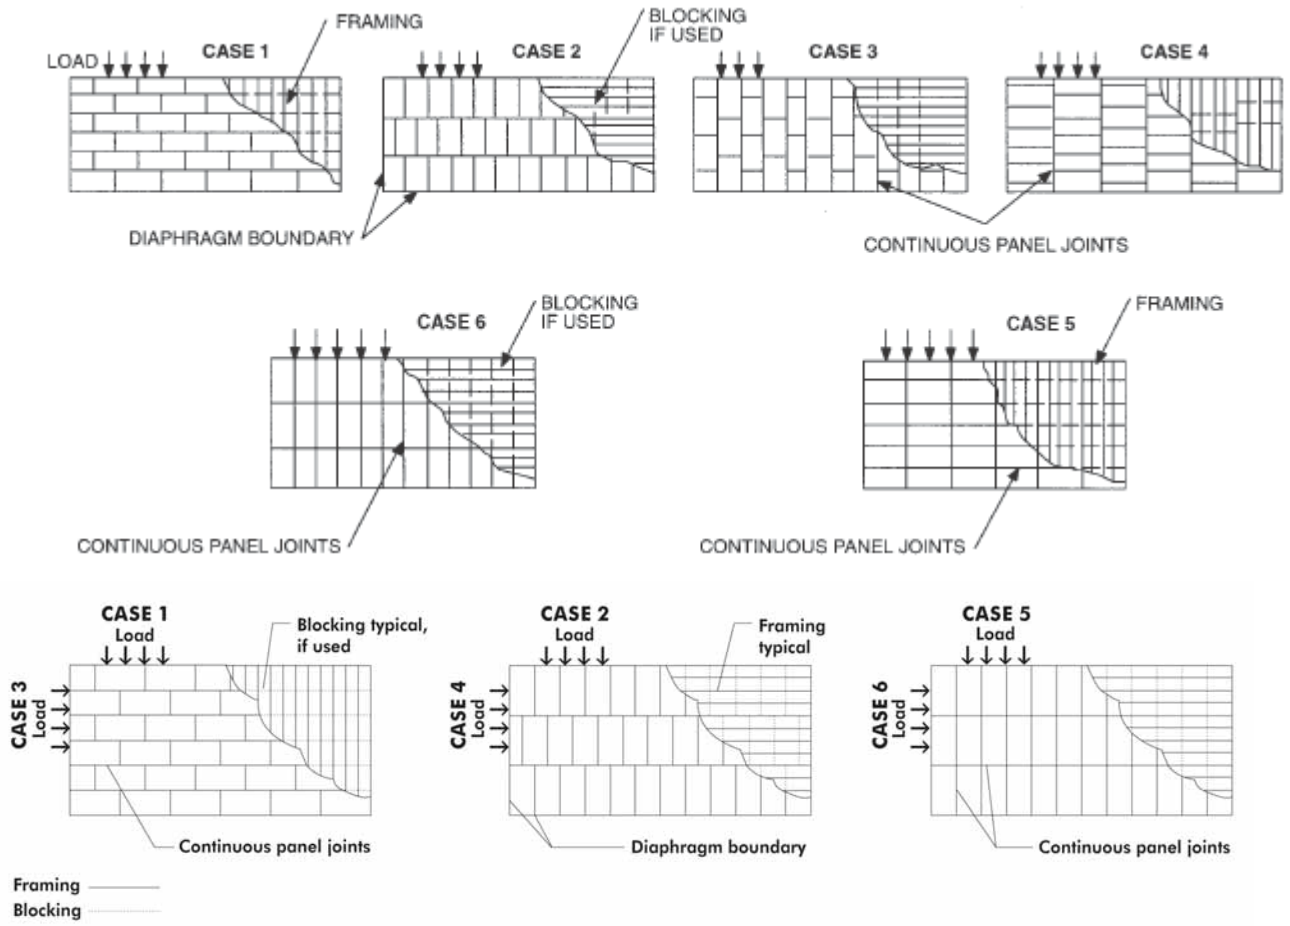
Table 2306.2.1(1)

Proponent: Edward L. Keith, PE, APA - The Engineered Wood Association

TABLE 2306.2.1(1)
ALLOWABLE SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL PANEL DIAPHRAGMS WITH FRAMING OF DOUGLAS FIR-LARCH, OR SOUTHERN PINE[a] FOR WIND OR SEISMIC LOADING[h]

Delete and substitute as follows:



Reason: The existing drawings in the 2006 Code are difficult to understand; partially because of the quality of the drawing and because of the improper placement of the annotation lines. The proposed drawing was drawn at a higher resolution to better differentiate between blocking and framing members. A legend was added to assist the user and the annotation lies were more carefully placed. This proposal makes no technical changes to the code.

As the designer is going to be concerned with a specific diaphragm geometry with two loading cases for that diaphragm (one load for each orthogonal direction), we have shown the 3 diaphragm configurations represented by the old 6 figures and added the two appropriate cases for each configuration. We were also able to increase the size of the figure to make them easier to understand. No changes have been made to the case

numbers or table content. This provision just better matches the cases with the corresponding diaphragm configurations to simplify the use of the table.

Cost Impact: The code change proposal will not increase the cost of construction.

S211–09/10
2308.3.2, 2308.3.2.1 (New), 2308.3.2.2 (New), 2308.12.6

Proponent: Robert Rice, Grants Pass, representing Josephine County Building Safety and Southern Oregon Chapter International Code Council.

Revise as follows:

2308.3.2 Braced wall line connections. Wind and seismic lateral forces shall be transferred from the roof ~~roofs~~ and floor ~~floors~~ diaphragms to braced wall lines and from the braced wall lines in upper stories to the braced wall lines in the story below in accordance with ~~this section~~ Sections 2308.3.2.1 and 2308.3.2.2.

2308.3.2.1 Bottom plate connection. Braced wall line bottom plates shall be connected to joists or full-depth blocking below in accordance with Table 2304.9.1, Item 6, or to foundations in accordance with Section 2308.3.3.

2308.3.2.2 Top plate connection. Where joists or rafters are used, braced wall line top plates shall be fastened to joists, rafters or full-depth blocking above in accordance with Table 2304.9.1, Items 11, 12, 15 or 19 as applicable based on the orientation of the joists or rafters to the braced wall line. ~~Braced wall line bottom plates shall be connected to joists or blocking below in accordance with Table 2304.9.1, Item 6, or to foundations in accordance with Section 2308.3.3.~~ Blocking shall be a minimum of 2 inches (51 mm) nominal in thickness and equal to the depth of the joist or rafter at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11.

Exception: Blocking at rafters need not be full depth when there are no braced wall lines above but shall extend to within 2 inches (51 mm) from the sheathing above.

At exterior gable end walls braced wall panel sheathing in the top *story* shall be extended and fastened to roof framing where the spacing between parallel exterior braced wall lines is greater than 50 feet (15240 mm).

~~Exception:~~ Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses or by other *approved* methods providing equivalent lateral force transfer. Blocking shall be minimum 2 inch (51 mm) nominal thickness and equal to the depth of the truss at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11

2308.12.6 Irregular structures. *Conventional light-frame construction* shall not be used in irregular portions of structures in *Seismic Design Category* D or E. Such irregular portions of structures shall be designed to resist the forces specified in Chapter 16 to the extent such irregular features affect the performance of the conventional framing system. A portion of a structure shall be considered to be irregular where one or more of the conditions described in Items 1 through 6 below are present.

1. Where exterior braced wall panels are not in one plane vertically from the foundation to the uppermost *story* in which they are required, the structure shall be considered to be irregular [see Figure 2308.12.6(1)].

   Exception: Floors with cantilevers or setbacks not exceeding four times the nominal depth of the floor joists [see Figure 2308.12.6(2)] are permitted to support braced wall panels provided:

   1. Floor joists are 2 inches by 10 inches (51mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) o.c.
   2. The ratio of the back span to the cantilever is at least 2:1.
   3. Floor joists at ends of braced wall panels are doubled.

4. A continuous rim joist is connected to the ends of cantilevered joists. The rim joist is less than 0.058 inch (1.47 mm) (16 galvanized gage) and 11/2 inches (38 mm) wide fastened with six 16d common nails on each side. The metal tie shall have a minimum yield of 33,000 psi (227 MPa).
5. Joists at setbacks or the end of cantilevered joists shall not carry gravity loads from more than a single *story* having uniform wall and roof loads, nor carry the reactions from headers having a span of 8 feet (2438 mm) or more.

2. Where a section of floor or roof is not laterally supported by braced wall lines on all edges and connected in accordance with Section 2308.3.2, the structure shall be considered to be irregular [see Figure 2308.12.6(3)].

   Exception: Portions of roofs or floors that do not support braced wall panels above are permitted to extend up to 6 feet (1829 mm) beyond a braced wall line [see Figure 2308.12.6(4)] provided that the framing members are connected to the braced wall line below in accordance with Section 2308.3.2.

3. Where the end of a required braced wall panel extends more than 1 foot (305 mm)over an opening in the wall below, the structure shall be considered to be irregular. This requirement is applicable to braced wall panels offset in plane and to braced wall panels offset out of plane as permitted by the exception to Item 1 above in this section [see Figure 2308.12.6(5)].

   Exception: Braced wall panels are permitted to extend over an opening not more than 8 feet (2438 mm) in width where the header is a 4-inch by 12-inch (102 mm by 305 mm) or larger member.

4. Where portions of a floor level are vertically offset such that the framing members on either side of the offset cannot be lapped or tied together in an *approved* manner, the structure shall be considered to be irregular [see Figure 2308.12.6(6)].

   Exception: Framing supported directly by foundations need not be lapped or tied directly together.

5. Where braced wall lines are not perpendicular to each other, the structure shall be considered to be irregular [see Figure 2308.12.6(7)].

6. Where openings in floor and roof diaphragms having a maximum dimension greater than 50 percent of the distance between lines of bracing or an area greater than 25 percent of the area between orthogonal pairs of braced wall lines are present, the structure shall be considered to be irregular [see Figure 2308.12.6(8)].

Reason: This code section addresses the connection of braced wall lines to framing above and below to transfer lateral (wind and seismic) forces into the roof and floor diaphragms. This proposal does not add any new requirements. First, in Section 2308.3.2, this proposal separates the top plate connection requirements from the bottom plate connections for clarity. Secondly, in section 2308.12.6, a reference is added to point to the connection requirements in 2308.3.2.

Purpose: As currently written, the text of the code combines top plate and bottom plate connections in the same paragraph. Top plate connection requirements at roofs and ceilings are typically different than connections to floors above. At roofs, rafters or trusses are used and pose different challenges as opposed to flat floor joists. This proposal is intended to make the section read more clearly as well as arrange it to work with another proposal revising this section that will provide prescriptive solutions for connections at the top plate to the roof diaphragm when full-depth, solid blocking will not work or is impractical.

Cost Impact: The code change proposal will not increase the cost of construction.

2308.3.2, Figure 2308.3.2(1) (New), Figure 2308.3.2(2) (New)

Proponent: Robert Rice, Grants Pass, OR, representing Josephine County Building Safety and Southern Oregon Chapter International Code Council.

Revise as follows:

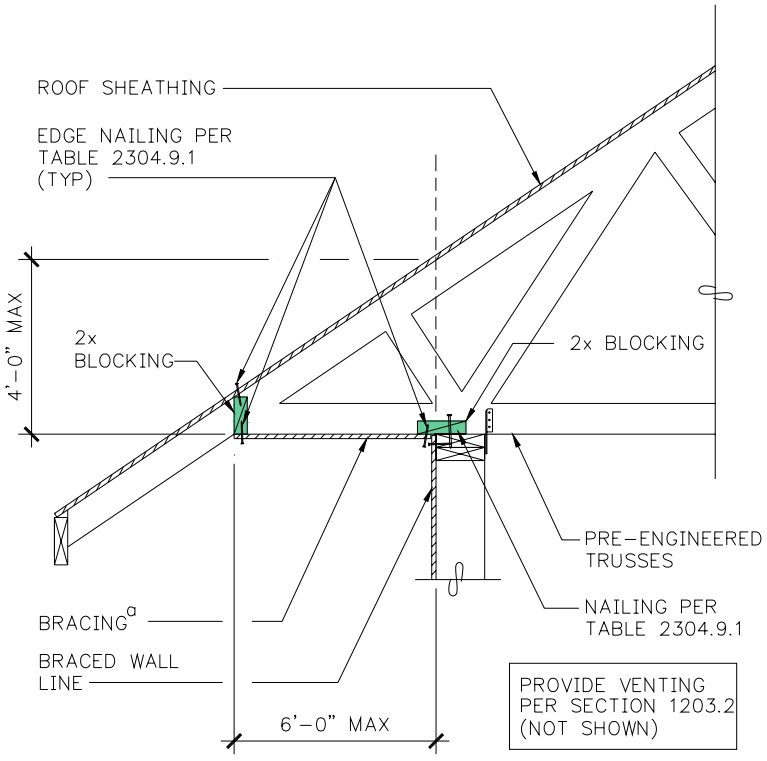
2308.3.2 Braced wall line connections. Wind and seismic lateral forces shall be transferred from the roofs and floors to braced wall lines and from the braced wall lines in upper stories to the braced wall lines in the story below in accordance with is section.

Braced wall line top plates shall be fastened to joists, rafters or full-depth blocking above in accordance with Table 2304.9.1, Items 11, 12, 15 or 19 as applicable based on the orientation of the joists or rafters to the braced wall line. Braced wall line bottom plates shall be connected to joists or blocking below in accordance with Table 2304.9.1, Item 6, or to foundations in accordance with Section 2308.3.3. At exterior gable end walls, braced wall panel sheathing in the top story shall be extended and fastened to roof framing where the spacing between parallel exterior braced wall lines is greater than 50 feet (15 240 mm).

~~**Exception:**~~ Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses or by other approved methods providing equivalent lateral force transfer. Blocking shall be a minimum of 2 inches (51 mm) nominal in thickness and equal to the depth of the truss at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11.

Exceptions:

1. For buildings that are classified as Seismic Design Category A, B or C and the basic wind speed is less than 100 mph (45 m/s) where the framing members are perpendicular to the wall line below and the distance from the top plate to the sheathing above is less than 9 1/4 inches (235 mm) solid blocking need not be provided when the perpendicular framing members or a parallel member such as a continuous rim joist or header is attached to the wall line in accordance with Table 2304.9.1.
2. Where the roof sheathing is greater than 9-1/4 inches (235 mm) above the top plate solid blocking is not required when the framing members are connected in accordance with one of the following methods:
   - 2.1 In accordance with Figure 2308.3.2 (1)
   - 2.2 In accordance with Figure 2308.3.2 (2)
   - 2.3 With full height engineered blocking panels designed for values listed in AF&PA WFCM.
   - 2.4 Designed in accordance with accepted engineering methods.

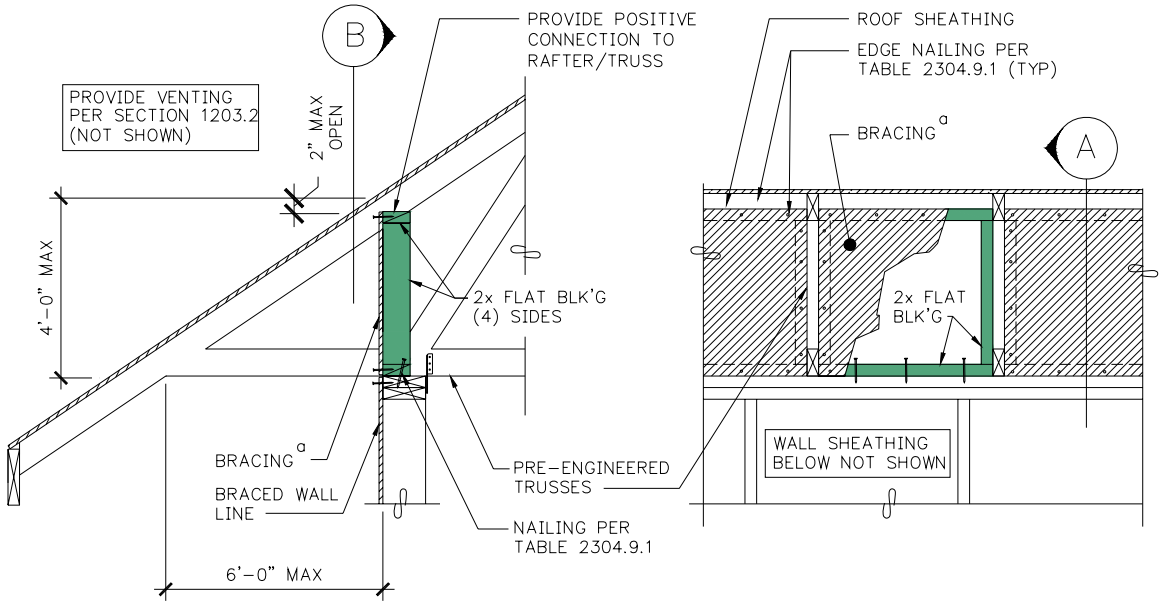


a. Methods of bracing shall be as described in Section 2308.9.3 method 2, 3, 4, 6, 7 or 8

A SECTION

For SI: 1 inch = 25.4 mm

FIGURE 2308.3.2 (1)
BRACED WALL PANEL TOP PLATE CONNECTION



For SI: 1 inch = 25.4 mm

FIGURE 2308.3.2 (2)
BRACED WALL PANEL TOP PLATE CONNECTION

Reason: The 2006 IBC had fairly clear wording that the diaphragms need to be connected to the braced wall lines. With the approval of proposal 2008/2009 S224 the 2009 language was modified to make the purpose even more clear in that the connection is required to resist wind and seismic (lateral) forces. This proposal merely provides prescriptive methods to accomplish the connection whether with solid blocking or when solid blocking doesn't work.

In addition, another proposal that I have submitted rearranges the existing section to separate top plate connections from bottom plate connections since roof connections at the top plate differ from conditions where there is floor framing above. The two proposals are intended to work together and are shown at the end of the purpose statement combined as one.

Purpose: The current text of the IBC states the intention of connecting the braced wall line to the roof or floor diaphragm above in section 2308.3.2. A similar version of this proposal was adopted as an Oregon amendment for the adoption of the 2006 IBC (and the recent adoption of the 2009 IBC) and has worked well. Since then, countless hours have gone into developing proposals for both the IRC and the IBC in the 2009 code development process. The proposal for the IRC (which was the main focus) was successful and was approved for the 2009 IRC. The details for that proposal are the same ones submitted for this proposal. During the process of resolving opposition and developing a consensus two main changes were made to the proposals. First, based on engineering reports and historical data, an exception was made for low heel connections (9 ¼") in lower wind and seismic zones to not require the blocking. Second, the details for the high-heel blocking was modified to allow a 2" gap at the top to allow for venting (again, backed up by engineering data). Following the approval for the 2009 IRC an article was published in the Spring 2009 issue of *Wood Design Focus* addressing the issue. The article, "*When is Roof Eave Blocking Required?", states, Because the 2006 IRC lacks clarity on when roof eave blocking is required for lateral force transfer, IRC users and code officials are forced to interpret its intent on a case by case basis, often with varied results." "Fortunately, Section R602.10.6.2 of the 2009 IRC provides a reasonable solution that addresses the above concerns, places reasonable limits on past successful practices, and avoids the pitfalls of the 2006 IRC…..".*

This proposal does not add additional requirements to the code. This proposal clarifies that the connection needs to occur and provides prescriptive solutions when solid blocking in not possible or is impractical.

Per accepted engineering practice for lateral design loads, the floor and roof diaphragms transmit wind and seismic loads into the braced walls (engineered shearwalls or prescriptive braced panels). The fact that the diaphragm needs to be connected to the braced wall line is often not fully understood by plans examiners, inspectors and contractors. The typical requirement that is intended by the code is that solid blocking occur at this connection with the blocking connected to the top plate of the wall to transfer the diaphragm (plf) force to the wall top plates. This is evidenced in the IBC by the exception to irregular structures stating, *"..lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses.."*. In order for the forces to be transferred there has to be a connection capable of transferring the diaphragm shear evenly to the top plates.

The condition that occurs at an increasing rate that brings this issue up is with cantilevered or high stub-heel trusses. In that construction method solid blocking (either with 2x or engineered wood products) is often not possible due to the height of the diaphragm above the top plate of the wall.

Without this clarification of the text it is a connection that may or may not occur based on what I have seen in the field and have discussed with code officials. The blocking that is called for in the code serves three functions. It provides closure to prevent animals, birds, etc. from entering the

attic space, it prevents the trusses or rafters from "rolling over" and it transfers the diaphragm forces to the wall. Most code officials, inspectors and contractors understand the first two objectives. However, the latter is a concept that is often not fully understood. This needs to be perceived, understood and implemented in a uniform way.

In addition, rather than identify a problem without providing a solution, my proposal includes two details to accomplish this connection simply. The solutions are, in principle, fundamentally extending the braced wall sheathing to the roof diaphragm either vertically in the truss bays or horizontally through the soffit. No engineering or testing is required since it is just completing the load path with the already defined sheathing and nailing.

Without prescriptive provisions in the current code this condition would require engineering or, as stated in 2308.3.2, Exception to item 1 "..by other approved methods." would be left up to the Authority Having Jurisdiction to determine what is acceptable without any guidance or uniformity between jurisdictions.

Typically, the engineering solution would provide details similar to those included in this proposal. Therefore, the solution and construction costs would not change. Costs would be reduced by eliminating additional costs for engineering where these prescriptive solutions work.

If approved, the two proposals I have submitted for section 2308.3.2 would read as shown below when combined:

2308.3.2 Braced wall line connections. Wind and seismic lateral forces shall be transferred from the roof and floor diaphragms to braced wall lines and from the braced wall lines in upper stories to the braced wall lines in the story below in accordance with this sections 2308.3.2.1 and 2308.3.2.2.
2308.3.2.1 Bottom plate connection. Braced wall line bottom plates shall be connected to joists or full depth blocking below in accordance with Table 2304.9.1, Item 6, or to foundations in accordance with Section 2308.3.3.
2308.3.2.2 Top plate connection. Where joists or rafters are used, braced wall line top plates shall be fastened to joists, rafters or full-depth blocking above in accordance with Table 2304.9.1, Items 11, 12, 15 or 19 as applicable based on the orientation of the joists or rafters to the braced wall line. Blocking shall be a minimum of 2 inches (51 mm) nominal in thickness and equal to the depth of the truss at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11.

Exception: Blocking at rafters need not be full depth when there are no braced wall lines above but shall extend to within 2 inches (51mm) from the sheathing above.

At exterior gable end walls, braced wall panel sheathing in the top story shall be extended and fastened to roof framing where the spacing between parallel exterior braced wall lines is greater than 50 feet (15 240 mm).

Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses or by other approved methods providing equivalent lateral force transfer. Blocking shall be a minimum of 2 inches (51 mm) nominal in thickness and equal to the depth of the truss at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11.

Exceptions:

1. For Seismic Design Categories C and less and wind speed zones less than 100 mph where the rafters, joists or trusses are perpendicular to the wall line below and the distance from the top plate is less than 9 ¼ inches (235 mm) solid blocking need not be provided when the perpendicular framing members or a parallel member such as a continuous rim joist or header is attached to the wall line per Table 2304.9.1
2. Where the roof sheathing is greater than 9-1/4 inches (235 mm) above the top plate solid blocking is not required when the rafters, joists or trusses are connected in accordance with one of the following methods:
    1. In accordance with Figure 2308.3.2 (1)
    2. In accordance with Figure 2308.3.2 (2)
    3. With full height engineered blocking panels designed for values listed in American Forest and Paper Association (AF&PA) Wood Frame Construction Manual for One- and Two-Family Dwellings (WFCM).
    4. Designed in accordance with accepted engineering methods.

Bibliography: "When is Roof Eave Blocking Required*", by Jay H. Crandell, P.E., Robert Rice, Brian Foley, P.E., and Frank Woeste, PhD, P.E Volume 19, Number 1, Spring 2009 Wood Design Focus, a quarterly publication of Forest Products Society, Madison WI..*

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-S2-2308.3.2

S213–09/10
2308.9.2.3

Proponent: Edwin Huston, National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee

Revise as follows:

2308.9.2.3 Nonbearing walls and partitions. In nonbearing walls and partitions, studs shall be spaced not more than ~~28~~ 24 inches (~~711~~ 609 mm) o.c. and in interior nonbearing walls and partitions, are permitted to be set with the long dimension parallel to the wall. Interior nonbearing partitions shall be capped with no less than a single top plate installed to provide overlapping at corners and at intersections with other walls and partitions. The plate shall be continuously tied at joints by solid blocking at least 16 inches (406 mm) in length and equal in size to the plate or by 1/2-inch by 11/2-inch (12.7 mm by 38 mm) metal ties with spliced sections fastened with two 16d nails on each side of the joint.

Reason: The ICC Structural Committee liked the idea of Code Change Proposal S228-07/08 but thought it was unclear. NCSEA was not the author of S228-07/08, but is now proposing a change to this section to address what we see as a potential safety concern for wind loading. Section 2308.9.2.3 allows 2x studs to be placed flat wise in a wall and be spaced at up to 28" oc. Table 2308.9.1 limits the height of edge wise studs in such a wall to 14 feet for 2x4 nonbearing walls, for example. Our Code Change Proposal is aimed at limiting this construction to interior walls. Tall flat wise stud construction is not appropriate for exterior walls which are subject to wind loads.

We are also recommending that the 28" spacing in Section 2308.9.2.3 should be changed to 24" oc. Table 2308.9.1 limits the maximum spacing of edge wise studs in all non-bearing walls to 24". Turning the stud and using it flat wise in the wall, should not let the stud spacing increase. We also note that in modern construction almost all wall framing is based on modules which fit within dimensions of 48" or 96". A spacing of 24" oc is a module of 48" and 96" but a spacing of 28" oc is not.

Cost Impact: This code change proposal will not increase the cost of construction.

2308.9.4; IRC R602.9

Proponent: Robert Rice, Grants Pass, representing Josephine County Building Safety and Southern Oregon Chapter International Code Council.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2308.9.4 Cripple walls. Foundation cripple walls shall ~~be framed of studs~~ not be less in size than the required width of the studding above with a minimum length of 14 inches (356 mm), or the wall shall be framed of solid blocking or other approved method to prevent the studs from splitting. Where exceeding 4 feet (1219 mm) in height, such walls shall be framed of studs having the size required for an additional story.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R602.9 Cripple Walls. Foundation cripple walls shall be framed of studs not smaller than required size of the studding above. When exceeding 4 feet (1219 mm) in height, such walls shall be framed of studs having the size required for an additional story.

Cripple walls with a stud height less than 14 inches (356 mm) shall be sheathed on at least one side with a wood structural panel that is fastened to both the top and bottom plates in accordance with Table R602.3(1) or other approved method to prevent studs from splitting or the cripple walls shall be constructed of solid blocking. Cripple walls shall be braced as required for lateral loads per section R602.10.2 and R602.10.11.4 and supported on continuous foundations~~.~~

Reason: There are situations where the wall above is of studs larger than what would be required for structural reasons. In some cases it is to accommodate increased insulation or for tall walls. Typically, a 2x4 cripple wall is structurally sufficient even though the wall above may be 2x 6 for insulation reasons or 2x 8 for tall studs. The words "..required width…" would clear this up.

Regarding the 14" studs, this code section has been modified in the past by Oregon amendment and perhaps been misunderstood by others. The purpose for "Cripple walls with a stud height less than 14 inches…", to be sheathed does not relate to lateral bracing as the Oregon amendment implies,

For example, the Oregon amendment reads as follows:

> *Cripple walls with a stud height less than 14 inches (356 mm)* ***supporting exterior walls or an interior braced wall line which is supported by a continuous foundation as required by Section 602.10.9*** *shall be sheathed on at least one side with a wood structural panel that is fastened to both the top and bottom plates in accordance with Table R602.3(1), or the cripple walls shall be constructed of solid blocking.*

The intention of this code requirement is to ensure structural stability of walls with studs that are short enough to be susceptible to splitting. The 14" limit is due to the fact that, historically, up to 14" dimensional lumber was available to be used as solid blocking in lieu of the short studs. In addition, the proposal states, "or other approved method" since mechanical anchors are currently available that would allow the studs to be attached to the top and bottom plate without damaging the studs.

With the provision contained in R602.9, studs shorter than 14" can be used as long as sheathing is placed on one side of the wall to maintain the integrity of the studs and plates. The text continues, "...or the cripple walls shall be constructed of solid blocking." which would allow a number of

products, now available, to be used such as glue-laminated beams (GLB), laminated veneer lumber beams (LVL) or dimensional lumber such as 4x's and 6x's.

The IRC commentary states, "The minimum length of 14 inches for cripple wall studs provides sufficient clear space for required nailing of the framing". The IBC commentary states, "The minimum stud length of 14 inches is based on the length necessary to properly fasten the studs to the foundation wall plate and the double plate above."

In addition, "Section R602.9 Cripple Walls" appears in the wall "framing" portion of the code. Wall "bracing" begins to be addressed in section R602.10. In Section R602.10.2 "Cripple wall bracing" is addressed specifically.

In summary, section "R602.9 Cripple Walls" has nothing to do with lateral bracing.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-S-2308.9.4

S215–09/10
2308.12.4, Table 2308.12.4

Proponent: Ali M. Fattah, City of San Diego, Development Services Department, representing SD Area Chapter ICC Code Committee

Revise as follows:

2308.12.4 Braced wall line sheathing. Braced wall lines shall be braced by one of the types of sheathing prescribed by Table 2308.12.4 as shown in Figure 2308.9.3. The sum of lengths of braced wall panels at each braced wall line shall conform to the required percentage of wall length required to be braced per braced wall line in Table 2308.12.4. Braced wall panels shall be distributed along the length of the braced wall line and start at not more than 8 feet (2438 mm) from each end of the braced wall line. Panel sheathing joints shall occur over studs or blocking. Sheathing shall be fastened to studs, top and bottom plates and at panel edges occurring over blocking. Wall framing to which sheathing used for bracing is applied shall be nominal 2 inch wide [actual 11/2 inch (38 mm)] or larger members.

Cripple walls having a stud height exceeding 14 inches (356 mm) shall be considered a story for the purpose of this section and shall be braced as required for braced wall lines in accordance with the required percentage of wall length required to be braced per braced wall line in Table 2308.12.4. Where interior braced wall lines occur without a continuous foundation below, the length of parallel exterior cripple wall bracing shall be one and one-half times the lengths required by Table 2308.12.4. Where the cripple wall sheathing type used is Type S-W and this additional length of bracing cannot be provided, the capacity of Type S-W sheathing shall be increased by reducing the spacing of fasteners along the perimeter of each piece of sheathing to 4 inches (102 mm) o.c.

TABLE 2308.12.4
WALL BRACING IN SEISMIC DESIGN CATEGORIES D AND E
(Minimum Percentage ~~Length~~ of Wall Bracing per each ~~25 Linear Feet of~~ Braced Wall Line[a])

Condition	SHEATHING TYPE[b]	$S_{DS} < 0.50$	$0.50 \le S_{DS} < 0.75$	$0.50 \le S_{DS} \le 1.00$	$S_{DS} > 1.00$
One Story	G-P[c]	~~10 feet 8 inches~~ 43 %	~~14 feet 8 inches~~ 59 %	~~18 feet 8 inches~~ 75 %	~~25 feet 0 inches~~ 100 %
	S-W	~~5 feet 4 inches~~ 21 %	~~8 feet 0 inches~~ 32 %	~~9 feet 4 inches~~ 37 %	~~12 feet 0 inches~~ 48 %

(No change to footnotes)

Reason: This proposed change is to add clarity to the IBC. This is necessary to account for real world cases like a 20 ft by 20 ft building or a 40 ft by 40 ft building. This will also assist both the code official and designer to better visualize what the expected wall bracing pattern will appear to be as a percentage by showing the percentage of the wall that is required to be solid.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: FATTAH-S1-2308.12.4

S216–09/10
Table 2308.12.4, 2308.12.4.1 (New)

Proponent: Gregory Mahoney, City of Davis Community Development Department, representing Sacramento Valley Association of Building Officials

1. Add new text as follows:

2308.12.4.1 Alternative bracing. An alternate braced wall panel constructed in accordance with Section 2308.9.3.1 or 2308.9.3.2 is permitted to be substituted for a braced wall panel in Section 2308.9.3 Items 2 through 8. For methods 2, 3, 4, 6, 7 and 8 each 48 inch (1219 mm) section or portion thereof required by Table 2308.12.4 is permitted to be replaced by one alternate braced wall panel constructed in accordance with Section 2308.9.3.1 or 2308.9.3.2. For method 5 each 96 inch (2438 mm) section (applied to one face) or 48 inch (1219 mm) section (applied to both faces) or portion thereof required by Table 2308.12.4 is permitted to be replaced by one alternate braced wall panel constructed in accordance with Section 2308.9.3.1 or 2308.9.3.2.

2. Revise as follows:

TABLE 2308.12.4
WALL BRACING IN SESIMIC DESIGN CATEGORIES D AND E
(Minimum Length of Wall Bracing per each 25 Linear Feet of Braced Wall Line[a])
(No change to table entries

a. Minimum length of panel bracing of one face of the wall for S-W sheathing or both faces of the wall for G-P sheathing; h/w ratio shall not exceed 2:1. For S-W panel bracing of the same material on two faces of the wall, the minimum length is permitted to be one-half the tabulated value but the h/w ratio shall not exceed 2:1 and design for uplift is required. The 2:1 h/w ratio limitation does not apply to alternate braced wall panels constructed in accordance with Section 2308.9.3.1 or 2308.9.3.2.

(No change to footnotes b and c)

Reason: Sections 2308.9.3.1 and 2308.9.3.2 provide for the substitution of braced wall panels listed in 2308.9.3 with Alternative bracing (2308.9.3.1) or Alternate bracing wall panels (2308.9.3.2). Section 2308.12 specifies additional requirements governing the use of braced wall panels constructed in accordance with 2308.9.3 in Seismic Design Categories D and E. The code is not clear regarding the use of alternate braced wall panels constructed in accordance with 2308.9.3.1 or 2308.9.3.2 in Seismic Design Categories D and E.

The purpose of this addition is to clarify that alternate braced wall panels may be substituted for braced wall panels in Seismic Design Categories D and E. In addition the proposed code addition further clarifies that an alternate brace wall panel is equal to one section of brace wall panel or portion thereof when used in Seismic Design Categories D and E.

So if Table 2308.12.4 requires 5'4" of S-W braced wall panel then that section of wall could be replaced by 2 alternate braced wall panels. If Table 2308.12.4 required 8' of S-W braced wall panels then the section of wall could also be replaced by 2 alternate braced wall panels.

The second part of the proposed change is a clarification of Footnote a to Table 2308.12.4. Footnote a to Table 2308.12.4 indicates that the h/w ratio shall not exceed 2:1. Table 2308.12.4 is based on Table 12.4-2 of the 2003 NEHRP Provisions. The NEHRP commentary suggests that the primary concern in limiting the height-to-width is to limit the overturning demand on braced wall panels due to the lack of overturning restraint. However, the NEHRP provisions do not include or address alternative braced wall panels. Since alternate braced wall panels incorporate overturning restraint devices, they should not be subject to the 2:1 limit.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MAHONEY-S1-T2308.12.4

S217–09/10
2406.1

Proponent: Don Davies representing Utah Chapter of ICC

Revise as follows:

2406.1 Human impact loads. Individual glazed areas, including glass mirrors, in hazardous locations as defined in Section 2406.4 shall comply with Sections 2406.1.1 through 2406.1.4. Wired glass is not permitted in any of the locations where safety glazing is required in Section 2406.4.

Reason: The process of removing wired glazing from hazardous locations has taken several years and has involved changes to both sections 715.5 and 2406.1. Some confusion in Section 715 has been cleared up in the 2009 I.B.C. in sections 715.4.7.4 and 715.5.3 which both reference to chapter 24 for safety glazing. The bottom line is that wired glass is not allowed in those locations. When one turns to chapter 24 it is still unclear to the first time user of the code that wired glass is no longer allowed when a fire-protection rating is required. In the 2006 commentary to I.B.C.

Section 715.4.6.4 second paragraph on page 7-94 it states “Code users should be very aware of the change that first occurred in Chapter 24 of the 2006 code. Earlier editions of the code permitted wired glass to meet a lower level of impact resistance”. Changes to Chapter 24 relating to this issue even go back to the 2003 edition of the I.B.C. where only Group E occupancies were identified as locations where wired glass could not be used in Section 2406.1.2. In the 2006 code the reference to wired glass in 2406.1 has been removed leading one to surmise that it is no longer addressed in the code at that location. The current code user shouldn’t have to refer to two previous editions of the code to determine how the current code addresses an issue. The current code should stand on its own and be a straight forward document stating what is allowed and what is not. The convoluted path listing test and standards mean nothing to the typical code user. This item is too important to miss due to an oversight.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Roger R. Evans, Park City Municipal Corporation, representing Utah Chapter of Building Officials

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2406.1 Human impact loads. Individual glazed areas, including glass mirrors, in hazardous locations as defined in Section 2406.4 shall comply with Sections 2406.1.1 through 2406.1.4.

Exception: Mirrors and other glass panels mounted or hung on a surface that provides a continuous backing support.

2406.4 Hazardous locations. The ~~following~~ locations specified in Sections 2306.4.1 through 2406.4.7 shall be considered specific hazardous locations requiring safety glazing materials.~~:~~

1. ~~Glazing in swinging doors except jalousies (see Section 2406.4.1).~~
2. ~~Glazing in fixed and sliding panels of sliding door assemblies and panels in sliding and bifold closet door assemblies.~~
3. ~~Glazing in storm doors.~~
4. ~~Glazing in unframed swinging doors.~~
5. ~~Glazing in doors and enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers. Glazing in any portion of a building wall enclosing these compartments where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above a standing surface.~~

2406.4.1 Glazing in doors. Glazing in all fixed and operable panels of swinging, sliding, and bifold doors shall be considered a hazardous location.

Exceptions:

1. Glazed openings of a size through which a 3-inch diameter (76 mm) sphere is unable to pass.
2. Decorative glazing.
3. Glazing materials used as curved glazed panels in revolving doors.
4. Commercial refrigerated cabinet glazed doors.

~~6.~~ **2406.4.2 Glazing adjacent doors**. Glazing in an individual fixed or operable panel adjacent to a door where the nearest ~~exposed~~ vertical edge of the glazing is within a 24-inch (610 mm) arc of either vertical edge of the door in a closed position and where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the walking surface shall be considered a hazardous location.

Exceptions:

1. Decorative glazing.
2. ~~Panels where~~ When there is an intervening wall or other permanent barrier between the door and glazing.
3. Where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth. Glazing in this application shall comply with Section ~~2406.4, Item 7~~ 2406.4.3.
4. Glazing in walls ~~perpendicular to the plane of the door in a closed position, other than the wall towards which the door swings when opened,~~ on the latch side of and perpendicular to the plane of the door in a closed position in one- and two-family *dwellings* or within *dwelling units* in Group R-2.
5. Glazing that is adjacent to the fixed panel of patio doors.

~~7.~~ **2406.4.3 Glazing in windows.** Glazing in an individual fixed or operable panel~~, other than in those locations described in preceding Items 5 and 6, which~~ that, meets all of the following conditions shall be considered a hazardous location:

~~7.~~1. ~~Exposed~~ The exposed area of an individual pane is greater than 9 square feet (0.84 m^2);
~~7.~~2. ~~Exposed~~ The bottom edge of the glazing is less than 18 inches (457 mm) above the floor;
~~7.~~3. ~~Exposed~~ The top edge of the glazing is greater than 36 inches (914 mm) above the floor; and
~~7.~~4. One or more walking surface(s) are within 36 inches (914 mm), measured horizontally ~~of the plane~~ and in a straight line, of the glazing.

Exceptions: ~~Safety glazing for Item 7 is not required for the following installations:~~

~~1. A protective bar 11/2 inches (38 mm) or more in height, capable of withstanding a horizontal load of 50 pounds plf (730 N/m) without contacting the glass, is installed on the accessible sides of the glazing 34 inches to 38 inches (864 mm to 965 mm) above the floor.~~

1. Decorative glazing.
2. When a horizontal rail is installed on the accessible side(s) of the glazing 34 to 38 inches above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be a minimum of 1½ inches (38 mm) in cross sectional height.
~~2~~3. ~~The outboard~~ Outboard panes in insulating glass units or multiple glazing where the bottom exposed edge of the glass is 25 feet (7620 mm) or more above any grade, roof, walking surface or other horizontal or sloped (within 45 degrees of horizontal) (0.78 rad) surface adjacent to the glass exterior.

~~8.~~ **2406.4.4 Glazing in guards and railings.** Glazing in guards and railings, including structural baluster panels and nonstructural in-fill panels, regardless of area or height above a walking surface shall be considered a hazardous location.

~~9. Glazing in walls and fences enclosing indoor and outdoor swimming pools, hot tubs and spas where all of the following conditions are present:~~

~~9.1. The bottom edge of the glazing on the pool or spa side is less than 60 inches (1524 mm) above a walking surface on the pool or spa side of the glazing; and~~

~~9.2. The glazing is within 60 inches (1524 mm) horizontally of the water's edge of a swimming pool or spa.~~

2406.4.5 Glazing and wet surfaces. Glazing in walls, enclosures or fences containing or facing hot tubs, spas, whirlpools, saunas, steam rooms, bathtubs, showers and indoor or outdoor swimming pools where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface shall be considered a hazardous location. This shall apply to single glazing and all panes in multiple glazing.

Exception: Glazing that is more than 60 inches (1524 mm), measured horizontally and in a straight line, from the water's edge of a bathtub, hot tub, spa, whirlpool, or swimming pool.

~~10.~~ **2406.4.6 Glazing adjacent stairs and ramps.** Glazing ~~adjacent to~~ where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the plane of the adjacent walking surface of stairways, landings between flights of stairs, and ramps shall be considered a hazardous location ~~within 36 inches (914 mm) horizontally of a walking surface; when the exposed surface of the glass is less than 60 inches (1524 mm) above the plane of the adjacent walking surface~~.

Exceptions:

1. The side of a stairway, landing or ramp which has a guard complying with the provisions of Sections 1013 and 1607.7, and the plane of the glass is greater than 18 inches (457 mm) from the railing.
2. Glazing 36 inches (914 mm) or more measured horizontally from the walking surface.

~~11.~~ **2406.4.7 Glazing adjacent the bottom stair landing.** ~~Glazing adjacent to *stairways* within 60 inches (1524 mm) horizontally of the bottom tread of a *stairway* in any direction when the exposed surface of the glass is less than 60 inches (1524 mm) above the nose of the tread.~~ Glazing adjacent the landing at the bottom of a stairway where the glazing is less than 36 inches (914 mm) above the landing and within 60 inches (1524 mm) horizontally of the bottom tread shall be considered a hazardous location.

Exception: ~~Safety glazing for Item 10 or 11 is not required for the following installations where:~~

1. The ~~side of a stairway, landing or ramp which has~~ glazing is protected by a guard ~~or handrail, including balusters or in-fill panels,~~ complying with ~~the provisions of~~ Sections 1013 and 1607.7~~;~~ and ~~2. The~~ the plane of the glass is greater than 18 inches (457 mm) from the ~~railing~~ guard.

~~**2406.4.1 Exceptions.** The following products, materials and uses shall not be considered specific hazardous locations:~~

1. ~~Openings in doors through which a 3-inch (76 mm) sphere is unable to pass.~~
2. ~~Decorative glass in Section 2406.4, Item 1, 6 or 7.~~
3. ~~Glazing materials used as curved glazed panels in revolving doors.~~
4. ~~Commercial refrigerated cabinet glazed doors.~~
5. ~~Glass-block panels complying with Section 2101.2.5.~~
6. ~~Louvered windows and jalousies complying with the requirements of Section 2403.5.~~
7. ~~Mirrors and other glass panels mounted or hung on a surface that provides a continuous backing support.~~

PART II – IRC BUILDING/ENERGY

Revise as follows:

R308.4 Hazardous locations. The ~~following~~ locations specified in Sections R308.4.1 through R308.4.7 shall be considered specific hazardous locations for the purposes of glazing:

~~1.~~ **R308.4.1 Glazing in doors.** Glazing in all fixed and operable panels of swinging, sliding and bifold doors shall be considered a hazardous location.

Exceptions:

1. Glazed openings of a size through which a 3-inch diameter (76 mm) sphere is unable to pass.
2. Decorative glazing.

~~2.~~ **R308.4.2 Glazing adjacent doors.** Glazing in an individual fixed or operable panel adjacent to a door where the nearest vertical edge of the glazing is within a 24-inch (610 mm) arc of either vertical edge of the door in a closed position and ~~whose~~ where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the floor or walking surface shall be considered a hazardous location.

Exceptions:

1. Decorative glazing.
2. When there is an intervening wall or other permanent barrier between the door and the glazing.
3. Glazing in walls on the latch side of and perpendicular to the plane of the door in a closed position.
4. ~~Glazing adjacent to a door where~~ Where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth. Glazing in this application shall comply with section R308.4.3.
5. Glazing that is adjacent to the fixed panel of patio doors.

~~3.~~ **R308.4.3 Glazing in windows.** Glazing in an individual fixed or operable panel that meets all of the following conditions shall be considered a hazardous location:

~~3.1.~~1. The exposed area of an individual pane is larger than 9 square feet (0.836 m2); and
~~3.2.~~2. The bottom edge of the glazing is less than 18 inches (457 mm) above the floor; and
~~3.3.~~3. The top edge of the glazing is more than 36 inches (914 mm) above the floor; and
~~3.4.~~4. One or more walking surfaces are within 36 inches (914 mm), measured horizontally and in a straight line, of the glazing.

Exceptions:

1. Decorative glazing.
2. When a horizontal rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be a minimum of 11/2 inches (38 mm) in cross sectional height.
3. Outboard panes in insulating glass units and other multiple glazed panels when the bottom edge of the glass is 25 feet (7620 mm) or more above grade, a roof, walking surfaces or other horizontal [within 45 degrees (0.79 rad) of horizontal] surface adjacent to the glass exterior.

~~4.~~ **R308.4.4 Glazing in guards and railings.** ~~All glazing in railings regardless of area or height above a walking surface. Included are structural baluster panels and nonstructural infill panels.~~ Glazing in guards and railings, including structural baluster panels and nonstructural in-fill panels, regardless of area or height above a walking surface shall be considered a hazardous location.

~~5. Glazing in enclosures for or walls facing hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface.~~

~~**Exception:** Glazing that is more than 60 inches (1524 mm) measured horizontally and in a straight line, from the waters edge of a hot tub, whirlpool or bathtub.~~

~~6. Glazing in walls and fences adjacent to indoor and outdoor swimming pools, hot tubs and spas where the bottom edge of the glazing is less than 60 inches (1524 mm) above a walking surface and within 60 inches (1524 mm), measured horizontally and in a straight line, of the water's edge. This shall apply to single glazing and all panes in multiple glazing.~~

R308.4.5 Glazing and wet surfaces. Glazing in walls, enclosures or fences containing or facing hot tubs, spas, whirlpools, saunas, steam rooms, bathtubs, showers and indoor or outdoor swimming pools where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface shall be considered a hazardous location. This shall apply to single glazing and all panes in multiple glazing.

Exception: Glazing that is more than 60 inches (1524 mm), measured horizontally and in a straight line, from the water's edge of a bathtub, hot tub, spa, whirlpool, or swimming pool.

~~7.~~ **R308.4.6 Glazing adjacent stairs and ramps.** Glazing ~~adjacent to~~ where the bottom exposed edge of the glazing is less than 36 inches (914 mm) above the plane of the adjacent walking surface of stairways, landings between flights of stairs, and ramps shall be considered a hazardous location ~~within 36 inches (914 mm) horizontally of a walking surface when the exposed surface of the glazing is less than 60 inches (1524 mm) above the plane of the adjacent walking surface~~.

Exceptions:

1. When a rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965 mm) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be a minimum of 11/2 inches (38 mm) in cross sectional height.
2. Glazing 36 inches (914 mm) or more measured horizontally from the walking surface.
~~2. The side of the stairway has a guardrail or handrail, including balusters or in-fill panels, complying with Sections R311.7.6 and R312 and the plane of the glazing is more than 18 inches (457 mm) from the railing; or~~
~~3. When a solid wall or panel extends from the plane of the adjacent walking surface to 34 inches (863 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a guard.~~

~~8.~~ **R308.4.7 Glazing adjacent the bottom stair landing.** ~~Glazing adjacent to stairways within 60 inches (1524 mm) horizontally of the bottom tread of a stairway in any direction when the exposed surface of the glazing is less than 60 inches (1524 mm) above the nose of the tread.~~ Glazing adjacent the landing at the bottom of a stairway where the glazing is less than 36 inches (914 mm) above the landing and within 60 inches (1524 mm) horizontally of the bottom tread shall be considered a hazardous location.

Exceptions~~:~~:

1. ~~1.~~ The ~~side of the stairway has~~ glazing is protected by a guard~~rail or handrail, including balusters or in-fill panels~~, complying with Section~~s R311.7.6 and~~ R312 and the plane of the glass is more than 18 inches (457 mm) from the ~~railing; or~~ guard.
2. ~~2. When a solid wall or panel extends from the plane of the adjacent walking surface to 34 inches (864 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a guard.~~

Reason:
PART I- This code change was submitted for the IRC in Palm Springs. While the Committee said they supported the change, they said that the proposal should include the IBC for consistency. There is a companion code change submitted for the IRC. The main purpose of this code change is to eliminate conflicts, create consistency, and ease the use of the safety glazing requirements. Following is a point by point explanation of the changes.

The Exception to Section 2406.1 is relocated from 2406.4.1

Items 1-4 are combined into Section 2406.4.1 and item 5 is relocated to Section 2406.4.5.

Exception 1 to Section 2406.4.2 is from 2406.4.1 and exceptions 4 & 5 provide consistency with the IRC.

Editorial revision in Section 2406.4.3 removes unnecessary language.

Exception 1 to Section 2406.4.3 is from 2406.4.1. Exception 2 is for consistency w/IRC. "Protective bar" implies evaluation by the BO that the "bar" meets certain safety standards. The language already provides a minimum size and rigidity which is sufficient.

Section 2406.4.5 combines all of the language related to hazardous glazing adjacent water, eliminates conflicting or confusing language, and eases interpretation. It also addresses the issue of glazing adjacent a freestanding bathtub by treating it the same as a hot tub, spa or whirlpool. Consistency with the IRC/IBC.

Section 2406.4.6 is largely editorial however there is a difference between the IRC and IBC in that the IRC exempts safety glazing if the glass is in a wall and 34 to 38 inches above the walking surface. No such exception occurs in the IBC so 60 inches is the rule. Exception one is repeated from current item #11. Reference to a handrail with balusters (a guard) is deleted.

(2406.4.7) While the current text says "stairways", clearly what is being regulated is the bottom landing because of the use of the term "horizontally of the bottom tread.. Exception 2 provides the basis for the least restrictive scenario, that being a wall with glazing 34-38 inches above the walking surface.

PART II- This code change was submitted for the IRC in Palm Springs. While the Committee said they supported the change, they said that the proposal should include the IBC for consistency. There is a companion code change submitted for the IBC. The main purpose of this code change is to eliminate conflicts, create consistency, and ease the use of the safety glazing requirements. Following is a point by point explanation of the changes.

Safety glazing requirements have been placed in separate sections, R308.4.1 through R308.4.7, with descriptive titles to aid in use of the code.

R308.4.2 and R308.4.4 are revised for consistency w/IBC

R308.4.5 combines all of the language related to hazardous glazing adjacent water, eliminates conflicting or confusing language, and eases interpretation. It also addresses the issue of glazing adjacent a freestanding bathtub by treating it the same as a hot tub, spa or whirlpool and provides consistency with the IBC.

R308.4.6 is largely editorial but permits unprotected glazing within 36 inches horizontally of the plane of the walking surface. Exception 3 reduces the height when safety glazing is required from 60 inches to 34-38 inches if the glazing is in a wall or panel. Since glazing usually means windows and since windows are typically in a wall, the exception is most always the rule. It is puzzling that such a wall would have an upper limit. Does the glazing become hazardous again if the wall is 40 inches high? An average of 36 inches was chosen as the minimum height for the wall consistent with the height of a guard. Exception 1 exempts safety glazing if a rail is installed 34 to 38 inches high regardless of whether or not there are balusters or in-fill panels and without regard to the proximity of the glass. Since this is the least restrictive exception, it makes no sense to require glazing to be 18 inches from a guard or to require a guard have balusters or in-fill panels in Exception 2. Exception 3 language is incorporated into the main section since the standard installation is for the window to be installed in a wall. This exception says if a wall places the window 34 to 38 inches above the walking surface safety glazing is not required. There is no legitimate reason to have an upper limit.

(R308.4.7) While the current text says "stairways", clearly what is being regulated is the bottom landing because of the use of the term "horizontally of the bottom tread. Exception 2 provides the basis for the least restrictive scenario, that being a wall with glazing 34-38 inches above the walking surface and is incorporated into the main section since the standard installation is for the window to be installed in a wall. The exception says if a wall places the window 34 to 38 inches above the walking surface safety glazing is not required. There is no legitimate reason to have an upper limit.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EVANS-S1-2406.

S219–09/10
2406.2; IRC R308.3.1

Proponent: William E. Koffel, Koffel Associates, Inc., representing Glazing Industry Code Committee

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2406.2 Impact Test. Where required by other sections of this code, glazing shall be tested in accordance with CPSC 16 CFR 1201. Glazing shall comply with the test criteria for Category ~~I or~~ II ~~as,~~ unless otherwise indicated in Table 2406.2(1)

> **Exception:** Glazing not in doors or enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers shall be permitted to be tested in accordance with ANSI Z97.1. Glazing shall comply with the test criteria for Class A ~~or B as~~ , unless otherwise indicated in Table 2406.2(2).

PART II – IRC BUILDING/ENERGY

Revise as follows:

R308.3.1 Impact Test. Where required by other sections of this code, glazing shall be tested in accordance with CPSC 16 CFR 1201. Glazing shall comply with the test criteria for Category ~~I or~~ II ~~as,~~ unless otherwise indicated in Table R308.3.1(1).

> **Exception:** Glazing not in doors or enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers shall be permitted to be tested in accordance with ANSI Z97.1. Glazing shall comply with the test criteria for Class A ~~or B as~~ , unless otherwise indicated in Table R308.3.1(2).

Reason: Not all of the hazardous locations are indicated in the Table and as such the performance or test criteria for the safety glazing are not specified in the Code. The proposal uses the higher test criteria as the default value and the Table relaxes the requirement for specific applications.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KOFFELL-S2-2406.2

S220–09/10
2406.4

Proponent: John D. McGee, Binswanger Glass Training Center, representing self

Revise as follows:

2406.4 Hazardous locations. The following shall be considered specific hazardous locations requiring safety glazing materials:

(No change to items 1 through 11)

12. Ceiling mounted glass mirrors panels shall be no larger than 18 square feet (1.672 m^2), shall have CPSC 16 CFR 1201 Category II safety backing applied to back of mirror, and shall apply for annealed, heat strengthened, or tempered glass mirrors. Both adhesive fastening and mechanical retention systems shall be used for all ceiling-mounted glass mirrors. Substrate and mechanical fasteners shall be of suitable strength to support a 4:1 ratio of the weight of the mirror. Design by a registered design professional shall be provided where required by the Building Official. The adhesive shall be applied in accordance with the manufacturer's instructions and the mechanical fastener or retainer shall capture a minimum glass bite of ½-inch (12.7 mm) on all mirror edges. Where rosette-type fasteners are used, holes shall be no closer to the mirror edge than the mirror thickness plus ¼-inch (6.4 mm). All holes drilled into the mirror (i.e., screws, light fixtures, etc.) shall have adequate radius to prevent stress cracks. Screw- and bolt-type fasteners shall be of stainless steel.

Reason: With over 100 nationwide locations, Binswanger Glass regularly receives numerous requests to mount mirrors on ceilings, which is an extremely dangerous practice. The ICC indicates no code exists to address this application, even though poorly mounted ceiling mirrors can kill if they fall off. The revision indicated above is only a starting point for council consideration; detailed assessment by other glazing specialists is urged.

Cost Impact: Variable based on glass thickness.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCGEE-S1-2406.4.DOC

S221–09/10
2407.1.1

Proponent: Thomas B. Zuzik Jr., Artistic Railing Inc., representing self

Revise as follows:

2407.1.1 Loads. The glass ~~panels and their support system~~ shall be designed to withstand the loads specified in Sections 1607.7.1 and 1607.7.1.2. ~~1607.7.~~ A safety factor of four shall be used.

Reason: I am requesting that 2407.1.1 be revised to more clearly define which loads the glass is required to meet when glass is used in guards or handrails. Currently 2407.1.1 states that the glass be DESIGNED to withstand the loads of 1607.7, however 1607.7.1.2 is not directly a design load, but arguably a test load, as the text states "shall be able to resist" without the notation requirement of design.

"**1607.7.1.1 Concentrated load.** Handrails and *guards* **SHALL BE ABLE** to **RESIST A SINGLE CONCENTRAITED LOAD OF 200 POUNDS…"**

Further more the 2006 IBC commentary for section 2407.1.1 states in the last sentence " It is not intended that an in-place glass guard or handrail system be tested for or capable of withstanding four times the design load"

This confusion with the current language in 2407.1.1 brings forth the question is the code directing us to use only the loads in 1607.7 that are design loads?

The intent is a four times design load as 1607.7.1 directs the reader to section 2407 when glass is part of a guard or handrail system. The four times safety factor would require the guard or handrail to be designed to resist a 200 plf (0.73 kN/m) rather than the set 50 plf. However, 1607.7.1.2 which notes a 200 pound concentrated would be elevated to a 800 pound load which is not an intended requirement.

The removal of the language "panels and their support system" from the text is redundant and not needed as the glass is required to meet the loads and when installed section 1607.7.1 requires the loads to be transfer through the support structure.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Michael Gardner, representing Gypsum Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I- IBC STRUCTURAL

1. Revise as follows:

FIGURE 721.5.1(2)
GYPSUM WALLBOARD PROTECTED
STRUCTURAL STEEL COLUMNS WITH SHEET STEEL
(No change to figure)

2. Type X gypsum wallboard in accordance with ASTM ~~C 36~~ C 1396. For single-layer applications, the wallboard shall be applied vertically with no horizontal joints. For multiple-layer applications, horizontal joints are permitted at a minimum spacing of 8 feet, provided that the joints in successive layers are staggered at least 12 inches. The total required thickness of wallboard shall be determined on the basis of the specified fire-resistance rating and the weight-to-heated-perimeter ratio (*W/D*) of the column. For fire-resistance ratings of 2 hours or less, one of the required layers of gypsum wallboard may be applied to the exterior of the sheet steel column covers with 1-inch-long Type S screws spaced 1 inch from the wallboard edge and 8 inches on center. For such installations, 0.0149-inch minimum thickness galvanized steel corner beads with 1½-inch legs shall be attached to the wallboard with Type S screws spaced 12 inches on center.

(No change to footnotes not shown)

FIGURE 721.5.1(3)
GYPSUM WALLBOARD PROTECTED STRUCTURAL STEEL COLUMNS WITH STEEL STUD/SCREW ATTACHMENT SYSTEM
(No change to figure)

3. Type X gypsum wallboard in accordance with ASTM ~~C 36~~ C 1396. For single-layer applications, the wallboard shall be applied vertically with no horizontal joints. For multiple-layer applications, horizontal joints are permitted at a minimum spacing of 8 feet, provided that the joints in successive layers are staggered at least 12 inches. The total required thickness of wallboard shall be determined on the basis of the specified fire-resistance rating and the weight-to-heated-perimeter ratio (*W/D*) of the column.

TABLE 2507.2
LATH, PLASTERING MATERIALS AND ACCESSORIES

MATERIAL	STANDARD
~~Gypsum lath~~	~~ASTM C 37~~
~~Gypsum base for veneer plasters~~	~~ASTM C 588~~

(Portions of Table not shown remain unchanged)

PART II- IRC

1. Revise as follows:

R702.3.1. Materials. All gypsum board materials and accessories shall conform to ASTM ~~C 36, C 79~~, C 475, C 514, ~~C 630~~, ~~C 931, C 960,~~ C 1002, C 1047, C 1177, C 1178, C 1278, ~~C 1395~~, C 1396, or C 1658 and shall be installed in accordance with the provisions of this section. Adhesives for the installation of gypsum board shall conform to ASTM C 557.

R702.2.1 Gypsum plaster. Gypsum plaster materials shall conform to ASTM C 5, C 28, C 35, ~~C 37~~, C 59, C 61, C 587, ~~C 588~~, C 631, C 847, C 933, C 1032 and C 1047 and shall be installed or applied in conformance with ASTM C 843 and C 844. Gypsum lath or gypsum base for veneer plaster shall conform to ASTM C 1396. Plaster shall not be less than three coats when applied over metal lath and not less than two coats when applied over other bases permitted by this section, except that veneer plaster may be applied in one coat not to exceed 3/16 inch (4.76 mm) thickness, provided the total thickness is in accordance with Table R702.1(1).

R702.2.2 Cement plaster. Cement plaster materials shall conform to ASTM ~~C 37~~, C 91 (Type M, S or N), C 150 (Type I, II, and III), ~~C 588~~, C 595 [Type IP, I (PM), IS and I (SM), C 847, C 897, C 926, C 933, C 1032, C 1047 and C 1328, and shall be installed or applied in conformance with ASTM C 1063. Gypsum lath shall conform to ASTM C 1396. Plaster shall not be less than three coats when applied over metal lath and not less than two coats when applied over other bases permitted by this section, except that veneer plaster may be applied in one coat not to exceed 3/16 inch (4.76 mm) thickness, provided the total thickness is in accordance with Table R702.1(1).

Reason:
PART I- In December 2004, a single composite ASTM International reference Specification C 1396/ C1396M, *Specification for Gypsum Board*, replaced nine individual standards previously used to designate specific gypsum board products employed in residential and non-residential construction. The nine withdrawn standards are no longer being maintained by ASTM.

ASTM C 1396 is presently contained in Tables 2506.2 and 2507.2 of IBC Chapter 25 as a reference standard.

Proposal is submitted to reflect the use of the composite standard. It eliminates references to standards that are no longer available.

PART II- In December 2004, a single composite ASTM International reference Specification C 1396/ C1396M, *Specification for Gypsum Board*, replaced nine individual standards previously used to designate specific gypsum board products employed in residential and non-residential construction. The nine withdrawn standards are no longer being maintained by ASTM.

ASTM C 1396 is presently contained in the IRC as a reference standard.

Proposal is submitted to reflect the use of the composite standard. It eliminates references to standards that are no longer available.

Proposal is submitted to remove the reference to the withdrawn standards.

Section R702.2.1 has been modified to reflect the elimination of the individual standards for gypsum lath and gypsum veneer base.

Section R702.2.2 has been modified to reflect the elimination of the individual standard for gypsum lath. The reference to the veneer base standard (C 588) has been eliminated, as it is not appropriate to install cement plaster directly to gypsum veneer base.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IBC:

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II- IRC:

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GARDNER-S1-Figure 721.5.2(2).doc-RB2-702.2-RB4-702.3

S223–09/10
2509.2

Proponent: Jose M. Estrada, representing USG Corporation

1. Revise as follows:

2509.2 Base for Tile. Glass mat water-resistant gypsum backing panel, discrete nonasbestos fiber-cement interior substrate sheets, water-resistant fiber-reinforced gypsum backers or nonasbestos fiber-mat reinforced cement substrate sheets in compliance with ASTM C 1178, C 1288, C 1278 or C 1325 and installed in accordance with manufacturer recommendations shall be used as a base for the wall tile in tub and shower areas and wall and ceiling panels in shower areas. Water-resistant gypsum backing board shall be used as a base for tile in water closet compartment walls when installed in accordance with GA -216 or ASTM C 840 and manufacturers recommendations. Regular gypsum wallboard is permitted under tile or wall panels in other wall and ceiling areas when installed in accordance with GA-216 or ASTM C 840.

Reason: The purpose of this proposal is to include an ASTM material standard for current provisions of the IBC. ASTM C 1278 products are engineered and manufactured specifically for interior water-resistant backing. The proposed ASTM material standard has been recognized by the International Residential Code (IRC) since the 2007 Supplement. The water-resistant products complying with this ASTM standard have a demonstrated track record, which has been documented substantially and historically, in consensus industry publications such as the TCA Handbook for Ceramic Tile Installation, published by the Tile Council of North America, where the ASTM C1278 products have been recognized for use in wet areas, including their use as a base for the wall tile in tub and shower surrounds since 2007. The wall and floor designs for the ASTM

C1278 products listed in the TCA Handbook for wet area application are equivalent to those of ASTM C 1178, C 1288 and C 1325 products. The products covered under ASTM C 1278 for use as a base for tile have a proven track record in the field, where hundreds of millions of feet have been installed since its release to the market. The inclusion of this standard will allow for more competitive product bidding in turn reducing overall construction costs.

Bibliography:
The Tile Council of North America. 2009 TCA Handbook for Ceramic Tile Installation. Anderson, SC: TCNA, 2009.

Cost Impact: This code proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ESTRADA-S1-2509.2

S224–09/10
2509.2; IRC R702.4.2

Proponent: Keith Poerschke representing National Gypsum Company

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC

Revise as follows:

2509.2 Base for tile. Glass mat water-resistant gypsum backing panels, discrete nonasbestos fiber-cement interior substrate sheets or nonasbestos fiber-mat reinforced cementitious backer units ~~cement substrate sheets~~ in compliance with ASTM C 1178, C 1288 or C 1325 and installed in accordance with manufacturer recommendations shall be used as a base for wall tile in tub and shower areas and wall and ceiling panels in shower areas. Water-resistant gypsum backing board shall be used as a base for tile in water closet compartment walls when installed in accordance with GA-216 or ASTM C 840 and manufacturer recommendations. Regular gypsum wallboard is permitted under tile or wall panels in other wall and ceiling areas when installed in accordance with GA-216 or ASTM C 840.

PART II – IRC

Revise as follows:

R702.4.2 Fiber-cement, fiber-mat reinforced cement, glass mat gypsum backers and fiber-reinforced gypsum backers. Fiber-cement, fiber-mat reinforced cementitious backer units ~~cement~~, glass mat gypsum backers or fiber-reinforced gypsum backers in compliance with ASTM C 1288, C 1325, C 1178 or C 1278, respectively, and installed in accordance with manufacturers' recommendations shall be used as backers for wall tile in tub and shower areas and wall panels in shower areas.

Reason: The ASTM C17 subcommittee, which is responsible for the C1325 standard, voted and approved a title change and other modifications in 2008. The title of ASTM C 1325 was changed to cementitious backer units, which is more representative of how these products have been referred to for decades. This change should be reflected in the language of IBC Section 2509.2 and IRC R702.4.2. Additional changes were made to the standard to more accurately describe what constitutes failure in the test methods and to bring the requirements of the standard more in line with the ANSI standard for the product.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IBC STRUCTURAL

Proponent: Kimdolyn Boone, representing DuPont Building Innovations

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I- IBC STRUCTURAL

Revise as follows:

2510.6 Water-resistive barriers. Water-resistive barriers shall be installed as required in Section 1404.2 and, where applied over wood-based sheathing, shall include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of Grade D paper. The individual layers shall be installed such that each layer is installed ship lapped fashion and any flashing (installed in accordance with Section 1405.4) intended to drain to the water-resistive barrier is directed between the layers.

Exception: Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of 60-minute Grade D paper and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or drainage space.

PART II- IRC BUILDING/ENERGY

Revise as follows:

R703.6.3 Water-resistive barriers. Water-resistive barriers shall be installed as required in Section R703.2 and, where applied over wood-based sheathing, shall include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of Grade D paper. The individual layers shall be installed such that each layer is installed ship lapped fashion and any flashing (installed in accordance with Section R703.8) intended to drain to the water-resistive barrier is directed between the layers.

Exception: Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of 60 minute Grade D paper and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or designed drainage space.

Reason: Clarification of current requirement of the code

Currently the code requires 2 layers be installed but does not address how these layers are installed. There are 2 methods of installation and these methods provide different performance Attributes.

1. 2 layer system – Each layer of WRB is individually installed in a ship lapped fashion. The interior layer is configured to form a continuous drainage plane and is integrated with the flashing.
2. ply system - Both layers are installed and lapped together. The outboard layer is integrated the flashing.

The benefits of using two layers of water resistive barrier (WRB) can only be realized if the method and manner of the installation establish a continuous drainage plane, separated from the stucco.

In a 2-layer system each layer provides a separate & distinct function. The primary function of the inboard layer is to resist water penetration into the cavity. This layer should be integrated with window and door flashings, the weep screed at the bottom of the wall and any through-wall flashings or expansion joints. This layer becomes the drainage plane for incidental water. The primary function of the outboard layer (layer that comes in contact with the stucco) is to separate the stucco from the water resistive barrier. This layer has historically been called a sacrificial layer, intervening layer or bond break layer.

When structures are detailed as 2 layer systems, it is possible to install each layer to meet its intended function. A continuous drainage plane can be established on the inboard layer. However, this is not the case with a 2-ply system. A 2-ply system functions as a single layer and the only benefit provided is additional water resistance. If additional water holdout is the only benefit you are seeking then a superior 1 layer WRB should be sufficient.

This dual function concept has also been noted in building science research studies. A few of the conclusions in the Final Report For Energy Efficient, Mold-Resistant Materials and Construction Practices for New California Homes (California Energy Commission August 2008) are as follows:

A Capillary break between stucco and WRB is required for optimal gravity drainage.
Double layer provides space, outer layer provides bond break.
Sill pan drains to the interior layer (the functional WRB)

Cost Impact: For installations that currently install 2 ply systems this may have a slight increase in the labor costs.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL ENERGY CONSERVATION CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

EC1–09/10
Table 301.1, Figure 301.1; IRC Table N1101.2, Figure N1101.2

Proponent: Thomas F. Johnson, Code Official for the Town of Durham, NH, representing the NH Seacoast Code Officials Association and NH Building Officials Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

TABLE 301.1
CLIMATE ZONES, MOISTURE REGIMES, AND WARM-HUMID DESIGNATIONS BY STATE, COUNTY AND TERRITORY

NEW HAMPSHIRE

~~6A Belknap~~
~~6A Carroll~~
~~5A Cheshire~~
~~6A Coos~~
~~6A Grafton~~
~~5A Hillsborough~~
~~6A Merrimack~~
~~5A Rockingham~~
~~5A Strafford~~
~~6A Sullivan~~

6A All

(Portions of table not shown remain unchanged)

2. Figure 301.1 shading of the 4 NH southern counties should also be changed to reflect Zone 6 shading statewide.

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

TABLE N1101.2
CLIMATE ZONES, MOISTURE REGIMES AND WARM-HUMID DESIGNATIONS BY STATE, COUNTY AND TERRITORY

NEW HAMPSHIRE
~~6A Belknap~~
~~6A Carroll~~
~~5A Cheshire~~
~~6A Coos~~
~~6A Grafton~~
~~5A Hillsborough~~
~~6A Merrimack~~
~~5A Rockingham~~
~~5A Strafford~~
~~6A Sullivan~~
6A All

(Portions of table not shown remain unchanged)

2. Figure N1101.2 shading of the 4 NH southern counties should also be changed to reflect Zone 6 shading statewide.

Reason
(Part I): The State of New Hampshire thru the N.H. Public Utilities Commission and N.H. Building Code Review Board had previously amended the adopted 2000 IECC, and then the adopted 2006 IECC Table 301.1 and Figure 301.1 to delete all of the Zone 5 counties and effectively placed all of New Hampshire in Zone 6. It is expected that the current 2009 IECC soon to be adopted will similarly be amended. By not carrying this statewide amendment into the 2012 IECC document provides improper guidance to all those users of the I-Codes that may not be aware of the statewide amendments during design drawings or installations using the printed code document text and tables based on our enforcement experiences with the 2000 and 2006 IECC.

(Part II): The State of New Hampshire thru the N.H. Public Utilities Commission and N.H. Building Code Review Board had previously amended the adopted 2000 IRC, and then the adopted 2006 IRC to delete all of the Zone 5 counties and effectively placed all of New Hampshire in Zone 6. It is expected that the current 2009 IRC soon to be adopted will similarly be amended. By not carrying this statewide amendment into the 2012 IRC document provides improper guidance to all those users of the I-Codes that may not be aware of the statewide amendments during design drawings or installations using the printed code document text and tables based on our enforcement experiences with the 2000 and 2006 IRC.

Cost Impact: The change in the IECC and the IRC will not impact the cost of construction; the State of New Hampshire has already mandated the proposed change therefore no increase to NH construction. In fact, the change will reduce the cost of construction by eliminating errors using the current code text during the design phase of construction which gets rejected during code plan review; or improper installations rejected upon code compliance inspections.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JOHNSON(THOMAS)-EC-1-T. 301.1-RE-1-T. N1101.2

EC2–09/10
303.1.1.2 (New); IRC N1101.4.2.1 (New)

Proponent: Craig Conner, Building Quality, representing self

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Part I – IECC

Add new text as follows:

303.1.1.2 Insulated sheathing R-value mark. Where R-values for multiple sheathing thicknesses are printed on insulated sheathing, the actual R-value shall be printed on the insulated sheathing board in lettering at least two times the height of any other R-value or thickness. Alternatively, the installed insulated sheathing R-value shall be listed on the insulation certification required in Section 303.1.1

Part II – IRC

Add new text as follows:

N1101.4.2.1 Insulated sheathing R-value mark. Where R-values for multiple sheathing thicknesses are printed on insulated sheathing, the actual R-value shall be printed on the insulated sheathing board in lettering at least two times the height of any other R-value or thickness. Alternately, the installed insulated sheathing R-value shall be listed on the insulation certification required in section N1101.4.2.

Reason: Sheets of insulated sheathing routinely carry tables of multiple R-values printed on the sheet, where the R-value for a variety of thicknesses is displayed on every sheet. Verifying compliance would be easier if the actual R-value for the specific product installed was clear at a glance. This can be accomplished through an enlarged font for the actual R-Value, or through the installer certificate

Cost Impact: The code change proposal will increase the cost of construction, but ease inspection for compliance.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CONNER-EC-6-303.1.1.2.DOC

EC3–09/10
202 (New), 303.1.3, Table 303.1.3(3)

Proponent: Garrett Stone, Brickfield, Burchette, Ritts & Stone, representing Cardinal Glass Industries

1. Add new definition as follows:

VISIBLE TRANSMITTANCE (VT). The ratio of visible light entering the space through the fenestration product assembly to the incident visible light. VT includes the effects of glazing material and frame and is expressed as a number between 0 and 1.

2. Revise as follows:

303.1.3 Fenestration product rating. *U*-factors of fenestration products (windows, doors and skylights) shall be determined in accordance with NFRC 100 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled *U*-factor shall be assigned a default *U*-factor from Table 303.1.3(1) or 303.1.3(2). The solar heat gain coefficient (SHGC) and *visible transmittance* (VT) of glazed fenestration products (windows, glazed doors and skylights) shall be determined in accordance with NFRC 200 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled SHGC shall be assigned a default SHGC from Table 303.1.3(3).

TABLE 303.1.3(3)
DEFAULT GLAZED FENESTRATION SHGC AND VT

	SINGLE GLAZED		DOUBLE GLAZED		
	Clear	**Tinted**	**Clear**	**Tinted**	**GLAZED BLOCK**
SHGC	0.8	0.7	0.7	0.6	0.6
VT	0.6	0.3	0.6	0.3	0.6

Reason: The visible transmittance (VT) of fenestration products represents the amount of light that enters the building through the fenestration product. It is the key performance parameter in encouraging proper daylighting, which can reduce lighting and internal heat loads. The effective use of daylighting in commercial construction has long been recognized as bringing energy savings and benefits to a building's occupants.
In order to better utilize VT in the code, the code needs to include a definition of VT and specify a method for determining this performance feature. This proposal satisfies both of these needs.

Visible transmittance is currently determined for the fenestration industry according to NFRC 200 – *Procedure for Determining Fenestration Product Solar Heat Gain Coefficients and Visible Transmittance at Normal Incidents*, which is already a referenced standard in the *IECC* and is referenced in *IECC* Section 303.1.3 for determining SHGC. This proposal offers the appropriate modification to the language of 303.1.3 to include VT.

This proposal also establishes default values where rated values are not available. The values proposed for the default table are taken from the *ASHRAE Handbook of Fundamentals*, Table 13, pages 31.26 - 31.28 as the worst-case (lowest) visible light values for any frame with clear and tinted glass and rounded off using the same approach as currently incorporated into the code for SHGC. This produces reasonable, conservative values for VT for default products. Because values for glass block were not available in the *Handbook*, we set the value equal to the double pane clear product.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: STONE-EC-3-202-303.1.3

EC4–09/10
303.1.4; IRC N1101.6

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing The Extruded Polystyrene Foam Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

303.1.4 Insulation product rating. The thermal resistance (*R*-value) of insulation shall be determined in accordance with the U.S. Federal Trade Commission *R*-value rule (CFR Title 16, Part 460, May 31, 2005) in units of h x ft^2 x °F/Btu at a mean temperature of 75°F (24°C). Foam plastic products that contain a captive blowing agent shall report the thermal resistance (*R*-value) after aging for180 days at ambient conditions (75°F (24°C) and 50% relative humidity or aging for 90 days at 140°F (60°C) prior to thermal conductivity testing and reporting.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1101.6 Insulation product rating. The thermal resistance (*R*-value) of insulation shall be determined in accordance with the CFR Title 16, Part 460 in units of h · ft^2 · °F/Btu at a mean temperature of 75°F (24°C). Foam plastic products that contain a captive blowing agent shall report the thermal resistance (R-value) after aging for 180 days at ambient conditions (75°F (24°C) and 50% relative humidity or aging for 90 days at 140°F (60°C) prior to thermal conductivity testing and reporting.

Reason: The new language improves the clarity and the enforceability of the Code requirement by specifying the specific aging requirements prior to testing. Currently, there are several different procedures for aging, making the comparison of *R*-values confusing. This language will level the playing field and ensure that thermal performance reported is that which will exist over time.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Proponent: Ronald Majette, representing US Department of Energy

1. Delete without substitution:

~~**SECTION 302**~~
~~**DESIGN CONDITIONS**~~

~~**302.1 Interior design conditions.** The interior design temperatures used for heating and cooling load calculations shall be a maximum of 72ºF (22ºC) for heating and minimum of 75ºF (24ºC) for cooling.~~

2. Revise as follows:

403.6 Equipment sizing (Mandatory). Heating and cooling equipment shall be sized in accordance with Section M1401.3 of the *International Residential Code*. The interior design temperatures used for heating and cooling load calculations shall be a maximum of 72ºF (22ºC) for heating and minimum of 75ºF (24ºC) for cooling.

503.2.1 Calculation of heating and cooling loads. Design loads shall be determined in accordance with the procedures described in the ASHRAE/ACCA Standard 183. Heating and cooling loads shall be adjusted to account for load reductions that are achieved when energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE *HVAC Systems and Equipment Handbook*. Alternatively, design loads shall be determined by an *approved* equivalent computation procedure, using ~~the design parameters specified in Chapter 3.The~~ an interior design temperature~~s used for heating and cooling load calculations shall be a maximum of~~ no more than 72ºF (22ºC) for heating and ~~minimum of~~ no less than 75ºF (24ºC) for cooling.

3. Delete without substitution:

~~**SECTION 303**~~
~~**MATERIALS, SYSTEMS AND EQUIPMENT**~~

~~**303.1 Identification.** Materials, systems and equipment shall be identified in a manner that will allow a determination of compliance with the applicable provisions of this code.~~

~~**303.1.1 Building thermal envelope insulation.** An *R*-value identification mark shall be applied by the manufacturer to each piece of *building thermal envelope* insulation 12 inches (305 mm) or greater in width. Alternately, the insulation installers shall provide a certification listing the type, manufacturer and *R*-value of insulation installed in each element of the *building thermal envelope*. For blown or sprayed insulation (fiberglass and cellulose), the initial installed thickness, settled thickness, settled *R*-value, installed density, coverage area and number of bags installed shall be *listed* on the certification. For sprayed polyurethane foam (SPF) insulation, the installed thickness of the areas covered and *R*-value of installed thickness shall be *listed* on the certification. The insulation installer shall sign, date and post the certification in a conspicuous location on the job site.~~

~~**303.1.1.1 Blown or sprayed roof/ceiling insulation.** The thickness of blown-in or sprayed roof/ceiling insulation (fiberglass or cellulose) shall be written in inches (mm) on markers that are installed at least one for every 300 square feet (28 m^2) throughout the attic space. The markers shall be affixed to the trusses or joists and marked with the minimum initial installed thickness with numbers a minimum of 1 inch (25 mm) in height. Each marker shall face the attic access opening. Spray polyurethane foam thickness and installed *R*-value shall be *listed* on certification provided by the insulation installer.~~

~~**303.1.2 Insulation mark installation.** Insulating materials shall be installed such that the manufacturer's *R*-value mark is readily observable upon inspection.~~

~~**303.1.3 Fenestration product rating.** *U*-factors of fenestration products (windows, doors and skylights) shall be determined in accordance with NFRC 100 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled *U*-factor shall be assigned a default *U*-factor from Table 303.1.3(1) or 303.1.3(2). The solar heat gain coefficient (SHGC) of glazed fenestration products (windows, glazed doors and skylights) shall be determined in accordance with NFRC 200 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled SHGC shall be assigned a default SHGC from Table 303.1.3(3).~~

401.3.1.4 Insulation product rating. The thermal resistance (*R*-value) of insulation shall be determined in accordance with the U.S. Federal Trade Commission *R*-value rule (CFR Title 16, Part 460, May 31, 2005) in units of h x ft^2 x°F/Btu at a mean temperature of 75°F (24°C).

502.2 Specific insulation requirements (Prescriptive). Opaque assemblies shall comply with Table 502.2(1). Materials shall be identified in a manner that will allow a determination of compliance with the applicable provisions of this code. The thermal resistance (*R*-value) of insulation shall be determined in accordance with the U.S. Federal Trade Commission *R*-value rule (CFR Title 16, Part 460, May 31, 2005) in units of h _ ft2 _ °F/Btu at a mean temperature of 75°F (24°C).

An *R*-value identification mark shall be applied by the manufacturer to each piece of *building thermal envelope* insulation 12 inches (305 mm) or greater in width. Alternately, the insulation installers shall provide a certification listing the type, manufacturer and *R*-value of insulation installed in each element of the *building thermal envelope*. For blown or sprayed insulation (fiberglass and cellulose), the initial installed thickness, settled thickness, settled *R*-value, installed density, coverage area and number of bags installed shall be *listed* on the certification. For sprayed polyurethane foam (SPF) insulation, the installed thickness of the areas covered and *R*-value of installed thickness shall be *listed* on the certification. The insulation installer shall sign, date and post the certification in a conspicuous location on the job site. Insulating materials shall be installed such that the manufacturer's *R*-value mark is readily observable upon inspection.

Insulation applied to the exterior of basement walls, crawlspace walls and the perimeter of slab-on-grade floors shall have a rigid, opaque and weather-resistant protective covering to prevent the degradation of the insulation's thermal performance. The protective covering shall cover the exposed exterior insulation and extend a minimum of 6 inches (153 mm) below grade.

5. Revise as follows:

502.2.1 Roof assembly. The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table 502.2(1), based on construction materials used in the roof assembly.

Exception: Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly with the *R*-value specified in Table 502.2(1).

Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

The thickness of blown-in or sprayed roof/ceiling insulation (fiberglass or cellulose) shall be written in inches (mm) on markers that are installed at least one for every 300 square feet (28 m2) throughout the attic space. The markers shall be affixed to the trusses or joists and marked with the minimum initial installed thickness with numbers a minimum of 1 inch (25 mm) in height. Each marker shall face the attic access opening. Spray polyurethane foam thickness and installed *R*-value shall be *listed* on certification provided by the insulation installer.

502.3 Fenestration (Prescriptive). Fenestration shall comply with Table 502.3(1). *U*-factors of fenestration products (windows, doors and skylights) shall be determined in accordance with NFRC 100 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled *U*-factor shall be assigned a default *U*-factor from Table ~~303.1.3(1) or 303.1.3(2)~~ Table 502.3. The solar heat gain coefficient (SHGC) of glazed fenestration products (windows, glazed doors and skylights) shall be determined in accordance with NFRC 200 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled SHGC shall be assigned a default SHGC from Table ~~303.1.3(3)~~.

6. Delete without substitution:

~~**303.2 Installation.** All materials, systems and equipment shall be installed in accordance with the manufacturer's installation instructions and the *International Building Code*.~~

7. Revise as follows:

401.2 Compliance. All materials, systems and equipment shall be installed in accordance with the manufacturer's installation instructions and the *International Building Code.* Projects shall comply with Sections 401, 402.4, 402.5, and 403.1, 403.2.2, 403.2.3, and 403.3 through 403.9 (referred to as the mandatory provisions) and either:

1. Sections 402.1 through 402.3, 403.2.1 and 404.1 (prescriptive); or
2. Section 405 (performance).

8. Add new text as follows:

501.3 Installation. All materials, systems and equipment shall be installed in accordance with the manufacturer's installation instructions and the *International Building Code*.

9. Relocate and renumber as follows:

~~**303.2.1 Protection of exposed foundation insulation.** Insulation applied to the exterior of basement walls, crawlspace walls and the perimeter of slab-on-grade floors shall have a rigid, opaque and weather-resistant protective covering to prevent the degradation of the insulation's thermal performance. The protective covering shall cover the exposed exterior insulation and extend a minimum of 6 inches (153 mm) below grade.~~

402.2.12 Protection of exposed foundation insulation. Insulation applied to the exterior of basement walls, crawlspace walls and the perimeter of slab-on-grade floors shall have a rigid, opaque and weather-resistant protective covering to prevent the degradation of the insulation's thermal performance. The protective covering shall cover the exposed exterior insulation and extend a minimum of 6 inches (153 mm) below grade.

~~**303.3 Maintenance information.** Maintenance instructions shall be furnished for equipment and systems that require preventive maintenance. Required regular maintenance actions shall be clearly stated and incorporated on a readily accessible label. The label shall include the title or publication number for the operation and maintenance manual for that particular model and type of product.~~

403.10 Maintenance information. Maintenance instructions shall be furnished for equipment and systems that require preventive maintenance. Required regular maintenance actions shall be clearly stated and incorporated on a readily accessible label. The label shall include the title or publication number for the operation and maintenance manual for that particular model and type of product.

10. Add new text as follows:

501.4 Maintenance information. Maintenance instructions shall be furnished for equipment and systems that require preventive maintenance. Required regular maintenance actions shall be clearly stated and incorporated on a readily accessible label. The label shall include the title or publication number for the operation and maintenance manual for that particular model and type of product.

Reason: The proposal merely moves and rearranges text so that specific provisions are found in correct and logical locations. Section 302 relates only to interior design conditions, which is unrelated to the topic of Chapter 3 (Climate Zones). The content of Section 302 is more relevant to Section 403.6 and 503.2.1 and is proposed to be located therein alongside the related topics of load calculations and equipment sizing. The content in Section 303 not related to climate zones and is more appropriate in Chapters 4 and 5 at locations where it is relevant.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-64-Ch 3-4-5-

EC6–09/10
202

Proponent: Michael P. Burnetter, PE, New York State Department of State, representing Division of Code Enforcement and Administration

Revise definition as follows:

CONDITIONED SPACE. An area or room ~~within a building being heated or cooled, containing uninsulated ducts, or with a fixed opening directly into an adjacent *conditioned space*.~~ which is within the thermal envelope of a building heated or cooled using fossil or electric fuel as the energy source.

Reason: The definition change is to eliminate confusion and gaming of the code as the 2009 IECC allows for an un-insulated duct passing through a space, or having a small outlet in any duct, to define that space of any size as conditioned. In NYS, the New York Research and Development Authority (NYSERDA) has identified this as a problem causing much confusion in their Energy Star Homes program. The thermal envelope is what should define conditioned space since a well installed thermal envelope will equate the temperature within a building to all be "conditioned" even if unintentional which is simply acknowledged here. This will then build consistency in the code as this approach is used in Section 403.2 (see the Exception). This change will help to make the code more consistent with other sections as well.

Cost Impact: Providing clarity of purpose should lower the design costs of a building involving this type of space.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BURNETTER-EC-2-CH 2

EC7–09/10
202

Proponent: Ronald Majette, representing US Department of Energy

1. Revise definition as follows:

CONDITIONED FLOOR AREA. The ~~horizontal projection of the floors associated with~~ gross floor area of the *conditioned space*.

2. Add new definition as follows:

GROSS FLOOR AREA. The sum of the floor areas of the spaces within the building, including basements, mezzanine and intermediate-floored tiers, and penthouses with a headroom height of 7.5 ft or greater. It is measured from the exterior faces of exterior walls or from the centerline of walls separating buildings, but excluding covered walkways, open roofed-over areas, porches and similar spaces, pipe trenches, exterior terraces or steps, chimneys, roof overhangs, and similar features.

Reason: For consistency with ASHRAE Standard 90.1. The term as presented is not precise in that it does not fully represent the area associated with ramps.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: This will create a different definition for the same term that is currently in the IBC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAJETTE-EC-34-202-REDONE

EC8–09/10
202 (New)

Proponent: Ronald Majette, representing US Department of Energy

Add new definition as follows:

FLOOR. That portion of the building, other than slab on grade, that has conditioned space above and is horizontal or tilted at an angle of less than 60 degrees from horizontal.

Reason: For consistency with ASHRAE Standard 90.1-07. Since floors are currently undefined, it is difficult to determine when sloped surfaces must meet either the floor or wall requirements in the code. This proposal eliminates any confusion or need for interpretation on this issue.

Cost Impact: The code change will decrease the cost of construction associated with those assemblies that previously would have been considered walls under the ICC and would now be considered floors.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAJETTE-EC-35-202

EC9–09/10
202

Proponent: Ronald Majette, representing US Department of Energy

Revise as follows:

RESIDENTIAL BUILDING. For this code, includes detached one- and two-family dwellings and multiple single-family dwellings (townhouses) ~~R-3 buildings~~, as well as Group R-2, R-3 and R-4 buildings three stories or less in height above grade.

Reason: To clarify that the residential portion of the IECC applies to the buildings under the scope of the IRC (one/two family dwellings and townhouses) as well as low-rise R-2 and R-3 and R-4 buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAJETTE-EC-79-202

EC10–09/10
202

Proponent: Ron Nickson, representing the National Multi Housing Council

Revise definition as follows:

RESIDENTIAL BUILDING. For this code, includes R-2, R-3, and R-4 buildings~~, as well as R-2 and R-4 buildings three stories or less in height above grade~~.

Reason: To allow the energy provisions of Chapter 4 for residential occupancies to apply to all residential occupancies without any restriction on building height. Building height is controlled in either the IRC or IBC based on the type of construction and building area. The energy performance of a residential building is not a function of the building height, but rather a function of the building components that make up the building envelope and the performance of the systems within the structure for heating, cooling, light and water heating. The primary occupancy impacted by this change would be an R-2. Currently R-2 buildings three-stories or less in height fall under the provisions of Chapter 4. R-2 buildings four-or-more stories in height are covered by Chapter 5 for commercial buildings. Typically buildings four-or-less stories in height are wood frame, whereas taller buildings will have either a concrete or steel frame. Energy wise, they function the same and the provisions of Chapter 4 of the IECC would be applicable to all of the buildings except for those which have central HVAC systems. Section 403.7 of the IECC addresses the issue by directing the code user to Sections 503 (Building Mechanical Systems) and 504 (Service Water Heating) in the commercial portion of the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

401.2 Compliance. Projects shall comply with Sections 401, 402.4, 402.5, and 403.1, 403.2.2, 403.2.3, and 403.3

through 403.9 (referred to as the mandatory provisions) and either:

1. Sections 402.1 through 402.3, including Section 402.1.3, (prescriptive) and Section 406 or
2. Section 405 (performance) with the annual energy cost of the proposed design 10 percent less than the annual energy cost of the standard reference design.

401.3 Additions. Additions to an existing dwelling unit shall comply with Sections 401.2 and 406.1.

~~401.3~~ 401.4 Certificate. A permanent certificate shall be posted on or in the electrical distribution panel. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall be completed by the builder or registered design professional. The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the tested ACH50 for envelope air leakage and also the tested CFM for duct leakage if applicable. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

402.1.3 *U*-factor alternative. An assembly with a *U*-factor equal to or less than that specified in Table 402.1.3 shall be permitted as an alternative to the *R*-value in Table 402.1.1.

402.4 Air leakage (Mandatory).

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections 402.4.1.1 and 402.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings.~~
~~11. Rim joist junction.~~
~~12. Other sources of infiltration.~~

402.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table 402.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.

TABLE ~~402.4.2~~ 402.4.1.1
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls ~~is~~ shall be installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier ~~are~~ shall be filled or ~~repaired~~ sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Air permeable insulation ~~is~~ shall be inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers are insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed.
Windows, skylights, and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include an air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. An air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.

Shafts, penetrations	Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	~~Batts in narrow cavities are cut to fit, or narrow cavities are filled by spayed/blown insulation.~~ Insulation to be installed in non-standard framing cavity spaces shall be cut to fit the cavity or the cavity shall be insulated with insulation that will readily conform to the cavity.
Garage separation	Air sealing ~~is~~ shall be provided ~~between~~ for the ~~assemblies the~~ separating the garage ~~and~~ from conditioned spaces.
Recessed lighting	Recessed light fixtures that penetrate the building envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception: fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut to fit around wiring and plumbing without compression in exterior walls, or sprayed/blown insulation shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulati~~on~~ed and an air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The required air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~

~~**402.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2.~~

~~**Exception:** Residential occupancies other than one- and two-family dwellings shall follow Section 402.4.2.2~~

~~**402.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is no greater less than seven four air changes per hour (ACH) in zones 1 to 3 and three ACH in zones 4 to 8 when tested with a blower door at a pressure of 33.5 psf 50 Pascals(50 Pa) using ASHRAE 119. Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances. Where required by the *code official*, an *approved* independent party shall perform the building envelope air leakage testing.~~

402.4.1.2 Testing. The dwelling shall be tested and found to have an air leakage rate not exceeding seven air changes per hour (ACH50) in climate zones 1 and 2 and five ACH50 in climate zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 50 Pascals (50 Pa) in accordance with ASHRAE 119 by a party *approved* by the *code official.* Where required by the *code official*, testing shall be conducted by an *approved* party independent from the builder and the installer of insulation, air barrier and other sealing materials. A written report of the results of the test shall be signed by the party conducting the testing attesting to the accuracy of the values and provided to the *code official*. Testing shall be performed any time after rough in and creation of all penetrations of the *building thermal envelope*

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~;~~ beyond the weatherstripping or other infiltration control measures that will be installed;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond infiltration control measures that will be installed;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~

~~7.~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully open.

Exceptions:

1. Dwelling units of multi-family residential buildings with more than four individual units shall be exempted from the testing requirement if they satisfy the requirements 402.1.1.
2. Additions less than 1,000 square feet.
3. Projects that are unsuccessful in complying with the maximum air leakage performance standards shall, at the approval of the code official and, in the presence of either the code official or designated third party:
   3.1. Determine that all identifiable air leakage openings have been sealed, and
   3.2. Conduct a blower door test

The certificate required in section 401.4 shall note the tested air leakage rate of the home and that the home did not comply with the air leakage performance standard.

402.4.1.3 Sampling. For groups of five or more homes of the same model, with no variations in foundation and construction which will be tested for air leakage during the same sixty-day period, the code official may elect to test less than 100 percent, but not less than 20 percent of the homes. If any tested home fails to meet the maximum air leakage requirement stated in Section 402.4.1.2 then the code official shall have all homes tested until a minimum of three consecutive homes pass the test.

Exception: The first three homes built of the same model, with no variations in foundation and construction.

~~**402.4.2.2 Visual inspection for buildings other than one- and two family dwellings option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

402.4.2 Fireplaces. New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.

403.2.2 Sealing (Mandatory). All ducts, air handlers, filter boxes and building cavities used as ducts shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*.

Duct tightness shall be verified by ~~either of~~ the following:

~~1. Postconstruction test: Leakage to outdoors shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft2 (9.29 m2) of *conditioned floor area* or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft2 (9.29 m2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.~~

2. ~~Rough-in test:~~ Total leakage shall be less than or equal to ~~6~~ 4 cfm (169.9 L/min) per 100 ft2 (9.29 m2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) ~~across the roughed-in system,~~ including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (113.3 L/min) per 100 ft2 (9.29 m2) of *conditioned floor area*.

Exceptions: Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.

SECTION 405
SIMULATED PERFORMANCE ALTERNATIVE
(Performance)

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air exchange rate	~~Specific leakage area (SLA)[d] = 0.00036 assuming no energy recovery~~ Air Changes Per Hour (ACH50)	For residences that are not tested, the same as the standard reference design. For residences without mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange rate[e] but not less than 0.35 ACH For residences with mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange rate[e]

	assuming no energy recovery Climate Zone 1 -2: ACH50 = 7 Climate Zone 3 -8: ACH50 = 5	combined with the mechanical ventilation rate, *f* which shall not be less than 0.01 x *CFA* + 7.5 x (N_{br}+1) where: *CFA* = conditioned floor area N_{br} = number of bedrooms

2. Add new section as follows:

SECTION 406
ADDITIONAL PRESCRIPTIVE EFFICIENCY MEASURES

406.1 Additional efficiency measures. Each dwelling unit shall include two of the measures described in Table 406.1. Single-family dwelling units greater than or equal to 4,000 square feet in floor area shall include three measures described in Table 406.1.

Exceptions:

1. Projects installing a ground or water source heat pump with minimum COP meeting the requirements of Table 503.2.3(2). Single-family dwelling units greater than or equal to 4,000 square feet in floor area shall include one additional measure.
2. Additions less than 1000 square feet shall include one measure from Table 406.1.

TABLE 406.1
ADDITIONAL EFFICIENCY MEASURES
(SELECT TWO MEASURES BASED ON CLIMATE ZONE).

CLIMATE ZONES 1, 2 and 3	
MEASURE	
1	HIGH EFFICIENCY HVAC SYSTEM: SEER 15 Air Conditioner
2	HIGH EFFICIENCY WATER HEATING: Tankless Gas Water Heater for all water heater end uses, EF-0.82, Capacity 1 Gallon
3	SOLAR HOT WATER Solar water heating supplementing a minimum standard water heater. Solar water heating will provide a rated minimum savings of 85 therms or 2000 kWh based on the Solar Rating and Certification Corporation (SRCC) Annual Performance of OG-300 Certified Solar Water Heating Systems
4	CEILING AND WINDOWS OPTION 1: R-38 Ceiling and the following window characteristics: Zone 1: U-factor 0.45, SHGC .25 Zone 2: U-factor 0.45, SHGC .25 Zone 3: U-factor 0.35, SHGC ,25
5	CEILING AND WINDOWS OPTION 2: R-30 Ceiling with radiant barrier and the following window characteristics: Zone 1: U-factor 0.45, SHGC .25 Zone 2: U-factor 0.45, SHGC .25 Zone 3: U-factor 0.35, SHGC ,25
6	HIGH EFFICIENCY HVAC DISTRIBUTION SYSTEM: All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion. Not qualifying: Systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.
7	SMALL HOUSING UNIT:

	Housing units less than 1300 square feet in floor area with less than 220 square feet of fenestration.

CLIMATE ZONES 4, MARINE 4, 5 and 6	
MEASURE	
1	HIGH EFFICIENCY HVAC SYSTEM: Gas, propane or oil-fired furnace or boiler with minimum AFUE of 90% and SEER 14 Air Conditioner, or Air-source heat pump with minimum HSPF of 8.5
2	HIGH EFFICIENCY BUILDING ENVELOPE: Zone 4: Attic R-49, Vaults R-38 or Glazing U-0.30 Zone 4 Marine and 5: Walls: R-20+R5, Attic R-49, Vaults R-38 or Attic R-49, Vaults R-38 and Glazing U-0.30 or Glazing U-0.25. Zone 6: Walls: R-20+R5, Attic R-49, Vaults R-38 or Attic R-60 Vaults R-49 and Glazing U-0.30 or Glazing U-0.25.
3	ENVELOPE UA: The proposed building envelope shall have a total UA at least 15% less than the code target UA as calculated using Table 402.1.4 and Section 402.1.4 Total UA alternative**.**
4	REDUCED AIR LEAKAGE ENVELOPE: Envelope leakage of an ACH50 of 2.5 or less when tested with a blower door at a pressure difference of 50 pascals. Testing shall follow the requirements in Section 402.4.1.2.
5	HIGH EFFICIENCY HVAC DISTRIBUTION SYSTEM: All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion. Not qualifying: Systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.
6	HIGH EFFICIENCY WATER HEATING. Water heating system includes one of the following: Gas, propane or oil water heater with a minimum EF of 0.80 or Electric Heat Pump Water Heater with a minimum COP of 2.
7	SOLAR HOT WATER Solar water heating supplementing a minimum standard water heater. Solar heater will provide a rated minimum savings of 85 therms or 2000 kWh based on the Solar Rating and Certification Corporation (SRCC) Annual Performance of OG-300 Certified Solar Water Heating Systems
8	SMALL HOUSING UNIT: Housing units less than 1300 square feet in floor area with less than 220 square feet of fenestration.

CLIMATE ZONES 7 and 8	
MEASURE	
1	HIGH EFFICIENCY HVAC SYSTEM: Gas propane or oil-fired furnace or boiler with minimum AFUE of 90 percent and SEER 14 air conditioner, or Air-source heat pump with minimum HSPF of 8.5
2	HIGH EFFICIENCY BUILDING ENVELOPE: Walls: R-20+R5, Attic R-60, Vaults R-38 or Walls: R-20, Attic R-60 Vaults R-38 and Glazing U-0.30, or

	Glazing U-0.25.
3	ENVELOPE UA: The proposed building envelope shall have a total UA at least 15 percent less than the code target UA as calculated using Table 402.1.4 and Section 402.1.4 Total UA alternative**.**
4	REDUCED AIR LEAKAGE ENVELOPE: Envelope leakage of an ACH50 of 2.5 or less when tested with a blower door at a pressure difference of 50 pascals. Testing shall follow the requirements in Section 402.4.1.2.
5	HIGH EFFICIENCY HVAC DISTRIBUTION SYSTEM: All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion. Not qualifying: Systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.
6	HIGH EFFICIENCY WATER HEATING: Water heating system includes one of the following: Gas, propane or oil water heater with a minimum EF of 0.80 or Electric Heat Pump Water Heater with a minimum COP of 2.
7	SOLAR HOT WATER Solar water heating supplementing a minimum standard water heater. Solar water heating will provide a rated minimum savings of 85 therms or 2000 kWh based on the Solar Rating and Certification Corporation (SRCC) Annual Performance of OG-300 Certified Solar Water Heating Systems
8	SMALL HOUSING UNIT: Housing units less than 1300 square feet in floor area with less than 220 square feet of fenestration.

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

N1101.2 Compliance. Compliance shall be demonstrated by either meeting the requirements of the *International Energy Conservation Code* or meeting the requirements of ~~this chapter~~ Sections N1101 through N1104 and Section N1105. Climate zones from Figure N1101.2 or Table N1101.2 shall be used in determining the applicable requirements from this chapter.

2. Add new text as follows:

N1101.2.1 Additions. Additions to an existing dwelling unit shall comply with Section N1101.2.

3. Revise as follows:

N1101.9 Certificate. A permanent certificate shall be posted on or in the electrical distribution panel. The certificate shall not cover or obstruct the visibility of the circuit directory *label*, service disconnect *label* or other required *labels*. The certificate shall be completed by the builder or registered *design professional*. The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside *conditioned spaces*; *U*-factors for fenestration; and the solar heat gain coefficient (SHGC) of fenestration. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the tested ACH50 for envelope air leakage and also the tested CFM for duct leakage if applicable. The certificate shall list the types and efficiencies of heating, cooling and service water heating *equipment*. Where a gas-fired unvented room heater, electric furnace and/or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be listed for gas-fired unvented room heaters, electric furnaces or electric base board heaters.

(Footnotes remain unchanged)

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections N1102.4.1.1 and N1102.4.1.2 ~~be durably sealed to limit infiltration~~. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material.~~

1. ~~All joints, seams and penetrations.~~
2. ~~Site-built windows, doors and skylights.~~
3. ~~Openings between window and door assemblies and their respective jambs and framing.~~
4. ~~Utility penetrations.~~
5. ~~Dropped ceilings or chases adjacent to the thermal envelope.~~
6. ~~Knee walls.~~
7. ~~Walls and ceilings separating the garage from *conditioned spaces*.~~
8. ~~Behind tubs and showers on *exterior walls*.~~
9. ~~Common walls between *dwelling units*.~~

~~10. Attic access openings.~~
~~11. Rim joists junction.~~
~~12. Other sources of infiltration.~~

4. Add new text as follows:

N1102.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table N1102.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table N1102.4.2, as applicable to the method of construction. Where required by the *building official*, an *approved third* party from the installer of the insulation shall inspect the air barrier and insulation.

5. Revise as follows:

TABLE N1102.4.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls ~~is~~ shall be installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier ~~are~~ shall be filled or ~~repaired~~ sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Air permeable insulation ~~is~~ shall be inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers are insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed.
Windows, skylights, and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include an air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. An air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	~~Batts in narrow cavities are cut to fit, or narrow cavities are filled by spayed/blown insulation.~~ Insulation to be installed in non-standard framing cavity spaces shall be cut to fit the cavity or the cavity shall be insulated with insulation that will readily conform to the cavity.
Garage separation	Air sealing ~~is~~ shall be provided ~~between~~ for the ~~assemblies the~~ separating the garage ~~and~~ from conditioned spaces.
Recessed lighting	Recessed light fixtures that penetrate the building envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception: fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut to fit around wiring and plumbing without compression in exterior walls, or sprayed/blown insulation shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulati~~on~~ed and an air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The required air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~

6. Delete without substitution:

~~**N1102.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section N1102.4.2.1 or N1102.4.2.2.~~

~~**N1102.4.2.1 Testing option.** Tested air leakage is less than 7 ACH when tested with a blower door at a pressure of 50 pascals (0.007 psi). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

~~During testing:~~

1. ~~Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;~~
2. ~~Dampers shall be closed, but not sealed; including exhaust, intake, makeup air, back draft, and flue dampers;~~
3. ~~Interior doors shall be open;~~
4. ~~Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;~~
5. ~~Heating and cooling system(s) shall be turned off;~~
6. ~~HVAC ducts shall not be sealed; and~~
7. ~~Supply and return registers shall not be sealed.~~

7. Add new text as follows:

N1102.4.1.2 Testing. The dwelling shall be tested and found to have an air leakage rate not exceeding seven air changes per hour (ACH50) in climate zones 1 and 2 and five ACH50 in climate zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 50 pascals (50 Pa) in accordance with ASHRAE 119 by a party *approved* by the *building official.* Where required by the *building official*, testing shall be conducted by an *approved* party independent from the builder and the installer of insulation, air barrier and other sealing materials. A written report of the results of the test shall be signed by the party conducting the testing attesting to the accuracy of the values and provided to the *building official*. Testing shall be performed any time after rough in and creation of all penetrations of the *building thermal envelope*

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed beyond the weatherstripping or other infiltration control measures that will be installed;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed that will be installed;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off;
7. Supply and return registers, if installed at the time of the test, shall be fully opened.

Exceptions:

1. Dwelling units of multi-family residential buildings with more than four individual units shall be exempted from the testing requirement if they satisfy the requirements of Section N1102.4.1.1.
2. Additions less than 1,000 square feet.
3. Projects that are unsuccessful in complying with the maximum air leakage performance standards shall, at the approval of the code official and, in the presence of either the code official or designated third party:
   - 3.1. Determine that all identifiable air leakage openings have been sealed, and
   - 3.2. Conduct a blower door test.

The certificate required in Section N1101.9 shall note the tested air leakage rate of the dwelling unit and that the dwelling unit did not comply with the air leakage performance standard.

N1102.4.3 Sampling. For groups of five or more dwelling units of the same model, with no variations in foundation and construction which will be tested for air leakage during the same sixty-day period, the building official may elect to test less than 100 percent, but not less than 20 percent, of the homes. If any tested home fails to meet the maximum air leakage requirement stated in Section N1102.4.1.2 then the building official shall have all homes tested until a minimum of three consecutive homes pass the test.

Exception: The first three homes built of the same model, with no variations in foundation and construction.

8. Revise as follows:

N1103.2.2 Sealing. Ducts, air handlers, filter boxes and building cavities used as ducts shall be sealed. Joints and seams shall comply with Section M1601.4. Duct tightness shall be verified by either of the following:

~~1. Post-construction test: Leakage to outdoors shall be less than or equal to 8 cfm (3.78 L/s) per 100 ft2 (9.29 m2) of conditioned floor area or a total leakage less than or equal to 12 cfm (5.66 L/s) per 100 ft2 (9.29m2) of conditioned floor area when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the entire system, including the manufacturer's air handler end closure. All register boots shall be taped or otherwise sealed during the test.~~

~~2~~ 1. ~~Rough-in test:~~ Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~2.83~~ 1.89 L/s) per 100 square feet (9.29 m2) of conditioned floor area when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~1.89~~ 1.42 L/s) per 100 ft2 (9.29 m2) of conditioned floor area.

Exception: Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.

SECTION N1103
SYSTEMS

N1103.2 Ducts

N1103.2.2 Sealing. Ducts, air handlers, filter boxes and building cavities used as ducts shall be sealed. Joints and seams shall comply with Section M1601.4. Duct tightness shall be verified by either of the following:

~~1. Post-construction test: Leakage to outdoors shall be less than or equal to 8 cfm (3.78 L/s) per 100 ft2 (9.29 m2) of conditioned floor area or a total leakage less than or equal to 12 cfm (5.66 L/s) per 100 ft2 (9.29m2) of conditioned floor area when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the entire system, including the manufacturer's air handler end closure. All register boots shall be taped or otherwise sealed during the test.~~

~~2.~~1. ~~Rough-in test:~~ Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~2.83~~ 1.89 L/s) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~1.89~~ 1.42 L/s) per 100 ft^2 (9.29 m^2) of conditioned floor area.

Exception: Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.

9. Add new section as follows:

SECTION N1105
ADDITIONAL PRESCRIPTIVE EFFICIENT MEASURES

N1105.1 Additional Efficiency Measures. Each project shall include two of the measures described in Table 1105.1. Single-family dwelling units greater than or equal to 4,000 square feet in floor area shall include three measures described in Table N1105.1.

Exceptions:

1. Projects installing a ground or water source heat pump with minimum COP meeting the requirements of Table 503.2.3(2) of the *International Energy Conservation Code*. Single-family dwelling units greater than or equal to 4,000 square feet in floor area shall include one additional measure.
2. Additions less than 1000 square feet shall include one measure from Table N1105.1.

TABLE N1105.1
ADDITIONAL EFFICIENCY MEASURES
(SELECT TWO MEASURES BASED ON CLIMATE ZONE).

CLIMATE ZONES 1, 2, AND 3	
Measure	
1	HIGH EFFICIENCY HVAC SYSTEM: SEER 15 Air Conditioner
2	HIGH EFFICIENCY WATER HEATING: Tankless Gas Water Heater, EF-0.82, Capacity 1 Gallon
3	SOLAR HOT WATER Solar water heating supplementing a minimum standard water heater. Solar water heating will provide a rated minimum savings of 85 therms or 2000 kWh based on the Solar Rating and Certification Corporation (SRCC) Annual Performance of OG-300 Certified Solar Water Heating Systems
4	CEILING AND WINDOWS OPTION 1: R-38 Ceiling and the following window characteristics: Zone 1: U-factor 0.45, SHGC .25 Zone 2: U-factor 0.45, SHGC .25 Zone 3: U-factor 0.35, SHGC ,25
5	CEILING AND WINDOWS OPTION 2: R-30 Ceiling with radiant barrier and the following window characteristics: Zone 1: U-factor 0.45, SHGC .25 Zone 2: U-factor 0.45, SHGC .25 Zone 3: U-factor 0.35, SHGC ,25
6	HIGH EFFICIENCY HVAC DISTRIBUITON SYSTEM: All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion. Not qualifying: Systems utilizing electric baseboard heat as the primary heat source.
7	SMALL HOUSING UNIT: Housing units less than 1300 square feet in floor area with less than 220 square feet of fenestration.

CLIMATE ZONE 4, MARINE 4, 5 and 6	
MEASURE	
1	HIGH EFFICIENCY HVAC SYSTEM: Gas, propane or oil-fired furnace or boiler with minimum AFUE of 90% and SEER 14 Air Conditioner, or Air-source heat pump with minimum HSPF of 8.5
2	HIGH EFFICIENCY BUILDING ENVELOPE: Zone 4: Attic R-49, Vaults R-38 or Glazing U-0.30 Zone 4 Marine and 5: Walls: R-20+R5, Attic R-49, Vaults R-38 or Attic R-49, Vaults, R-38 and Glazing U-0.30 or Glazing U-0.25. Zone 6: Walls: R-20+R5, Attic R-49, Vaults R-38 or Attic R-60, Vaults, R-49 and Glazing U-0.30 or Glazing U-0.25.

3	ENVELOPE UA: The proposed building envelope shall have a total UA at least 15% less than the code target UA as calculated using Table N1102.1.2 and Section N1102.1.2 Total UA alternative**.**
4	REDUCED AIR LEAKAGE ENVELOPE: Envelope leakage of an ACH50 of 2.5 or less when tested with a blower door at a pressure difference of 50 pascals. Testing shall follow the requirements in Section N1102.4.1.2.
5	HIGH EFFICIENCY HVAC DISTRIBUITON SYSTEM: All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion. Not qualifying: Systems with components located in conditioned crawl spaces and systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.
6	HIGH EFFICIENCY WATER HEATING. Water heating system includes one of the following: Gas, propane or oil water heater with a minimum EF of 0.80 or Electric Heat Pump Water Heater with a minimum COP of 2.
7	SOLAR HOT WATER Solar water heating supplementing a minimum standard water heater. Solar heater will provide a rated minimum savings of 85 therms or 2000 kWh based on the Solar Rating and Certification Corporation (SRCC) Annual Performance of OG-300 Certified Solar Water Heating Systems
8	SMALL HOUSING UNIT: Housing units less than 1300 square feet in floor area with less than 220 square feet of fenestration.

CLIMATE ZONES 7 & 8	
MEASURE	
1	HIGH EFFICIENCY HVAC SYSTEM: Gas propane or oil-fired furnace or boiler with minimum AFUE of 90% and SEER 14 air conditioner, or Air-source heat pump with minimum HSPF of 8.5
2	HIGH EFFICIENCY BUILDING ENVELOPE: Walls: R-20+R5, Attic R-60, Vaults R-38 or Attic R-60 Vaults R-38 and Glazing U-0.30, or Glazing U-0.25.
3	ENVELOPE UA: The proposed building envelope shall have a total UA at least 15% less than the code target UA as calculated using Table N1102.1.2 and Section N1102.1.2 Total UA alternative**.**
4	REDUCED AIR LEAKAGE ENVELOPE: Envelope leakage of an ACH50 of 2.5 or less when tested with a blower door at a pressure difference of 50 pascals. Testing shall follow the requirements in Section N1102.4.1.2.
5	HIGH EFFICIENCY HVAC DISTRIBUITON SYSTEM: All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion. Not qualifying: Systems with components located in conditioned crawl spaces and systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.
6	HIGH EFFICIENCY WATER HEATING: Water heating system includes one of the following: Gas, propane or oil water heater with a minimum EF of 0.80 or Electric Heat Pump Water Heater with a minimum COP of 2.

7	SOLAR HOT WATER Solar water heating supplementing a minimum standard water heater. Solar water heating will provide a rated minimum savings of 85 therms or 2000 kWh based on the Solar Rating and Certification Corporation (SRCC) Annual Performance of OG-300 Certified Solar Water Heating Systems
8	SMALL HOUSING UNIT: Housing units less than 1300 square feet in floor area with less than 220 square feet of fenestration.

Reason: PART I- The proposal submitted by the Northwest Energy Codes Group (NWECG) increases the efficiency of new residential construction 30% above that of a base-case residence meeting the 2006 IECC. The innovative feature of this proposal is the inclusion of menus from which users must pick a fixed number of items. This approach was successfully incorporated into the Oregon residential code that went into effect in July of 2008. There have been no problems to date implementing that code.
The proposal offers several important benefits:

Provides flexibility for designers and builders;

Contains a limited number of discrete option items that are understandable and enforceable which will result in high compliance rates.

The proposed modifications have broad industry support, are proven energy savers, and appear in several other IECC code change proposals. The NWECG also is proposing to require air leakage testing for the building envelope for residential construction. Reducing air leakage provides significant energy savings especially in Climate Zones 3 and above and requiring air leakage testing has broad industry support. This proposal maintains the Total UA Alternative and also the Simulated Performance Alternative to provide flexibility to the code.

The modifications made to the base case prescriptive requirements in Table 402.1 provide a portion of the energy savings. The Additional Prescriptive Efficiency Measures in Section 406 provide the remainder. The tables in Section 406 were developed by reviewing a wide variety of measures to identify the most promising possibilities for achieving the desired 30% incremental change in efficiency. Next, the basic construct of Table 406.1 was developed and the measures to be included were selected, guided by several important criteria including ease of identification and implementation and applicability to a large percentage of homes. Products that were not broadly familiar were purposefully excluded. Once the measures were selected, they were analyzed in detail to generate a savings estimate for the code change proposal. All of the energy evaluations were conducted using REM/Rate Version 12.43. This is an evaluation tool commonly used to provide IECC simulated performance alternative code compliance documentation. Measures can be added or removed from the table as the IECC evolves or through local amendment which increases the usefulness of the format.

The NWECG proposal includes differentiated treatment of homes by size, a new idea for the IECC. Additional energy efficiency measures are required for larger homes, while small housing is included as an efficiency measure. The housing unit sizes selected were not determined using energy analysis. They represent approximately the smallest and the largest deciles of housing unit sizes in the United States, as reported in the 2003 American Housing Survey. The energy savings for small homes, or increased energy use in large homes, far exceed any measure analyzed in this study.

The NWECG solicited broad industry review and comment to ensure that the proposed changes could be implemented and enforced and achieve the target energy savings. The Energy Systems Laboratory at Texas A&M and Florida Solar Energy Center were consulted to ensure that the measures selected for hot climates were both practical and saved energy. Research studies and individuals with research and field experience were also used to help select measures for colder climates. We urge your support on this proposal.

Reason: PART II- The proposal submitted by the Northwest Energy Codes Group (NWECG) increases the efficiency of new residential construction 30% above that of a base-case residence meeting the 2006 IRC and IECC. The innovative feature of this proposal is the inclusion of menus from which users must pick a fixed number of items. This approach was successfully incorporated into the Oregon residential code that went into effect in July of 2008. There have been no problems to date implementing that code.
The proposal offers several important benefits:

Provides flexibility for designers and builders;

Contains a limited number of discrete option items that are understandable and enforceable which will result in high compliance rates.

This proposal focuses on maintaining the existing format of the 2009 IRC and adding a set of prescriptive measures that allow the code user to select from to achieve the additional energy savings. Modifications were made Table N1102.1 to increase the efficiency of the base building requirements. The proposed modifications have broad industry support, are proven energy savers, and appear in several other IECC code change proposals. Changes are also proposed to align the Solar Heat Gain Coefficient requirements in the IRC with those in the IECC. The NWECG also is proposing to require air leakage testing for the building envelope for residential construction. Reducing air leakage provides significant energy savings especially in Climate Zones 3 and above and requiring air leakage testing has broad industry support. This proposal maintains the Total UA Alternative to provide flexibility to the code.

The modifications made to the base case prescriptive requirements in Table N1102.1 provide a portion of the energy savings. The Additional Prescriptive Efficiency Measures in Section N1105 provide the remainder. The tables in Section N1105 were developed by reviewing a wide variety of measures to identify the most promising possibilities for achieving the desired 30% incremental change in efficiency. Next, the basic construct of Table N1105 was developed and the measures to be included were selected, guided by several important criteria including ease of identification and implementation and applicability to a large percentage of homes. Products that were not broadly familiar were purposefully excluded. Once the measures were selected, they were analyzed in detail to generate a savings estimate for the code change proposal. All of the energy evaluations were conducted using REM/Rate Version 12.43. This is an evaluation tool commonly used to provide IECC simulated performance alternative code compliance documentation. Measures can be added or removed from the table as the IRC evolves or through local amendment which increases the usefulness of the format.

The NWECG proposal includes differentiated treatment of homes by size, a new idea for the IECC. Additional energy efficiency measures are required for larger homes, while small housing is included as an efficiency measure. The housing unit sizes selected were not determined using energy analysis. They represent approximately the smallest and the largest deciles of housing unit sizes in the United States, as reported in the 2003 American Housing Survey. The energy savings for small homes, or increased energy use in large homes, far exceed any measure analyzed in this study.

The NWECG solicited broad industry review and comment to ensure that the proposed changes could be implemented and enforced and achieve the target energy savings. The Energy Systems Laboratory at Texas A&M and Florida Solar Energy Center were consulted to ensure that the measures selected for hot climates were both practical and saved energy. Research studies and individuals with research and field experience were also used to help select measures for colder climates. We urge your support on this proposal.

Cost Impact: The code change proposal will increase the cost of construction. The initial cost of this improvement may be higher, but long-term energy savings outweigh these costs.

	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EC12–09/10
103.1.1, 401, 402, 403, 405

Proponent: Craig Conner, Building Quality, representing self

Revise as follows:

103.1.1 Above code programs. The code official or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings approved in writing by such an energy efficiency program shall be considered in compliance with this code. ~~The requirements identified as "mandatory" in Chapters 4 and 5 of this code, as applicable, shall be met.~~

401.1 Scope. This chapter applies to residential buildings.

401.2 Compliance. ~~Projects shall comply with Sections 401, 402.4, 402.5, 403.1, 403.2.2, 403.2.3 and 403.4 through 403.9 (referred to as the mandatory provisions) and either:~~

1. ~~Sections 402.1 through 402.3, 403.2.1 and 404.1 (prescriptive); or~~
2. ~~Section 405 (performance).~~

Compliance shall be demonstrated by meeting the applicable provisions of this chapter.

402.1 General. ~~(Prescriptive).~~
402.2 Specific insulation requirements. ~~(Prescriptive)~~
402.3 Fenestration. ~~(Prescriptive)~~
402.4 Air leakage. ~~(Mandatory)~~
~~402.5 Maximum fenestration *U*-factor and SHGC. (Mandatory).~~

SECTION 403
SYSTEMS ~~(Mandatory~~)

403.1 Controls. ~~(Mandatory)~~
403.1.2 Heat pump supplementary heat. ~~(Mandatory)~~
403.2 Ducts.
403.2.1 Insulation. ~~(Prescriptive)~~
403.2.2 Sealing. ~~(Mandatory)~~
403.2.3 Building cavities. ~~(Mandatory)~~
403.3 Mechanical system piping insulation. ~~(Mandatory)~~
403.4 Circulating hot water systems. ~~(Mandatory)~~
403.5 Mechanical ventilation. ~~(Mandatory)~~
403.6 Equipment sizing. ~~(Mandatory)~~
403.7 Systems serving multiple dwelling units. ~~(Mandatory)~~
403.8 Snow melt system controls. ~~(Mandatory)~~
403.9 Pools. ~~(Mandatory)~~
404.1 Lighting equipment ~~(Prescriptive).~~

SECTION 405
SIMULATED PERFORMANCE ALTERNATIVE –
~~(Performance)~~

405.2 Mandatory requirements. Compliance with this Section requires that ~~the mandatory provisions identified in Section 401.2 be met~~ projects comply with Sections 401, 402.4, 402.5, 403.1, 403.2.2, 403.2.3 and 403.4 through 403.9. All supply and return ducts not completely inside the building thermal envelope shall be insulated to a minimum of R-6.

Reason: This creates consistency between the IECC and IRC, corrects erroneous use of the term "*mandatory*", and corrects errors in the IECC concerning what can be traded in the performance section. This change creates a simple listing of the sections that cannot be traded off within the performance approach, as was in energy codes prior to 2006.

The three labels "*mandatory*", "*prescriptive*" and "*performance*" are used to label many sections in IECC, but not used at all in the IRC. Code consistency could be achieved by removing the terms from section headings in the IECC or by adding the terms to the IRC.

The word "*shall*" and the concept of "*mandatory*" is woven throughout the I-codes. It is important that the energy code be correct in its use of the word "*mandatory*" and be consistent with the other I-codes, including the IRC. The IRC definition is ***SHALL**. The term, when used in this code, is construed to mean "mandatory".* Therefore any section with "*shall*" in it implies "*mandatory*". Implying sections with the word "*prescriptive*" are somehow not "*mandatory*" is at the very least confusing, if not outright wrong.

Why are the three labels even in the IECC? The three labels were intended to separate what could or could not be traded off in the performance path. A simpler and clearer way to separate what can and cannot be traded off is to list the sections in one place as was done prior to 2006. Section 405 (Performance) already has a subsection ("Mandatory Requirements") defining what is subject to the performance tradeoff and what is not. The sections that cannot be traded off in the performance calculation should simply be listed under the existing heading "Mandatory Requirements" (Section 405.2) and the multiple unneeded headings can be removed as is shown below.

The existing code incorrectly lists some requirements as "prescriptive", meaning they can be traded off under the performance approach. Requirements incorrectly listed as "tradable" include installing insulation to be permanently attached in the floor and crawlspace (Sections 402.2.6 and 402.2.9), and the crawl space vapor retarder (Section 402.2.9). Permanent attachment of the insulation and important vapor retarders should not be traded away in a performance calculation.

Even if one argued that the three labels were not required in the IRC due to performance being only in IECC only, there are still inconsistencies within the IECC. Most importantly the IECC uses the word "mandatory" incorrectly in respect to the rest of the I-codes. Furthermore, the use of the terms is even inconsistent within the IECC. For example some (but not all) of sections labeled "*prescriptive*" and some (but not all) of the sections labeled "*mandatory*" in the IECC are also included as possible variables in the Performance Section (Section 405). Duct insulation is both "*mandatory*" (Section 405.2) and "*prescriptive*" (Section 403.2).

This change moves the list of requirements that cannot be traded into a single location in the performance section. It removes the mention of mandatory from the above-codes program (which after all are "above code"), removes 19 instances of the use of "*mandatory*", "*prescriptive*" and "*performance*" from section and subsection heading, and corrects errors in labeling requirements that can be traded; all without any change to section or subsection content. No change is made to the IRC, as the two codes are now consistent.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Ronald Majette, representing US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

401.2 Compliance. Projects shall comply with Sections identified as "mandatory" and with either sections identified as "prescriptive" or the performance approach in Section 406. ~~Sections 401, 402.4, 402.5, and 403.1, 403.2.2, 403.2.3, and 403.3 through 403.9 (referred to as the mandatory provisions) and either:~~

~~1. Sections 402.1 through 402.3, 403.2.1 and 404.1 (prescriptive); or~~
~~2. Section 405 (performance).~~

401.3 Certificate (Mandatory). A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

7 and 8	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	~~21~~ 20+5 or 13+10[h]	19 / 21	38[g]	15/19	10,4ft	10/13

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.
b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
c. 15/19" means R-15 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home. "10/13" means R-10 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required in the locations where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.
i. The second R-value applies when more than half the insulation is on the interior of the mass wall.
j. For impact rated fenestration in wind-borne debris regions ~~complying with Section R301.2.1.2 of the IRC or Section 1608.1.2 of the IBC~~, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.

R-19	R-19+6 in 2×6; R-19+12 in 2×8 or 2×10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.

b. Insulation exceeding the height of the framing shall cover the framing.

402.4 Air leakage (Mandatory).

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections 402.4.1.1 and 402.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings.~~
~~11. Rim joist junction.~~
~~12. Other sources of infiltration.~~

3. Add new text as follows:

402.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table 402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party shall inspect all components and verify compliance.

4. Revise as follows:

Table ~~402.4.2~~ 402.4.1.1
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any ~~A~~air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception: fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulati~~on~~ed and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

5. Delete and substitute as follows:

~~**402.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2.~~

~~**402.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

402.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 5 air changes per hour (ACH50) in zones 1 and 2, and 3 air changes per hour in zones 3 through 8. Testing

shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

Exception: Where heating and cooling equipment meets the requirements of Section 404, maximum leakage rate shall be seven air changes per hour (ACH50) in zones 1 and 2 and five air changes per hour in zones 3 through 8. Additions less than 1000 square feet are exempt from testing.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~;~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~
7. ~~7~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully open.

6. Add new text as follows:

402.4.1.2.1 Sampling. Where groups of seven or more buildings of similar design and construction are completed and are issued occupancy permits during a 120-day period, or where a multifamily structure contains more than four dwelling units, testing of less than 100 percent, but not less than 1 in 7 or 15 percent, of the buildings from a specific builder and/or contractor or of dwelling units in a multifamily structure shall be permitted when *approved* by the *code official*. The specific buildings or dwelling units to be tested shall be selected by the *code official*. If any tested building or dwelling unit fails to comply with the maximum air leakage requirement in Section 402.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor or multifamily structure before the *code official* may permit sampling to resume.

7. Delete without substitution:

~~**402.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

8. Revise as follows:

402.4.3 Fireplaces. New wood-burning fireplaces shall have ~~gasketed doors and~~ outdoor combustion air.

403.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 4 cfm (~~226.5~~ 113.3 L/min) per 100 square feet (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 square feet (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 square feet (9.29 m^2) of *conditioned floor area*.

~~**Exceptions:** Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*~~.

Exception: Where heating and cooling equipment meets the requirements of Section 404:

1. Maximum total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 square feet (9.29m^2) of conditioned floor area for ducts located outside conditioned space, and
2. The maximum leakage test is not required for ducts and air handlers located entirely within conditioned space.

9. Add new text as follows:

403.2.4 Location (Prescriptive). All ducts and air handlers shall be located within the conditioned space.

Exception: Where heating and cooling equipment meets the requirements of Section 404.

10. Revise as follows:

403.4 Service hot water systems.

~~**403.4**~~ **403.4.1 Circulating hot water systems (Mandatory).** ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

11. Add new text and table as follows:

403.4.2 Hot water pipe insulation (Prescriptive). Insulation with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 inch nominal diameter;
2. Piping serving more than one dwelling unit;
3. Piping from the water heater to kitchen outlets;
4. Piping located outside the conditioned space;
5. Piping from the water heater to a distribution manifold;
6. Piping located under a floor slab;
7. Buried piping; and
8. Supply and return piping in recirculation systems other than demand recirculation systems.

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table 403.4.2.

TABLE 403.4.2
MAXIMUM RUN LENGTH (feet)[a]

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length	30	20	10	5

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

12. Revise as follows:

403.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of Section M1507 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

13. Add new text as follows:

404 Improved equipment efficiency alternative. (Prescriptive) For new residences, Sections 404.1 and 402.2 shall be permitted as an alternative to certain requirements as specified by Exceptions in Sections 402.4.1.2, 403.2.2, and 403.2.4.

404.1 Heating equipment. In zones 3 and 4 gas furnace AFUE shall be at least 90. In zones 5 through 8, gas furnace AFUE shall be at least 92. In zones 3 through 8, gas boiler, oil boiler, or oil furnace AFUE shall be at least 85. In zones 3 through 8, heat pump HSPF shall be at least 8.5. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2). All-electric heated buildings shall utilize either an air-source or ground source heat pump.

404.2 Cooling equipment. In zones 1 and 2, vapor compression air conditioning SEER shall be at least 16.0 and EER at least 12.5. In zone 3, vapor compression air conditioning SEER shall be at least 15.0 and EER at least 12.5. In zones 1 through 3, room air conditioner EER shall be at least 11.0 for air conditioners with capacity less than 20,000 Btu/hr, or 10.0 for capacities equal to or greater than 20,000 Btu/hr. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2).

404.2.3 Future updates to federal manufacturing standards. If applicable Federal manufacturing standards as specified in 10 CFR 430 are updated to establish new efficiency requirements, equipment efficiency requirements in this section shall be improved by a percentage equivalent to the percentage improvement from the efficiency required by 10 CFR 430 as of January 1, 2011 to the efficiency required by 10 Code of Federal Regulations 430 at the date of plan check approval.

Exception: AFUEs for furnaces and boilers shall not be required to exceed the higher of 95 or the requirement in 10 CFR 430 at the date of plan check approval.

14. Revise as follows:

SECTION ~~404~~ 405
ELECTRICAL POWER AND LIGHTING SYSTEMS

~~404.1~~ 405.1 Lighting equipment (Prescriptive). A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air Exchange Rate	~~Specific leakage area (SLA)[d] = 0.00036~~ Air leakage rate of 5 air changes per hour in zones 1 and 2, and 3 air changes per hour in zones 3 through 8 at a pressure of 0.2 inches w.g. (50 Pa). ~~assuming no energy recovery~~. The mechanical ventilation rate shall be in addition to the air leakage rate and the same as in the proposed design, but no greater than 0.01 x *CFA* + 7.5 x (*Nbr*+1) where: *CFA* = conditioned floor area *Nbr* = number of bedrooms Energy recovery shall not be assumed for mechanical ventilation.	For residences that are not tested, the same air leakage rate as the standard reference design. ~~For residences without mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange rate[e] but not less than 0.35 ACH~~ For tested residences ~~with mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1~~, the measured air exchange rate[e] ~~combined with the~~ proposed mechanical ventilation rate, ~~*f* which shall not be less than 0.01 x *CFA* + 7.5 x (*Nbr*+1)~~ ~~where:~~ ~~*CFA* = conditioned floor area~~ ~~*Nbr* = number of bedrooms~~ The mechanical ventilation rate shall be in addition to the air leakage rate and shall be as proposed.

Thermal distribution systems	~~A thermal distribution system efficiency (DSE) of 0.88 shall be applied to both the heating and cooling system efficiencies for all systems other than tested duct systems. Duct insulation: From Section 403.2.1. For tested duct systems, the leakage rate shall be the applicable maximum rate from Section 403.2.2. 4 cfm (113.3 L/min) per 100 ft2 (9.29 m2) of conditioned floor area at a pressure differential of 0.1 inches w.g. (25 Pa).~~	Thermal distribution system efficiency shall be as tested or as specified by Table 405.5.2(2) if not tested. Duct insulation shall be as proposed.

e. Where required by the *code official*, testing shall be conducted by an *approved* party. ~~Tested envelope leakage shall be determined and documented by an independent party approved by the *code official*.~~ Hourly calculations as specified in the ~~2001~~ASHRAE *Handbook of Fundamentals*~~, Chapter 26, page 26.21, Equation 40 (Sherman-Grimsrud model)~~ or the equivalent shall be used to determine the energy loads resulting from infiltration.

(Portions of table and footnotes not shown remain unchanged)

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

N1101.9 Certificate. A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY Component

CLIMATE ZONE	FENESTRATION *U*-FACTOR	SKYLIGHT *U*-FACTOR	GLAZED FENESTRATION SHGC	CEILING *R*-VALUE	WOOD FRAME WALL *R*-VALUE	MASS WALL *R*-VALUE[k]	FLOOR *R*-VALUE	BASEMENT[c] WALL *R*-VALUE	SLAB[d] *R*-VALUE & DEPTH	CRAWL SPACE[c] WALL *R*-VALUE

3	~~0.50~~ 0.40[i]	0.55 ~~0.65~~	0.30 0.35[e, j]	~~30~~38	13	5 / 8	19	5/13[f]	0	5 / 13
4 except Marine	0.35	0.55 ~~0.60~~	NR	38	~~13~~ 20 or 13+5[h]	~~5 / 10~~ 8 / 13	19	10 / 13	10, 2 ft	10/13
5 and Marine 4	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	~~38~~49	20 or 13+5[h]	13 / 17	30[f g]	10/13	10,2ft	10/13
6	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	20+5 or 13+~~5~~ 10[h]	15 / ~~19~~ 20	30[g]	15/19	10,4ft	10/13
7 and 8	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	~~21~~ 20+5 or 13+10[h]	19 / 21	38[g]	15/19	10,4ft	10/13

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.

b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.

c. The first value applies to continuous insulation, the second to framing cavity insulation; either insulation meets the requirement.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure N1101.2 and Table N1101.2.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required in the locations where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.
i. For impact rated fenestration in wind-borne debris regions ~~complying with Section R301.2.1.2~~, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.
~~j. For impact rated fenestration complying with Section R301.2.1.2 of the *International Residential Code*, the maximum SHGC shall be 0.40.~~
k. The second R-value applies when more than half the insulation is on the interior of the mass wall.

TABLE N1102.1.2
EQUIVALENT *U*-FACTORS[a]

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.
b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in zone 1, 0.14 in zone 2, 0.12 in zone 3, 0.10 in zone 4 except Marine, 0.087 in zone 5 and Marine 4, and the same as the frame wall U-factor in Marine zone 4 and zones 5 through 8.
c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure N1101.2 and Table N1101.2.

TABLE N1102.2.5
STEEL-FRAME CEILING, WALL AND FLOOR INSULATION
(*R*-VALUE)

R-19	R-19+6 in 2×6; R-19+12 in 2×8 or 2×10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

N1102.4 Air leakage (Mandatory).

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections N1102.4.1.1 and N1102.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

1. ~~All joints, seams and penetrations.~~
2. ~~Site-built windows, doors and skylights.~~
3. ~~Openings between window and door assemblies and their respective jambs and framing.~~
4. ~~Utility penetrations.~~
5. ~~Dropped ceilings or chases adjacent to the thermal envelope.~~
6. ~~Knee walls.~~
7. ~~Walls and ceilings separating a garage from conditioned spaces.~~
8. ~~Behind tubs and showers on exterior walls.~~
9. ~~Common walls between dwelling units.~~
10. ~~Attic access openings.~~
11. ~~Rim joist junction.~~
12. ~~Other sources of infiltration.~~

3. Add new text as follows:

N1102.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table N1102.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table N1102.4.1.1, as applicable to the method of construction. Where required by the *building official*, an *approved* party shall inspect all components and verify compliance.

4. Revise as follows:

TABLE N1102.4.1.1 ~~N1102.4.2~~
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are~~ ~~filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any ~~A~~air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception- fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulati~~on~~ed and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

5. Delete and substitute as follows:

~~**N1102.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section N1102.4.2.1 or N1102.4.2.2.~~

~~**N1102.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

N1102.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 5 air changes per hour (ACH50) in zones 1 and 2, and 3 air changes per hour in zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *building official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *building official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

> **Exception:** Where heating and cooling equipment meets the requirements of Section N1104, maximum leakage rate shall be seven air changes per hour (ACH50) in zones 1 and 2 and five air changes per hour in zones 3 through 8. Additions less than 1000 square feet are exempt from testing.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~;~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~

~~7~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully open.

6. Add new text as follows:

N1102.4.1.2.1 Sampling. Where groups of seven or more buildings of similar design and construction are completed and are issued occupancy permits during a 120-day period, or where a multifamily structure contains more than four dwelling units, testing of less than 100 percent, but not less than 15 percent, of the buildings from a specific builder and/or contractor or of dwelling units in a multifamily structure shall be permitted when *approved* by the *building official*. The specific buildings or dwelling units to be tested shall be selected by the *building official*. If any tested building or dwelling unit fails to comply with the maximum air leakage requirement in Section N1102.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor or multifamily structure before the *building official* may permit sampling to resume.

7. Delete without substitution:

~~**N1102.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table N1102.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

8. Revise as follows:

N1102.4.3 Fireplaces. New wood-burning fireplaces shall have ~~gasketed doors and~~ outdoor combustion air.

N1103.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4. Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 4 cfm (~~226.5~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 square feet (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

~~**Exceptions:** Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*~~.

Exception: Where heating and cooling equipment meets the requirements of section N1104:

1. Maximum total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29m^2) of conditioned floor area for ducts located outside conditioned space, and
2. The maximum leakage test is not required for ducts and air handlers located entirely within conditioned space.

9. Add new text as follows:

N1103.2.4 Location (Prescriptive). All ducts and air handlers shall be located within the conditioned space.

Exception: Where heating and cooling equipment meets the requirements of Section N1104.

10. Revise as follows:

N1103.4 Service hot water systems.

~~**N1103.4**~~ **N1103.4.1 Circulating hot water systems (Mandatory).** ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

11. Add new text and table as follows:

N1103.4.2 Hot water pipe insulation (Prescriptive). Insulation with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 inch nominal diameter;
2. Piping serving more than one dwelling unit;
3. Piping from the water heater to kitchen outlets;
4. Piping located outside the conditioned space;
5. Piping from the water heater to a distribution manifold;
6. Piping located under a floor slab;
7. Buried piping; and
8. Supply and return piping in recirculation systems other than demand recirculation systems.

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table N1103.4.2.

TABLE N1103.4.2
MAXIMUM RUN LENGTH (feet)[a]

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length	30	20	10	5

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

12. Revise as follows:

N1103.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of Section M1507 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

13. Add new text as follows:

N1104 Improved equipment efficiency alternative. (Prescriptive) For new residences, Sections N1104.1 and N1102.2 shall be permitted as an alternative to certain requirements as specified by exceptions in Sections N1102.4.1.2, N1103.2.2, and N1103.2.4.

N1104.1 Heating equipment. In zones 3 and 4 gas furnace AFUE shall be at least 90. In zones 5 through 8, gas furnace AFUE shall be at least 92. In zones 3 through 8, gas boiler, oil boiler, or oil furnace AFUE shall be at least 85. In zones 3 through 8, heat pump HSPF shall be at least 8.5. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2). All-electric heated buildings shall utilize either an air-source or ground source heat pump.

N1104.2 Cooling equipment. In zones 1 and 2, vapor compression air conditioning SEER shall be at least 16.0 and EER at least 12.5. In zone 3, vapor compression air conditioning SEER shall be at least 15.0 and EER at least 12.5. In zones 1 through 3, room air conditioner EER shall be at least 11.0 for air conditioners with capacity less than 20,000 Btu/hr, or 10.0 for capacities equal to or greater than 20,000 Btu/hr. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2).

N1104.2.3 Future updates to federal manufacturing standards. If applicable Federal manufacturing standards as specified in 10 CFR 430 are updated to establish new efficiency requirements, equipment efficiency requirements in this section shall be improved by a percentage equivalent to the percentage improvement from the efficiency required by 10 CFR 430 as of January 1, 2011 to the efficiency required by 10 Code of Federal Regulations 430 at the date of plan check approval.

> **Exception:** AFUEs for furnaces and boilers shall not be required to exceed the higher of 95 or the requirement in 10 CFR 430 at the date of plan check approval.

14. Revise as follows:

SECTION ~~N1104~~ N1105
LIGHTING SYSTEMS

~~N1104.1~~ N1105.1 Lighting equipment. A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

> **Exception:** Low-voltage lighting.

15. Add new standard to Chapter 44 as follows:

DOE
10 CFR, Part 430 Energy Conservation Standards
