TABLE OF CONTENTS

INTRODUCTION

This publication contains the Final Action Agenda for consideration at the Final Action Hearings of the International Code Council on May 15 – 23, 2010 at the Sheraton Dallas Hotel in Dallas, TX (see page viii). See page xxvii for hearing schedule.

This publication contains information necessary for final action consideration of the proposed code changes which have been considered in the ICC Code Development Hearings held on October 24 – November 11, 2009 at the Hilton Baltimore in Baltimore, MD. More specifically, this agenda addresses final action consideration for proposed code changes to the *International Building Code, International, International Existing Building Code, International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Private Sewage Disposal Code, International Residential Code,* and *International Wildland-Urban Interface Code,* considered by the respective Code Committee at the Code Development Hearings.

ICC GOVERNMENTAL MEMBER REPRESENTATIVES

Council Policy #28-Code Development (page xiii) requires that ICC's membership records regarding ICC Governmental Member Representatives reflect the eligible voters **10 days prior** to the start of the Final Action Hearing. This includes new as well as changes to voting status. Section 7.4 of CP #28 (page xxiii) reads as follows:

> **7.4** **Eligible voters:** ICC Governmental Member Representatives and Honorary Members in attendance at the Final Action Hearing shall have one vote per eligible attendee on all International Codes. Applications, whether new or updated, for governmental member voting representative status must be received by the Code Council ten days prior to the commencement of the first day of the Final Action Hearing in order for any designated representative to be eligible to vote.

As such, new and updated eligible voter status must be received by ICC's Member Services Department by May 4, 2010. As noted in Section 2.1.1.1 of the Bylaws, this must be done in writing – via either a letter or a form which can be downloaded from the Members-Only area of the ICC website. This can be mailed, faxed to 205-591-0775 or emailed as an attachment to members@iccsafe.org. These records will be used to verify eligible voter status for the Final Action Hearing. Voting members are strongly encouraged to review their membership record for accuracy well in advance of the Final Action Hearing so that any necessary changes are made prior to the May 4, 2010 deadline.

ADVANCE REGISTRATION

In addition to the Final Action Hearings, ICC will be presenting an educational opportunity on Friday, May 14. Please see p. ix for the registration form and information on the Dallas Tour. **All attendees to the Final Action Hearings are required to register. Registration (see page ix) for the Final Action Hearings is FREE, and is necessary to verify voting status (see above). You are encouraged to register prior to the Final Action Hearings.**

NOTICE: If you or your companion require special accommodations to participate fully, please advise ICC of your needs.

AGENDA FORMAT

The Final Action Agenda includes the Consent Agenda and the Individual Consideration Agenda. The Consent Agenda is comprised of proposed changes to the 2009 editions of the International Codes which did not receive a successful assembly action or public comment, and therefore are not listed on the Individual Consideration Agenda.

The Individual Consideration Agenda is comprised of proposed changes to the 2009 editions of the International Codes which received a successful assembly action or received a public comment in response to the Code Committee's action at the Code Development Hearings.

Items on the Individual Consideration Agenda are published with information as originally published for the Code Development Hearing as well as the published hearing results. Following the hearing results is the reason that the item is on the Individual Consideration Agenda followed by the public comments which were received.

Public testimony will follow the *CP#28-05 Code Development* as published on page xiii. Refer to the tentative hearing order on page xxvii.

MODIFICATIONS BY ASSEMBLY ACTION AND PUBLIC COMMENT

CP#28-05 Code Development allows modifications to be proposed by the assembly at the Code Development Hearings and by a public comment to code changes for consideration on the Individual Consideration Agenda at the Final Action Hearings. Therefore, some proposed changes may have up to five possible motions - Approval as Submitted, Approval as Modified by the Code Committee, Approval as Modified by a successful Assembly Action, Approval as Modified by a Public Comment, or Disapproval.

CONSENT AGENDA

The Final Action Consent Agenda consists of proposals which have neither an assembly action nor public comments. The Final Action Consent Agenda for each code or segment of code changes will be placed before the assembly with a single motion for final action in accordance with the results of the Code Development Hearing at the beginning of the respective portion of the hearings. For codes which have no code change proposals on the Individual Consideration Agenda, a motion for the final action in accordance with the results of the Code Development Hearing will be placed before the assembly at the beginning of the hearings.

INDIVIDUAL CONSIDERATION AGENDA

The Final Action Individual Consideration Agenda is comprised of proposals which have an assembly action or public comment. This includes code changes which affect only one code (i.e. FG12-09/10) and code changes which affect multiple codes and were considered individually at the Code Development Hearings by the respective Code Committee (i.e. F120-09/10: Part I-Fire Committee; Part II-IRC Building/Energy Committee). Where a public comment was submitted to more than one part of the code change proposal (i.e. FS156-09/10), each part of the code change is heard with the code in which the proposal was originally published, but each part is published separately (F1S156-09/10 Part I and FS156-09/10 Part II) and considered separately. In some cases, code change proposals which affect multiple codes received a public comment to only one code (i.e. FS107-09/10 Part II). In such cases, the public comment to the code change is heard with the code that is the subject of the public comment (in this case, the IFC). All proposed changes on the Individual Consideration Agenda shall be placed before the assembly for individual consideration of each item. The hearing order is found on page xxvii and the agenda starts on page 1. There are some exceptions in the hearing order for the placement of code change proposals. Please review the hearing order on pages xxviii-xxx to see these exceptions.

ICC WEBSITE - WWW.ICCSAFE.ORG

While great care has been exercised in the publication of this document, there may be errata posted for the Final Action Agenda. Errata, if any, identified prior to the Final Action Hearings will be posted on the ICC website at www.iccsafe.org. Users are encouraged to periodically review the ICC Website for updates to errata to the 2009/2010 Final Action Agenda.

ELECTRONIC VOTING

Electronic voting by the ICC Governmental Member Representative in attendance at the Final Action Hearings which was first tried in Rochester during the 2007 Final Action Hearings, will continue to be used in Dallas, TX. Eligible voters will be issued a handheld device to be used to cast their vote.

VIEW THE FINAL ACTION HEARINGS ON YOUR PC

The Final Action Hearings are scheduled to be “webcast”. Streaming video broadcast over the Internet will provide a gateway for all International Code Council members, the construction industry and other interested parties anywhere in the world to view and listen to the hearings. Logging on to the Internet broadcast will be as simple as going to the International Code Council web site, www.iccsafe.org, and clicking on a link. [Actual site to be determined - be sure to check the ICC web site for further details].

The hearings can be seen free by anyone with Internet access. Minimum specifications for viewing the hearings are an Internet connection, sound card and Microsoft Windows Media Player. DSL, ISDN, Cable Modems or other leased-line connections are recommended for the best viewing experience. A dial-up modem connection will work, but with reduced video performance.

Spring 2010 Group A Final Action Hearings

May 14-23 - Sheraton Dallas Hotel - Dallas, TX

The Sheraton Dallas Downtown will be the host for the 2010 Group A Final Action Hearings. This downtown Dallas location is located in the Arts and Financial District near the American Airlines Center, the historic 6th Floor Museum and great dining options.

Group A Final Action Hearings will include IBC (all groups), IEBC, IFC, IFGC, IMC IPC, IRC (only Building, Mechanical and Plumbing) and IWUIC.

HEARING SCHEDULE NOW AVAILABLE!

Dallas Building Tour - Friday, May 14

Come learn about the architecture and local code challenges by attending an educational and exciting Dallas Building Tour. Students will see firsthand how architects and builders are bringing more sustainable buildings and housing to Dallas. There will be two different tours hosted by individuals who have extensive local code knowledge. **Students can earn up to .5 ICC CEUs & AIA CEU's for participating in this educational tour. The fee is $63 for each tour.**

1st Tour: 9:00 am-11:30 am

Location #1: This 3,500 square-foot home takes the shape of a two story box. Around two sides an engawa, a veranda of Japanese origin, anchors a liner garden and morphs into an enclosed porch on the upper level. Innovate building materials include cast-in-place board-form concrete, red-painted hardy plank (over conventional wood frame), foam insulation and more. Explore this home with the architect involved in the project.

Location #2: An existing 7,500 sq-ft PowerStation built in the 1920's is being converted to a single-family residence/exhibition space. A new stair and elevator tower are being added along with other mep upgrades inside.

2nd Tour: 1:00 pm - 3:30 pm

Location #1: This LEED gold home, built to exceptional standards less than a year ago, is located in a developed, gated community in Dallas. The owner, a retired engineer, and his wife were very active in all aspects of the design/construction process. From the metal roof, providing lasting durability and insurance savings, to the strategically sited windows, filling the home with natural light without the unwanted solar heat gain, to the flexible HVAC system, functioning efficiently either for the small family or large social gatherings, to the exquisite furnishings, thoughtfully chosen sustainable materials throughout, the design strategies were carefully examined and implemented. The landscaping has incorporated a buried 1700 gallon tank, collecting storm water and roof runoff and used to support the drip irrigation system. The turf area was reduced to less than 15%, and there is extensive use of native plantings which results in less need for additional municipal water. You will have the opportunity to tour this exciting LEED Gold home with the owner, architect and builder.

Location #2: This exciting NetZero home will take your breath away. NetZero energy buildings are very energy efficient. From the energy efficient windows to the solar hot water heater, this home is an extrordinary green house. Please check back on this website for more information about this exciting home.

GET INVOLVED—ICC COMMITTEES

The ICC relies upon the work and expertise of volunteers to develop and maintain the I-Codes and the ICC Standards. The ICC does this through committees that review and approve code change proposals, interpret the codes, draft standards, and review code correlation issues.

Code Committees

The ICC Code Committees are an instrumental part of the ICC Code Development Process. There are currently 16 Code Committees, responsible for the review and evaluation of code change proposals submitted to 14 *International Codes*. The Code Committees for the 2012/2013 Code Development Cycle will hear the code change proposals at the 2012 or 2013 Code Development Hearings, depending upon the Group into which the code committee is placed. Deadline for application to all code committees is June 1, 2011. Current Code Committee members interested in serving are required to re-apply.

Interpretation Committees

The purpose of the ICC Interpretation Committees is to provide technical support for adopting jurisdictions by processing official interpretations for the *International Codes*. Committee Interpretations represent the official position of the ICC but in all cases, the final authority on matters of interpretation is the code official. There are currently 5 ICC Interpretation Committees. Committee travel is not anticipated - the committee conducts its business via correspondence. Current Interpretation Committee members interested in serving are required to re-apply.

Code Correlation Committee

The Code Correlation Committee is responsible for evaluating matters of consistency, coordination and format in the *International Codes*. This includes determining matters of maintenance responsibility of Code Committees and identification of technical and editorial revisions necessary in the *International Codes*. Committee travel is anticipated. Current Code Correlation Committee members interested in serving are required to re-apply.

CP# 28-05 CODE DEVELOPMENT

Approved: 9/24/05
Revised: 2/27/09

CP # 28-05 is an update to *ICC's Code Development Process for the International Codes* dated May 15, 2004.

1.0 Introduction

1.1 Purpose: The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).

1.2 Objectives: The ICC Code Development Process has the following objectives:

1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.

1.2.2 The open discussion of proposals by all parties desiring to participate.

1.2.3 The final determination of Code text by officials representing code enforcement and regulatory agencies and by honorary members.

1.3 Code Publication: The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.

1.3.1 Code Correlation: The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. Where a given subject matter or code text could appear in more than one Code, the ICC Board shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for review and maintenance of the code text. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.4.

1.4 Process Maintenance: The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which ICC codes are developed embodies core principles of the organization. One of those principles is that the final content of ICC codes is determined by a majority vote of the governmental and honorary members. It is the policy of the Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

1.5 Secretariat: The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals and public comments shall be addressed to the Secretariat.

1.6 Video Taping: Individuals requesting permission to video tape any meeting, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that they have insurance coverage for liability and misuse of video tape materials. Equipment and the process used to video tape shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the videotaping. An unedited copy of the video tape shall be forwarded to ICC within 30 days of the meeting.

2.0 Code Development Cycle

2.1 Intent: The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 3.5) and ending with publication of final action on the code change proposals (see Section 7.6).

2.2 New Editions: The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the last edition.

2.3 Supplements: The results of code development activity between editions may be published.

2.4 Emergency Procedures: In the event that the ICC Board determines that an emergency

amendment to any Code is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.
The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the ICC Governmental Member Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

3.0 Submittal of Code Change Proposals

3.1 Intent: Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

3.2 Withdrawal of Proposal: A code change proposal may be withdrawn by the proponent (WP) at any time prior to Final Action Consideration of that proposal. A withdrawn code change proposal shall not be subject to a public hearing, motions, or Final Action Consideration.

3.3 Form and Content of Code Change Submittals: Each code change proposal shall be submitted separately and shall be complete in itself. Each submittal shall contain the following information:

3.3.1 Proponent: Each code change proposal shall include the name, title, mailing address, telephone number, and email address of the proponent.

3.3.1.1 If a group, organization or committee submits a code change proposal, an individual with prime responsibility shall be indicated.

3.3.1.2 If a proponent submits a code change on behalf of a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated.

3.3.2 Code Reference: Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.

3.3.2.1 If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.

3.3.2.2 If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.

3.3.3 Multiple code change proposals to a code section. A proponent shall not submit multiple code change proposals to the same code section. When a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 4.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.

3.3.4 Text Presentation: The text proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.

3.3.4.1 A charging statement shall indicate the referenced code section(s) and whether the proposal is intended to be an addition, a deletion or a revision to existing Code text.

3.3.4.2 Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.

3.3.4.3 Each proposal shall be in proper code format and terminology.

3.3.4.4 Each proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.

3.3.4.5 The proposed text shall be in mandatory terms.

3.3.5 Supporting Information: Each code change proposal shall include sufficient supporting information to indicate how the proposal is intended to affect the intent and application of the Code.

3.3.5.1 Purpose: The proponent shall clearly state the purpose of the proposed code change (e.g. clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.)

3.3.5.2 Reasons: The proponent shall justify changing the current Code provisions, stating why the proposal is superior to the current provisions of the Code. Proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such proposals will improve the Code.

3.3.5.3 Substantiation: The proponent shall substantiate the proposed code change based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the proposed code change shall be identified as such. The proponent shall be notified that the proposal is considered an incomplete proposal in accordance with Section 4.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal.

3.3.5.4 Bibliography: The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing.

3.3.5.5 Copyright Release: The proponent of code change proposals, floor modifications and public comments shall sign a copyright release reading: "I hereby grant and assign to ICC all rights in copyright I may have in any authorship contributions I make to ICC in connection with any proposal and public comment, in its original form submitted or revised form, including written and verbal modifications submitted in accordance Section 5.5.2. I understand that I will have no rights in any ICC publications that use such contributions in the form submitted by me or another similar form and certify that such contributions are not protected by the copyright of any other person or entity."

3.3.5.6 Cost Impact: The proponent shall indicate one of the following regarding the cost impact of the code change proposal: 1) the code change proposal will increase the cost of construction; or 2) the code change proposal will not increase the cost of construction. This information will be included in the published code change proposal.

3.4 Number: One copy of each code change proposal, two copies of each proposed new referenced standard and one copy of all substantiating information shall be submitted. Additional copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the code development committee. Where such additional copies are requested, it shall be the responsibility of the proponent to send such copies to the respective code development committee. A copy of the code change proposal in electronic form is preferred.

3.5 Submittal Deadline: Each code change proposal shall be received at the office of the Secretariat by the posted deadline. Such posting shall occur no later than 120 days prior to the code change deadline. The submitter of a proposed code change is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

3.6 Referenced Standards: In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

3.6.1 Code References:

3.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.

3.6.1.2 The need for the standard to be referenced shall be established.

3.6.2 Standard Content:

3.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.

3.6.2.2 The standard shall be appropriate for the subject covered.

3.6.2.3 All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.

3.6.2.4 The scope or application of a standard shall be clearly described.

3.6.2.5 The standard shall not have the effect of requiring proprietary materials.

3.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.

3.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.

3.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.

3.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.

3.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.

3.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

3.6.3 Standard Promulgation:

3.6.3.1 Code change proposals with corresponding changes to the code text which include a reference to a proposed new standard or a proposed update of an existing referenced shall comply with this section. The standard shall be completed and readily available prior to Final Action Consideration based on the cycle of code development which includes the proposed code change proposal. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 4.5.

3.6.3.2 The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

4.0 Processing of Proposals

4.1 Intent: The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published proposal accurately reflects that proponent's intent.

4.2 Review: Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, number of copies, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different code committees, the Secretariat shall determine the code committee responsible for determining the committee action in accordance with Section 5.6.

4.3 Incomplete Proposals: When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies addressed by this section, a proposal that incorporates a new referenced standard shall be processed with an analysis of referenced standard's compliance with the criteria set forth in Section 3.6.

4.4 Editorial: The Chief Executive Officer shall have the authority at all times to make editorial and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. An editorial or format change is a text change that does not affect the scope or application of the code requirements.

4.5 Updating Standards:

4.5.1 Standards referenced in the 2012 Edition of the I-Codes: The updating of standards referenced by the Codes shall be accomplished administratively by the Administrative code development committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1, 2011. The published version of the 2012 Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued Multiple standards to be updated may be included in a single proposal.

4.5.2 Standards referenced in the 2015 Edition and following Editions of the I-Codes: The updating of standards referenced by the Codes shall be accomplished administratively by the Administrative code development committee in accordance with these full procedures except that multiple standards to be updated may be included in a single proposal. The standard shall be completed and readily available prior to Final Action Consideration of the Administrative code change proposal which includes the proposed update.

4.6 Preparation: All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned separate, distinct and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 3.3.2 to facilitate the hearing process.

4.7 Publication: All code change proposals shall be posted on the ICC website at least 30 days prior to the public hearing on those proposals and shall constitute the agenda for the public hearing. Code change proposals which have not been published shall not be considered.

5.0 Public Hearing

5.1 Intent: The intent of the public hearing is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The code development committee will consider such comments as may be presented in the development of their action on the disposition of such proposals. At the conclusion of the code development committee deliberations, the committee action on each code change proposal shall be placed before the hearing assembly for consideration in accordance with Section 5.7.

5.2 Committee: The Code Development Committees shall be appointed by the applicable ICC Council.

5.2.1 Chairman/Moderator: The Chairman and Vice-Chairman shall be appointed by the Steering Committee on Councils from the appointed members of the committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the public hearing.

5.2.2 Conflict of Interest: A committee member shall withdraw from and take no part in those matters with which the committee member has an undisclosed financial, business or property interest. The committee member shall not participate in any committee discussion on the matter or any committee vote. Violation thereof shall result in the immediate removal of the committee member from the committee. A committee member who is a proponent of a proposal shall not participate in any committee discussion on the matter or any committee vote. Such committee member shall be permitted to participate in the floor discussion in accordance with Section 5.5 by stepping down from the dais.

5.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the committee.

5.2.4 Committee Composition: The committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the committee members shall be regulators.

5.3 Date and Location: The date and location of each public hearing shall be announced not less than 60 days prior to the date of the public hearing.

5.4 General Procedures: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the public hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the committee.

5.4.1 Chair Voting: The Chairman of the committee shall vote only when the vote cast will break a tie vote of the committee.

5.4.2 Open Meetings: Public hearings of the Code Development Committees are open meetings. Any interested person may attend and participate in the Floor Discussion and Assembly Consideration portions of the hearing. Only eligible voters (see Section 5.7.4) are permitted to vote on Assembly Considerations. Only Code Development Committee members may participate in the Committee Action portion of the hearings (see Section 5.6).

5.4.3 Presentation of Material at the Public Hearing: Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 5.5.2. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 3.3.4.4 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the code development committee at the public hearing.

5.4.4 Agenda Order: The Secretariat shall publish an agenda for each public hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.

5.4.5 Reconsideration: There shall be no reconsideration of a proposed code change after it has been voted on by the committee in accordance with Section 5.6; or, in the case of assembly consideration, there shall be no reconsideration of a proposed code change after it has been voted on by the assembly in accordance with Section 5.7.

5.4.6 Time Limits: Time limits shall be established as part of the agenda for testimony on all proposed changes at the beginning of each hearing session. Each person requesting to testify on a change shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

5.4.6.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

5.4.6.2 Proponent Testimony: The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

5.4.7 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator or the Chairman. A majority vote of the eligible voters as determined in Section 5.7.4 shall determine the decision.

5.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

5.5.1 Discussion Order:

1. *Proponents.* The Moderator shall begin by asking the proponent and then others in support of the proposal for their comments.
2. *Opponents.* After discussion by those in support of a proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. *Rebuttal in support.* Proponents shall then have the opportunity to rebut points raised by the opponents.
4. *Rerebuttal in opposition.* Opponents shall then have the opportunity to respond to the proponent's rebuttal.

5.5.2 Modifications: Modifications to proposals may be suggested from the floor by any person participating in the public hearing. The person proposing the modification is deemed to be the proponent of the modification.

5.5.2.1 Submission and Written Copies. All modifications must be written, unless determined by the Chairman to be either editorial or minor in nature. The modification proponent shall provide 20 copies to the Secretariat for distribution to the committee.

5.5.2.2 Criteria. The Chairman shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. is not legible, unless not required to be written in accordance with Section 5.5.2.1; or
2. changes the scope of the original proposal; or
3. is not readily understood to allow a proper assessment of its impact on the original proposal or the code.

The ruling of the Chairman on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 5.4.7.

5.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairman, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 5.5.1.

5.6 Committee Action: Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the committee.

1. Approve the code change proposal as submitted (AS) or
2. Approve the code change proposal as modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to Code Development Committee members. If a committee member proposes a modification which had not been proposed during floor discussion, the Chairman shall rule on the modification in accordance with Section 5.5.2.2 If a committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume committee discussion.

The Code Development Committee shall vote on each motion with the majority dictating the committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each committee vote shall be supported by a reason.

The Code Development Committee shall maintain a record of its proceedings including the action on each code change proposal.

5.7 Assembly Consideration: At the conclusion of the committee's action on a code change proposal and before the next code change proposal is called to the floor, the Moderator shall ask for a motion from the public hearing attendees who may object to the committee's action. If a motion in accordance with Section 5.7.1 is not brought forward on the committee's action, the results of the public hearing shall be established by the committee's action. If a motion in accordance with Section 5.7.1 is brought forward and is sustained in accordance with Section 5.7.3, both the committee's action and the assemblies' action shall be reported as the results of the public hearing. Where a motion is sustained in accordance with Section 5.7.3, such action shall be the initial motion considered at Final Action Consideration in accordance with Section 7.3.8.2.

5.7.1 Floor Motion: Any attendee may raise an objection to the committee's action in which case the attendee will be able to make a motion to:

1. Approve the code change proposal as submitted from the floor (ASF), or
2. Approve the code change proposal as modified from the floor (AMF) with a specific modification that has been previously offered from the floor and ruled in order by the Chairman during floor discussion (see Section 5.5.2) or has been offered by a member of the Committee and ruled in order by the Chairman during committee discussion (see Section 5.6), or
3. Disapprove the code change proposal from the floor (DF).

5.7.2 Discussion: On receipt of a second to the floor motion, the Moderator shall place the otion before the assembly for a vote. No additional testimony shall be permitted.

5.7.3 Assembly Action: The assembly action shall be in accordance with the following majorities based on the number of votes cast by eligible voters (See 5.7.4).

Committee Action	**Desired Assembly Action**		
	ASF	**AMF**	**DF**
AS	**--**	**2/3 Majority**	**2/3 Majority**
AM	**2/3 Majority**	**2/3 Majority**	**2/3 Majority**
D	**2/3 Majority**	**2/3 Majority**	--

5.7.4 Eligible Voters: All members of ICC in attendance at the public hearing shall be eligible to vote on floor motions. Only one vote authorized for each eligible attendee. Code Development Committee members shall be eligible to vote on floor motions. Application, whether new or updated, for ICC membership must be received by the Code Council ten days prior to the commencement of the first day of the public hearing.

5.8 Report of the Public Hearing: The results of the public hearing, including committee action and successful assembly action, shall be posted on the ICC website not less than 60 days prior to Final Action Consideration except as approved by the ICC Board.

6.0 Public Comments

6.1 Intent: The public comment process gives attendees at the Final Action Hearing an opportunity to consider specific objections to the results of the public hearing and more thoughtfully prepare for the discussion for Final Action Consideration. The public comment process expedites the Final Action Consideration at the Final Action Hearing by limiting the items discussed to the following:

6.1.1 Consideration of items for which a public comment has been submitted; and
6.1.2 Consideration of items which received a successful assembly action at the public hearing.

6.2 Deadline: The deadline for receipt of a public comment to the results of the public hearing shall be announced at the public hearing but shall not be less than 30 days from the availability of the report of the results of the public hearing (see Section 5.8).

6.3 Withdrawal of Public Comment: A public comment may be withdrawn by the public commenter at any time prior to Final Action Consideration of that comment. A withdrawn public comment shall not be subject to Final Action Consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 7.3.4, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 7.3.4, the proposal shall continue as part of the individual consent agenda in accordance with Section 7.3.5, however the public comment shall not be subject to Final Action Consideration.

6.4 Form and Content of Public Comments: Any interested person, persons, or group may submit a public comment to the results of the public hearing which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

6.4.1 Public comment: Each public comment shall include the name, title, mailing address, telephone number and email address of the public commenter. If group, organization, or committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal, committee action or successful assembly action. Public comments which are determined as not within the scope of the code change proposal, committee action or successful assembly action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 3.3.4.5 shall be provided with the public comment.

6.4.2 **Code Reference:** Each public comment shall include the code change proposal number and the results of the public hearing, including successful assembly actions, on the code change proposal to which the public comment is directed.

6.4.3 **Multiple public comments to a code change proposal.** A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 6.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

6.4.4 **Desired Final Action:** The public comment shall indicate the desired final action as one of the following:

1. Approve the code change proposal as submitted (AS), or
2. Approve the code change proposal as modified (AM) by one or more specific modifications published in the Results of the Public Hearing or published in a public comment, or
3. Disapprove the code change proposal (D)

6.4.5 **Supporting Information:** The public comment shall include in a statement containing a reason and justification for the desired final action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 6.4 and determined as not germane to the technical issues addressed in the code change proposal or committee action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with the policy of the ICC Board. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Final Action Hearing.

6.4.6 **Number:** One copy of each public comment and one copy of all substantiating information shall be submitted. Additional copies may be requested when determined necessary by the Secretariat. A copy of the public comment in electronic form is preferred.

6.5 **Review:** The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (See Section 4.2).

6.5.1 **Incomplete Public Comment:** When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

6.5.2 **Duplications**: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for Final Action Consideration. Each public commenter shall be notified of this action when it occurs.

6.5.3 **Deadline:** Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the Final Action Consideration.

6.6 **Publication:** The public hearing results on code change proposals that have not been public commented and the code change proposals with public commented public hearing results and successful assembly actions shall constitute the Final Action Agenda. The Final Action Agenda shall be posted on the ICC website at least 30 days prior to Final Action consideration.

7.0 Final Action Consideration

7.1 Intent: The purpose of Final Action Consideration is to make a final determination of all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 7.4).

7.2 Agenda: The final action consent agenda shall be comprised of proposals which have neither an assembly action nor public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a successful assembly action or public comment (see Sections 5.7 and 6.0).

7.3 Procedure: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Final Action Consideration except as these Rules of Procedure may otherwise dictate.

7.3.1 Open Meetings: Public hearings for Final Action Consideration are open meetings. Any interested person may attend and participate in the Floor Discussion.

7.3.2 Agenda Order: The Secretariat shall publish an agenda for Final Action Consideration, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.

7.3.3 Presentation of Material at the Public Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 6.4.4 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

7.3.4 Final Action Consent Agenda: The final action consent agenda (see Section 7.2) shall be placed before the assembly with a single motion for final action in accordance with the results of the public hearing. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion.

7.3.5 Individual Consideration Agenda: Upon completion of the final action consent vote, all proposed changes not on the final action consent agenda shall be placed before the assembly for individual consideration of each item (see Section 7.2).

7.3.6 Reconsideration: There shall be no reconsideration of a proposed code change after it has been voted on in accordance with Section 7.3.8.

7.3.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all proposed changes at the beginning of each hearing session. Each person requesting to testify on a change shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

7.3.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

7.3.8 Discussion and Voting: Discussion and voting on proposals being individually considered shall be in accordance with the following procedures:

7.3.8.1 Allowable Final Action Motions: The only allowable motions for final action are Approval as Submitted, Approval as Modified by one or more modifications published in the Final Action Agenda, and Disapproval.

7.3.8.2 Initial Motion: The Code Development Committee action shall be the initial motion considered, unless there was a successful assembly action in accordance with Section 5.7.3. If there was a successful assembly action, it shall be the initial motion considered. If the assembly action motion fails, the code development committee action shall become the next motion considered.

7.3.8.3 **Motions for Modifications:** Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Final Action Agenda may be made (see Section 6.4.3). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.

7.3.8.4 **Voting:** After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. If the motion fails to receive the majority required in Section 7.5, the Moderator shall ask for a new motion.

7.3.8.5 **Subsequent Motion:** If the initial motion is unsuccessful, a motion for one of the other allowable final actions shall be made (see Section 7.3.8.1) and dispensed with until a successful final action is achieved. If a successful final action is not achieved, Section 7.5.1 shall apply.

7.3.9 **Proponent testimony:** The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

7.3.10 **Points of Order:** Any person participating in the public hearing may challenge a procedural ruling of the Moderator. A majority vote of the eligible voters as determined in Section 5.7.4 shall determine the decision.

7.4 **Eligible voters:** ICC Governmental Member Representatives and Honorary Members in attendance at the Final Action Hearing shall have one vote per eligible attendee on all International Codes. Applications, whether new or updated, for governmental member voting representative status must be received by the Code Council ten days prior to the commencement of the first day of the Final Action Hearing in order for any designated representative to be eligible to vote.

7.5 **Majorities for Final Action:** The required voting majority based on the number of votes cast of eligible voters shall be in accordance with the following table:

Public Hearing Action (see note)	**Desired Final Action**		
	AS	**AM**	**D**
AS	Simple Majority	2/3 Majority	Simple Majority
AM	2/3 Majority	Simple Majority to sustain the Public Hearing Action or; 2/3 Majority on additional modifications and 2/3 on overall AM	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

Note: The Public Hearing Action includes the committee action and successful assembly action.

7.5.1 **Failure to Achieve Majority Vote:** In the event that a code change proposal does not receive any of the required majorities for final action in Section 7.5, final action on the code change proposal in question shall be disapproval.

7.6 **Publication:** The Final action on all proposed code changes shall be published as soon as practicable after the determination of final action. The exact wording of any resulting text modifications shall be made available to any interested party.

8.0 **Appeals**

8.1 **Right to Appeal:** Any person may appeal an action or inaction in accordance with CP-1.

2009-2010 ICC CODE DEVELOPMENT CYCLE
ERRATA TO THE 2009
REPORT OF THE PUBLIC HEARING

INTERNATIONAL FIRE CODE

F69-09/10 Replace as follows:

Committee Action: Approved as Modified

Modify the proposal as follows:

903.2.4 (IBC [F] 903.2.4) Group F-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. Where a Group F-1 fire area exceeds 12,000 square feet (1115 m^2);
2. Where a Group F-1 fire area is located more than three stories above grade plane; or
3. Where the combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. Where a Group F-1 occupancy ~~is~~ used for the manufacture of upholstered furniture or mattresses <u>exceeds 2,500 square feet (232 m^2).</u>

.

903.2.7 (IBC [F] 903.2.7) Group M. An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. Where a Group M fire area exceeds 12,000 square feet (1115 m^2);
2. Where a Group M fire area is located more than three stories above grade plane; or
3. Where the combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2). ; or
4. Where a Group M occupancy ~~is~~ used for the display and sale of upholstered furniture or mattresses <u>exceeds 5,000 square feet (464 m^2).</u>

903.2.9 (IBC [F] 903.2.9) Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1115 m^2);
2. A Group S-1 fire area is located more than three stories above grade plane; or
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group S-1 fire area used for the storage of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m^2).
5. <u>Where</u> A Group S-1 occupancy ~~is~~ used for the storage of upholstered furniture or mattresses <u>exceeds 2,500 square feet (232 m^2).</u>

Committee Reason: The committee approved the proposal as they felt that Group F-1 and Group S-1 occupancies manufacturing and storing upholstered furnishings and mattresses pose the same hazard to occupants and fire fighters that Group M occupancies displaying and selling such materials. The proposal was modified to provide a reasonable threshold that would not penalize occupancies with very small amounts of such materials. These thresholds were based on the thresholds in Chapter 23 of the IFC with regard to size of high piled storage areas.

Assembly Action: None

IRC – PLUMBING

RP13-09/10

Committee Action: Approved as Modified

Modify Section 2904.2.3.2 of the proposal as follows:

P2904.2.4.2 Obstructions to coverage. Sprinkler discharge shall not be blocked by obstructions unless additional sprinklers are installed to protect the obstructed area. Additional sprinklers shall not be required where the sprinkler separation from obstructions complies with either of the minimum distance indicated in Table P2904.2.4.2 ~~and~~ or the minimum distances specified in the sprinkler manufacturer's instructions where the manufacturer's instructions permit a lesser distance.

Committee Reason: Modification made to clarify that the distance between a sprinkler and an obstruction can be less than that indicated in the table as long as manufacturer allows the lesser distance. Proposed change will provide greater flexibility in locating sprinklers.

Assembly Action: None

Reason: These changes were approved at the Baltimore hearing according to my notes, but they were not reflected in the Committee Report. They are intended to be editorial, and as written currently, the text makes no sense.

IBC – GENERAL

G28-09/10 Part II - See text at the end of Exception 2.

PART II – IRC – B/E

Committee Action: Disapproved

Committee Reason: The committee feels this is a good change but it needs more work. The term "to be constructed" implies new construction and renovations need to be addressed. Also, some of the distinctions would be better suited in the Zoning Code rather than the IRC.

Assembly Action: Approved as Modified

R101.2 Scope. The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures*.

Exceptions:

1. Live/work units complying with the requirements of Section 419 of the *International Building Code* shall be permitted to be built as one- and two-family *dwellings* or townhouses. Fire suppression required by Section 419.5 of the *International Building Code* when constructed under the *International Residential Code for One- and Two-family Dwellings* shall conform to Section P2904 ~~903.3.1.3 of the *International Building Code*~~.
2. Owner occupied lodging houses with five or fewer guest rooms shall be permitted to be constructed in accordance with the *International Residential Code for One- and Two-family Dwellings* when equipped with a fire sprinkler system complying with Section P2904.

(Portions of proposal not shown remain unchanged)

Reason for modification: The modification adds the term "owner occupied" and would aid the misinterpretation about accessibility. The modification also will assure these units will be sprinklered.

IBC – STRUCTURAL

S22-09/10, Parts I & II: Modifications to read as follows:

Modify the proposal as follows:

PHOTOVOLTAIC MODULES/SHINGLES. A roof covering composed of flat-plate photovoltaic modules fabricated into ~~sheets that resemble three-tab composite~~ shingles.

1507.17.3 Wind resistance. Photovoltaic modules/shingles shall be tested in accordance with procedures ~~adapted from~~ and acceptance criteria in ASTM D 3161. Photovoltaic modules/shingles shall comply with the classification requirements of Table 1507.2.7.1(2) for the appropriate

maximum basic wind speed. Photovoltaic modules/shingle packaging shall bear a label to indicate compliance with the procedures ~~adapted from~~ in ASTM D 3161 and the required classification from Table 1507.2.7.1(2).
(Portions not proposal not shown are unchanged)

S67-09/10: Modification to Item 7 in Table 1607.1 to read as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND MINIMUM CONCENTRATED LIVE LOADS [g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
7. Catwalks ~~for maintenance access~~	40	300

(Portions of table not shown are unchanged)

2010 FINAL ACTION HEARING SCHEDULE
May 15 – 23, 2010
Sheraton Dallas Hotel, Dallas, TX

The hearings will start on Saturday, May 15 instead of the originally scheduled Friday, May 14.

Unless noted by "Start no earlier than X am/pm," the hearing on each code will begin immediately upon completion of the hearings for the prior code. This includes moving the hearing up or back from the day indicated based on hearing progress. Actual start times for the various codes cannot be stipulated due to uncertainties in hearing progress.

The schedule anticipates that the hearings will be completed no later than 12:00 p.m. on Sunday, May 23. This may require adjustments to the daily start/end times based on hearing progress. Be sure to review the published hearing order for code changes that are heard with a code other than that indicated by the code change prefix (see note 4).

In accordance with the revised ICC Code Development Procedures, this hearing is the first of two Final Action Hearings to be conducted in 2010. The Final Action Hearings for the following codes will occur October 28 – November 1, 2010: Administrative; IECC; IPMC; IRC – Energy; and IZC.

Saturday May 15	Sunday May 16	Monday May 17	Tuesday May 18	Wednesday May 19	Thursday May 20	Friday May 21	Saturday May 22	Sunday May 23
Start 8 am	**Start 12 pm**	**Start 8 am**	**Start 8 am**	**Start 8 am**	**Start 8 am**	**Start 8 am**	**Start 8 am**	**Start 8 am**
IFGC	**IPC**	**IBC – Means of Egress**	**IBC – General**	**IBC – Fire Safety**	**IFC**	**IRC – Building**	**IEBC (Start no earlier than 8 am)**	**IBC – Structural**
IMC	**IRC-P**							
IRC-M	**IBC – Means of Egress (Start no earlier than 3 pm)**	**IBC – General (Start no earlier than 3 pm)**	**IBC – Fire Safety (Start no earlier than 3 pm)**	**IWUIC/IFC (Start no earlier than 3 pm)**	**IRC – Building (Start no earlier than 3 pm)**		**IBC – Structural**	
IPC								
End 6 pm	**End 6 pm**	**End 6 pm**	**End 6 pm**	**End 6 pm**	**End 6 pm**	**End 6 pm**	**End 6 pm**	**End 12 pm**

Notes:

1. Daily start and end hearing times are subject to change based on progress.

2. Due to the uncertainties in the hearing process, start times indicated as "Start no earlier than x am/pm" are conservatively estimated and are not intended to be scheduled targets.

3. Lunch breaks to be announced. The hearings are scheduled without a dinner break.

4. Consult the hearing order for code changes to be heard with a code other than the code under which the code change

is designated. For example, accessibility related changes to the IEBC ("EB" code changes) will be heard with the agenda of the IBC - Means of Egress.

TENTATIVE HEARING ORDER FOR EACH INDIVIDUAL CONSIDERATION AGENDA

Note: Code changes to be heard out of numerical order or to be heard with a different code designation are indented. Be sure to review the cross index on page xxxvii for code change which affect codes other than those under their respective code change number prefix.

2009/2010 ICC CODE DEVELOPMENT CYCLE
CROSS INDEX OF PROPOSED CODE CHANGES WITH PUBLIC COMMENTS

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of Staff Secretaries on page xiii. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this index are proposed code changes that include sections or codes other than those listed on page xiii. For example, International Building Code Section 307.2 is proposed for revision in code changes F186-09/10, F190-09/10, and F196-09/10. The International Building Code Chapter 3 is the responsibility of the IBC General Code Committee as listed in the table of Staff Secretaries. It is therefore identified in this index. Another example is Section 403.1 of the International Fuel Gas Code. The IFGC is maintained by the IFGC code committee, and the proposed revision to Section 403.1 was considered for revision in code change G16-09/10. In some instances, there are other subsections that are revised by an identified code change that are not included in the list. For example, numerous sections in Chapter 10 of the International Fire Code would be revised by the proposed changes to Chapter 10 of the IBC. This was done to keep the list brief enough for easy reference.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect the IMC, review the proposed code changes for the IMC Code Committee (listed with a M prefix) then review this cross reference for the IMC for proposed code changes published in other code change groups. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	PROPOSED CHANGE GROUP (see Table of Contents on page xliiii for location)
E	**International Building Code - Means of Egress**
EC	**International Energy Conservation Code**
EB	**International Existing Building Code**
F	**International Fire Code**

INTERNATIONAL FUEL GAS CODE

FG2-09/10
202

Proposed Change as Submitted

Proponent: Guy Tomberlin, Bluemont, VA, representing self

Add new definitions follows:

COMBUSTIBLE ASSEMBLY. Wall, floor, ceiling or other assembly constructed of one or more component materials that are not defined as noncombustible.

COMBUSTIBLE MATERIAL. Any material not defined as noncombustible.

NONCOMBUSTIBLE MATERIALS. Materials that, when tested in accordance with ASTM E 136, have at least three of four specimens tested meeting all of the following criteria:

1. The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than 54ºF (30ºC) above the furnace temperature at the beginning of the test.
2. There shall not be flaming from the specimen after the first 30 seconds.
3. If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.

Reason: These are the exact terms and definitions found in the IMC. They have been used for many years as the guiding principals for the installation of mechanical equipment. Please recall the first edition of the IMC which included fuel gas provisions, these were the definitions used. Since the IFGC fails to provide the definitions of these terms they are applied inconsistently and non-uniformly. Gypsum is a non combustible product according to the IBC however the application of gypsum in the IMC and IFGC is quite different. The IBC addresses gypsum when used to construct walls ceilings, etc.. In the IFGC, the only reference to gypsum would be when dealing with clearance to combustibles. It is common knowledge that gypsum is typically covered with a paper product which will in fact burn. It is not uncommon to see a brown or charred section of gypsum when it has been installed within the prohibited dimension of 6" for a single wall or 1" for a double wall chimney or vent (or connecter). You wouldn't want this situation any more than a wood stove installed to close to gypsum, there is no difference. Excessive heat next to paper will cause fire.

The testimony on this proposal has done nothing but create confusion in fact some actually want a third definition to be added to the IFGC. That is ridiculous. The current definition in the IMC is exactly what the IFGC needs to say. Yes, gypsum is noncombustible according to the IBC but as previously stated the reference to gypsum is entirely a different application in the IFGC. Paper burns and needs to be installed outside the allowable distances according to Section 308.

Cost Impact: This code change proposal will not increase the cost of construction.

ICCFILENAME: TOMBERLIN-FG5-202

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The 3 criteria in the definition of noncombustible are unenforceable. It is inappropriate to state testing requirements in a definition. The definition of noncombustible could cause code officials to require ASTM E136 testing of all materials commonly known to be noncombustible.

Assembly Action: **Approved as Submitted**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. Note that the assembly action, Approved as Submitted, will be the initial motion on the floor for consideration when this item is called.

Public Comment:

Richard Grace representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII request Approval as Submitted. Note that the assembly action, Approved as Submitted, will be the initial motion on the floor for consideration when this item is called.

Commenter's Reason: The confusing testimony on this subject is merely smoke and mirrors for no good reason. Gypsum board when used around fuel gas equipment such as venting systems is a combustible. This fundamental philosophy has been in the codes many years prior the International codes inception. Who hasn't seen charred gypsum board when installed to close to a heat source? It is covered with paper! This is not an over regulation, it only requires that when a clearance to a combustible is required, that gypsum board shall not be installed within those dimensions. This isn't about checking the testing or listing and labeling. This will not create any hardship on any installation, because this is already common practice. This gains consistency within the I codes, specifically the IMC, because that is the other code that identifies with the exact same applications.

Gypsum board is not necessarily a combustible according to the IBC for the reason that it is being used for a totally different purpose. This isn't about constructing walls and ceilings it is about safely installed systems and protection from fire.

Final Action: AS AM AMPC____ D

FG9-09/10
202

Proposed Change as Submitted

Proponents: James Ranfone, representing American Gas Association; Don Surrena, CBO, representing National Association of Home Builders (NAHB)

Revise definition as follows:

ROOM LARGE IN COMPARISON WITH SIZE OF THE APPLIANCE. Rooms having a volume equal to at least 12 times the total volume of a furnace, ~~water heater~~ or air-conditioning appliance and at least 16 times the total volume of a boiler. Total volume of the appliance is determined from exterior dimensions and is to include fan compartments and burner vestibules, when used. When the actual ceiling height of a room is greater than 8 feet (2438 mm), the volume of the room is figured on the basis of a ceiling height of 8 feet (2438 mm).

Reason:
(RANFONE)- The definition phrase "Room Large in Comparison with Size of the Appliance" is not used in relation to the installation of water heaters and therefore the term "water heater" is not technically appropriate for the definition. The phrase is only used in section 308.3(that covers air conditioning appliances) and section 308.4 (that covers central-heating boilers and furnaces).
(SURRENA)- In the 2009 IFGC the words "water heater" were added to this definition. There already exist requirements in the IFGC to cover the issue of volume of space for fuel fired appliances. Specifically, Section 304.5 covers indoor combustion air, relating to the required volume of the room. The change to this definition does not take into consideration compensation for the use of outside air, nor does it defer to manufactures installation instructions. By adding "Water Heater" to the definition, the size of the room will increase to 12 times the volume of the water heater.

This change in the sizing of rooms for water heaters is inconsistent with conventional building practices. Sizing principles and methods for providing adequate combustion air, and clearances for appliances in closets and other rooms already exist within the IFGC. Also by the definition requiring oversized rooms for water heaters, goes directly against the instructions of many manufacturers. Requiring spaces that are current code requirements for providing combustion air and clearances are unsafe or otherwise unacceptable. Manufacturer's instructions and Section 304.5 adequately cover the installation without requiring a random volume ratio.

Cost Impact: The code change proposal will not increase the cost of construction.

RANFONE-FG17-202; SURRENA-FG2-202 DOC:

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: There is no text addressing water heaters in association with this definition.

Assembly Action: **Disapproved**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. Note that the assembly action, Disapproved, will be the initial motion on the floor for consideration when this item is called.

Public Comment:

Richard Grace representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII requests Disapproval. Note that the assembly action, Disapproved, will be the initial motion on the floor for consideration when this item is called.

Commenter's Reason: The term water heater must remain in the *large in comparison* definition, otherwise the code fails to identify what is a closet. In that case, all appliance listings for installation within closets become a mystery. Why would a water heater not have to comply with the same provisions as any other gas appliance? Please look at this proposal and do the math, these are relatively small areas that are required for the safe and proper operation of a water heater. The manufactures are not putting these dimensions in their installation instructions, they just say to install per local code. If the code does not specify, then adequate clearance is not required.

Final Action: AS AM AMPC____ D

FG10-09/10, Part III

IRC M1303.1

NOTE: PART I & II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART I AND II REPRODUCED ONLY FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART III.

Proposed Change as Submitted

Proponent: Edward A. Spiers, representing Delaware County

PART III- IRC-M

Revise as follows:

M1303.1 Label information. A permanent factory-applied nameplate(s) shall be affixed to *appliances*, <u>heat pump units and condensing units</u> on which shall appear, in legible lettering, the manufacturer's name or trademark, the model number, a serial number <u>the energy efficiency rating</u> and the seal or *mark* of the testing agency. A *label* shall also include the following:

1. Electrical *appliances*. Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts and motor phase; and in Btu/h (W) output and required clearances.
2. Absorption units. Hourly rating in Btu/h (W), minimum hourly rating for units having step or automatic modulating controls, type of fuel, type of refrigerant, cooling capacity in Btu/h (W) and required clearances.
3. Fuel-burning units. Hourly rating in Btu/h (W), type of fuel *approved* for use with the *appliance* and required clearances.
4. Electric comfort heating *appliances*. Name and trademark of the manufacturer; the model number or equivalent; the electric rating in volts, amperes and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; required clearances from combustibles and a seal indicating approval of the *appliance* by an *approved agency*.

5. Maintenance instructions. Required regular maintenance actions and title or publication number for the operation and maintenance manual for that particular model and type of product.

Reason: The change is necessitated by the enforcement of the current conservation codes. We have been instructed to verify the efficiency ratings of the equipment that is used on any particular project; it must match the RES check report or the approved plans. The information in question is currently not being put on the units themselves. The problem being, that if the box that the unit has been delivered in is gone or the efficiency sticker (with the rating on it) has been removed the information is not readily available. With most heat pumps the information is hidden in the model or serial number, but that would mean that all inspectors would have to have special knowledge of every manufacturer's information coding in order to decipher the needed information. The efficiency of a gas furnace can be figured as well if one has the knowledge to do so, but becomes problematic when multistage, variable, and modulating units are employed. This leaves the inspector to have to possess special knowledge once again, and homeowners for that matter as well. It would seem a minor cost to print this information on a unit's label, rather than having code enforcement personnel calling different contractors or suppliers to find out what EER rating a heat pump might have or the rating of a geothermal unit.

It is not a problem when the minimum rating is specified on a RES check. However, when a job is only 1% or 0.6% better than required by the IECC and a 20 SEER heat pump is called for under the heating equipment. How does one find out what has been installed to verify this information. If a 13 SEER unit is installed instead, the job would then fall short of it's required RES compliance. My understanding is that with the 2006 IECC the scenario above could be quite normal. Contractors may be tempted to spec equipment with very high efficiency ratings to be able to pass the RES compliance form and then actually use the less efficient unit(s) on the job. Or, when the process of cost trade-offs begins to take place on the project it is very normal for items that are not absolutely necessary to get chopped, efficiency ratings to get dropped. Ampacity relates to wire sizing and amperes was the intended term as used in M1303.1, Item 4.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: SPIERS-FG2-301.6

Public Hearing Results

PART III- IRC-M
Committee Action: **Approved as Submitted**

Committee Reason: It is difficult or impossible for the code official to verify in the field whether a piece of equipment such as a heat pump unit or a condensing unit meets the energy efficiency rating required by the IECC. Heat pump and condensing units are typically not referred to as appliances, but, need to be included in what is required to bear the prescribed nameplate information.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Frank A. Stanonik, requests Disapproval

Commenter's Reason: The IFGC and IMC disapproved this proposal. The IRC-M approved it. It should be disapproved for the reasons noted by the IFGC.

Final Action: AS AM AMPC____ D

NOTE: PART I & II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

FG10–09/10
301.5; IMC 301.6

PART I – IMC
Revise as follows:

301.6 Label information. A permanent factory-applied nameplate(s) shall be affixed to appliances, heat pump units and condensing units on which shall appear in legible lettering, the manufacturer's name or trademark, the model number, serial number, the energy efficiency rating and the seal or mark of the *approved* agency. A label shall also include the following:

1. Electrical *equipment* and appliances: Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts, motor phase; Btu/h (W) output; and required clearances.
2. Absorption units: Hourly rating in Btu/h (W); minimum hourly rating for units having step or automatic modulating controls; type of fuel; type of refrigerant; cooling capacity in Btu/h (W); and required clearances.
3. Fuel-burning units: Hourly rating in Btu/h (W); type of fuel *approved* for use with the *appliance*; and required clearances.
4. Electric comfort heating appliances: Name and trade-mark of the manufacturer; the model number or equivalent; the electric rating in volts, ~~ampacity~~ amperes and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; required clearances from combustibles; and a seal indicating approval of the *appliance* by an *approved* agency.

PART II – IFGC

Revise as follows:

301.5 Label information. A permanent factory-applied nameplate(s) shall be affixed to appliances, heat pump units and condensing units on which shall appear in legible lettering, the manufacturer's name or trademark, the model number, serial number, the energy efficiency rating and, for listed appliances, the seal or mark of the testing agency. A label shall also include the hourly rating in British thermal units per hour (BTU/h) (W); the type of fuel approved for use with the appliance; and the minimum clearance requirements.

Reason: The change is necessitated by the enforcement of the current conservation codes. We have been instructed to verify the efficiency ratings of the equipment that is used on any particular project; it must match the RES check report or the approved plans. The information in question is currently not being put on the units themselves. The problem being, that if the box that the unit has been delivered in is gone or the efficiency sticker (with the rating on it) has been removed the information is not readily available. With most heat pumps the information is hidden in the model or serial number, but that would mean that all inspectors would have to have special knowledge of every manufacturer's information coding in order to decipher the needed information. The efficiency of a gas furnace can be figured as well if one has the knowledge to do so, but becomes problematic when multistage, variable, and modulating units are employed. This leaves the inspector to have to possess special knowledge once again, and homeowners for that matter as well. It would seem a minor cost to print this information on a unit's label, rather than having code enforcement personnel calling different contractors or suppliers to find out what EER rating a heat pump might have or the rating of a geothermal unit.

It is not a problem when the minimum rating is specified on a RES check. However, when a job is only 1% or 0.6% better than required by the IECC and a 20 SEER heat pump is called for under the heating equipment. How does one find out what has been installed to verify this information. If a 13 SEER unit is installed instead, the job would then fall short of it's required RES compliance. My understanding is that with the 2006 IECC the scenario above could be quite normal. Contractors may be tempted to spec equipment with very high efficiency ratings to be able to pass the RES compliance form and then actually use the less efficient unit(s) on the job. Or, when the process of cost trade-offs begins to take place on the project it is very normal for items that are not absolutely necessary to get chopped, efficiency ratings to get dropped. Ampacity relates to wire sizing and amperes was the intended term as used in M1303.1, Item 4.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IMC
Committee Action: **Disapproved**

Committee Reason: Rating plate information is prescribed by the listing process or federal law, not by the code.

Assembly Action: **None**

PART II- IFGC
Committee Action: **Disapproved**

Committee Reason: Disapproval is consistent with the action taken on FG10-09/10 Part I.

Assembly Action: **None**

FG12-09/10
308.1

Proposed Change as Submitted

Proponent: Guy Tomberlin, representing self

Revise as follows:

308.1 Scope. This section shall govern the reduction in required clearances to combustible materials, including gypsum board, and combustible assemblies for chimneys, vents, appliances, devices and equipment. Clearance requirements for air-conditioning equipment and central heating boilers and furnaces shall comply with Sections 308.3 and 308.4.

Reason: This adds clarification that gypsum has a combustible covering and therefore must be considered a combustible product. The clearances prescribed by manufacturers are typically directed to allow for adequate heat dissipation, and prevent potential fire. Paper coated products are a prime candidate for these clearances.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: This section is an IFGS section and IFGS sections are normally subject to the process that maintains the NFGC, ANSI Z223.1, however, the proposed revision affects only the IFGC, therefore, the proposal is subject to the ICC process that maintains the IFGC.

ICCFILENAME: TOMBERLIN-FG2-308.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed revision would not recognize gypsum board made with noncombustible facings.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII, requests Approval as Submitted.

Commenter's Reason: This is a companion change to coordinate with FG 2 and prevent any possible confusion that gypsum board shall not be allowed within the spaces that require clearance to combustibles. Gypsum board when used around fuel gas equipment such as venting systems is a combustible. This fundamental philosophy has been in the codes many years prior the International codes inception. Who hasn't seen charred gypsum when installed too close to a heat source? It is covered with paper! This is not an over regulation, it only requires that when a clearance to a combustible is required, that gypsum board shall not be installed within those dimensions. This will not create any hardship on any installation, because this is already common practice. This gains consistency within the I codes, specifically the IMC, because that is the other code that identifies with the exact same applications.

Gypsum board is not necessarily a combustible according to the IBC for the reason that it is being used for a totally different purpose. This isn't about constructing walls and ceilings it is about safely installed systems and protection from fire.

Final Action: AS AM AMPC____ D

FG14-09/10, Part I
202, 401.9 (New), 401.10 (New), 404.1 (New)

Proposed Change as Submitted

Proponent: Guy Tomberlin representing VA Plumbing and Mechanical Inspectors/VA Building and Code Officials and ICC Region 7.

PART I-IFGC

1. Add new definitions as follows:

SECTION 202

THIRD-PARTY CERTIFICATION AGENCY. An approved agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer's quality control system.

THIRD-PARTY CERTIFIED. Certification obtained by the manufacturer indicating that the function and performance characteristics of a product or material have been determined by testing and ongoing surveillance by an approved third-party certification agency. Assertion of certification is in the form of identification in accordance with the requirements of the third-party certification agency.

THIRD-PARTY TESTED. Procedure by which an approved testing laboratory provides documentation that a product, material or system conforms to specified requirements.

2. Add new text as follows:

401.9 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a fuel gas system shall bear the identification of the manufacturer.

401.10 Third-party testing and certification. All piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 401.9. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

404.1 Installation of materials. All materials used shall be installed in strict accordance with the standards under which the materials are accepted and approved. In the absence of such installation procedures, the manufacturer's installation instructions shall be followed. Where the requirements of referenced standards or manufacturer's installation instructions do not conform to minimum provisions of this code, the provisions of this code shall apply.

Reason:
PART I-Current IFGC contains several pipe, tube and fitting standards but never indicates how the industry must verify compliance with these standards. The proposed text is taken from the IPC and altered slightly to fit fuel gas system applications. This is the current typical industry method to demonstrate compliance with the appropriate standards. The new text provides guidance on how to achieve code compliance as intended.
PART II & III- Current IMC and IRC mechanical sections contain several pipe, tube and fitting standards but never indicates how the industry must verify compliance with these standards. The proposed text is taken from the IPC and altered slightly to fit mechanical system applications. This is the current typical industry method to demonstrate compliance with the appropriate standards. The new text provides guidance on how to achieve code compliance as intended.

Cost Impact: The code proposal will not increase the cost of construction. Tomberlin-M-5-303-RM-1-R1303

ICC FILENAME: TOMBERLIN -FG1-202.M5-303-RM1-R1303

Public Hearing Results

PART I- IFGC
Committee Action: **Disapproved**

Committee Reason: The proposed text does accomplish the proponent's intent as it does not guarantee compliance with any product standard. There is no evidence of problems with fittings that do not comply with the proposed text.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy Tomberlin representing VA Plumbing and Mechanical Inspectors Association, VA Building and Code Officials Association and ICC Region VII, requests Approval as Submitted.

Commenter's Reason: This is current code language taken directly from the IPC and was approved, by committee, to be included in the IRC during the public hearings in Baltimore. Opposing comments came from the gas industry, which appeared to stem from a general misunderstanding of the implementation of regulations when attempting to verify if approved products have been used. One commenter asked if we expect each ½ inch 90 degree elbow to be marked? The answer is quite simple and if they had been familiar with the requirements of the IPC they would have already known the answer is clearly yes. Each manufacturer identifies their product in their own way and each fitting gets its ID mark. This is the method the plumbing pipe and fitting industry has used for years and years. In fact, the manufacturing community assisted with crafting the original language. The plumbing code requires these appropriate measures be taken and unfortunately, the IFGC and IMC only insinuate that it is to be done. Right now there is no minimum guidance as to who can certify or list pipe and fittings for gas pipe service and hydronic systems covered under the IFGC and IMC. This proposal utilizes the industry accepted, and commonly practiced, provisions from the IPC and incorporates them into the other appropriate I codes. It would only seem reasonable that gas pipe and fittings along with hydronic pipe and fittings require the same level of certification that water systems currently require.

Another commenter said "this is already required, all pipes and fittings are already required to be listed." This comment makes the point of the misunderstanding with the current code text that I previously outlined in the first paragraph. Some pipe/fitting systems, such as CSST are in fact required to be listed, but that's not true for other pipes and fittings such as steel or copper. So why is CSST required to be listed and steel pipe not? The answer is simple; it is because the steel pipe industry elects to get their products certified not listed. There is a huge difference between certification and listing that apparently many people just don't understand. Listing is a much more rigorous process. This proposal actually lessens the burden for the folks that believe all pipe and fittings must be listed.

The reality is that the majority of pipe and fitting manufactures already perform this necessary function to protect their best interest. The problem arises when products are manufactured and no oversight is provided. Some overseas manufacturers actually consider self- certification as an acceptable form of certification. This is just not the case. This is where the code is lacking the appropriate provisions and without the additional text we have proposed, the end user could easily end up getting a less than satisfactory product and possibly even unsafe. The IMC committee disapproved this with no supporting reason, the ROP simply says based on the IFGC Committee's disapproval. This is an unfortunate situation because the same situation exists for hydronic systems and more and more manufacturers are making new pipe and fitting systems for hydronics.

Final Action: AS AM AMPC____ D

FG14-09/10, Part II
IMC 202, 301.3 (New), 301.4 (New), 301.5 (New)

Proposed Change as Submitted

Proponent: Guy Tomberlin representing VA Plumbing and Mechanical Inspectors/VA Building and Code Officials and ICC Region 7.

PART II - IMC

1. Add new definitions as follows:

THIRD-PARTY CERTIFICATION AGENCY. An approved agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer's quality control system.

THIRD-PARTY CERTIFIED. Certification obtained by the manufacturer indicating that the function and performance characteristics of a product or material have been determined by testing and ongoing surveillance by an approved third-party certification agency. Assertion of certification is in the form of identification in accordance with the requirements of the third-party certification agency.

THIRD-PARTY TESTED. Procedure by which an approved testing laboratory provides documentation that a product, material or system conforms to specified requirements.

2. Add new text as follows:

301.3 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a mechanical system shall bear the identification of the manufacturer.

301.4 Plastic pipe, fittings and components. Plastic pipe, fittings and components shall be third-party certified as conforming to NSF 14.

301.5 Third-party testing and certification. Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 301.3. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

Reason:
PART I-Current IFGC contains several pipe, tube and fitting standards but never indicates how the industry must verify compliance with these standards. The proposed text is taken from the IPC and altered slightly to fit fuel gas system applications. This is the current typical industry method to demonstrate compliance with the appropriate standards. The new text provides guidance on how to achieve code compliance as intended.
PART II & III- Current IMC and IRC mechanical sections contain several pipe, tube and fitting standards but never indicates how the industry must verify compliance with these standards. The proposed text is taken from the IPC and altered slightly to fit mechanical system applications. This is the current typical industry method to demonstrate compliance with the appropriate standards. The new text provides guidance on how to achieve code compliance as intended.

Cost Impact: The code proposal will not increase the cost of construction. Tomberlin-M-5-303-RM-1-R1303

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Frank A. Stanonik, requests Disapproval.

Commenter's Reason: The IFGC and IMC disapproved this proposal. The IRC-M approved it. It should be disapproved for the reasons noted by the IFGC.

Final Action: AS AM AMPC____ D

FG15-09/10
404.2 (New)

Proposed Change as Submitted

Proponent: James Ranfone representing American Gas Association

Add new text as follows:

<u>**404.2 CSST.** CSST piping systems shall be installed in accordance with the terms of their approval, the conditions of listing, the manufacturer's installation instructions and this code.</u>

Reason: The code requires that equipment and appliances be listed. Section 305.1 requires that equipment and appliances be installed by the terms of their approval, in accordance with the conditions of listing, the manufacturer's installation and this code. The terms equipment and appliance do not necessarily cover CSST which is the only gas piping system that is required to be listed to an ANSI standard. Therefore, the code is missing a specific statement regarding the installation of CSST as a listed system.

Cost Impact: The code change proposal will not increase the cost of construction.

RANFONE-FG12-404.2_NEW.DOC:

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Current code text requires appliances and equipment to be installed in accordance with the listing, manufacturer's instructions and the code, but, a listed piping system such as CSST is not accurately described as equipment or an appliance. The proposed text will provide coverage for CSST systems to make sure that they are installed as is required for other listed products.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tim Manz representing Association of Minnesota Building Officials (AMBO), requests Disapproval.

Commenter's Reason: This proposed code change is not necessary because CSST falls under the definition of equipment, which is defined in the IFGC as "apparatus and devices other than appliances." Merriam Webster dictionary defines apparatus as "a set of materials or equipment designed for a particular use" and this adequately describes products such as CSST.

Final Action: AS AM AMPC____ D

FG16-09/10
404.4

Proposed Change as Submitted

Proponents: James Ranfone, representing American Gas Association; Don Surrena, CBO, representing National Association of Home Builders (NAHB)

Delete and substitute as follows:

~~**404.4 Underground penetrations prohibited.** Gas piping shall not penetrate building foundation walls at any point below grade. Gas piping shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.~~

404.4 Piping through foundation wall. Underground piping, where installed below grade through the outer foundation or basement wall of a building, shall be encased in a protective pipe sleeve or shall be protected by an approved device or method. The annular space between the gas piping and the sleeve and between the sleeve and the wall shall be sealed.

Reason:
(RANFONE)- No evidence was provided during the 2007-2008 revision cycle that justified adding the prohibition of customer-owned gas piping from penetrating a foundation wall below grade. Testimony centered on the possibility that gas from an underground leak would be significant enough to cause gas migration along the buried gas piping and entry into the building. No statistics were presented and AGA does not know of any incidents of gas migrating along a customer-owned underground piping that has resulted in an explosion. Section 404.4 covers only customer-owned piping, most of which would be low pressure (the remaining would be a maximum of 2 psi) that does not result , in the event of a underground leak, in significant gas leakage and migration. The low number of incidences AGA is aware of were traced to utility-owned gas service lines that operate at much higher pressures (often up to 40 psi). The proposed language combines the 2006 IFGC language with the approved changes FG20-07/08 and FG21-07/08.
(SURRENA)- The purpose of this proposal is to allow gas piping to enter a foundation below grade as it has done in the past. Without this change, gas piping will have to come above ground before entering a building.

The conventional installation practice of allowing piping to go through foundation walls below grade should not be prohibited. This is an installation method that has been used for decades. No data was ever presented that would show a safety problem or inadequacy when a proper installation and sealing of the opening was installed in accordance with the IFGC.

Requiring above grade entry points into the foundation will require extra piping and joints, both inside and outside, exposing the piping system to physical damage and increased risk of leakage on the outside of buildings as well as within the building. This increase in outside exposure will be particularly significant in a city or at congested commercial locations where piping must come above grade at times through sidewalks at the front or rear of the building or come through the ground in public ways before turning to enter the foundation or building. This will also present practical issues of locating the exterior and interior piping system to have entry points that are compatible with the building design, i.e., doorways, loading docks, accessible entry systems (ramps) etc. There will also be additional costs in these circumstances when the underground piping must be relocated to miss one of the items just mentioned.

Accepting this change will coordinate the IFGC provisions with all other industry Fuel Gas Codes.

Cost Impact: The code change proposal will not increase the cost of construction.

RANFONE-FG13-404.4-SURRENA-FG3-404.4DOC:

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Customer-owned piping would operate at 2 psi and less and such pressure would not result in significant migration of gas leakage. No documentation was provided to justify the current prohibition on underground penetrations. The proposed new text restores previous code text that prescribed the method of protecting and sealing underground penetrations of foundation walls. The current text will require extra piping, fittings and joints that will be exposed to physical damage with increased risk of leakage. The proposed text is consistent with other fuel gas codes.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Disapproval.

Commenter's Reason: There have been many cases throughout the country where damage has occurred as a result of a gas leakage that originated underground and made its way into the building. One of the reasons this occurs is because natural gas will follow the pipe in its ditch due to less resistance. Piping entering foundations below grade provides a path for gas to follow. The safety of residents should not be left up to how well a bead of caulking has been applied. Plastic piping is also subject to the same scenario, especially when the 8-inch burial depth is taken into consideration. Plastic will not hold up to common tools such as shovels, spades, picks and roto-tillers. Also think about expansive soil and the potential effect it can have on the piping. The heaving soil will have a devastating effect on a caulked sleeve. It's not uncommon to have a gas line snapped off completely at the foundation wall due to the overwhelming force of expansive soil. Only by requiring the pipe to enter the building above grade will we eliminate the likelihood that gas would enter the building. The protection of life, limb, property and the potential threat of explosion should not be determined by the integrity of a sealed joint alone. Depending on how deep the ditch is, the weight of the back-fill alone could be significant enough to have an impact on a caulked joint. One should also consider that the joint could deteriorate over time**.** The perfect recipe for an explosion is a 4-15% gas to air ratio.

Final Action: AS AM AMPC____ D

FG18-09/10
407.2

Proposed Change as Submitted

Proponent: Don Surrena, CBO, representing National Association of Home Builders (NAHB)

Revise as follows:

407.2. Design and Installation. *Piping* shall be supported with ~~metal~~ pipe hooks, ~~metal~~ pipe straps, ~~metal~~ bands, ~~metal~~ brackets, or ~~metal~~ hangers, or building structural components, suitable for the size of *piping*, of adequate strength and quality, located at intervals so as to prevent or damp out excessive vibration. *Piping* shall be anchored to prevent undue strains on connected appliances and shall not be supported by other *piping*. Pipe hangers and supports shall conform to the requirements of MSS SP-58 and shall be spaced in accordance with Section 415. Supports, hangers, and anchors shall be installed so as not to interfere with the free expansion and contraction of the *piping* between anchors. All parts of the supporting equipment shall be designed and installed so they will not be disengaged by movement of the supported *piping*.

Reason: The purpose of this proposal is to retain the provisions of the 2006 International Code (IFGC) allowing for more than just metal to be used as pipe strapping.

This change from the 2006 International Fuel Gas Code (IFGC) is clearly proprietary in nature. To disallow any other material that is proven to meet the requirements for support is contrary to the spirit of the ICC family of codes (I-Codes). Favoring one type of material without reason is unacceptable. The change to the 2009 IFGC is too restrictive and eliminates other support materials that have been used successfully for years. The 2009 change will have a significant impact on several manufacturers that have established alternate materials other than metal supports. If the structural properties of a material is tested and proven to meet the structural specifications for supporting the piping it should be accepted for use. These other materials should be eliminated and the code allowed to become exclusionary. The I-Codes have railed from the exclusivity of other codes that limit the type of materials. These other materials have proven themselves acceptable over the years and should not be eliminated to prosper one type of material.

We encourage the adoption of this proposal to allow any and all materials that meet the requirements of the code to be used, not just a proprietary product or single material.

Cost Impact: The code change proposal will not increase the cost of construction.

SURRENA_FG1-407.2.DOC:

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The current text favors one material over others without reason. Other materials have been used successfully for many years. Other materials, besides metal, that have been tested and proven to have the structural strength necessary to support piping should be allowed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Robert Adkins representing VPMIA/VBCOA, requests Disapproval.

Commenter's Reason: In a fire scenario, metallic hangers will maintain the integrity of the gas piping installation, supporting it much longer than plastic or nylon hangers would. If the hangers fail to hold due to melting, softening or burning and the piping support fails, the piping system could break and contribute a gas fuel load to the fire, which in turn increases the potential for a much larger fire or explosion.

Public Comment 2:

Guy McMann representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Disapproval.

Commenter's Reason: Removing the word "metal" will result in inferior support installations permitting such materials as nylon straps such as one might encounter on a flex duct installation. There are many ways to hang piping and spelling out that hangers must be metal of some type ensures a safer installation. This proposed code change will also result in the IFGC being less stringent than ANSI Z 223.1/NFPA 54 (NFGC) as that standard still requires metal hangers. This is a step in the wrong direction for the IFGC and may result in support failures resulting in serious damage.

Public Comment 3:

Tim Manz, requests Disapproval.

Commenter's Reason: MSS SP-58 requires metallic pipe hangars and supports, so this code change proposal contradicts itself. It is critical to have metallic pipe hangars and supports to maintain the structural integrity of gas piping systems.

Final Action: AS AM AMPC____ D

FG23-09/10
409.5.3

Proposed Change as Submitted

Proponent: Brent Ursenbach, Salt Lake County, representing Utah Chapter of ICC

Revise text as follows:

409.5.3 Located at manifold. Where the *appliance* shutoff valve is installed at a manifold, such shutoff valve shall be located within 50 feet (15 240 mm) of the *appliance* served, <u>shall be located on the same building level,</u> and shall be readily accessible and permanently identified. The *piping* from the manifold to within 6 feet (1829 mm) of the *appliance* shall be designed, sized and installed in accordance with Sections 401 through 408.

Reason: It is common to have a gas manifold located in a basement level furnace room, with another furnace for an upper level of a 2 story home located in the attic. The commissioning/start-up, altitude or gas heat value adjustments that may be required on gas furnaces typically require the gas control valve and manifold to be removed from the furnace for orifice inspection and orifice changing, which requires the gas to be shut off outside the furnace. Performing an inlet gas pressure test at a furnace requires removal of a plug at the gas inlet of the gas control valve, which also requires the gas to be shut off outside the furnace to attach a test gauge adapter. It is unreasonable and may pose a safety hazard to expect a technician to make multiple trips from the upper attic mechanical room down a ladder, then down two flights of stairs to the basement furnace room where the manifold is located shut off the gas. The technician then returns to the upper furnace. Typically the gas needs to be turned on and off two, three or four times or more to complete these procedures. It is reasonable to expect a shut off valve to be located on the same level as the appliance.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: URSENBACH-FG1-409.5.3.doc

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The current distance limit of 50 feet assures that convenient access is provided without requiring the valve to be located on the same floor level as the appliance served.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brent Ursenbach representing Utah Chapter of ICC, requests Approval as Submitted.

Commenter's Reason: The reason given by the Committee for disapproval is that any appliance shutoff valve that is located within 50' of the appliance served is *convenient.*

The opening statement of the Preface of the IFGC reads: "Internationally, code officials recognize the need for a modern, up-to-date fuel gas code addressing the design and installation of fuel gas systems and gas-fired appliances through requirements emphasizing performance. The *International Fuel Gas Code*®, in this 2009 edition, is designed to meet these needs through model code regulations that safeguard the public health and safety in all communities, large and small."

The change made in the 2009 IFGC 409.5.3, allowing an appliance gas shutoff to be 50 feet from an appliance simply is not safe and does not safeguard public health and safety. Virtually every experienced gas technician has encountered multiple situations where upon complete of a repair of a gas appliance, he or she has discovered a gas leak upon turning the gas back on to the appliance. The leaks may be small, while other times it may be large. The leak may be a faulty pipe fitting, a leaking hose on test equipment, a missing plug in a control valve or a loose union, connector flare fitting or CSST fitting. A technician completes a repair, goes down several flights of stairs to the manifold and turns the gas back on. In the 30 to 40 seconds it takes to return to the upper level appliance location, considerable gas has leaked into the location. Upon discovery of the leak, the technician must return to the manifold to shut the gas off. If there is an ignition source in the area, such as another gas appliance, with gas leaking for 80 seconds or more, the possibility of a catastrophic fire or explosion is real.

The Rocky Mountain Gas Association of Utah Board of Directors unanimously agrees that this change to the 2009 IFGC is dangerous, and strongly supports this Code Change.

Consider a gas furnace is located in an attic of a two story home, which requires a ladder to access the attic, and the gas manifold with the shut-off valves located in the basement of the home. A service technician will often need to turn the gas off to the furnace, at a valve prior to the control valve inside the furnace. It is unreasonable to consider it ***convenient*** for the technician to go back to the attic access, down a ladder, down stairs to the main level, then down stairs again to the basement level, to the manifold, to turn the gas off. The shut-off valve is located within 50', however there is nothing convenient when needing to turn the gas off and then back on.

To place a new furnace in operation the gas may need to be shut off and turned on five or more times. Consider this sequence followed by a gas furnace service technician who has been dispatched to perform a start-up/adjustment on a new furnace located in the attic:

- One of the first steps is to check the input gas pressure. The 1/8th inch pipe thread test port for testing is located on the inlet side of the control valve in the furnace. The technician makes a trip down to the manifold, turns of the gas, and then returns to the attic.
- The plug is removed from the test port and the threaded adapter, hose and test gauge is connected. The tech then goes back down to the manifold in the basement to turn the gas on. He/she then goes back to the attic.
- The gas pressure is checked in the attic to insure it is within the required range. Adjustments as required are made. The tech then goes back to the basement to turn the gas off, and then returns back to the attic. The pressure testing gauge is removed and the plug re-installed in the control valve.
- The next step is to check the manifold pressure, on the outlet of the control valve. Another trip to the basement to turn the gas back on. The plug on the outlet/manifold side of the control valve can be isolated from the gas supply by operating the valve on the control valve.
- The manifold pressure is then checked with the furnace operating. The pressure is adjusted at the control valve as necessary. If the geographical location is several thousand feet above sea level, and/or if the heat content value for the gas supplied to the home is less than or more than 1000 BTU/cubic foot (for natural gas), the gas burner orifices typically must be changed to provide a clean complete combustion process.
- The tech goes back to the basement, turns off the gas, then back to the attic.
- The gas control valve manifold assembly is removed from the furnace, the orifices are changed, the manifold re-installed.

- The tech goes back to the basement and turns the gas back on, then back to the attic to test for leaks. He/she then checks the manifold pressure, clocks the meter, assuring the furnace is fired at the correct rate.

The count is 5 round trips from the attic, down through the upper and main levels to the basement. This is a typical procedure. The following also must be considered:

- If there is a leak in the pressure testing equipment or the re-assembled gas fittings during the start up procedure, considerable gas may escape while the tech travels from the basement, to the attic, realizes there is a leak, returns to the basement and turns the gas back off.
- Problems discovered while performing this procedure may add even more trips to the process.
- Whenever a long fuel gas line is opened, air enters the open line. The tech must then bleed the air out before the equipment will fire.
- No one would ever consider placing an electrical disconnect switch where it was not readily accessible, in a basement with the furnace in the attic. Why are we allowing this with gas appliances?

Final Action: AS AM AMPC____ D

FG25-09/10
202 (New), 410.4 (New)

Proposed Change as Submitted

Proponent: Sidney Cavanaugh, Cavanaugh Consulting, representing Brass Craft.

1. Add new text as follows:

410.4 Excess Flow Valve. Where automatic excess flow valves are installed, they shall be listed as complying with ANSI Z21.93/CSA 6.30 and shall be sized and installed in accordance with the manufacturer's installation instructions.

2. Add new definition as follows:

SECTION 202

EXCESS FLOW VALVE. A valve designed to activate when the fuel gas passing through it exceeds a prescribed flow rate.

3. Add new standard to Chapter 8 as follows:

ANSI/CSA

ANSI Z21.93/CSA 6.30-XX Excess Flow Valves for Natural and LP Gas Up to Pressures of 5 Psi.

Reason: These devices increase the protection of health and safety of consumers and meet appropriate standards CSA 3-92 and ANSI Z21.93-CSA 6.30. The code change provides guidance to installations that are already occurring in many local jurisdictions for EFVs which can be used on low pressure fuel lines to prevent the open flow of gas in the event of a pipe disconnect or rupture. It is a companion to other code changes. Similar wording has been adopted in the UPC, UMC and the NFGC/NFPA 42 ANSI Z223.1.

Cost Impact: Minimal.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI Z21.93/CSA 6.30-xx, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: CAVANAUGH-FG2-202_410.4

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: The standard was not submitted for review.

Committee Action: **Disapproved**

Committee Reason: The proposed standard is not yet published and available.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Sidney Cavanaugh representing Brass Craft, requests Approval as Submitted.

Commenter's Reason: The proposal was denied because the standard was not completed but it is hopeful that it will be by the public hearings in May.

Final Action: AS AM AMPC____ D

FG30-09/10
202, 603.1, Chapter 8

Proposed Change as Submitted

Proponent: James Ranfone representing American Gas Association

1. Revise definition as follows:

SECTION 202

~~**LOG LIGHTER**~~ **FIREPLACE ACCESSORY DEVICE.** A manually operated ~~solid fuel ignition appliance~~ fireplace accessory device ~~for installation~~ installed in a vented solid fuel-burning fireplace and used to ignite the solid fuel.

2. Revise text as follows:

603.1 General. Log lighter~~s~~ fireplace accessory devices shall be approved ~~tested in accordance with CSA 8~~ and shall be installed in accordance with the manufacturer's installation instructions.

3. Delete standard in Chapter 8 as follows:

CSA

~~CSA 8-93~~ ~~Requirements for Gas-fired Log Lighters for Wood Burning Fireplaces – with Revisions through January 1999~~

Reason: The following reasons support the proposed revised coverage for log lighters:
CSA Requirement No. 8 covering log lighters was withdrawn on January 1, 2009.
The definition is being revised since a log lighter is more typically viewed as a fireplace accessory then an appliance.
The revisions to section 608.1 allows for the installation of an unlisted log lighter fireplace accessory when approved by the code official. While section 105.2 can be used to approve these accessories, specific coverage in 608.1 is being proposed since unlisted log lighters are the only types available. The accessory's inherent simplicity is the reason for the lack of listing and the withdrawal of the CSA requirement. A typical log lighter is an iron pipe with drilled holes and shut off valve. They can be constructed on site from readily available materials or are available from small fabricators as complete units or kits. There is a lack of a mass market demand and thus the market is supplied by small fabricators.

Cost Impact: The code change proposal will not increase the cost of construction.

RANFONE-FG9-603.1_202.DOC

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: CSA 8 was withdrawn without replacement. Only the control valves were listed in the past. The proposed text provides code official guidance by accurately describing these devices.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Richard Grace representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

603.1 General. Log lighters shall be <u>listed and labeled</u> ~~tested in accordance with CSA 8~~ and installed in accordance with the manufacturer's installation instructions.

CSA
~~CSA 8-93 Requirements for Gas-fired Log Lighters for Wood Burning Fireplaces – with Revisions through January 1999~~

Commenter's Reason: These devices are appropriately defined as appliances in accordance with the current definition. The commenter mentions the simplicity of the device…yes, they are typically nothing more than a steel pipe with holes drilled in them that allow gas to escape uncontrollably in a fireplace, and then a small igniter creates ignition to get a fire started. Contrary to the original submitter's published comments, this is definitely not a simple device in fact quite the opposite it is a dangerous device. There are other methods that have worked well for years and years such as paper and matches. If the Standard has been withdrawn , the appliances cannot be listed and labeled, therefore, it cannot be installed until a standard or new testing criteria are developed. Section 301.states that all appliances shall be listed and labeled, the revised language originally proposed makes that very difficult to achieve.

Public Comment 2:

Robert Adkins representing VPMIA/VBCOA, requests Disapproval.

Commenter's Reason: A "log lighter" is by definition an appliance and should be treated as such. "APPLIANCE. Any apparatus or device that utilizes gas as a fuel or raw material to produce light, heat, power, refrigeration or *air conditioning*. " Without proper testing and approval there is no way to determine the potential risks and dangers of an installation.

Final Action: AS AM AMPC____ D

FG32-09/10, Part I
618.5

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanicals (CAPMO)

PART I- IFGC

Revise as follows:

618.5 Prohibited sources. ~~Outside~~ <u>Outdoor</u> or return air for forced-air heating and cooling systems shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining

rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an *appliance* where such a room or space serves as the sole source of return air.

   Exception: This shall not apply where:

   1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
   2. The room or space complies with the following requirements:
      2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
      2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
      2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of <u>a draft hood in the same room or space or the combustion chamber of</u> any <u>atmospheric burner</u> *appliance* ~~firebox or draft hood~~ in the same room or space.
   3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.

6. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room~~, boiler room, furnace room or <u>unconditioned</u> attic.

   Exception<u>s</u>:

   1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
   <u>2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.</u>

7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.

Reason: The definition of "mechanical room" states that there are no fuel fired appliances located in the space, therefore pulling air thru one should not be an issue. This section precludes pulling return air from a garage but doesn't recognize a dedicated garage system where doing so is perfectly acceptable. Adding the word "atmospheric" differentiates between open and closed combustion chambers.

Cost Impact: The code change proposal will not increase the cost of construction.

MCMANN-FG2-618.5.DOC:

<u>Public Hearing Results</u>

PART I- IFGC
Committee Action: **Approved as Modified**
Modify the proposal as follows:

618.5 Prohibited sources. Outdoor or return air for a forced-air heating system shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an *appliance* where such a room or space serves as the sole source of eturn air.

Exception: This shall not apply where:.

1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
2. The room or space complies with the following requirements:
   2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
   2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
   2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.

6. A closet, bathroom, toilet room, kitchen, garage, <u>mechanical room</u>, boiler room, furnace room or unconditioned attic.

   Exceptions:

   1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
   <u>2.</u> ~~Dedicated~~ Forced air <u>heating</u> systems serving only a garage. ~~shall not be prohibited from obtaining return air from the garage.~~

7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.

Committee Reason: Current text unintentionally prohibits the taking of return air from a garage for a system that serves only a garage. Substituting "atmospheric burner" for "appliance firebox" differentiates between open and sealed combustion chamber appliances. The modification maintains the prohibition on taking return from a mechanical room and simplifies the proposed second exception.

Assembly Action: None

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows

618.5 Prohibited sources. Outdoor or return air for forced-air heating <u>and cooling</u> system<u>s</u> shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.
5. A room or space containing an *appliance* where such a room or space serves as the sole source of eturn air.

   Exception: This shall not apply where:
   1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
   2. The room or space complies with the following requirements:
      2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
      2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
      2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
   3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.

6. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room~~, boiler room, furnace room or unconditioned attic.

Exceptions:

1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
2. Dedicated Forced air ~~heating~~ systems serving only a garage. shall not be prohibited from obtaining return air from the garage.

7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.

Commenter's Reason: Although this was approved as modified it would be best that mechanical rooms are excluded as the code clearly permits them to be used as a plenum. Also, the committee offered a modification which mentions heating systems in Section 618.6 Item # 6, Exception # 2. This inadvertently leaves out cooling systems which was included in the original text. This modification essentially returns the proposal to what it was as originally submitted, and revises the main section to recognize that both heating and cooling systems should be addressed as they are in the IRC.

Final Action: AS AM AMPC____ D

FG32-09/10, Part II
IMC 918.6

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanicals (CAPMO)

PART II- IMC

Revise as follows:

918.6 Prohibited sources. Outdoor or return air for forced-air heating and cooling systems shall not be taken from the following locations:

1. Less than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outdoor air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration *machinery room* as defined in this code.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Sections 918.2 and 918.3, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room,~~ boiler room, furnace room or unconditioned attic.

   Exceptions:

   5.1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances, and serve the kitchen area only, taking return air from a kitchen shall not be prohibited.
   5.2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.
7. A room or space containing a fuel-burning *appliance* where such room or space serves as the sole source of return air.

Exceptions:

7.1. This shall not apply where the fuel-burning *appliance* is a direct-vent *appliance*.
7.2. This shall not apply where the room or space complies with the following requirements:
   7.2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning appliances therein.
   7.2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
   7.2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* ~~firebox or draft hood~~ in the same room or space.
7.3. This shall not apply to rooms or spaces containing solid-fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of the appliances.

Reason: The definition of "mechanical room" states that there are no fuel fired appliances located in the space, therefore pulling air thru one should not be an issue. This section precludes pulling return air from a garage but doesn't recognize a dedicated garage system where doing so is perfectly acceptable. Adding the word "atmospheric" differentiates between open and closed combustion chambers.

Cost Impact: The code change proposal will not increase the cost of construction.

   7.3. This shall not apply to rooms or spaces containing solid-fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of the appliances.

Committee Reason: The reason is the same as given for FG32-09/10 Part I.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

918.6 Prohibited sources. Outdoor or return air for forced-air heating <u>and cooling</u> systems shall not be taken from the following locations:

1. Less than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outdoor air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration *machinery room* as defined in this code.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Sections 918.2 and 918.3, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room~~, boiler room, furnace room or unconditioned attic.

   Exceptions:

   5.1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances, and serve the kitchen area only, taking return air from a kitchen shall not be prohibited.
   5.2. <u>Dedicated F</u>orced air ~~heating~~ systems serving only a garage. <u>shall not be prohibited from obtaining return air from the garage</u>

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.
7. A room or space containing a fuel-burning *appliance* where such room or space serves as the sole source of return air.

   Exceptions:

   7.1. This shall not apply where the fuel-burning *appliance* is a direct-vent *appliance*.
   7.2. This shall not apply where the room or space complies with the following requirements:
   7.2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning appliances therein.
   7.2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
   7.2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
   7.3. This shall not apply to rooms or spaces containing solid-fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of the appliances.

Commenter's Reason: See FG32-09/10, Part I

Final Action: AS AM AMPC____ D

FG32-09/10, Part III
IRC M1602.2

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanicals (CAPMO)

PART III- IRC

M1602.2 Prohibited sources. Outdoor and return air for a forced-air heating or cooling system shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) to an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where flammable vapors are present; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A room or space, the volume of which is less than 25 percent of the entire volume served by the system. Where connected by a permanent opening having an area sized in accordance with ACCA Manual D, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of the rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to the room or space.

4. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room~~, boiler room, furnace room, unconditioned *attic* or other *dwelling unit*.

   Exception: <u>Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.</u>

5. A room or space containing a fuel-burning *appliance* where such room or space serves as the sole source of return air.

   Exceptions:

   1. The fuel-burning *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section M1801.1 or Chapter 24.
   2. The room or space complies with the following requirements:
      2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning *appliances* therein.
      2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
      2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of <u>a draft hood in the same room or space</u> or <u>the combustion chamber of</u> any <u>atmospheric burner</u> *appliance* ~~firebox or draft hood~~ in the same room or space.
   3. Rooms or spaces containing solid-fuel burning *appliances*, if return-air inlets are located not less than 10 feet (3048 mm) from the firebox of those *appliances*.

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.

Reason: The definition of "mechanical room" states that there are no fuel fired appliances located in the space, therefore pulling air thru one should not be an issue. This section precludes pulling return air from a garage but doesn't recognize a dedicated garage system where doing so is perfectly acceptable. Adding the word "atmospheric" differentiates between open and closed combustion chambers.

Cost Impact: The code change proposal will not increase the cost of construction.

<u>Public Hearing Results</u>

PART III-IRC-M
Committee Action: **Approved as Modified**

Modify the proposal as follows:

M1602.2 Prohibited sources. Outdoor and return air for a forced-air heating or cooling system shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) to an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where flammable vapors are present; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.

3. A room or space, the volume of which is less than 25 percent of the entire volume served by the system. Where connected by a permanent opening having an area sized in accordance with ACCA Manual D, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of the rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to the room or space.

4. A closet, bathroom, toilet room, kitchen, garage, mechanical room, boiler room, furnace room, unconditioned *attic* or other *dwelling unit*.

   Exception: Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.

5. A room or space containing a fuel-burning *appliance* where such room or space serves as the sole source of return air.

   Exceptions:

   1. The fuel-burning *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section M1801.1 or Chapter 24.
   2. The room or space complies with the following requirements:
      2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning *appliances* therein.
      2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
      2.3 Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
   3. Rooms or spaces containing solid-fuel burning *appliances*, if return-air inlets are located not less than 10 feet (3048 mm) from the firebox of those *appliances*.

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.

Committee Reason: The reason is the same as given for FG32-09/10 Part I.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: Although this was approved as submitted it would be best that mechanical rooms be excluded as the code clearly permits mechanical rooms to be used as plenums**.**

Final Action: AS AM AMPC____ D

FG33-09/10
621.2, 621.4

Proposed Change as Submitted

Proponent: Craig Conner, Building Quality representing self.

1. Delete without substitution.

~~**621.2 Prohibited use.** One or more unvented room heaters shall not be used as the sole source of comfort heating in a dwelling unit~~.

2. Revise as follows:

621.4 Prohibited locations. Unvented room heaters shall not be installed within occupancies in Groups A, E and I and shall not be installed within dwelling units. The location of unvented room heaters shall also comply with Section

303.3.

Reason: This proposal prohibits unvented gas room heaters in residences. Energy efficiency in buildings is becoming increasingly important. Reduced air infiltration from airtight new buildings is a key part of making buildings more energy efficient. Obviously all products of combustion from these heaters are vented directly into the building, including venting moisture and nitrous oxides. Airtight residences are not compatible with unvented room heaters.

The 2009 IRC and IECC were made significantly more energy efficient in the last code cycle. The added efficiency included a requirement for an air tightness inspection or an air tightness test (IRC N1102.4.2, IECC 402.4.2). Incoming code changes by multiple parties are likely to greatly increase residential air tightness. There may even be a Federal law requiring increased energy efficiency in energy codes, with the prospect of a "Federalized energy code" if there is not a substantial increase in IECC energy efficiency. The increased energy efficiency in the IRC and IECC is not compatible with unvented room heaters.

Manufacturers are pushing unvented heaters to provide a greater portion of the heating for residences. Unvented heaters are called the most efficient form of heating or touted as 99% efficient. Although they legalistically including the word "supplemental" in most literature, unvented heater manufacturers focus on encouraging unvented heaters as zone or room heaters. Manufacturers or their representatives, such as the Vent-Free Alliance, even suggest lowering the thermostat of the central heating system so that more space heating is provided by the unvented heater. Greater use of unvented heaters means increased venting of combustion products directly into the living space.

The addition of vents to room heaters and fireplaces solves the problem. The most effective strategy for limiting indoor pollutants and moisture is to prevent them from being released inside in the first place, which is a key principal of indoor air quality. For room heaters and fireplaces this means exhausting the combustion products outside. Diluting the combustion products by venting the whole house is an energy-wasteful way of dealing with combustion products. Over ventilation of the residence on the possibility that an unvented heater might be in some part of the home, or might be added at a future date, is especially wasteful of energy.

So where is the evidence of a problem? The best evidence of a problem is the programs, standards, and companies "voting with their feet". ICC's new National Green Building Standard (ICC-700) outright disqualifies a residence with an unvented heater from a green designation at any level. Similarly, Energy Star, LEED and the American Lung Association's Health House outright prohibit unvented heaters in any residence in their programs. Unvented room heaters are not "green", they are "brown".

Likewise codes and standards are singling out unvented heaters. The 2009 IRC and IECC require homes with unvented heaters to state "gas-fired unvented room heater" as part of the energy certificate required to be posted on each residence (IRC N1101.9, IECC 401.3). To prevent claims of high efficiency heating, the IRC and IECC prohibit listing an efficiency for unvented heaters on the energy certificate. ASHRAE 62.2, the standard for residential indoor air quality, does not even apply in residences with unvented heaters (see scope section).

Unvented heaters are prohibited in new manufactured (HUD-code) homes by both HUD's Manufactured Home Construction and Safety Standards (Section 3280.707) and NFPA 501, the "Standard for Mobile Homes". NFPA 501, Section 10.6 states:

> *"Fuel-burning, heat-producing appliances and refrigeration appliances shall be of the vented type and shall vent to the outside. Exception: Ranges and ovens."*

In spite of HUD and NFPA 501's regulation, unvented heaters are often sold for use in existing manufactured homes. The I-codes should not allow heating combustion products to be vented directly into an existing manufactured, as those homes were never designed to accommodate a heater's combustion products.

The trend among manufacturers is clear- several companies refuse to make unvented heaters (Hearth & Home Technologies, Jotul, Kozy Heat Fireplaces, Mendota Fireplaces, Travis Industries), including the largest maker of fireplaces and hearth products. Recently Renni went from being a Vent-Free Alliance member to not producing unvented heaters.

Unvented gas room heaters are an impediment to greater energy efficiency. Unvented gas room heaters do not belong in residences.

Cost Impact: This code change proposal will increase the cost of construction.

CONNOR-FG1-621.2.DOC:

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: No evidence was presented to prove that any harm is caused by these appliances. No evidence was presented to show that houses are excessively tight such that problems will result with the installation of these appliances.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Craig Conner, Building Quality, representing self, requests Approval as Submitted.

Commenter's Reason: Unvented room heaters produce water as a product of combustion. Water can be produced at a rate of between a cup and almost two quarts per hour of operation. Power humidifiers have similar rates of moisture production.

Unvented heaters are power humidifiers with out any humidity control. The simple addition of a vent to vent moisture outside removes the problem. Why would anyone put a power humidifier without controls into a new, tight, energy-efficient residence?

Public Comment 2:

Tim Manz representing Association of Minnesota Building Officials (AMBO), requests Approval as Submitted.

Commenter's Reason: The Minnesota Mechanical Code and NFPA 501, "Standard on Manufactured Housing" both prohibit unvented heaters due to the products of combustion and moisture that are generated during the combustion process, since there is no effective way to remove these contaminants from inside the structure when a venting system does not exist.

Public Comment 3:

Patrick A. McLaughlin, McLaughlin & Associates, representing The Air-Conditioning, Heating and Refrigeration Institute, requests Disapproval.

Commenter's Reason: The Air-Conditioning, Heating and Refrigeration Institute (AHRI) is the trade association representing more than 300 manufacturers of air conditioning, heating and commercial refrigeration equipment. Our product categories include many types of vented and unvented gas residential heating appliances.

AHRI endorses the judgment of the International Fuel Gas Code Committee in its unanimous disapproval of proposal FG33.

Unvented room heaters possess the highest energy efficiency of any gas appliance, providing consumers with comfort and warmth while saving energy and money. The federal government exempts them from energy labeling and higher efficiency targets, since it recognizes that they already perform at the highest achievable level.

The requirements for ventilation and combustion air are exactly the same as for vented gas appliances. As homes become tighter, unvented room heaters perform better with diminishing heat demand, and they include unique combustion control and gas control that provide extra safety for such conditions.

Independent, peer-reviewed scientific research performed by Gas Research Institute, AGA Research, Arthur D. Little, Wilson Environmental, and Risksciences have documented the acceptable indoor air quality (IAQ) performance of unvented room heaters through actual field testing and verified computer modeling, including the utilization of the Environmental Protection Agency's IAQ modeling platform.

With 20 million units installed over the last 30 years, unvented room heaters have a remarkable safety record compared to other gas appliance. They are certified by independent third-parties such as CSA and Underwriters Laboratories (UL) in accordance with the national product standard, ANSI Z21.11.2, for safety, performance, and construction.

Unvented room heaters have been allowed by ICC codes since the first editions were published. Over the years in state and local jurisdictions, the overall trend has been for acceptance based upon the safety record that has been achieved and health department evaluations that have been performed. They are recognized for green construction by the Naturally Green Natural Gas Home Program.

The national product standard, ANSI Z21.11.2, permits installation of unvented room heaters in site-located manufactured homes--an application acknowledged by the Manufactured Housing Institute.

Manufacturers of unvented room heaters also manufacture vented gas heating appliances, and they are highly knowledgeable on the acceptability of both technologies. A code should never be used to restrict consumer choice, especially for a proven appliance with such a remarkable history of safety, performance, and reliability.

Final Action: AS AM AMPC____ D

INTERNATIONAL MECHANICAL CODE

M1-09/10, Part I
202 (New)

Proposed Change as Submitted

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

PART I – IMC

Add new definitions as follows:

CONTINUOUS OPERATION. Automatically activated and operating 24 hours a day or whenever the space is occupied.

INTERMITTENT OPERATION. Manually activated.

Reason: Currently the IMC and the IRC has several sections that require continuous or intermittent operation but never provides the guidance for how either is to be achieved. This addition to the definition section clearly provides the guidance necessary to address these specific sections.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: TOMBERLIN-M-4-M-13-202-RB-3-R202

Public Hearing Results

PART I - IMC
Committee Action: **Disapproved**

Committee Reason: The operation status of something is not dependent upon the type of controls whether intermittent or continuous. The dictionary definition is adequate for these terms. Spaces such as battery rooms and machine rooms are not occupied yet the ventilation is continuous. A ventilation shaft roof fan runs 24/7 and is manually operated, but, it would fit under the definition of intermittent. A continuously operating fan could be manually activated.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII, requests Approval as Submitted.

Commenter's Reason: Currently the IMC and the IRC have several sections that require continuous or intermittent operation but never provide the guidance for how either is to be achieved. This addition to the definition section clearly provides the guidance necessary to address these specific sections. The most prominent reason that both committees had for disapproval was that a manually operated switch could be used and be considered continuously operated. I disagree. Generally a manually operated switch is installed as a disconnecting means to service equipment. This switch is not designed to be used as a control mechanism for the equipment.

Final Action: AS AM AMPC____ D

M11-09/10
306.5 (IFGC 306.5)

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

306.5 (IFGC 306.5) Equipment and appliances on roofs or elevated structures. <u>Where equipment requiring access or appliances are located on an elevated structure or the roof of a building such that personnel will have to climb higher than 16 feet above grade to access such equipment or appliances, an interior or exterior means of access shall be provided. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) high or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Such access shall not require the use of portable ladders.\</u>

~~Where equipment requiring access and appliances are installed on roofs or elevated structures at a height exceeding 16 feet (4877 mm), such access shall be provided by a permanent approved means of access, the extent of which shall be from grade or floor level to the equipment and appliances' level service space. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) high or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope)~~ Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.

Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).
2. Ladders shall have rung spacing not to exceed 14 inches (356 mm) on center.
3. Ladders shall have a toe spacing not less than 6 inches (152 mm) deep.
4. There shall be a minimum of 18 inches (457 mm) between rails.
5. Rungs shall have a minimum 0.75-inch (19 mm) diameter and be capable of withstanding a 300-pound (136.1 kg) load.
6. Ladders over 30 feet (9144 mm) in height shall be provided with offset sections and landings capable of with standing 100 pounds per square foot (488.2 kg/m2). Landing dimensions shall be not less than 18 inches (457 mm) and not less than the width of the ladder served. A guard rail shall be provided on all open sides of the landing.
7. Ladders shall be protected against corrosion by *approved* means.

Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

Exception: This section shall not apply to Group R-3 occupancies.

Reason: This is an effort to stream-line and simplify this section and exclude unnecessary language. This text eliminates where roofs are to be measured by prescribing that if the roof is greater than 16 feet, inside or outdoor access is required regardless of how high parapets are. Prohibiting the use of portable ladders assures that the ladders associated with access are close enough to the ground or floor to access. There is nothing new in this text.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-33-306.5

Public Hearing Results

Modify the proposal as follows:

306.5 (IFGC 306.5) Equipment and appliances on roofs or elevated structures. Where equipment requiring access or appliances are located on an elevated structure or the roof of a building such that personnel will have to climb higher than 16 feet above grade <u>or floor level</u> to access such equipment or appliances, an interior or exterior <u>permanent</u> means of access shall be provided. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) high or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Such access shall not require the use of portable ladders.

~~Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.~~

Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).
2. Ladders shall have rung spacing not to exceed 14 inches (356 mm) on center.
3. Ladders shall have a toe spacing not less than 6 inches (152 mm) deep.

4. There shall be a minimum of 18 inches (457 mm) between rails.
5. Rungs shall have a minimum 0.75-inch (19 mm) diameter and be capable of withstanding a 300-pound (136.1 kg) load.
6. Ladders over 30 feet (9144 mm) in height shall be provided with offset sections and landings capable of with standing 100 pounds per square foot (488.2 kg/m2). Landing dimensions shall be not less than 18 inches (457 mm) and not less than the width of the ladder served. A guard rail shall be provided on all open sides of the landing.
7. Ladders shall be protected against corrosion by *approved* means.

Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

Exception: This section shall not apply to Group R-3 occupancies.

Reason: This is an effort to stream-line and simplify this section and exclude unnecessary language. This text eliminates where roofs are to be measured by prescribing that if the roof is greater than 16 feet, inside or outdoor access is required regardless of how high parapets are. Prohibiting the use of portable ladders assures that the ladders associated with access are close enough to the ground or floor to access. There is nothing new in this text.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-33-306.5

Public Hearing Results

Committee Action: **Approved as Modified**

Committee Reason: The proposed revision deletes unnecessary text and clarifies the intent which is to ban the use of portable ladders where a climb to the equipment/appliance is over 16 feet in height. The modification deletes the parapet text which is already addressed in the revised text; adds the adjective “permanent” to enforce to the intended ban on portable ladders and adds “or floor level” to address multi-story buildings.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: The intent is if personnel must climb over 16 feet for any reason, which would include climbing a stairwell to an upper level, then a permanent ladder will need to be provided to an interior hatch even if it is 15 feet from the floor level. It is not safe or practical for fire or maintenance personal to haul long extension ladders up stairwells which may be many stories tall. The added term “permanent” is redundant with the last sentence which bans portable ladders. The stricken text related to parapets needs to be retained because the issue of roof height verses parapet height will be left unresolved without the text.

Final Action: AS AM AMPC____ D

M18-09/10
401.4

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

401.4 Intake opening location. Air intake openings shall comply with all the following:

1. Intake openings shall be located a minimum of 10 feet (3048 mm) from lot lines or buildings on the same lot. ~~Where openings front on a street or public way, the distance shall be measured to the centerline of the street or public way~~.

2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, ~~parking lots~~ and loading docks. Where openings front on a street or public way, the distance shall be measured from the ~~centerline~~ closest edge of the street or public way.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening.
4. Intake openings on structures in flood hazard areas shall be at or above the design flood level.

Reason: The second sentence seems to be misplaced as the dialogue concerning streets and alleys is in item # 2. Another problem here is that most streets are 20 feet wide. Measuring from the center places an opening directly on the side of the street which defeats the purpose. The contaminant sources listed make sense due to constant vehicle movement and idling but parking lots don't fit. Parking lots generally have vehicles that are not running and are open on all sides preventing an accumulating emission problem. An occasional vehicle entering or leaving a lot should not present a significant concern.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-35-401.4

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Parking lots should not be deleted because of the contaminants present in such locations. The current text is more clear.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Judson Collins, JULYCO, representing self, requests Approval as Submitted.

Commenter's Reason: The proponent has offered a logical modification to the section. If a measurement is taken from the middle of the street on a 4-lane street, the intake could be over the street or at least at the very edge of the street. Measuring from the edge of the public way or street seems to be more in line with the intent of this section to minimize the chance of contaminants entering the intake.

Public Comment 2:

Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

401.4 Intake opening location. Air intake openings shall comply with all the following:

1. Intake openings shall be located a minimum of 10 feet (3048 mm) from lot lines or buildings on the same lot.
2. 2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks. Where openings front on a street or public way, the distance shall be measured from the closest edge of the street or public way
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening.
4. Intake openings on structures in flood hazard areas shall be at or above the design flood level.

Commenter's Reason: There were concerns that parking lots should not have been removed. Most streets are 20 feet wide or more and measuring from the center could permit openings dangerously close to contaminants.

Final Action: AS AM AMPC____ D

M24-09/10
Table 403.3

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise table as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE RP CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE RA CFM/FT2 [A]	DEFAULT OCCUPANT DENSITY #/1000 FT2[A]	EXHAUST AIRFLOW RATE CFM/FT2[A]
Beauty and nail salons– ~~[b,h]~~ Nail salon stations [h]	20 -	0.12 -	25 -	0.6 50 per station[h]

h. For Nail Salons, ~~the required exhaust shall include ventilation tables or other systems that capture the contaminants and odors at their source and are capable of exhausting a minimum of 50 cfm per station~~ <u>each nail station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station.</u>

(Portions of table and notes not shown remain unchanged)

Reason: Beauty and nail salons should not be combined and treated the same way as it relates to exhaust. Beauty salons in general do not use the same chemicals as found in nail stations. When a properly installed source capture system is employed, as defined in this code, recirculation of air should not be an issue. Source capture systems may take many forms and include ventilation tables and small hood arraignments that are intended to capture the contaminants at their source. This is why some of the language in the footnote has been removed because source capture systems include all these. The definition also states that the exhaust must be discharged to the outdoors. The general area of a nail salon should not be prohibited from recirculation because the source capture system has solved the concerns involving contamination associated with the use of acetone and other chemicals. The exhaust requirements in the table take care of the mild odors commonly found in these occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-24-T. 403.3

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Note b should remain. The exhaust rate of 50 cfm per station is in addition to the exhaust rate of 0.6 cfm per sq. ft required for beauty and nail salons.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Judson Collins, JULYCO, representing self, requests Approval as Submitted.

Commenter's Reason: The proposal does not change the current requirements in the code. It just clarifies that each nail salon station is required to have a source capture system with a minimum exhaust rate of 50 cfm as currently required in footnote h.

Final Action: AS AM AMPC____ D

Public Comment 2:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

Occupancy Classification	People Outdoor Airflow Rate in Breathing Zone Rp cfm/person	Area Outdoor Airflow Rate in Breathing Zone Ra Cfm/ft2 (a)	Default Occupant Density #/1000 ft2 (a)	Exhaust Airflow Rate Cfm/ft2 (a)
Beauty ~~and nail~~ salons[b] Nail salons[b,h]	20 20	0.12 0.12	25 25	0.6 ~~50 per station[h]~~ 0.6

h. For Nail Salons, each nail station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station.

Commenter's Reason: The committee said that footnote "b" should remain with beauty salons and they were correct, so, it has been restored. Generally, beauty and nail salons were separated into two categories for ease of understanding that footnote h would not apply to beauty salons that do not do nails. No new requirements are in this proposal. It is obvious that the current code requires a general exhaust system for nail salons in addition to the required source capture system and, so, the ventilation specifications have been inserted in the newly separated row for nail salons.

Final Action: AS AM AMPC____ D

M31-09/10, Part I
501.5 (New)

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

PART I – IMC

Add new text as follows:

501.5 Domestic exhaust fan manifolding prohibited. Domestic-type environmental air exhaust fans shall not be interconnected to a common discharge duct. Such fans shall be independently exhausted to the outdoors.

Reason: The code does not address the manifolding of residential type exhaust fans. This practice produces poor results for venting. Air, like water, will seek the path of least resistance and the back-draft dampers are not intended to be air tight. Once the duct is pressurized, air still makes it way back into the building. The practice of combining fans and enlarging ducts produces velocity issues as the manufacturers will agree with, resulting in poor performance which is just one of the reasons this type of arrangement is not printed in any of the instructions. Conversations with engineers at Braun/Nu Tone agree, the best performance is achieved when these fans are exhausted independently. Rarely when combined is it done correctly, which would require extra back-draft dampers at wye locations and the calculations required to properly size ducts and determine maximum lengths. The practice of throwing two, three or more fans together defeats the purpose from an effective ventilation standpoint. The excuse that multiple penetrations in the building are undesirable cannot be the reason for this practice. If a single penetration is desired for multiple bathrooms, then a central exhaust system properly designed for the load is the way to achieve it.

As we can see in this poor example, the code does not address this situation. There needs to be clear guidance in order to prevent this type of installation.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-31-501.5-RM-2-M1506.1

Public Hearing Results

PART I - IMC
Committee Action: Disapproved

Committee Reason: The proposal limits designer flexibility. The text could be misconstrued to prohibit common exhaust shaft arrangements with subducts. The term manifold is not defined.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Replace proposal as follows:

501.5 Multiple exhaust fan discharge interconnections prohibited. The discharge ducts from exhaust fans shall not be interconnected except where such interconnections are in accordance with accepted engineering practice or are in accordance with the manufacturers' installation instructions.

Commenter's Reason: This fix addresses the concerns raised by the committee and some members on the floor. The committee didn't care for the word "manifolding" so it was replaced with the word "interconnected". The revised wording clarifies that it does not intend to prohibit a common fan with multiple intakes. The proposed text prevents interconnection of discharge ducts on the outlet side of the fans and does not prevent connection of a fan to multiple intake ducts. This change in general is attempting to address the abuses of installers tying together multiple fans with no thought behind it, and as a result, exhausted air makes its way back into the building through leaky back-draft dampers. Tying fans together also decreases the flow performance and efficiency of the fans. There is no guidance in the code that inspectors can use to prevent these poor installations.

Final Action: AS AM AMPC____ D

M31-09/10, Part II
IRC M1506.1 (New)

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

PART II – IRC MECHANICAL

Add new text as follows:

M1506.1 Exhaust fan manifolding prohibited. Exhaust fans shall not be interconnected utilizing a common discharge duct. Exhaust fans shall be independently exhausted to the outdoors.

Reason: The code does not address the manifolding of residential type exhaust fans. This practice produces poor results for venting. Air, like water, will seek the path of least resistance and the back-draft dampers are not intended to be air tight. Once the duct is pressurized, air still makes it way back into the building. The practice of combining fans and enlarging ducts produces velocity issues as the manufacturers will agree with, resulting in poor performance which is just one of the reasons this type of arrangement is not printed in any of the instructions. Conversations with engineers at Braun/Nu Tone agree, the best performance is achieved when these fans are exhausted independently. Rarely when combined is it done correctly, which would require extra back-draft dampers at wye locations and the calculations required to properly size ducts and determine maximum lengths. The practice of throwing two, three or more fans together defeats the purpose from an effective ventilation standpoint. The excuse that multiple penetrations in the building are undesirable cannot be the reason for this practice. If a single penetration is desired for multiple bathrooms, then a central exhaust system properly designed for the load is the way to achieve it.

As we can see in this poor example, the code does not address this situation. There needs to be clear guidance in order to prevent this type of installation.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-31-501.5-RM-2-M1506.1

Public Hearing Results

PART II - IRC
Committee Action: Disapproved

Committee Reason: Disapproval is consistent with action taken on Part I. Text should be revised by a public comment so as not to prohibit systems that use a common fan with multiple exhaust inlets.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

M1506.1 Multiple exhaust fan discharge interconnections prohibited. The discharge ducts from exhaust fans shall not be interconnected except where such interconnections are in accordance with accepted engineering practice or are in accordance with the manufacturers' installation instructions.

Commenter's Reason: This fix addresses the concerns raised by the committee and some members on the floor. The committee didn't care for the word "manifolding" so it was replaced with the word "interconnected". The revised wording clarifies that it does not intend to prohibit a common fan with multiple intakes. The proposed text prevents interconnection of discharge ducts on the outlet side of the fans and does not prevent connection of a fan to multiple intake ducts. This change in general is attempting to address the abuses of installers tying together multiple fans with no thought behind it, and as a result, exhausted air makes its way back into the building through leaky back-draft dampers. Tying fans together also decreases the flow performance and efficiency of the fans. There is no guidance in the code that inspectors can use to prevent these poor installations.

Final Action: AS AM AMPC____ D

M35-09/10, Part I
504.4, 504.6.2

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED ONLY FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

PART I – IMC

Revise as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a back-draft damper. Screens shall not be installed at the duct termination. Ducts shall ~~not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow.~~ be mechanically fastened in accordance with *SMACNA Duct Construction Standard- Metal and Flexible.* Fasteners shall not protrude into the duct more than 1/8 inch. Ducts shall be sealed in accordance with Section 603.9. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

504.6.2 Duct installation. Exhaust ducts shall be supported at ~~4~~ 12 foot intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. ~~Ducts shall not be joined with screws or similar fasteners that protrude into the inside of the duct.~~

Reason: (PART I) 504.4 and 504.6.2 conflict with the SMACNA Standard and contain conflicting or, at least, redundant text. Tape alone is no means of correctly fastening any duct. Code Officials may certainly permit this practice if they chose to do so but the code should not direct a practice that conflicts with the Standard it condones. There is nothing wrong with small fasteners as long as they don't extend too far into the duct. A maximum penetration of 1/8 inch will assure minimum lint buildup as much more than that collects on the duct walls. Duct cleaning firms are having difficulties because the ducts are coming apart, requiring them to open up finished walls to repair them, there by creating added expenses and unhappy customers. Duct separations in any location, especially in concealed locations, could result in a fire hazard and moisture and lint accumulation. Mechanically fastened ducts can tolerate a longer interval (12 feet) between supports and the current 4 feet interval is overkill.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-27-504.4-504.6.2-RM-6-M1502.4.1

Public Hearing Results

PART I - IMC
Committee Action: Disapproved

Committee Reason: Screws that protrude ¼ inch into ducts can create blockages and allowing 1/8 inch protrusions is not much safer.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a back-draft damper. Screens shall not be installed at the duct termination. Ducts shall be mechanically fastened<u>.</u> ~~in accordance with *SMACNA Duct Construction Standard- Metal and Flexible.*~~ Fasteners shall not protrude into the duct more than 1/8 inch. Ducts shall be sealed in accordance with Section 603.9. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

504.6.2 Duct installation. Exhaust ducts shall be supported at <u>intervals not to exceed</u> 12 <u>feet</u> ~~foot intervals~~ and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of flow.

Commenter's Reason:

The committee had concerns about the reference to SMACNA so it was removed**.** The modification to 504.6.2 is consistent with the SMACNA standard.

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

M35–09/10
IRC M1502.4.1, M1502.4.2, M1502.4.4.1

Revise as follows:

M1502.4.1 Material and size Exhaust ducts shall have a smooth interior finish and be constructed of metal <u>having</u> a minimum <u>thickness</u> of ~~0.016 inch (0.4 mm)~~ 0.0157 inches (.3950 mm) (No. 28 gage). ~~thick~~. The duct shall be 4 inches nominal in diameter.

M1502.4.2 Duct installation. Exhaust ducts shall be supported at ~~4~~ <u>12</u> foot intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. <u>Exhaust duct joints shall be sealed in accordance with Section M1601.4.1 and shall be mechanically fastened.</u> Ducts shall not be joined with screws or similar fasteners that protrude <u>more than 1/8 inch (3.2 mm)</u> into the inside of the duct.

M1502.4.4.1 Specified length. The maximum length of the exhaust duct shall be ~~25 feet (7620 mm)~~ <u>35 feet (1068 mm)</u> from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table M1502.4.4.1.

Reason: (PART II) The language in M1502.4.1 is consistent with language in last cycles M-16 Part II which was approved. M1502.4.2 violates the SMACNA Standard for hanger spacing and the last sentence also violates M1502.5 in that tape alone is not a means of connection for dryer vents. Duct cleaning firms are having fits because the ducts are coming apart requiring them to open up finished walls to repair them thereby creating added expense and unhappy customers. The 35-foot dimension is consistent with what is already in the IMC and IFGC.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II – IRC

Modify the proposal as follows:

Revise as follows:

M1502.4.1 Material and size Exhaust ducts shall have a smooth interior finish and be constructed of metal having a minimum thickness of 0.0157 inches (.3950 mm) (No. 28 gage). The duct shall be 4 inches nominal in diameter.

M1502.4.2 Duct installation. Exhaust ducts shall be supported at ~~12~~ ~~foot~~ intervals <u>not to</u> <u>exceed 12 feet</u> and shall be secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Exhaust duct joints shall be sealed in accordance with Section M1601.4.1 and shall be mechanically fastened. Ducts shall not be joined with screws or similar fasteners that protrude more than 1/8 inch (3.2 mm) into the inside of the duct.

M1502.4.4.1 Specified length. The maximum length of the exhaust duct shall be 35 feet (1068 mm) from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table M1502.4.4.1.

Committee Action: **Approved as Modified**

Modify the proposal as follows:

Committee Reason: Approval is based upon the proponent's printed reason. The modification clarifies that the 12 foot interval is a maximum interval.

Assembly Action: **None**

M39-09/10, Part I
504.6.4, 504.6.4.3

Proposed Change as Submitted

Proponent: Julius Ballanco, PE, JB Engineering and Code Consulting, PC, representing the Home Ventilating Institute

PART I – IMC

1. Revise as follows:

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections 504.6.4.1 ~~or~~ through ~~504.6.4.2~~ 504.6.4.3.

2. Add new text as follows:

504.6.4.3 Dryer exhaust duct power ventilator. The maximum length of the exhaust duct shall be determined by the manufacturer's installation instructions for the dryer exhaust duct power ventilator. Dryer exhaust duct power ventilators shall be listed and labeled for use in dryer exhaust duct systems and shall be installed in accordance with the manufacturer's installation instructions.

Reason: During the rewrite of this section, dryer exhaust duct power ventilators were originally a part of the requirements. The section was deleted when the Supplemental requirements were not completed prior to the final code change hearing. This proposed text is similar to the original language proposed during the last cycle.

Dryer exhaust duct power ventilators are now regulated by Supplemental requirements to UL 705. These supplemental requirements specify testing for ventilators used in this application. The requirements include many safety provisions for the ventilators. The ventilator manufacturer specifies the maximum length of the dryer exhaust duct. This length is used for testing and listing the ventilator, thus verifying the instructions.

ICCFILENAME: BALLANCO-M-1-504.6.4-RM-1-M1502.4.4

Public Hearing Results

PART I - IMC
Committee Action: **Disapproved**

Committee Reason: The UL standard for such units is not yet available. The proposed text lacks a requirement for a label stating that a power ventilator is part of the installed system. The proposed text would allow such units to be tested to any criteria or standard, thus allowing all units to be sold as dryer exhaust duct power ventilators without consistency in product safety.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Julius Ballanco, PE, JB Engineering and Code Consulting, PC, representing the Home Ventilating Institute, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

PART I – IMC

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections 504.6.4.1 through 504.6.4.3.

504.6.4.3 Dryer exhaust duct power ventilator. The maximum length of the exhaust duct shall be determined by the manufacturer's installation instructions for the dryer exhaust duct power ventilator. Dryer exhaust duct power ventilators shall be listed and labeled ~~for use in dryer exhaust duct systems~~ as complying with Supplement SA of UL 705 and shall be installed in accordance with the manufacturer's installation instructions.

Commenter's Reason: At the first hearing, the Supplement to UL 705 was out to ballot. Furthermore, the Committee thought a direct reference to Supplement SA of UL 705 was appropriate. I have made the changes to reference the standard that regulates dryer exhaust duct power ventilators. Supplement SA of UL 705 complies with the ICC Policy for referenced standards.

Analysis: The standard, UL 705, was not reviewed or considered by the IMC Code Development committee and it was not considered by the hearing attendees at the time of the code development hearings. Section 3.6.3.1 of Council Policy #28, *Code Development,* requires that new standards be introduced in the original code change proposal, therefore, the introduction of a new standard via a public comment is not in accordance with the process required by CP# 28 for adding new standards to the code.

Public Comment 2:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Section<u>s</u> 504.6.4.1 ~~or~~ <u>through</u> ~~504.6.4.2~~ <u>504.6.4.3.</u>

504.6.4.3 Dryer exhaust duct power ventilator. The maximum length of the exhaust duct shall be determined by the manufacturer's installation instructions for the dryer exhaust duct power ventilator. Dryer exhaust duct power ventilators shall be listed and labeled <u>in accordance with UL 705</u> for use in dryer exhaust duct systems and shall be installed in accordance with the manufacturer's installation instructions.

Commenter's Reason: The committee was concerned that the standard was not yet ready. UL 705 is currently being balloted for this application. The results of the ballot should be available prior to the Final Action Hearing.

Analysis: The standard, UL 705, was not reviewed or considered by the IMC Code Development committee and it was not considered by the hearing attendees at the time of the code development hearings. Section 3.6.3.1 of Council Policy #28, *Code Development,* requires that new standards be introduced in the original code change proposal, therefore, the introduction of a new standard via a public comment is not in accordance with the process required by CP# 28 for adding new standards to the code.

Final Action: AS AM AMPC____ D

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Julius Ballanco, PE, JB Engineering and Code Consulting, PC, representing the Home Ventilating Institute, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

PART II – IRC MECHANICAL

M1502.4.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections M1502.4.4.1 through M1502.4.4.3.

M1502.4.4.3 Dryer exhaust duct power ventilator. The maximum length of the exhaust duct shall be determined by the manufacturer's installation instructions for the dryer exhaust duct power ventilator. Dryer exhaust duct power ventilators shall be listed and labeled ~~for use in dryer exhaust duct systems~~ as complying with Supplement SA of UL 705 and shall be installed in accordance with the manufacturer's installation instructions.

Commenter's Reason: At the first hearing, the Supplement to UL 705 was out to ballot. Furthermore, the Committee thought a direct reference to Supplement SA of UL 705 was appropriate. I have made the changes to reference the standard that regulates dryer exhaust duct power ventilators. Supplement SA of UL 705 complies with the ICC Policy for referenced standards.

Analysis: The standard, UL 705, was not reviewed or considered by the IRC Code Development committee and it was not considered by the hearing attendees at the time of the code development hearings. Section 3.6.3.1 of Council Policy #28, *Code Development,* requires that new standards be introduced in the original code change proposal, therefore, the introduction of a new standard via a public comment is not in accordance with the process required by CP# 28 for adding new standards to the code.

Public Comment 2:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

M1502.4.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections M1502.4.4.1 through M1502.4.4.3.

M1502.4.4.3 Dryer exhaust duct power ventilator. The maximum length of the exhaust duct shall be determined by the manufacturer's installation instructions for the dryer exhaust duct power ventilator. Dryer exhaust duct power ventilators shall be listed and labeled in accordance with UL 705 for use in dryer exhaust duct systems and shall be installed in accordance with the manufacturer's installation instructions.

Commenter's Reason: The committee was concerned that the standard was not yet ready. UL 705 is currently being balloted for this application. The results of the ballot should be available prior to the Final Action Hearing.

Analysis: The standard, UL 705, was not reviewed or considered by the IRC Code Development committee and it was not considered by the hearing attendees at the time of the code development hearings. Section 3.6.3.1 of Council Policy #28, *Code Development,* requires that new standards be introduced in the original code change proposal, therefore, the introduction of a new standard via a public comment is not in accordance with the process required by CP# 28 for adding new standards to the code.

Final Action: AS AM AMPC____ D

M54-09/10
506.3.9

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete and substitute as follows:

506.3.9 Grease duct horizontal cleanouts~~. Cleanouts located on horizontal sections of ducts shall be spaced not more than 20 feet (6096 mm) apart. The cleanouts shall be located on the side of the duct with the opening not less than 1.5 inches (38 mm) above the bottom of the duct, and not less than 1 inch (25 mm) below the top of the duct. The opening minimum dimensions shall be 12 inches (305 mm) on each side. Where the dimensions of the side of the duct prohibit the cleanout installation prescribed herein, the openings shall be on the top of the duct or the bottom of the duct. Where located on the top of the duct, the opening edges shall be a minimum of 1 inch (25 mm) from the edges of the duct. Where located in the bottom of the duct, cleanout openings shall be designed to provide internal damming around the opening, shall be provided with gasketing to preclude grease leakage, shall provide for drainage of grease down the duct around the dam, and shall be approved for the application. Where the dimensions of the sides, top or bottom of the duct preclude the installation of the prescribed minimum-size cleanout opening, the cleanout shall be located on the duct face that affords the largest opening dimension and shall be installed with the opening edges at the prescribed distances from the duct edges as previously set forth in this section~~.

Cleanouts serving horizontal sections of grease duct shall:

1. Be spaced not more than 20 feet apart.
2. Be located not more than 10 feet from changes in direction.
3. Be located on the bottom only where no other locations are available and shall be provided with internal damming of the opening such that grease will flow past the opening without pooling. Bottom cleanouts and openings shall be approved for the application and installed liquid tight.
4. Not be closer than 1 inch from the edges of the duct.
5. Have opening dimensions of not less than 12 inches by 12 inches. Where such dimensions preclude installation, the opening shall be not less than 12 inches on one side and shall be large enough to provide access for cleaning and maintenance.
6. Shall be located at grease reservoirs.

Reason: This is a novel of a section, packed with information and in need of updating. Item # 2 is somewhat new though already implied. There is nothing prohibiting only one cleanout installed in the middle of a 24 foot section of duct as the code is silent on minimum numbers. This text would require that two cleanouts be provided. In item # 5, although the National Standard calls for 1 1/2 inches, it is an arbitrary number. This 1 inch dimension will have no effect structurally on the door installation nor will it have an effect on the duct itself and as a result, will provide a little more flexibility. Item # 6 already provides for a minimum 12 X 12 door but some flexibility is required for smaller duct sizes, but in no case should one side be less than 12 inches. Item # 7 is new. This establishes that a cleanout needs to be installed at grease reservoir locations in order to properly inspect and maintain the reservoir.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-17-506.3.9

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The revised list version is easier to read than the original paragraph.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, Virginia, representing VA Plumbing and Mechanical Inspectors Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

506.3.9 Grease duct horizontal cleanouts. Cleanouts serving horizontal sections of grease duct shall:

1. Be spaced not more than 20 feet apart.
2. Be located not more than 10 feet from changes in direction that are greater than 45 degrees.
3. Be located on the bottom only where no other locations are available and shall be provided with internal damming of the opening such that grease will flow past the opening without pooling. Bottom cleanouts and openings shall be approved for the application and installed liquid tight.
4. Not be closer than 1 inch from the edges of the duct.
5. Have opening dimensions of not less than 12 inches by 12 inches. Where such dimensions preclude installation, the opening shall be not less than 12 inches on one side and shall be large enough to provide access for cleaning and maintenance.
6. Shall be located at grease reservoirs.

Commenter's Reason: The only change is the language of #2 which previously did not state a specific degree of the change of direction meaning any slight change of direction would be required to be located not more than 10 feet from a cleanout. The added language specifies that a cleanout be located within 10 feet from changes in direction that are greater than 45 degrees.

Final Action: AS AM AMPC____ D

M57-09/10
506.3.10.2

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

506.3.10.2 Field applied enclosure. Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by field-applied grease duct enclosure that is a listed and labeled material, system, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration fire-stop system classified in accordance with ASTM E814 or UL 1497 and having a "F" and "T" rating equal to the fire-resistance rating of the assembly being penetrated. Such systems shall be installed in accordance with the listing and the manufacturer's installation instructions. Partial application of a field-applied grease duct enclosure system shall not be installed for the sole purpose of reducing clearance to combustibles at isolated sections of grease duct except where specifically listed and labeled for such partial application. Exposed duct-wrap systems shall be protected where subject to physical damage.

Reason: The true intent of duct wrap systems is that they be applied to an *entire* system, not just a portion of one. This comes into play when Section 506.3.10.4 is employed. This section usually works up to the point where the roof must be penetrated. Most of these structures are wood construction or there is combustible material on decking and so forth, that the duct must get by. A practice has been to only wrap the duct from a point 18 inches from the bottom of the roof deck up through the curb. If this material was intended to be used this way, it would be found in Table 308.6. This material must meet all 5 tests of ASTM E 2336 which includes the internal fire test and the external full engulfment test. The material would never pass the test under partial application and has never been tested in this fashion, that is, to reduce clearances in small sections of duct. The manufacturers will be the first to explain that their product is not approved for this application. The code does not specifically address this poor practice. The intent of the exception is for the duct to be able to exit the structure on its own ability and to not come within 18 inches of combustible construction.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-28-506.3.10.2

Public Hearing Results

Modify the proposal as follows:

Revise as follows:

506.3.10.2 Field applied enclosure. Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by field-applied grease duct enclosure that is a listed and labeled material, system, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration fire-stop system classified in accordance with ASTM E814 or UL 1497 and having a "F" and "T" rating equal to the fire-resistance rating of the assembly being penetrated. Such systems shall be installed in accordance with the listing and the manufacturer's installation instructions. Partial application of a field-applied grease duct enclosure system shall not be installed for the sole purpose of reducing clearance to combustibles at isolated sections of grease duct. ~~except where specifically listed and~~ ~~labeled for such partial application~~. Exposed duct-wrap systems shall be protected where subject to physical damage.

Committee Action: Approved as Modified

Committee Reason: This product is being misapplied in some cases and some product installation instructions are silent on partial application. The revision is consistent with the intent of the code to require a continuous duct enclosure (i.e. no partial enclosures) and consistent with Section 506.3.6, Exception # 3. The modification deletes text that suggests that there are methods of testing for partial applications because there are none.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tim Manz representing Association of Minnesota Building Officials (AMBO), requests Disapproval.

Commenter's Reason: This issue is already addressed adequately in Exception #3 of Section 506.3.6, as the Committee Reason states, so there is no need for the proposed change to Section 506.3.10.2.

Final Action: AS AM AMPC____ D

M58-09/10
506.3.10.4

Proposed Change as Submitted

Proponent: Tony Crimi, A.C. Consulting Solutions, Inc., representing the International Firestop Council

Revise as follows:

506.3.10.4 Duct enclosure not required. A duct enclosure shall not be required for a grease duct that penetrates only a non fire-resistance-rated roof/ceiling assembly. <u>Grease duct systems and exhaust *equipment* serving Type I hoods shall comply with the requirements of section 506.3.6.</u>

Reason: The proposed change clarifies that while a duct enclosure is not required for a grease duct that penetrates only a non fire-resistance-rated roof/ceiling assembly, the clearances of grease duct systems and exhaust *equipment* serving a Type I hoods still need to comply with the requirements of section 506.3.6 to both combustible and non-combustible construction.

Justification: This proposal clarifies the need to apply the existing provision in 506.3.6 of the Code for a grease duct that penetrates a non- fire-resistance-rated roof/ceiling assembly.. The IMC differentiates between requirements for grease duct systems and exhaust equipment serving a Type I hoods to maintain clearances to combustible and non-combustible construction, and the requirements to provide a duct enclosure. Section 506.3.10 waives the requirement to provide a duct enclosure in this specific instance. However, it is important that users understand that the allowance to waive the enclosure does not also waive the need to maintain clearances between these grease ducts and combustible and non-combustible construction as specified in 506.3.6.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: CRIMI-M-2-506.3.10.4

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: There is no reason to refer to only one applicable provision because there are many.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tony Crimi, AC Consulting Solutions Inc, representing International Firestop Council, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

506.3.10.4 Duct enclosure not required. A duct enclosure shall not be required for a grease duct that penetrates only a non fire-resistance-rated roof/ceiling assembly. Grease duct systems and exhaust *equipment* serving a Type I hood shall comply with ~~the requirements of~~ Section 506.3.6.

Commenter's Reason: Section 506.3.10 waives the requirement to provide a duct enclosure in this specific instance. However, the allowance to waive the enclosure does not also waive the need to maintain clearances as specified in 506.3.6. The proposed change clarifies that when a grease duct penetrates a non fire-resistance-rated roof/ceiling assembly, the clearances of grease duct systems and exhaust *equipment* serving a Type I hoods still need to comply with the requirements of section 506.3.6 for clearances to combustible and non-combustible construction.

Final Action: AS AM AMPC____ D

M60-09/10
506.3.12.3

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

506.3.12.3 Termination location. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from parts of the same or contiguous buildings, adjacent buildings and adjacent property lines and shall be located not less than 10 feet (3048 mm) above the adjoining grade level. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from or not less than 3 feet (914 mm) above air intake openings into any building.

> **Exception:** Exhaust outlets shall terminate not less than 5 feet (1524 mm) <u>horizontally</u> from parts of the same or contiguous building, an adjacent building, adjacent property line and air intake openings into a building where ~~air from~~ the exhaust outlet discharge~~s away~~ <u>is not directed at any angle toward such points</u> ~~from such locations~~.

Reason: There is some confusion as to what exactly is meant by the term "away from the building" and what it actually permits. It would seem that the side of an up blast fan whether it is a utility set or centrifugal fan would be compliant with the 5-foot exception when the closest edge of the discharge is measured horizontally and no angle short of parallel would be compliant. This is a much needed clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-20-506.3.12.3

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Disapproval is based upon the action taken on M59-09/10 which does a better job of clarifying the intent of this section.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: The committee never addressed why this change was disapproved with respect to the bulk of the change. This language eliminates interpretation confusion with regards to what is meant by "away from the building".

Final Action: AS AM AMPC____ D

M63-09/10
507.2

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.2 Where required. A Type I or Type II hood shall be installed at or above all *commercial cooking appliances* in accordance with Sections 507.2.1 and 507.2.2. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.

> **Exception:** Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application, a hood shall not be required at or above them.

Reason: This is an effort to recognize hoodless griddle type cooking appliances which are becoming more popular. Sometimes they are referred to as Hibachi Tables where generally smaller amounts of food are prepared in front of the customers directly at their table. These cooking tables have built-in downdraft exhaust systems running between 800 and 1000 cfm designed with two fans, one to push and one to draw air across the table. The cooking vapors are captured and delivered to a grease duct attached at the bottom of the table. All current IMC grease duct requirements apply at this point.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-25-507.2

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent's printed reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Revise Committee action as follows:

507.2 Where required. A Type I or Type II hood shall be installed at or above all *commercial cooking appliances* in accordance with Sections 507.2.1 and 507.2.2. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.

> **Exception:** Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application in accordance with NFPA 96, a hood shall not be required at or above them.

Commenter's Reason: There's confusion over what the appropriate requirements are for these downdraft appliances and if an exception is to be provided, I believe the Code must specify the requirements used for listing. Chapter 15 of NFPA 96 was added to specifically address requirements for these systems.

Analysis: The standard, NFPA 96, was not reviewed or considered by the IMC Code Development committee and it was not considered by the hearing attendees at the time of the code development hearings. Section 3.6.3.1 of Council Policy #28, *Code Development,* requires that new standards be introduced in the original code change proposal, therefore, the introduction of a new standard via a public comment is not in accordance with the process required by CP# 28 for adding new standards to the code.

Final Action: AS AM AMPC____ D

M64-09/10
507.2.1, 507.2.2

Proposed Change as Submitted

Proponent: Douglas J. Horton, D.J. HORTON and Associates, Inc., representing Commercial Kitchen Ventilation Technical Interest Group

Revise as follows:

507.2.1 Type I hoods. Type I hoods shall be installed where cooking *appliances* produce grease or smoke. Type I hoods shall be installed over *medium-duty*, *heavy-duty* and *extra-heavy-duty cooking appliances*. Type I hoods shall be installed over *light-duty cooking appliances* that produce grease or smoke.

> **Exception**: A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m^3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m^3/s) in accordance with Section 17 of UL 710B.

507.2.2 Type II hoods. Type II hoods shall be installed above dishwashers and ~~*light-duty appliances*~~ appliances that produce heat or moisture and do not produce grease or smoke, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II hoods shall be installed above all ~~*light-duty appliances*~~ appliances that produce products of *combustion* and do not produce grease or smoke. Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m^2).

Reason: A growing issue is the proliferation of small appliances and related cooking in which little or no grease is produced, such as in convenience stores and other venues. Thus, a minimum threshold should be provided in the IMC to eliminate the expense of first cost, and energy costs of fan energy and tempering makeup air, where grease emissions are minimal or nonexistent. Such a minimum threshold already exists in codes and standards, and this proposal is provided to harmonize the IMC with NFPA Standard 96 and UL Standard 710B. NFPA 96 contains the threshold requirement and UL 710B, Section 17, contains the applicable test procedure. NFPA 96, in sections 4.1.1.2 and 4.1.1.3, exempts from exhaust systems cooking equipment that has grease discharge that does not exceed 5 mg/m^3 when tested at an exhaust airflow rate of 500 cfm (0.236 m^3/s). Note that NFPA 96 is written entirely from a fire safety point of view, so only a Type I (in IMC terms) hood requirements are included in the standard.

State jurisdictions are beginning to pick up this exception in their adoptions of the IMC. For example, both Michigan and California mechanical codes either cite the grease test requirements explicitly or cite NFPA 96 for exhaust system requirements.

Editorial Note: The 2008 NFPA 96 cites UL 197 in sections 4.1.1.2 and 4.1.1.3, though the grease emissions test has been moved to Section 17 of UL 710B. Therefore, the proposed IMC exception should cite the actual grease emissions threshold requirement rather than citing NFPA 96, which contains the outdated reference.

In relation to Section 507.2.2, if a Type I hood is not required because of low grease emissions, per the first part of this proposal, the provisions of section 507.2.2 still apply, and a Type II hood may be required. This is problematic with the existing wording because Type II hoods are currently required only for dishwashers and light-duty appliances. Yet it is well known that appliances with duty ratings higher than light-duty produce heat and moisture while not producing grease or combustion products, such as electric ranges, electric pasta cookers, electricpizza ovens, and electric tilting skillets, for example. Accordingly, Type II hoods should be required for appliances based on their actual emissions of heat and moisture, regardless of duty. Of course, per current Section 507.2.2, additional HVAC capacity is still available as an alternative to use of a Type II hood.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: HORTON-M-1-507.2

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent's printed reason. Having a measurable performance criteria is desired in applying the code. The proposed text is consistent with NFPA 96.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tony Crimi, A.C. Consulting Solutions Inc , representing International Firestop Council, requests Disapproval.

Reason: The existing IMC requirement in 507.2.1 is very clear in requiring Type I hoods to be installed over *medium-duty*, *heavy-duty* and *extra-heavy-duty cooking appliances and* over *light-duty cooking appliances* that produce grease or smoke. The proposed change clouds the issue because it somehow gives credit for the power source of the appliance, when determining the need for the installation of a Type 1 hood for exhausting hazardous and flammable vapours emitting from the cooking medium (i.e. vegetable oils and fats).

There is insufficient justification provided as to the significance of the 5 mg/m^3 , and as to why this would apply only to electric heating appliances. The fact that the appliance is electric does not change the fact that it is a "*light-duty cooking appliances* that produce grease or smoke", as the current IMC requires.

Final Action: AS AM AMPC____ D

M72-09/10
507.3

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.3 Fuel-burning appliances. ~~Where vented fuel-burning appliances are located in the same room or space as the hood, provisions shall be made to prevent the hood system from interfering with normal operation of the appliance vents.~~ <u>Non-direct-vent appliances shall not be located in a room or space containing a Type I or Type II hood nor in a room or space that opens only into a room or space containing such hoods.</u>

<u>Exception:</u> <u>Non-direct-vent appliances shall be permitted in a room or space containing a Type I or Type II hood provided that the room or space is continuously maintained under positive pressure.</u>

Reason: 507.3 only states that "provisions" need to be made when dealing with these types of appliances but provides no guidance as what is really required. This only creates confusion in the enforcement community as to what needs to occur. Non direct vent appliances and those with draft hoods are subject to many factors that could result in improper venting. Losses in building pressure will cause improper venting. It only takes 5 Pascal's to overcome a gravity vent. These appliances are also in competition for air with other appliances and are no match for powered exhaust equipment such as hoods. The kitchen environment lends itself to negative pressure either by design or by accident. A perfectly balanced system never lasts very long as every minute detail affects them. Even kitchens with slight positive pressure can be subject to negative building pressures simply by opening doors. If kitchen pressures are even negative in the slightest or cannot be verified, then the appliance should be isolated. This text will provide the user with guidance that is more concise.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-15-507.3

<u>Public Hearing Results</u>

Committee Action: Disapproved

Committee Reason: The current text allows the designer to account for venting and pressure issues. Positive pressure maintenance could cause odor migration from the kitchen. The exception needs to identify the reference space to which the positive pressure is to be measured.

Assembly Action: None

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows

507.3. Fuel burning appliances. Non-direct vent appliances shall not be located in a room or space containing a Type I or Type II hood nor in a room or space that opens only into a room or space containing such hoods <u>except where such room or space is continuously maintained under positive pressure with respect to the outdoors.</u>

> ~~**Exception:** Non-direct vent appliances shall be permitted in a room or space containing a Type I or Type II hood provided that the room or space is continuously maintained under positive pressure~~.

Commenter's Reason: The committee had a concern about pressure and what it was relative to. The relation to the outdoors was the intent and was added. Non-direct vent appliances usually means appliances with draft hoods. The word "provisions" is subjective to the inspection community and this text provides guidance as to the intention of the word. This text in no way removes options from designers that will prevent draft hood back-drafting that may be acceptable to the code official. The exception was incorporated into the body of the text as a clean-up effort.

Final Action: AS AM AMPC____ D

M73-09/10
507.10

<u>Proposed Change as Submitted</u>

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.10 Hoods penetrating a ceiling. Type I hoods or portions thereof penetrating a ceiling, wall or furred space shall comply with ~~all the requirements of~~ Section 506.3.10. <u>Field-applied grease duct enclosure systems, as addressed in Section 506.3.10.2, shall not be utilized to satisfy the requirements of this section.</u>

Reason: Hoods penetrating ceilings that are also required to have the associated ductwork protected, are required to be enclosed in a 1 or 2 hour enclosure. Field applied duct-wrap systems are listed for ducts only, not hoods. Hoods have never been tested or listed to have duct-wrap materials placed over the hood as a replacement for a 1 or 2 hour enclosure. There is no standard for installation of duct-wrap systems on hoods. Nor is there a method of fastening or method of providing access to services located on top of the hood such as lights, J-boxes etc. To permit this practice only creates a false sense of security and code compliance. The manufacturers are aware that some jurisdictions allow this application but they don't condone the practice or seek to market their product in this fashion. The best practice is to not have the hood penetrate the ceiling in the first place. As currently written, 507.10 says that **all** the requirements of 506.3.10 should be met. This is misleading because two of the exceptions cannot be applied although they are part of the section. This is a much needed clarification that will provide concise guidance as to what exactly needs to occur when hoods are required to be protected when ceilings are penetrated.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-5-507.10

<u>Public Hearing Results</u>

Committee Action: **Approved as Submitted**

Committee Reason: The proposed text will prevent the misuse of such materials. ASTM E 2336 does address the application prohibited by the proposed text.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tony Crimi, AC Consulting Solutions Inc, representing International Firestop Council, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

507.10 Hoods penetrating a ceiling. Type I hoods or portions thereof penetrating a ceiling, wall or furred space shall comply with Section 506.3.10. ~~Field-applied grease duct enclosure systems, as addressed in Section 506.3.10.2, shall not be utilized to satisfy the requirements of this section.~~

Commenter's Reason: The language in the second sentence of this proposal targets a single technology, and prohibits its use in an application for which the IMC does not even provide a specific performance Standard or criterion. It is not entirely clear from the language of this proposal whether or not the use of Section 105.2 on Alternative materials, methods, equipment and
appliances would still be possible.

The Committee's reason statement identifies ASTM E2336 as having no specific performance or testing requirements for enclosure of a Type 1 hood. While this is correct, it is equally true for UL 2221 and ASTM E119. There are other options in Section 506.3.10 which would still be permitted in this application, even though they are also not specifically tested for this use.

The *International Mechanical Code* is a model code that regulates the design and installation of mechanical systems, including appliance venting, duct and ventilation systems. The purpose of the code is to establish the minimum acceptable level of safety and to protect life and property from the potential dangers associated with the installation and operation of mechanical systems. While the IMC is primarily a prescriptive code with some performance text, the code relies heavily on product testing, specifications and listings to provide much of the appliance and equipment installation requirements. The general Section 105.2 allows designs and installations to be performed by approved engineering methods as alternatives to the prescriptive methods in the code. Section 105.2 specifically states "The provisions of this code <u>are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*.</u> An alternative material or method of construction shall be *approved* where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety."

The proposal, as modified by this public comment, clarifies the application of 506.3.10 without infringing on the code officials authority to use Section 105.2 if desired.

Final Action: AS AM AMPC____ D

M78-09/10
510.8.1

Proposed Change as Submitted

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Revise as follows:

510.8.1 Duct joints. Ducts shall be made tight with lap joints having a minimum lap of 1 inch (25 mm). <u>Joints used in ANSI/SMACNA Round Industrial Duct Construction Standards and ANSI/SMACNA Rectangular Industrial Duct Construction Standards are also acceptable</u>.

Reason: The types of joints used in either of these manuals have been used in industrial exhaust and conveyance systems for years and provide acceptable alternatives to lap joints.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: HOWARD-M-7-510.8.1

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at <u>http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf</u> :

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC staff, the standards did not comply with ICC standards criteria, Sections 3.6.2.1, 3.6.3.2.

Committee Action: **Approved as Submitted**

Committee Reason: The proposed text will provide for new technology and options to current practice and will help reduce duct leakage.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble representing ICC Reference Standards Committee, requests Disapproval.

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically Section 3.6.2.1 which requires reference standards be written in mandatory language, and Section 3.6.3 which requires standards be promulgated according to a consensus process.

We therefore propose to have this code change proposal disapproved.

Final Action: AS AM AMPC____ D

M83-09/10
515 (New), 515.1 (New)

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

SECTION 515
COMMON MULTISTORY EXHAUST SYSTEMS

515.1 Common bathroom and toilet room exhaust in multistory buildings. Where a common shaft is designed and installed to convey bathroom or toilet room exhaust, or both, in multiple story buildings, the construction of such system shall be in accordance with all of the following:

1. The building shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Building Code*.
2. Shaft construction shall conform to Section 708 of the *International Building Code*.
3. Volume dampers, fire dampers and smoke dampers shall be prohibited in the exhaust duct. Penetrations of the shaft be protected in accordance with Section 607.5.5, Exception 2.
4. The shaft shall be served by an exhaust fan located at the top of the shaft and such fan shall be specifically designed for the intended application.
5. The exhaust fan shall run continuously and maintain negative pressure in the shaft at all times.
6. The exhaust fan operation shall be monitored in an approved location and shall initiate an audible or visual signal when the fan is not in operation.
7. Makeup air shall be provided for the spaces served in accordance with Section 501.3.
8. A cleanout opening of an approved size shall be located at the base of the shaft to provide access for inspection.
9. Screens installed at termination points shall comply with Section 501.2.2.

Reason: This proposal provides guidance as to the correct way to construct a sub-duct system utilizing a shaft constructed in accordance with the building code as long as that building is sprinkled. This method has been around for years and is an economical way to provide a method of exhausting bathroom exhaust in multi-story buildings without having to install fire and smoke dampers in the shaft. Dryer and kitchen exhaust would be prohibited in this scenario. This method when installed correctly can be located in any occupancy. Normally this would be practical in buildings of 4 stories or more and most commonly be employed in hotels.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-26-515

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Volume dampers need to be allowed. A cleanout opening in the shaft is unnecessary for this application. The proposed text creates a conflict with Section 607.5.5 regarding fire damper options. Item # 3 is confusing.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 515
Common Multistory Bathroom Sub Duct Exhaust Systems

515.1 Common bathroom exhaust sub-duct systems located in multi-story buildings. Where a common shaft is designed and installed to convey bathroom exhaust, ~~or~~ toilet room exhaust, or both, in multiple story buildings, the construction of such system shall be in accordance with all of the following:

~~1.~~ ~~The building shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Building Code*~~.
~~2.~~ 1. Shaft construction shall conform to Section 708 of the *International Building Code*.
~~3.~~ ~~Volume dampers, fire dampers and smoke dampers shall be prohibited in the exhaust duct. Penetrations of the shaft shall be protected in accordance with Section 607.5.5 Exception 2~~.
2. Shaft penetrations shall be accomplished utilizing steel exhaust sub ducts having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) extending 22 inches vertically in the shaft. Shaft penetration protection shall be in accordance with Section 607.5.5.
~~4.~~ 3. The shaft shall be served by an exhaust fan located at the top of the shaft. ~~and s~~ Such fan shall be ~~specifically designed for the intended~~ listed and tested for the application.
~~5.~~ 4. The exhaust fan shall run continuously and maintain negative pressure in the shaft at all times.
~~6.~~ 5. The exhaust fan operation shall be monitored in an approved location and shall initiate an audible or visual signal when the fan is not in operation.
~~7.~~ 6. Makeup air shall be provided for the spaces served in accordance with Section 501.3.
~~8.~~ ~~A cleanout opening of an approved size shall be located at the base of the shaft to provide access for inspection.~~
~~9.~~ ~~Screens installed at termination points shall comply with Section 501.2.2~~

Commenter's Reason: The committee said to make the modifications and bring it back. One concern was that the word "sub duct" wasn't in the heading. Another was prohibiting volume dampers in which the committee was correct. Volume dampers may be needed for balancing. Another concern was a cleanout wasn't required so that provision was removed. The reference to sub ducts extending 22 inches in the shaft was also added along with some general cleanup. Not including kitchen exhaust here is intentional although the Building Code permits it. The affect grease might have on drywall is not apparent at this time.

Final Action: AS AM AMPC____ D

M85-09/10
202, 602.1, 603.18 (New)

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

1. Delete and substitute as follows:

~~**602.1 General.** Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces and mechanical equipment rooms. Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed within a plenum.~~

602.1 General. The following shall be considered to be an air plenum:

1. Interstitial spaces above ceilings and below floors.
2. Stud wall cavities and spaces between solid floor joists utilized in accordance with Section 602.3
3. Boxes or chambers constructed to support air handlers and furnaces and to collect return air for such furnaces and air-handlers.
4. Mechanical room enclosures used to convey return air to air-handlers therein.

Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed in plenums.

2. Add new definition and text as follows:

DUCT PLENUM A box or chamber constructed of duct materials and used to collect air from or supply air to other ducts. Such plenums typically connect to the inlets and outlets of furnaces and air handlers.

603.18 Duct plenums. Duct plenums shall be constructed as required for ducts in accordance with Section 603.

Reason: This is only an attempt for the body of the code to recognize the use of various plenums found in most HVAC systems. Currently the code only speaks of plenums that take the form of structural components. The word "plenum" has been used in the trade for many years and can be most commonly found in residential applications but applies to many commercial systems as well. Sometimes large plenums are built as "fan houses" employing vane axial equipment. Plenums can be very big or small and never be part of the structure. Furnaces sometimes sit on top of plenum boxes. Many attic installations employ a plenum for flex duct distribution and so on. Using an attic or crawl space as a plenum makes little sense. Some of the problems associated with these types of designs are leakage, plenum heat loss, mold and moisture control, acceptable outlet performance, cleanliness and odor control. Verifying these issues would be very difficult for any inspector and the smallest oversight could wreak havoc for a jurisdiction. This text will solve the duct plenum recognition issue.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-34-202-602.1-603.18

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed term "duct plenum" creates confusion with current plenum definitions. Item # 1 of proposed section 602.1 would classify all such spaces as plenums and then restrictions would apply to piping and other materials installed in such spaces.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.1 General. ~~The following shall be considered an air plenum:~~ Air plenums shall be limited to the following:

1. Interstitial spaces above ceilings and below floors.
2. Interior ~~S~~ stud wall cavities and spaces between solid floor joists utilized in accordance with Section 602.3
3. Duct plenums. ~~Boxes or chambers constructed to support air handlers and furnaces to collect return air for such furnaces and air-handlers~~.
4. Mechanical room enclosures used to convey return air to air-handlers therein.

Plenums shall be limited to one fire area. Fuel-fired appliance shall not be installed in plenums.

DUCT PLENUM A box or chamber constructed of duct materials and used to collect air from or supply air to other ducts, equipment or appliances. ~~Such plenums typically connect to the inlet and outlet sides of furnaces and air handlers.~~

603.18 Duct plenums. Duct plenums shall be constructed as required for ducts in accordance with Section 603.

Commenter's Reason: The committee didn't care for the word "considered" so it was removed. Exterior wall building cavities are no longer condoned to be utilized as an air plenum. # 3 now refers to the new definition as the definition explains how duct plenums are intended to be used. The words "equipment and appliances" was added for clarification and the last sentence of the definition could be construed as commentary. The intent of this proposal was to house all requirements for plenums in one place for convenience to the user. The current code text only acknowledges structural components as plenums. There are no definitions in the IMC defining what a duct plenum is.

Final Action: AS AM AMPC____ D

M87-09/10
602.2.1

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1through 602.2.1.6, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
   5.1. continuous noncombustible raceways or enclosures
   5.2. approved gypsum board assemblies
   5.3. ~~or within~~ materials listed and labeled ~~for such application~~ as part of a tested assembly or system.

Reason: The issue of what materials are considered acceptable for exposure in a plenum is a life safety issue. The proposed change format of Exception 5 is to clarify that any one of these three options are only permitted when the combustible material is fully enclosed. The third option in Exception 5 is not clear as to what is meant by "for such application". This "protecting" material needs to provide sufficient protection of the combustible material during the event of a fire. Thus, to determine if the "protecting" material will remain in place during the event of a fire and not expose the combustible material to the fire, then the "protecting material" and the combustible material needs to be tested as an assembly or system.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: EUGENE-M-15-602.2.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The revised text is confusing. Other means such as smoke detection should be pursued to lessen the hazard in plenums. There is no standard for testing and listing the assemblies and systems referred to in item 5.3.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1through 602.2.1.6, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.

3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
   5.1. continuous noncombustible raceways or enclosures
   5.2. approved gypsum board assemblies
   5.3. materials listed and labeled ~~as part of a tested assembly or system~~ <u>for installation within a plenum</u>.

Commenter's Reason: The issue of what materials are considered acceptable for exposure in a plenum is a life safety issue. The proposed change format of Exception 5 is to clarify that any one of these three options are only permitted when the combustible material is fully enclosed. The third option in Exception 5 is not clear as to what is meant by "for such application". This "protecting" material needs to provide sufficient protection of the combustible material during the event of a fire.

Final Action: AS AM AMPC____ D

M88-09/10
602.2.1

<u>Proposed Change as Submitted</u>

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.6, materials within plenums<u>, and the exposed surfaces of the materials of construction of the plenums containing the materials,</u> shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

Reason: This code proposal is just clarification. Materials of construction of the plenum need to comply with the requirements to be noncombustible or to have a flame spread index of no more than 25 and a smoke developed index of no more than 50 when tested to ASTM E 84. Plenums cannot be constructed of combustible materials unless they comply with those requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: HIRSCHLER-M-4-602.2.1

<u>Public Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The proposed revision conflicts with current Section 602.2 and Section 602.2 is the appropriate place for such revision.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Marcelo M. Hirschler (GBH International), representing American Fire Safety Council and Robert J. Davidson (Davidson Code Concepts, LLC) representing self, requests Approval as Modified.

Replace the proposal as follows:

602.2 Construction. *Plenum* enclosures for buildings of Types I and II construction shall be constructed of noncombustible materials. Plenum enclosures for all other buildings shall be constructed of materials that are noncombustible or that exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723 ~~permitted for the type of construction classification of the building~~.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125ºF (52ºC) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

Commenter's Reason: The technical committee was concerned that the proposal was placed in the wrong location because the requirements conflicted with the requirements of section 602.2 which would appear to allow plenum enclosures to be constructed of wood or other combustible building materials. This permission is not logical since all materials within plenums have to be noncombustible or meet the flame spread index and smoke-developed index requirements (25/50). Therefore, if the plenum enclosures can be made of wood, any fire would be able to spread along the walls of the plenum (wood typically has a flame spread index of up to 200) even with the best materials contained within the plenum. The revised language takes care of this by requiring that plenum enclosures are constructed of noncombustible materials for plenums in buildings of Types I and II construction and of materials that meet the same fire test requirements as the materials in the plenum for all other types of buildings.

Final Action: AS AM AMPC____ D

M89-09/10
602.2.1, 602.2.1.6

Proposed Change as Submitted

Proponent: Bob Eugene, representing Underwriter Laboratories, Inc.

1. Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1through 602.2.1.~~6~~5, materials within plenums shall be noncombustible or shall be listed and labeled as having ~~have~~ a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, approved gypsum board assemblies or within materials listed and labeled for such application.
6. Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

2. Delete without substitution:

~~**602.2.1.6 Semiconductor fabrication areas.** Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area shall not be subject to the provisions of Section 602.2.1~~.

Reason: Section 602.2.1.6 is an exception to Section 602.2.1. The issue of what materials are considered acceptable for exposure in a plenum is a life safety issue. Other combustible products in the plenum, such as wiring, fire sprinkler piping, pneumatic tubing, and electrical equipment, are required to be listed and labeled. Only listing and labeling of a product can verify that the product installed at a jobsite is composed of the same material originally tested.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: EUGENE-M-3-602.2.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent's printed reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

David W Ash, Lubrizol Advanced Materials Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall ~~be listed and labeled as having~~ have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, approved gypsum board assemblies or within materials listed and labeled for such application.
6. Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

Commenter's Reason: This modification would preserve the current language as it pertains to the substantiation required to demonstrate a flame spread index of 25 or less and a smoke developed index of 50 or less. The proposal approved by the Technical Committee would require that all materials in a plenum, regardless of the amount, be both listed and labeled. Listing and labeling would be an additional requirement for the manufacturer and the cost of that process would most certainly be an added cost of construction contrary to the proponent's statement in the proposal.

No data has been presented that substantiates the position that the current language has created a safety concern.

Public Comment 2:

Michael Cudahy representing PPFA (Plastic Pipe and Fittings Association), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1through 602.2.1.65, materials within plenums shall be noncombustible or shall ~~be listed and labeled as having~~ have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, approved gypsum board assemblies or within materials listed and labeled for such application.
6. Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

Commenters Reason: Adding "be listed and labeled as having" seems like a minor change in language, but it is a significant change in intent. That part of this change would increase the costs of construction and it is unclear if all manufacturers would chose to list and label every product that could potentially be used in a plenum space. Not every device or material is even described on how it should be tested to ASTM E84. This could unintentionally result in an inability to complete projects due to the lack of a few critical components and is a bad idea.

Redundant testing of existing products is simply unnecessary and a new burden on manufacturing at the worst possible time economically.

PPFA urges the FAH to accept this modification.

Final Action: AS AM AMPC____ D

M90-09/10
602.2.1, 602.2.1.7 (New)

Proposed Change as Submitted

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

1. Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.~~6~~7, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

2. Add new text as follows:

602.2.1.7 Plastic plumbing pipe. Plastic drain, waste and vent piping exposed within a plenum shall comply with one or more of the following requirements:

1. The piping shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.
2. The piping shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Reason: As many have noted, the current version of ASTM E-84, while having been used to evaluate plastic pipe fire related properties for use in plenums, is not an ideal test method for this use. Amongst the reasons for this are the contents of the current version of the E-84 standard which is vague as to mounting methods and other test conditions for evaluating such pipe. For that reason, UL 1887, an existing test method based on technology which has been evaluated with considerable scrutiny and was developed to test and rate combustible fire sprinkler piping systems for use in plenum spaces is recommended in this case by PPFA.

With regard to enhancing the ASTM E-84 language, the ASTM E-5 committee is currently voting on changes to the current standard which will clarify mounting methods for plastic pipe materials in the tunnel making its results more comparable between materials and from material to material within a generic group. PPFA is also supporting development of new text for the E-84 standard referring and recommending that flamespread properties of plastic pipe for plenum applications be tested according to UL – 1887. UL has been consulted on the proposed change and does not oppose it. UL 1887 is already referenced in the IMC and is not a new standard.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: CUDAHY-M-2-602.2.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The UL 1887 standard is not appropriate for DWV piping as it is not filled with water. The proposed revision will lessen safety with regard to smoke production.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Michael Cudahy representing PPFA (Plastic Pipe and Fittings Association), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.7, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

602.2.1.7 Plastic water distribution ~~plumbing~~ pipe. Plastic water distribution ~~drain, waste and vent~~ piping exposed within a plenum shall comply with one or more of the following requirements:

1. The piping shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.
2. The piping shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Commenter's Reason: The Committee's stated reasons for recommending disapproval were, "The UL 1887 standard is not appropriate for DWV piping as it is not filled with water. The proposed revision will lessen safety with regard to smoke production."

By making the modification above, the section would only apply to "wet" water distribution pipe and not DWV pipe. UL 1887 and the stated limits are ***already*** in the code, and are ***accepted*** parameters.

As many have noted, the current version of ASTM E-84, while having been used to evaluate plastic pipe for use in plenums, is not an ideal test method for this use. Amongst the reasons for this are the contents of the current version of the E-84 standard which is vague as to mounting methods and other test conditions for evaluating such pipe. For that reason, UL 1887, an existing test method based on technology which has been evaluated with considerable scrutiny and was developed to test and rate combustible fire sprinkler piping systems for use in plenum spaces is recommended in this case by PPFA. UL 1887 is simply a better tool in the tool box to rate plastic pipe of all kinds, not just plastic sprinkler pipe.

UL has been consulted on the proposed change and does not oppose it. UL 1887 is already referenced in the IMC and is not a new standard.

PPFA urges the FAH to support this modification, which answers the stated reasons of the committee.

Public Comment 2:

Marcelo M. Hirschler (GBH International), representing American Fire Safety Council and Robert J. Davidson (Davidson Code Concepts, LLC) representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.7, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

~~**602.2.1.7 Plastic plumbing pipe.** Plastic drain, waste and vent piping exposed within a plenum shall comply with one or more of the following requirements:~~

~~1. The piping shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.~~
~~2. The piping shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.~~

602.2.1.7 Plastic drain, waste and vent piping. Plastic drain, waste and vent piping exposed within a *plenum* shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Such piping shall be *listed* and *labeled*.

Commenter's Reason: The IMC code is silent with regard to plastic piping because plastic piping qualifies for use in plenums under the general requirements that all materials exposed within plenums must be noncombustible or be tested to ASTM E 84/UL 723 and get the 25/50 flame and smoke requirements. In fact most plastic materials that are used to make pipe can't meet those requirements. Therefore, what most plastic pipe manufacturers do is something "clever" that pretends to comply with the code but does not comply with the letter of the way ASTM E 84 is written. What is typically done is that the tests are conducted in the ASTM E 84 Steiner tunnel by stringing one pipe along the center of the tunnel and either (a) filling the pipe with water during the test and closing both ends, or (b) having water continuously run through the pipe from an outside source. It is much easier, of course, to meet the requirements that way. It is also not what is intended by the code, because the code intends to protect the building/structure at the time there is construction or alterations and when the pipe is empty.

The code also requires plastic fire sprinkler piping to be tested in accordance with UL 1887, as follows:

602.2.1.2 Fire sprinkler piping. Plastic fire sprinkler piping exposed within a *plenum* shall be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Piping shall be *listed* and *labeled*.

UL 1887 uses the same apparatus as ASTM E 84: the Steiner tunnel. In UL 1887 one length of sprinkler pipe is placed in the middle of the tunnel to conduct the test. The sprinkler pipe is empty and dry, without stoppers and of the thickness and overall width intended for use. In fact, UL 1887 is a test that was developed because it has always been understood that there can't be hundreds of fire sprinkler pipes in a plenum, as the sprinkler design does not permit that. In fact, similarly there can't be hundreds of drain, waste and vent pipes in the same area because they would interfere with the plenum air supply. Therefore, it would be appropriate to require that drain, waste and vent pipes be tested in exactly the same way as sprinkler pipes. Information on the UL 1887 requirements are contained in the UL Guide on UL 1887 (VIWT GuideInfo - Chlorinated Polyvinyl Chloride Sprinkler Pipe and Fittings).

The original proposal gave two options for testing pipe, one of which was to continue what is being done now, namely to test via ASTM E 84 full of water: that is not safe. I submitted a code proposal at the last cycle where the proposal required that the report indicate that the test was conducted without water. The proposal failed at final action because testimony said that code officials would not see that detail in the report and that it would create confusion. Therefore, accepting the proposal as written would allow plastic pipe manufacturers to keep testing that way and that is unacceptable.

What this comment recommends is that only the other option of the proposal be accepted and that it be made more severe so that it becomes just as severe as plastic sprinkler piping, in that the pipes must be tested in accordance with UL 1887, without use of water during the test and that the pipes must be listed and labeled and that the pipes can only be used in wet pipe systems.

The scope of UL 1887 is limited to fire sprinkler piping but UL has stated publicly that a change in the scope can be done, but only after the code requires pipes to be tested the same way as fire sprinkler pipes.

Public Comment 3:

Joseph Zicherman, Fire Cause Analysis, representing Plastic Pipe and Fittings Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.7, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

602.2.1.7 Plastic plumbing pipe. Plastic ~~drain, waste and vent~~ water distribution piping used in wet systems and exposed within a plenum shall comply with one or more of the following requirements:

1. The piping shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.
2. The piping shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Commenter's Reason: The intent of this proposal to the M-090 change text [as modified] is to provide a second, well known and widely accepted test method, UL-1887, to evaluate the acceptability of combustible supply piping to be used in plenum spaces. Such piping is used for hot and cold water supply but not as drain, waste and vent piping.

This action will complement the current standard, the ASTM E-84 test method, which is available to assess flamespread properties of combustible supply piping, and provide regulators and suppliers with the improved option of the UL test method to assess production of smoke by combustible piping.

While UL 1887 is specifically scoped for use with combustible sprinkler piping at the present time, it is my understanding from discussions with UL representatives that allowing for/requiring its utilization for combustible pressure piping, will not require modification of that standard. The membership should note that such piping is functionally equivalent to sprinkler piping in the application covered by the proposed code change.

In all cases testing according to UL 1887 is carried out on empty piping, i.e. piping NOT including water or any other liquid. This was a concern stated by the Committee in its earlier deliberations. This test condition insures that under the proposal combustible piping will be tested according to the most pessimistic scenario possible when comparing full or empty piping. This is because empty combustible piping is far more easily ignited and presents a greater smoke hazard than combustible piping that is full of water when they are compared directly.

The membership should also be aware that valid concerns have been raised that, on occasion, combustible piping has been tested develop flamespread and smoke developed indices in an E-84 furnace when it was full of water to.

Not surprisingly, such a testing condition yields lower E-84 flamespread results than when the same pipe is filled with water and then tested. The results of such testing practices are open to question.

As a result, currently a ballot measure assuring that piping materials shall not be tested containing water in the ASTM E-84 furnace is making its way thru the balloting process in the ASTM E-5 Committee (Fire Test Standards). In addition, mounting for E-84 testing conditions - in terms of amount of combustible pipe tested to provide E-84 data - have been under debate in ASTM. A change, requiring that tested items fill the furnace yielding full width testing in conjunction with the new requirement eliminating testing with liquid fill, will insure a more level playing field in testing combustible piping.

The combination of test methods that will result from enacting the proposed in the M-90 change as modified will enhance fire safety levels. At the same time the change will contribute to further the use of cost effective materials and installation techniques for users of the International Mechanical Code. Additionally, the inclusion of two test methods that eliminate the possibility of testing combustible pipe filled with water will reduce attendant possible levels of fire hazard when combustible pipe is used in air handling plenums. Adoption of the proposed change will also address the concerns of the committee in rejecting the original M-090 proposal.

Final Action: AS AM AMPC____ D

M93-09/10
602.2.1.2

Proposed Change as Submitted

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

Revise as follows:

602.2.1.2 Fire sprinkler <u>and water distribution</u> piping. Plastic fire sprinkler piping <u>and water distribution piping</u> exposed within a *plenum* shall <u>comply with one or more of the following requirements:</u> ~~be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Piping shall be *listed* and *labeled*.~~

1. <u>The piping shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.</u>
2. <u>The piping shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.</u>

<u>Plastic fire sprinkler piping shall be listed and labeled. Plastic fire sprinkler piping exposed within a plenum shall be used only in wet pipe systems.</u>

Reason: As many have noted, the current version of ASTM E-84, while having been used to evaluate plastic pipe fire related properties for use in plenums, is not an ideal test method for this use. This change addresses that situation and also extends the use of the test methods to other plastic piping materials that are currently being used in plenum spaces.

Amongst the reasons that ASTM E-84 has been criticized as a means to assess the fire performance of plastic pipe for plenum applications are the contents of the current version of the E-84 standard which are vague as to pipe mounting methods and amount of pipe exposed as well as other test conditions for evaluating plastic pipe. For that reason, UL 1887, an existing test method based on technology which has been evaluated with considerable scrutiny and was developed to test and rate combustible fire sprinkler piping systems for use in plenum spaces is recommended in this case by PPFA.

With regard to enhancing the ASTM E-84 language, the ASTM E-5 committee is currently voting on changes to the current standard which will clarify mounting methods for plastic pipe materials in the tunnel making its results more comparable between materials and from material to material within a generic group. PPFA is also supporting development of new text for the E-84 standard referring and recommending that flamespread properties of plastic pipe for plenum applications be tested according to UL – 1887. UL has been consulted on the proposed change and does not oppose it. UL 1887 is already referenced in the IMC and is not a new standard.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: CUDAHY-M-3-602.2.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Disapproval is consistent with the action taken on M90-09/10.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tim Manz representing Association of Minnesota Building Officials (AMBO) requests Approval as Submitted.

Modify the proposal as follows:

Commenter's Reason: UL 1887 is an appropriate test for water distribution piping as specified in code change proposal M93, since it is normally full of water--just like plastic sprinkler piping. Unlike M90, code change proposal M93 deals with water distribution piping, not DWV piping as the Committee Reason suggests.

Final Action: AS AM AMPC____ D

M96-09/10
602.2.1.7 (New)

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Add new text as follows:

602.2.1.7 Plumbing and mechanical equipment in plenums. Where discrete plumbing and mechanical equipment, appurtenances and appliances are located in a plenum and have exposed combustible material, they shall be listed and labeled for such use in accordance with UL 2043.

Reason: There are combustible plumbing and mechanical equipment, such as plumbing appurtenances, pipe and duct supports, grilles and registers that are used in plenums, that cannot be effectively tested in accordance with standards ASTM E84 or UL 723. The UL 2043 standard was developed to test products and materials not able to be tested in accordance with ASTM E84 or UL 723, and is currently adopted by reference in Section 602.2.1.4.2. These products are individual distinct pieces and non-continuous (i.e. "discrete").
This proposal was presented last cycle and the Committee had questions about the term "discrete'. Per the dictionary, 'discrete' refers to products that are non-continuous, individual distinct pieces, as compared to non-discrete products such as cable or plastic pipe.
If adopted this proposal will provide consistency in how the ICC codes treat discrete components in plenums.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: EUGENE-M-11-602.2.1.7

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The term "discrete" is subjective. UL 2043 is not equivalent to ASTM E 84 or UL 723. The proposed text is too broad in scope.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

602.2.1.7 Plumbing and mechanical equipment in plenums. Where discrete, noncontinuous, plumbing and mechanical equipment, appurtenances and appliances are located in a plenum and have exposed combustible material, they shall be listed and labeled for such use in accordance with UL 2043.

Commenter's Reason: The term "noncontinuous" is added to clarify that individual distinct products or accessory pieces such as duct supports, grilles and registers are appropriate for installation within a plenum when compliant with the rate of heat release and the rate of smoke release of the burning product samples as they relate to the requirements for fire-resistant and low-smoke-producing characteristics in accordance with the provisions of the International Mechanical Code. These discrete, non-continuous products are not of a shape and design to be eligible for evaluation in accordance with ASTM E84 or UL723.

Final Action: AS AM AMPC____ D

M100-09/10
603.5.2 (New)

Proposed Change as Submitted

Proponent: James Karnes, representing Dura Tite Systems, LLC

Add new text as follows:

603.5.2 Nonmetallic duct fittings. Non-metallic forced air duct fittings that are considered discrete shall pass testing in accordance with UL 2043.

Reason: Under the current code, duct fittings are not addressed. It is assumed in most jurisdictions that a fitting is part of the duct system, and therefore nonmetallic fittings should be addressed under section 603.5 Nonmetallic Ducts. Section 603.5 states requirements for nonmetallic ducts to be constructed with Class 0 or Class 1 material as tested under UL 723 using ASTM E-84 method. This section generally pertains to duct board products, and are considered continuous building products. Fittings are not addressed, and cannot be tested using UL 723 (ASTM E-84) due to the size limitations of the test chamber. Discrete products can be alternately tested using UL2043.

Discrete is identified as a non-continuous building product, and the definition has been accepted by the IMC in the past for electrical products such as speaker boxes. The UL 2043 utilizes a test chamber that is 24 inches cubed. UL 2043 is the alternate test method to UL 723, for discrete products.

This new sub-section will address nonmetallic fittings and clarify the standards for compliance within the code.

Toxicity of smoke is not tested for under UL 2043, nor under any other test method used in the codes. Toxicity of smoke is not a required test for any building product.

This section does not address plumbing fittings, which are generally solvent welded together, creating a continuous building product.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: KARNES-M-1-603.5.2

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: No pass/fail criteria is stated. The words "that are considered discrete" are subjective. There are no definitive limits stated in UL 2043. The words "forced air" used to describe fittings are odd because fittings are fittings regardless of the air type.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

James Karnes representing DuraTite Systems, LLC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

603.5.2 Nonmetallic Duct Fittings. Non-metallic ~~forced air~~ duct fittings ~~that are considered discrete~~ shall ~~pass testing~~ <u>be listed and labeled</u> in accordance with UL 2043.

Commenter's Reason: The proposed modification responds to the comments by the Committee. The section has been modified to require listing and labeling of nonmetallic duct fittings to UL 2043.

The Committee was confused by the reference to UL 2043. They thought that there needs to be end point criteria specified when you reference the standard. That is not true since the standard specifies a peak rate of heat release not greater than 100 kilowatts, a peak optical density not greater than 0.50, and an average optical density not greater than 0.15.

The requirements for nonmetallic duct fittings is unclear in the Mechanical Code. Without a specific reference, it is often thought that Section 603.5 is the applicable section. However, UL 181 is not the standard used for testing non-metallic duct fittings. UL 181 does refer to UL 2043 in its scope to deal with non-metallic mechanical fasteners which are discrete, non-continuous parts of the duct system.

UL 2043 ("Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces") is the appropriate testing standard for non-continuous building products ("discrete") and is accepted by reference in the code section 602.2.1.4 (Combustible Electrical Equipment). The UL 2043 Standard covers discrete electrical, plumbing, and mechanical products that are to be used within the air-handling space.

This new section is necessary to add the appropriate regulations and acceptance criteria for non-metallic duct fittings.

Final Action: AS AM AMPC____ D

M102-09/10, Part I
603.7 (New)

Proposed Change as Submitted

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

PART I – IMC

Add new text as follows:

<u>**603.7 Above ground plastic ducts**. Plastic ducts and fittings not listed in compliance with UL 181 shall be prohibited above grade.</u>

Reason: (**PART I**) Current code fails to say anything about the use of plastic ducts and fittings above grade. Section 603.8 is titled "underground ducts" and that's the only place that references an approved installation for plastic duct. Unfortunately, some believe that since they are not strictly prohibited they must be permitted, even absent code guidance for the installation. Until such time as industry comes out with an accepted standard and installation criteria similar to what is required for plumbing piping and fittings, the mechanical code needs to take a position on the use of the material.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:T OMBERLIN-M-10-603.7-RM-3-M1601.1.2

Public Hearing Results

PART I - IMC
Committee Action: Disapproved

Committee Reason: The proposed text limits plastic technologies. Fittings cannot be tested to UL 181 therefore the proposed text creates an impossibility.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), requests Approval as Submitted.

Commenter's Reason: Part of the committee's reason for disapproval stated that the fittings for these systems cannot be tested to UL 181. With that said, and the disapproval of the committee, we are to condone the installation of above ground plastic ducts that are not tested to a nationally recognized standard. That's completely contradictory to IMC 301.5.1 which requires mechanical equipment to be labeled to a relevant standard. UL 181 is the relevant standard for plastic duct systems, which of course would have to include any fittings used with that duct system.

Final Action: AS AM AMPC____ D

M102-09/10, Part II
IRC M1601.1.2 (New)

Proposed Change as Submitted

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

PART II – IRC MECHANICAL

Add new text as follows:

<u>**M1601.1.2 Prohibited ducts**. Plastic ducts and fittings not listed as in compliance with UL 181 shall be prohibited above grade.</u>

(**PART II**) Current code fails to say anything about the use of plastic ducts and fittings above grade. The only reference is existing Section 1601.1.2 titled "underground ducts," and that's the only place that references an approved installation for plastic duct. Unfortunately, some believe that since they are not strictly prohibited they must be permitted, even absent code guidance for the installation. Until such time as industry comes out with an accepted standard and installation criteria similar to what is required for plumbing piping and fittings, the mechanical code needs to take a position on the use of the material.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:T OMBERLIN-M-10-603.7-RM-3-M1601.1.2

Public Hearing Results

PART II - IRC
Committee Action: **Disapproved**

Committee Reason: Fittings cannot be tested to UL 181 and UL 181 is not the appropriate standard for plastic ducts. Plastic solvent-welded ducts should be encouraged for energy efficiency. Exposed DWV PVC plastic is acceptable, so why not PVC ducts ?

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), requests Approval as Submitted.

Commenter's Reason: Part of the committee's reason for disapproval stated that the fittings for these systems cannot be tested to UL 181. With that said, and the disapproval of the committee, we are to condone the installation of above ground plastic ducts that are not tested to a nationally recognized standard. That's completely contradictory to IMC 301.5.1 which requires mechanical equipment to be labeled to a relevant standard. UL 181 is the relevant standard for plastic duct systems, which of course would have to include any fittings used with that duct system.

Final Action: AS AM AMPC____ D

M106-09/10
603.10

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete and substitute as follows:

~~**603.10 Supports.** Ducts shall be supported with approved hangers at intervals not exceeding 10 feet (3048 mm) or by other approved duct support systems designed in accordance with the International Building Code. Flexible and other factory-made ducts shall be supported in accordance with the manufacturer's installation instructions~~.

<u>**603.10 Supports.** Ducts shall be supported in accordance with Chapter 5 of the SMACNA HVAC Duct Construction Standards- Metal and Flexible or by other approved supporting systems. Flexible and other factory-made ducts shall be supported in accordance with the manufacturer's installation instructions</u>.

Reason: The SMACNA Standard permits some sizes to be supported at intervals greater than 10 feet such as 4 inch. The IBC does not govern how ducts are to be supported, that's between the IMC and SMACNA. The code official can approve any engineered system with proper back-up.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-37-603.10

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The 10 foot interval proposed for deletion gave good guidance. The proposed text offers no guidance for the approval of other support methodologies.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

603.10 Supports. Ducts shall be supported at intervals not to exceed 12 feet and shall be in accordance with ~~Chapter 5 of the~~ SMACNA HVAC Duct Construction Standards Metal and Flexible ~~or by other approved supporting systems~~. Flexible and other factory-made ducts shall be supported in accordance with the manufacturers' installations instructions.

Commenter's Reason: The committee wanted to keep a maximum support interval stated and didn't care for the statement "or by other approved supporting systems". It's appropriate that the SMACNA Standard be referenced here because all the requirements for supports are there. The user can pick from the many supporting methods found in the standard that may fit a particular need.

Final Action: AS AM AMPC____ D

M120-09/10
908.1

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

908.1 General. A cooling tower used in conjunction with an air-conditioning appliance shall be installed in accordance with the manufacturer's installation instructions. Cooling towers shall comply with UL 1995.

Reason: UL 1995 is already referenced in Chapter 15. UL 1995 includes a comprehensive set of construction and performance requirements that are used to evaluate and list cooling towers, and is already adopted by reference in other sections of the IMC.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Eugene-M-22-908.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Rebuilt or rehabilitated cooling towers would have to be listed if they were not already listed before they could be reused or reinstalled. An optional standard is needed. Major components such as cooling towers should not be required to be listed. Some towers are huge structures that might not be able to be listed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

908.1 General. A cooling tower used in conjunction with an air-conditioning appliance shall be installed in accordance with the manufacturer's installation instructions. Factory-built cooling towers shall ~~comply~~ be listed in accordance with UL 1995.

Commenter's Reason: UL 1995 is already referenced in Chapter 15. UL 1995 includes a comprehensive set of construction and performance requirements that are used to evaluate and list cooling towers, and is already adopted by reference in other sections of the IMC. It is appropriate that factory-built cooling towers be listed.

Final Action: AS AM AMPC____ D

M125-09/10
928 (New), Chapter 15

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Add new text as follows:

SECTION 928
RADIANT HEATING SYSTEMS

928.1 General. Electric radiant heating systems shall be installed in accordance with the manufacturer's installation instructions and shall be listed for the application. Electric radiant heating panels and heating panel sets shall comply with UL 1693. Electric space heating cables shall comply with UL 1673.

928.2 Clearances. Clearances for radiant heating panels or elements to any wiring, outlet boxes and junction boxes used for installing electrical devices or mounting luminaires shall be in accordance with NFPA 70.

928.3 Installation on wood or steel framing. Radiant panels installed on wood or steel framing shall conform to the following requirements:

1. Heating panels shall be installed parallel to framing members and secured to the surface of framing members or shall be mounted between framing members.
2. Mechanical fasteners shall penetrate only the unheated portions provided for this purpose. Panels shall not be fastened at any point closer than ¼ inch (7 mm) to an element. Other methods of attachment of the panels shall be in accordance with the panel installation instructions.
3. Unless listed and labeled for field cutting, heating panels shall be installed as complete units.

928.4 Installation in concrete or masonry. Radiant heating systems installed in concrete or masonry shall conform to the following requirements:

1. Radiant heating systems shall be identified as being suitable for the installation, and shall be secured in place as specified in the manufacturer's installation instructions.
2. Radiant heating panels and radiant heating panel sets shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

928.5 Finish surfaces. Finish materials installed over radiant heating panels and systems shall be installed in accordance with the manufacturer's installation instructions. Surfaces shall be secured so that fasteners do not pierce the radiant heating elements.

2. Add new standards to Chapter 15 as follows:

UL

1673-96 Electric Space Heating Cables – with revisions through July 2003

1693-02 Electric Radiant Heating Panels and Heating Panel Sets

Reason: The requirements included in this new section cover the installation of radiant heating systems. They are based on requirements included in Section M1406 of the International Residential Code. UL 1673 and UL 1693 are the standards used to investigate and list electric space heating cables and electric radiant heating panels. Over 20 companies have listings for these products.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards UL 1673-96 and UL 1693-02, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: EUGENE-M-21-928-CH 15

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC staff, the standards did not comply with ICC standards criteria, Section 3.6.3.2.

Committee Action: Disapproved

Committee Reason: The clearance inspection requirement of proposed Section 928.2 is not enforceable because of the reference to NFPA 70.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 928
RADIANT HEATING SYSTEMS

928.1 General. Electric radiant heating systems shall be installed in accordance with the manufacturer's installation instructions and shall be listed for the application. ~~Electric radiant heating panels and heating panel sets shall comply with UL 1693. Electric space heating cables shall comply with UL 1673.~~

928.2 Clearances. Clearances for radiant heating panels or elements to any wiring, outlet boxes and junction boxes used for installing electrical devices or mounting luminaires shall be in accordance with the International Building Code and NFPA 70.

928.3 Installation on wood or steel framing. Radiant panels installed on wood or steel framing shall conform to the following requirements:

1. Heating panels shall be installed parallel to framing members and secured to the surface of framing members or shall be mounted between framing members.
2. Mechanical fasteners shall penetrate only the unheated portions provided for this purpose. Panels shall not be fastened at any point closer than ¼ inch (7 mm) to an element. Other methods of attachment of the panels shall be in accordance with the panel installation instructions.
3. Unless listed and labeled for field cutting, heating panels shall be installed as complete units.

928.4 Installation in concrete or masonry. Radiant heating systems installed in concrete or masonry shall conform to the following requirements:

1. Radiant heating systems shall be identified as being suitable for the installation, and shall be secured in place as specified in the manufacturer's installation instructions.
2. Radiant heating panels and radiant heating panel sets shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

928.5 Finish surfaces. Finish materials installed over radiant heating panels and systems shall be installed in accordance with the manufacturer's installation instructions. Surfaces shall be secured so that fasteners do not pierce the radiant heating elements.

UL
~~1673-96~~ ~~Electric Space Heating Cables – with revisions through July 2003~~
~~1693-02~~ ~~Electric Radiant Heating Panels and Heating Panel Sets~~

Commenter's Reason: The requirements included in this new section cover the installation of radiant heating systems. They are based on requirements included in Section M1406 of the International Residential Code. Over 20 companies have listings for these products. UL 1673 and UL 1693 have been deleted because, in the opinion of ICC staff, the standards did not comply with ICC standards criteria, Section 3.6.3.2. The International Building Code has been added to Section 928.2 to assure that the clearances required by NFPA 70 can be enforced.

Final Action: AS AM AMPC____ D

M127-09/10, Part I
1002.1, Chapter 15

Proposed Change as Submitted

PART I – IMC

1. Revise as follows:

1002.1 General. Potable water heaters and hot water storage tanks shall be listed and labeled and installed in accordance with the manufacturer's installation instructions, the *International Plumbing Code* and this code. All water heaters shall be capable of being removed without first removing a permanent portion of the building structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the *International Plumbing Code* . Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall comply with UL 732. <u>Solid-fuel-fired water heaters shall</u> <u>comply with UL 2523</u>. <u>Thermal solar water heaters shall comply with Chapter 14 and UL 174 or UL 1453.</u>

2. Add new standard to Chapter 15 as follows:

UL
<u>2523-09</u> <u>Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers</u>

Reason: The UL Subject 2523 Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list factory built manually and/or automatically fueled solid fuel-fired water heaters. UL 174 is the standard used to evaluate and list thermal solar water heaters.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 2523-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: EUGENE-M-23-1002.1-CH 15-RM-21-M2005.1-CH 44

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at <u>http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf</u> :

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC staff, the standard did not comply with ICC standards criteria, Section 3.6.3.2.

PART I - IMC
Committee Action: **Approved as Submitted**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

PART I – IMC

1002.1 General. Potable water heaters and hot water storage tanks shall be listed and labeled and installed in accordance with the manufacturer's installation instructions, the *International Plumbing Code* and this code. All water heaters shall be capable of being removed without first removing a permanent portion of the building structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the *International Plumbing Code* . Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall comply with UL 732. Solid-fuel-fired water heaters shall comply with UL 2523. Thermal solar water heaters shall comply with Chapter 14 and UL 174 or UL 1453.

UL
2523-09 ~~Outline of Investigation for~~ Solid Fuel-Fired <u>Hydronic Heating Appliances</u>.

Commenter's Reason: The First Edition of ANSI/UL 2523 includes requirements that cover solid fuel-fired hydronic heating appliances, water heaters, and boilers was issued December 22, 2009.

Public Comment 2:

Jonathan Humble (Chairman) representing ICC Reference Standards Committee, requests Approval as Modified.

Modify the proposal as follows:

PART I – IMC

1002.1 General. Potable water heaters and hot water storage tanks shall be listed and labeled and installed in accordance with the manufacturer's installation instructions, the *International Plumbing Code* and this code. All water heaters shall be capable of being removed without first removing a permanent portion of the building structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the *International Plumbing Code* . Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall comply with UL 732. ~~Solid-fuel-fired water heaters shall comply with UL 2523~~. Thermal solar water heaters shall comply with Chapter 14 and UL 174 or UL 14

UL
~~2523-09~~ ~~Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers~~

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically Section 3.6.3, which requires standards be promulgated according to a consensus process.

We therefore propose to have deleted the reference standard and subsequent reference to that standard as part of this proposal to modify the original proposal.

Final Action: AS AM AMPC____ D

M127-09/10, Part II
IRC M2005.1, Chapter 44

<u>Proposed Change as Submitted</u>

PART II – IRC MECHANICAL

1. Revise as follows:

M2005.1 General. Water heaters shall be installed in accordance with the manufacturer's installation instructions and the requirements of this code. Water heaters installed in an attic shall conform to the requirements of Section M1305.1.3. Gas-fired water heaters shall conform to the requirements in Chapter 24. Domestic electric water heaters shall conform to UL 174 or UL 1453. Commercial electric water heaters shall conform to UL 1453. Oiled-fired water heaters shall conform to UL 732. <u>Thermal solar water heaters shall comply with Chapter 23 and UL 174. Solid-fuel-fired water heaters shall comply with UL 2523.</u>

2. Add new standard to Chapter 44 as follows:

UL
<u>2523-09 Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers</u>

Reason: The UL Subject 2523 Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list factory built manually and/or automatically fueled solid fuel-fired water heaters. UL 174 is the standard used to evaluate and list thermal solar water heaters.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 2523-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

M131-09/10, Part II
IRC M1411.6

NOTE: PART I DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART I IS REPRODUCED ONLY FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.

Proposed Change as Submitted

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing the Air-Conditioning, Heating and Refrigeration Institute

PART II – IRC MECHANICAL

Revise as follows:

M1411.6 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps or shall be otherwise protected from unauthorized access in an approved manner.

Reason: During the last code cycle, the provision requiring locking-type tamper-resistant caps to restrict access to refrigerants was approved at the Final Action Hearings. This proposal would expand the means of restricting access to other approved methods. An example would be the placement of the equipment in inaccessible locations. Also, we are aware of only one locking-type tamper-resistant cap.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCLAUGHLIN-M-2-1101.10-M1411.6

Public Hearing Results

PART II – IRC

Modify the proposal as follows:

Revise as follows:

M1411.6 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps or shall be otherwise secured to prevent ~~protected from~~ unauthorized access. ~~in an approved manner.~~

Reason: During the last code cycle, the provision requiring locking-type tamper-resistant caps to restrict access to refrigerants was approved at the Final Action Hearings. This proposal would expand the means of restricting access to other approved methods. An example would be the placement of the equipment in inaccessible locations. Also, we are aware of only one locking-type tamper-resistant cap.

Committee Action: Approved as Modified

Committee Reason: Approval was based on the proponent's printed reason. The modification makes the text less restrictive, allowing more options.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII, requests Disapproval.

Commenter's Reason: The committee's reason for approving this change with modification included being able to restrict access to equipment by placing the equipment in an inaccessible location. That works great for commercial applications because equipment can be placed in locked refrigeration rooms or on roofs with keyed access only by maintenance personnel. I do not know anywhere in a one- or two-family home or townhouse that equipment can be placed in a location that would prevent unauthorized access. A 6' high fence around the property will not prevent unauthorized access from someone determined to huff these dangerous fumes, and I do not see condensing units installed on roofs of one- and two-family homes or townhouses. This is appropriate language for commercial applications, not for residential applications. This will only lessen the protection of personnel that was approved in the last code cycles' final action hearings.

Final Action: AS AM AMPC____ D

NOTE: PART I REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

PART I – IMC

Revise as follows:

1101.10 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps <u>or shall be otherwise protected from unauthorized access in an approved manner</u>.

PART II – IRC MECHANICAL

Revise as follows:

M1411.6 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps <u>or shall be otherwise protected from unauthorized access in an approved manner</u>.

Reason: During the last code cycle, the provision requiring locking-type tamper-resistant caps to restrict access to refrigerants was approved at the Final Action Hearings. This proposal would expand the means of restricting access to other approved methods. An example would be the placement of the equipment in inaccessible locations. Also, we are aware of only one locking-type tamper-resistant cap.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I - IMC Withdrawn by Proponent

M133-09/10, Part I
1101.11.1 (New)

Proposed Change as Submitted

Proponent: Mona Casey, United Parents to Restrict Open Access to Refrigerant

PART I – IMC

Add new text as follows:

1101.11.1 Existing systems. Existing refrigerant circuit access ports that are located outdoors shall be retrofitted with locking-type tamper-resistant caps whenever the refrigerant system is modified, serviced, or repaired.

Reason: The purpose of this code modification is to add new requirements to the Code. The existing code does not address the issue of accessibility to refrigerant from pre-existing units by unauthorized individuals. Refrigerant is extremely dangerous and potentially lethal.

Facts:

Refrigerant "can cause death without warning".
Refrigerant is considered a gateway drug because users often progress from refrigerant use to drug and alcohol abuse.
Refrigerant is not a cumulative substance where chances of dying from it increase as the dosage and number of use increases. It can kill on the 1^{st}, 10^{th}, 100^{th}, or any other time. 33 percent of deaths resulting from refrigerant huffing occurred on the 1^{st} use.
Refrigerant, like other poisons, must be kept out of reach of children.
Refrigerant theft is increasing.
According to Mike Opitz, Certification Manager, LEED for Existing Buildings, U.S. Green Building Council, chlorine in CFCs and HCFCs destroy the ozone and depletes the Earth's natural shield for incoming ultraviolet radiation and absorb outgoing infrared radiation from the earth, functioning as potent greenhouse gases.

National Statistics:

The National Institute on Drug Abuse reports that one in five American teens have used Inhalants to get high.
According to Stephen J. Pasierb, President and CEO of The Partnership for Drug-Free America, 22% of 6th and 8th graders admitted abusing inhalants and only 3% of parents think their child has ever abused inhalants.
An analysis of 144 Texas death certificates by the Texas Commission on Alcohol and Drug Abuse involving misuse of inhalants found that the most frequently mentioned inhalant (35%) was Freon (51 deaths). Of the Freon deaths, 42 percent were students or youth with a mean age of 16.4 years.
Suffocation, inhaling fluid or vomit into the lungs, and accidents each cause about 15% of deaths linked to inhalant abuse.
National Institute on Drug Abuse's 'Monitoring the Future' study reveals that inhalant abuse among 8th graders is up 7.7% since 2002.
55% of deaths linked to inhalant abuse are caused by "Sudden Sniffing Death Syndrome." SSDS can occur on the first use or any use. The
Inhalant causes the heart to beat rapidly and erratically, resulting in cardiac arrest.
22% of inhalant abusers who died of SSDS had no history of previous inhalant abuse. In other words, they were first-time users.

Collier County, FL Statistics:

The use of inhalants in middle schools has doubled in two years
The average age a child starts using drugs or alcohol is just 12½
Every third day a child is taken to the hospital because of a drug overdose
85 percent of all juvenile criminal cases are substance related
Deaths due solely to drug toxicity increased 76% between 1998 and 2005

The modification of this code will have an immense positive impact on the safety and health of our citizens, especially our youth. It will reduce the number of deaths associated with Inhalant abuse and the number of injuries associated with Freon accidents and leaks.

Cost Impact: The code change proposal will increase the cost of construction by $20-$25.

Public Hearing Results

PART I - IMC
Committee Action: **Disapproved**

Committee Reason: Legal action will likely ensue for those cases where the service personnel fail to install the devices. The locking caps are an "honest man's" lock and if someone is intent on getting refrigerant from the system, they will find a way to overcome the locking caps. Refrigerant can be obtained by making a hole in the coil tubing or connecting piping. The service personnel should not be made responsible for this. The proposed text conflicts with the intent of Section 102.2.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Mona Casey representing United Parents to Restrict Open Access to Refrigerant, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

PART I – IMC

1101.11.1 Existing systems. ~~Existing~~ <u>Air conditioning units with</u> refrigerant circuit access ports ~~that are~~ located outdoors shall be ~~retrofitted~~ <u>provided</u> with locking-type tamper-resistant caps <u>or shall be otherwise secured to prevent unauthorized access</u> whenever the ~~refrigerant~~ system is ~~modified~~ <u>recharged</u>, serviced, or repaired.

Commenter's Reason: At the previous code hearing, proposal PM14-09/10, which provides a trigger for securing existing refrigerant circuit access ports located outdoors, was approved by the Property Maintenance Committee. Because the IPMC has yet to be adopted by all states, it is important to add this provision to the IMC and IRC as well to ensure a broader adoption of the code. This proposed modification will standardize the language across all three codes.

Public Comment 2:

Julius Ballanco, PE, JB Engineering and Code Consulting PC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

PART I – IMC

1101.11.1 Existing systems. ~~Existing~~ <u>Air conditioning units with</u> refrigerant circuit access ports ~~that are~~ located outdoors shall be ~~retrofitted~~ <u>provided</u> with locking-type tamper-resistant caps <u>or shall be otherwise secured to prevent unauthorized access</u> whenever the ~~refrigerant~~ system is ~~modified~~ <u>recharged</u>, serviced, or repaired.

Commenter's Reason: The reason provided by the Mechanical Committee is not an appropriate comment. Service personnel are liable for everything they do when servicing equipment. This is merely one additional requirement. The other justification was that the change conflicts with Section 102.2. In fact, this proposal is consistent with Section 102.2.

This section does not apply to existing equipment. The section clearly establishes that the requirement is applicable when the system is recharged, serviced, or repaired. The system is the refrigerant circuit. Such a change is consistent with Section 102.4.

Another point discussed by both Committees was that the section is unenforceable. There are many sections of the code that are unenforceable. That doesn't mean that the code ignores those requirements. Just because a permit is not required does not mean that the installing contractor does not have to comply with the code. Case in point is any minor change to any building system. A permit is not required, but the change must be in accordance with the code.

What both Committees should have been focusing on is whether this section is necessary for the protection of health and safety. That has been answered previously with a big yes. Therefore, the change to the Mechanical Code and Residential Code should have been accepted. This is in inexpensive change that can save lives.

Public Comment 3:

Adam Deschamp representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART I-IMC

<u>**1101.11.1 Securing refrigerant access ports.** Air conditioning units with refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access whenever the system is recharged, serviced, or repaired.</u>

Commenter's Reason: A member of my friends' family died and others have died from how easy it is to access those parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 4:

Laura Pestano representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART I-IMC

1101.11.1 Securing refrigerant access ports. Air conditioning units with refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access whenever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 5:

Russell Phillips representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART I-IMC

1101.11.1 Securing refrigerant access ports. Air conditioning units with refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access whenever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Dana Prothro representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART I-IMC

1101.11.1 Securing refrigerant access ports. Air conditioning units with refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access whenever the system is recharged, serviced, or repaired.

Commenter's Reason: My daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 7:

Philippe Albert Schaedler representing Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART I-IMC

1101.11.1 Securing refrigerant access ports. Air conditioning units with refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access whenever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 8:

Michele Wagner representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART I-IMC

1101.11.1 Securing refrigerant access ports. Air conditioning units with refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access whenever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Final Action: AS AM AMPC____ D

M133-09/10, Part II
IRC M1411.6.1 (New)

Proposed Change as Submitted

Proponent: Mona Casey, United Parents to Restrict Open Access to Refrigerant

PART II – IRC MECHANICAL

Add new text as follows:

M1411.6.1 Existing HVAC systems. Existing refrigerant circuit access ports that are located outdoors shall be retrofitted with locking-type tamper-resistant caps whenever the refrigerant system is modified, serviced, or repaired.

Reason: The purpose of this code modification is to add new requirements to the Code. The existing code does not address the issue of accessibility to refrigerant from pre-existing units by unauthorized individuals. Refrigerant is extremely dangerous and potentially lethal.

Facts:

Refrigerant "can cause death without warning".
Refrigerant is considered a gateway drug because users often progress from refrigerant use to drug and alcohol abuse.
Refrigerant is not a cumulative substance where chances of dying from it increase as the dosage and number of use increases. It can kill on the 1st, 10th, 100th, or any other time. 33 percent of deaths resulting from refrigerant huffing occurred on the 1st use.
Refrigerant, like other poisons, must be kept out of reach of children.
Refrigerant theft is increasing.
According to Mike Opitz, Certification Manager, LEED for Existing Buildings, U.S. Green Building Council, chlorine in CFCs and HCFCs destroy the ozone and depletes the Earth's natural shield for incoming ultraviolet radiation and absorb outgoing infrared radiation from the earth, functioning as potent greenhouse gases.

National Statistics:

The National Institute on Drug Abuse reports that one in five American teens have used Inhalants to get high.
According to Stephen J. Pasierb, President and CEO of The Partnership for Drug-Free America, 22% of 6th and 8th graders admitted abusing inhalants and only 3% of parents think their child has ever abused inhalants.
An analysis of 144 Texas death certificates by the Texas Commission on Alcohol and Drug Abuse involving misuse of inhalants found that the most frequently mentioned inhalant (35%) was Freon (51 deaths). Of the Freon deaths, 42 percent were students or youth with a mean age of 16.4 years.
Suffocation, inhaling fluid or vomit into the lungs, and accidents each cause about 15% of deaths linked to inhalant abuse.
National Institute on Drug Abuse's 'Monitoring the Future' study reveals that inhalant abuse among 8th graders is up 7.7% since 2002.
55% of deaths linked to inhalant abuse are caused by "Sudden Sniffing Death Syndrome." SSDS can occur on the first use or any use. The
Inhalant causes the heart to beat rapidly and erratically, resulting in cardiac arrest.
22% of inhalant abusers who died of SSDS had no history of previous inhalant abuse. In other words, they were first-time users.

Collier County, FL Statistics:

The use of inhalants in middle schools has doubled in two years
The average age a child starts using drugs or alcohol is just 12½
Every third day a child is taken to the hospital because of a drug overdose
85 percent of all juvenile criminal cases are substance related
Deaths due solely to drug toxicity increased 76% between 1998 and 2005

The modification of this code will have an immense positive impact on the safety and health of our citizens, especially our youth. It will reduce the number of deaths associated with Inhalant abuse and the number of injuries associated with Freon accidents and leaks.

Cost Impact: The code change proposal will increase the cost of construction by $20-$25.

Public Hearing Results

PART II - IRC
Committee Action: **Disapproved**

Committee Reason: The proposed text is retro-active and unenforceable. The IPMC is the more appropriate place for such text.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Mona Casey representing United Parents to Restrict Open Access to Refrigerant, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

PART II – IRC MECHANICAL

M1411.6.1 Existing HVAC systems. ~~Existing~~ Air conditioning units with refrigerant circuit access ports ~~that are~~ located outdoors shall be ~~retrofitted~~ provided with locking-type tamper-resistant caps or shall be otherwise secured to prevent unauthorized access whenever the ~~refrigerant~~ system is ~~modified~~ recharged, serviced, or repaired.

Commenter's Reason: At the previous code hearing, proposal PM14-09/10, which provides a trigger for securing existing refrigerant circuit access ports located outdoors, was approved by the Property Maintenance Committee. Because the IPMC has yet to be adopted by all states, it is important to add this provision to the IMC and IRC as well to ensure a broader adoption of the code. This proposed modification will standardize the language across all three codes.

Public Comment 2:

Julius Ballanco, PE, JB Engineering and Code Consulting PC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

PART II – IRC MECHANICAL

M1411.6.1 Existing HVAC systems. ~~Existing~~ Air conditioning units with refrigerant circuit access ports ~~that are~~ located outdoors shall be ~~retrofitted~~ provided with locking-type tamper-resistant caps or shall be otherwise secured to prevent unauthorized access whenever the ~~refrigerant~~ system is ~~modified~~ recharged, serviced, or repaired.

Commenter's Reason: The reason provided by the Mechanical Committee is not an appropriate comment. Service personnel are liable for everything they do when servicing equipment. This is merely one additional requirement. The other justification was that the change conflicts with Section 102.2. In fact, this proposal is consistent with Section 102.2.

This section does not apply to existing equipment. The section clearly establishes that the requirement is applicable when the system is recharged, serviced, or repaired. The system is the refrigerant circuit. Such a change is consistent with Section 102.4.

Another point discussed by both Committees was that the section is unenforceable. There are many sections of the code that are unenforceable. That doesn't mean that the code ignores those requirements. Just because a permit is not required does not mean that the installing contractor does not have to comply with the code. Case in point is any minor change to any building system. A permit is not required, but the change must be in accordance with the code.

What both Committees should have been focusing on is whether this section is necessary for the protection of health and safety. That has been answered previously with a big yes. Therefore, the change to the Mechanical Code and Residential Code should have been accepted. This is in inexpensive change that can save lives.

Public Comment 3:

Adam Deschamp representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART II-IRC MECHANICAL

M1411.6.1 Securing refrigerant access ports. Air conditioning units with a refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access wheever the system is recharged, serviced, or repaired.

Commenter's Reason: A member of my friends' family died and others have died from how easy it is to access those parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 4:

Laura Pestano representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART II-IRC MECHANICAL

M1411.6.1 Securing refrigerant access ports. Air conditioning units with a refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access wheever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 5:

Russell Phillips representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART II-IRC MECHANICAL

M1411.6.1 Securing refrigerant access ports. Air conditioning units with a refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access wheever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 6:

Dana Prothro representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART II-IRC MECHANICAL

M1411.6.1 Securing refrigerant access ports. Air conditioning units with a refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access wheever the system is recharged, serviced, or repaired.

Commenter's Reason: My daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 7:

Philippe Albert Schaedler representing Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART II-IRC-MECHANICAL

M1411.6.1 Securing refrigerant access ports. Air conditioning units with a refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access whenever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Public Comment 8:

Michele Wagner representing UPROAR/Dana Prothro, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART II-IRC MECHANICAL

M1411.6.1 Securing refrigerant access ports. Air conditioning units with a refrigerant circuit access ports located outdoors shall be provided with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access wheever the system is recharged, serviced, or repaired.

Commenter's Reason: A friends' daughter died because of access to the parts. The request was sent to protect people and teens from accessing it, because they huff the refrigerant to get high.

Final Action: AS AM AMPC____ D

M134-09/10

Table 1103.1

Proposed Change as Submitted

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers

Revise table as follows:

[F] TABLE 1103.1
REFRIGERANT CLASSIFICATION, Amount and OEL

Chemical Refrigerant	Formula	Chemical Name of Blend	Refrigerant Classification	Degrees of Hazard[a]	[M] Amount Of Refrigerant Per Occupied Space			
					Pound per 1,000 cubic feet	ppm	g/m^3	OEL[e]
R-E170	CH_3OCH_3	methoxymethane (dimethyl ether)	A3		1	8,500	16	1,000
R-403A	zeotrope	R-290/22/218 (5/75/20)	~~A1~~ A2	2-0-0	7.6	33,000	120	1,000
R-433B	zeotrope	R-1270/290 (5.0-95.0)	A3		0.51	4,500	8.1	950
R-433C	zeotrope	R-1270/290 (25.0/75.0)	A3		0.41	3,600	6.6	790
R-438A	zeotrope	R-32/125/134a/600/601a (8.5/45.0/44.2/1.7/0.6)	A1		4.9	19,000	79	990
R-600a	$CH(CH_3)_2$-CH_3	~~isobutane (2-methyl propane)~~ 2-methyl propane (isobutane)	A3	2-4-0	0.6	4,000	9.6	1,000
R-601a	$(CH_3)_2CHCH_2CH_3$	2-methylbutane (isopentane)	A3		0.2	1,000	2.9	600

(Portions of table and notes not shown remain unchanged)

Reason: R-433B, R-433C, R-438A were recently added to ASHRAE Standard 34.

The classification of R-403A has been changed from A1 to A2 based on data developed as part of an ASHRAE research project using the current method of measuring the LFL of refrigerants.

The chemical names of R-E170, R-600a and R-601a have been changed to be consistent with IUPAC rules for naming organic compounds. The common names are listed in parenthesis.

If approved for publication by ASHRAE prior to the code hearings, a floor modification will be brought forward to add R-1234yf to this table.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FERGUSON-M-2-T. 1103.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent's printed reason. The proposed revisions update the table based on the chemicals being used today.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Steve Ferguson representing American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

[F]TABLE 1103.1
REFRIGERANT CLASSIFICATION, Amount and OEL

Chemical Refrigerant	Formula	Chemical Name of Blend	Refrigerant Classification	Degrees of Hazard[a]	[M] Amount Of Refrigerant Per Occupied Space			
					Pound per 1,000 cubic feet	ppm	g/m^3	OEL[e]
R-E170	CH_3OCH_3	methoxymethane (dimethyl ether)	A3		1	8,500	16	1,000
R-403A	zeotrope	R-290/22/218 (5/75/20)	A2	2-0-0	7.6	33,000	120	1,000
R-433B	zeotrope	R-1270/290 (5.0-95.0)	A3		0.51	4,500	8.1	950
R-433C	zeotrope	R-1270/290 (25.0/75.0)	A3		0.41	3,600	6.6	790
R-438A	zeotrope	R-32/125/134a/600/601a (8.5/45.0/44.2/1.7/0.6)	A1		4.9	19,000	79	990
R-600a	$CH(CH_3)_2$-CH_3	2-methyl propane (isobutane)	A3	2-4-0	0.6	4,000	9.6	1,000
R-601	$CH_3CH_2CH_2CH_2CH_3$	pentane	A3		0.2	1,000	2.9	600
R-601a	$(CH_3)_2CHCH_2CH_3$	2-methylbutane (isopentane)	A3		0.2	1,000	2.9	600
R-1234yf	$CF_3CF{=}CH_2$	2,3,3,3-tetrafluoro-1 propene	A2		4.7	16,000	75	500

(Portions of table not shown remain unchanged)

Commenter's Reason: This proposal adds two new refrigerants (R-601 and R-1234yf) which have recently been published as part of ASHRAE Standard 34. This makes Table 1103.1 consistent with all published refrigerants in ASHRAE Standard 34.

Final Action: AS AM AMPC____ D

M135-09/10
1105.6, 1105.6.3 (New), 1105.6.3.1, 1105.6.3.2

Proposed Change as Submitted

Proponent: Jeffrey M. Shapiro, PE, International Code Consultants, representing the International Institute of Ammonia Refrigeration

1. Revise as follows:

1105.6 Ventilation. Machinery rooms shall be mechanically ventilated to the outdoors. ~~Mechanical ventilation shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions. Multiple fans or multispeed fans shall be allowed in order to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.~~

> **Exception:** Where a refrigerating system is located outdoors more than 20 feet (6096 mm) from any building opening and is enclosed by a penthouse, lean-to or other open structure, natural or mechanical ventilation shall be provided. Location of the openings shall be based on the relative density of the refrigerant to air. The free-aperture cross section for the ventilation of the *machinery room* shall be not less than:

$$F = \sqrt{G}$$ **(Equation 11-1)**

For SI:
$$F = 0.138\sqrt{G}$$

where:

F = The free opening area in square feet (m^2).
G = The mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the *machinery room*.

2. Add new text as follows:

<u>**1105.6.3 Ventilation rate.** For other than ammonia systems, the mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. The minimum required ventilation rate for ammonia shall be in accordance with IIAR 2.</u>

<u>Multiple fans or multispeed fans shall be allowed to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.</u>

3. Revise as follows:

~~**1105.6.3**~~ <u>**1105.6.3.1**</u> **Quantity—normal ventilation.** During occupied conditions, the mechanical ventilation system shall exhaust the larger of the following:

1. Not less than 0.5 cfm per square foot (0.0025 $m^3/s \cdot m^2$) of *machinery room* area or 20 cfm (0.009 m^3/s) per person; or
2. A volume required to limit the room temperature rise to 18°F (10°C) taking into account the ambient heating effect of all machinery in the room.

~~**1105.6.4**~~ <u>**1105.6.3.2**</u> **Quantity—emergency conditions.** Upon actuation of the refrigerant detector required in Section 1105.3, the mechanical ventilation system shall *exhaust air* from the *machinery room* in the following quantity:

$$Q = 100 \times \sqrt{G}$$ **(Equation 11-2)**

For SI: $Q = 0.07 \times \sqrt{G}$

Where:

Q = The airflow in cubic feet per minute (m^3/s).
G = The design mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the *machinery room.*

Reason: The proposed change will defer the required ventilation rate for ammonia refrigeration machinery rooms to IIAR2, which is the ANSI accredited industry standard. IIAR 2 is in the process of being revised to change the basis of calculating required ventilation to an "air changes per minute/hour" basis. There is general agreement in the industry that the minimum ventilation rate for ammonia needs to be greater than the rate calculated using the current formula, and IIAR 2 is out for public comment so that a consensus rate that is unique based on the properties of ammonia can be established. It is anticipated that the public comment period for IIAR 2 will close prior to the ICC hearing in Baltimore, and additional information on the new calculation approach will be presented at that time to support this proposal.

As part of this change, requirements related to the required ventilation rate in Section 1105.6 have been moved to Section 1105.6.3 to create a single subsection on this topic rather than the current approach of splitting related requirements between two sections. This improves the usability of the code.

Cost Impact: Larger fans to be required by IIAR 2 will slightly increase the cost of construction.

ICCFILENAME: SHAPIRO-M-1-1105.6

Public Hearing Results

Modify the proposal as follows:

1. Revise as follows:

1105.6 Ventilation. Machinery rooms shall be mechanically ventilated to the outdoors.

> **Exception:** Where a refrigerating system is located outdoors more than 20 feet (6096 mm) from any building opening and is enclosed by a penthouse, lean-to or other open structure, natural or mechanical ventilation shall be provided. Location of the openings shall be based on the relative density of the refrigerant to air. The free-aperture cross section for the ventilation of the *machinery room* shall be not less than:

$$F = \sqrt{G} \qquad \textbf{(Equation 11-1)}$$

For SI:
$$F = 0.138\sqrt{G}$$

where:

F = The free opening area in square feet (m^2).
G = The mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the *machinery room*.

2. Add new text as follows:

1105.6.3 Ventilation rate. ~~For other than ammonia systems,~~ The mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. ~~The minimum required ventilation rate for ammonia shall be in accordance with IIAR 2.~~

Multiple fans or multispeed fans shall be allowed to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.

3. Revise as follows:

1105.6.3.1 Quantity—normal ventilation. During occupied conditions, the mechanical ventilation system shall exhaust the larger of the following:

1. Not less than 0.5 cfm per square foot ($0.0025\ m^3/s\cdot m^2$) of *machinery room* area or 20 cfm ($0.009\ m^3/s$) per person; or
2. A volume required to limit the room temperature rise to 18°F (10°C) taking into account the ambient heating effect of all machinery in the room.

1105.6.3.2 Quantity—emergency conditions. Upon actuation of the refrigerant detector required in Section 1105.3, the mechanical ventilation system shall *exhaust air* from the *machinery room* in the following quantity:

$$Q = 100 \times \sqrt{G} \qquad \textbf{(Equation 11-2)}$$

For SI: $Q = 0.07 \times \sqrt{G}$

Where:

Q = The airflow in cubic feet per minute (m^3/s).
G = The design mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the *machinery room.*

Committee Action: **Approved as Modified**

Committee Reason: The proposed revision consolidates text into one section to improve usability. The modification deletes references to ammonia and IIAR2 because the revised version of the standard is yet to be completed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey Shapiro, International Code Consultants, representing International Institute of Ammonia Refrigeration, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.6.3 Ventilation rate. For other than ammonia systems, the mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. The minimum required ventilation rate for ammonia shall be 30 air changes per hour, in accordance with IIAR 2.

Commenter's Reason: The proposed change will correlate the required ventilation rate for ammonia refrigeration machinery rooms with IIAR2, which is the ANSI accredited industry standard. IIAR 2 is in the process of being revised to change the basis of calculating required ventilation to an "air changes per minute/hour" basis. There is general agreement in the industry that the minimum ventilation rate for ammonia needs to be increased above the rate required for other refrigerants. Those other refrigerants will still be ventilated using a rate calculated by the current formula.

IIAR 2 is currently out for public comment so that a consensus rate that is unique based on the properties of ammonia can be established. It is anticipated that the public comment period for IIAR 2 will close prior to the ICC hearing in Dallas, and additional information on the background and technical basis for the new calculation approach will be presented at that time to support this proposal.

Final Action: AS AM AMPC____ D

M136-09/10
[F] 1105.8.1 (New), [F] 1105.8.2 (New), [F] 1105.8.3 (New), [F] 1105.8.4 (New)

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

[F] 1105.8.1 Ammonia refrigerant. Systems containing ammonia refrigerant shall discharge vapor to the atmosphere through an approved treatment system in accordance with Section 1105.8.2, a flaring system in accordance with Section 1105.8.3 or through an approved ammonia diffusion system in accordance with Section1105.8.4, or by other approved means.

Exceptions:

1. Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.
2. Where the fire code official determines, on review of an engineering analysis prepared in accordance with Section 104.7.2 of the *International Fire Code*, that a fire, health or environmental hazard would not result from discharging ammonia directly to the atmosphere.

[F] 1105.8.2 Treatment systems. Treatment systems shall be designed to reduce the allowable discharge concentration of the refrigerant gas to not more than 50 percent of the IDLH at the point of exhaust. Treatment systems shall be in accordance with Chapter 37 of the *International Fire Code*

[F] 1105.8.3 Flaring systems. Flaring systems for incineration of flammable refrigerants shall be designed to incinerate the entire discharge. The products of refrigerant incineration shall not pose health or environmental hazards.

Incineration shall be automatic upon initiation of discharge, shall be designed to prevent blowback, and shall not expose structures or materials to threat of fire. Standby fuel, such as LP gas, and standby power shall have the capacity to operate for one and one-half the required time for complete incineration of refrigerant in the system.

[F] 1105.8.4 Ammonia diffusion systems. Ammonia diffusion systems shall include a tank containing 1 gallon of water for each pound of ammonia (4 L of water for each 1 kg of ammonia) that will be released in 1 hour from the largest relief device connected to the discharge pipe. The water shall be prevented from freezing. The discharge pipe from the pressure relief device shall distribute ammonia in the bottom of the tank, but not lower than 33 feet (10 058 mm) below the maximum liquid level. The tank shall contain the volume of water and ammonia without overflowing.

Reason: This is an effort to make Chapter 11 a little more complete. This language is extracted from The Fire Code. There have been complaints that the I-codes in general refer to too many standards requiring many different documents to accomplish one thing. Some of the complaints have merit. The reference to ASHRAE-15 is left in tact but the Fire Code requirements satisfy the issue. Why not just say what is required for ammonia discharge rather than referring to the standard or the Fire Code. This will aid in plan review as well as field inspection because the requirements will be right there in the chapter.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-M-7-1105.8

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proponent asked for disapproval to allow the proposal to be reworked and resubmitted as a public comment. The provisions for the discharge of pressure relief valves are lacking.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.~~8~~ 7.1 Ammonia discharge. Pressure relief valves for ~~ammonia~~ refrigeration systems shall discharge in accordance with ASHRAE-15 and Sections 1105.7.1.1 through 1105.7.1.3.3.

[F] 1105.7.1.1 Flammable refrigerants. Systems containing flammable refrigerants having a density equal to or greater than the density of air shall discharge vapor to the atmosphere only through an approved treatment system in accordance with Section 1105.7.1.3.1. Systems containing flammable refrigerants having a density less than the density of air shall be permitted to discharge vapor to the atmosphere provided that the point of discharge is located outside of the structure at not less than15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or exit.

[F] 1105.7.1.2 Toxic and highly toxic refrigerants. Systems containing toxic of highly toxic refrigerants shall discharge vapor to the atmosphere only through an approved treatment system in accordance with Section 1105.7.1.3.1 or a flaring system in accordance with Section 1105.7.1.3.2.

[F] 1105.~~8.1~~ 7.1.3 Ammonia refrigerant. Systems containing ammonia refrigerant shall discharge vapor to the atmosphere through an approved treatment system in accordance with Section 1105~~.8.2.4~~ 7.1.3.1 a flaring system in accordance with Section 1105.~~8.3~~ 7.1.3.2 or through an approved ammonia diffusion system in accordance with Section1105~~.8.4~~ 7.1.3.3, or by other approved means.

Exceptions:

1. Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.
2. When the fire code official determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire, health or environmental hazard would not result from discharging ammonia directly to the atmosphere.

[F] 1105.~~8.2~~ 7.1.3.1 Treatment systems. Treatment systems shall be designed to reduce the allowable discharge concentration of the refrigerant gas to not more than 50 percent of the IDLH at the point of exhaust. Treatment systems shall be in accordance with Chapter 37 of the *International Fire Code*
.

[F] 1105.~~8.3~~ 7.1.3.2 Flaring systems. Flaring systems for incineration of flammable refrigerants shall be designed to incinerate the entire discharge. The products of refrigerant incineration shall not pose health or environmental hazards. Incineration shall be automatic upon initiation of discharge, shall be designed to prevent blowback, and shall not expose structures or materials to threat of fire. Standby fuel, such as LP gas, and standby power shall have the capacity to operate for one and one-half the required time for complete incineration of refrigerant in the system.

[F] 1105.~~8.4~~ 7.1.3.3 Ammonia diffusion systems. Ammonia diffusion systems shall include a tank containing 1 gallon of water for each pound of ammonia (4 L of water for each 1 kg of ammonia) that will be released in 1 hour from the largest relief device connected to the discharge pipe. The water shall be prevented from freezing. The discharge pipe from the pressure relief device shall distribute ammonia in the bottom of the tank, but no lower than 33 feet (10 058 mm) below the maximum liquid level. The tank shall contain the volume of water and ammonia without overflowing.

Commenter's Reason: We recommended disapproval because the text was parked under the wrong section and the balance of the Fire Code section was extracted to complete the section**.** Inspectors need this information in the code to verify that relief devices are terminated appropriately.

Final Action: AS AM AMPC____ D

M139-09/10

Table 1202.4, 1203.15, 1203.15.1, 1203.15.2, 1203.15.3, 1208.1, 1208.1.1, 1210 (New), Chapter 15

Proposed Change as Submitted

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

1. Revise table as follows:

TABLE 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD
~~Polyethylene (PE) pipe, tubing and fittings (for ground source heat pump loop systems)~~	~~ASTM D 2513; ASTM D 3035; ASTM D 2447; ASTM D 2683; ASTM F 1055; ASTM D 2837; ASTM D 3350; ASTM D 1693~~

(Portions of table not shown are unchanged)

2. Delete without substitution:

~~**1203.15 Polyethylene plastic pipe and tubing for ground source heat pump loop systems.** Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat fusion joints conforming to Section 1203.15.1, electrofusion joints conforming to Section 1203.15.2, or stab-type insertion joints conforming to Section 1203.15.3.~~

~~**1203.15.1 Heat-fusion joints.** Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.~~

~~**1203.15.2 Electrofusion joints.** Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.~~

~~**1203.15.3 Stab-type insert fittings.** Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.~~

3. Revise as follows:

SECTION 1208
TESTS

1208.1 General. Hydronic piping systems ~~other than ground source heat pump loop systems~~ shall be tested hydrostatically at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes. ~~Ground-source heat pump loop systems shall be tested in accordance with Section 1208.1.1.~~

4. Delete without substitution:

~~**1208.1.1 Ground source heat pump loop systems.** Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the problem shall be identified and corrected.~~

5. Add new text as follows:

SECTION 1210
GROUND SOURCE HEAT PUMP LOOP SYSTEMS

1210.1 General. Ground-source heat pump loop systems shall comply with this section.

1210.2 Piping material. Ground-source heat pump loop system piping material for water-based systems shall comply with Sections 1210.2.1 through 1210.2.4.

1210.2.1 Used materials. Reused piping, fittings, valves, or other materials shall not be used in ground-source heat pump loop systems.

1210.2.2 Material rating. Piping shall be rated for the operating temperature and pressure of the ground-source heat pump loop systems. Fittings shall be approved for pressure applications and recommended by the manufacturer for installation with the piping material installed. Materials installed underground shall be suitable for burial.

1210.2.3 Piping and tubing materials standards. Ground source heat pump loop system piping shall conform to the standards listed in Table 1210.2.3.

TABLE 1210.2.3
GROUND SOURCE HEAT PUMP LOOP SYSTEM PIPING

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM D 2846; ASTM F 441; ASTM F 442
Cross-linked polyethylene (PEX) tubing	ASTM F 876; ASTM F 877
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F 1282; CSA B137.9
Polyethylene (PE) pipe, tubing and fittings	ASTM D 3035; ASTM D 2447; ASTM D 2737; ASTM F 714; AWWA C901; CSA CAN/CSA-B-137.1
Polypropylene (PP-R) pipe, tubing and fittings	ASTM F 2389
Polyvinyl chloride (PVC) plastic pipe	ASTM D 1785; ASTM D 2241
Raised temperature polyethylene (PE-RT)	ASTM F 2623

1210.2.4 Fittings. Geothermal pipe fittings shall be approved for installation with the piping materials to be installed, suitable for use underground if buried, and shall conform to the standards listed in Table 1210.2.4.

TABLE 1210.2.4
GROUND SOURCE HEAT PUMP LOOP SYSTEM FITTINGS

PIPE MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM D 2846; ASTM F 437; ASTM F 438; ASTM F 439; CSA B137.6
Cross-linked polyethylene (PEX) tubing	ASTM F 877; ASTM F 1807; ASTM F 1960; ASTM F 2080; ASTM F 2098; ASTM F 2159; ASTM F 2434; CSA B137.5
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM D 3261; ASTM F 877; ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2434; CSA B137.5, B137.1
Polyethylene (PE) pipe, tubing and fittings	ASTM D 2609; ASTM D 2683; ASTM D 3261; ASTM F 1055; CSA B137.1
Polypropylene (PP-R) pipe, tubing and fittings	ASTM F 2389; CSA B137.11
Polyvinyl chloride (PVC) plastic pipe	ASTM D 2464; ASTM D 2466; ASTM D 2467; CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D 3261; ASTM F 877; ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2434; CSA B137.5, B137.1

1210.3 Joints and connections. Joints and connections in ground source heat pump loop systems shall be of an approved type and shall comply with Sections 1210.3.1 through 1210.3.9. Joints and connections shall be leak-free for the pressure of the ground source heat pump loop systems. Joints used underground shall be approved for buried applications.

1210.3.1 Joints between different piping materials. Joints between different piping materials shall be made with approved transition fittings.

1210.3.2 Preparation of pipe ends. Piping shall be cut square, reamed, and shall be free of burrs and obstructions. CPVC, PE, and PVC pipe shall be chamfered. Pipe ends shall have full-bore openings and shall not be undercut.

1210.3.3 Joint preparation and installation. Where required by Sections 1210.3.4 through 1210.3.6, the preparation and installation of mechanical and thermoplastic-welded joints shall comply with Sections 1210.3.3.1 and 1210.3.3.2 as applicable.

1210.3.3.1 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1210.3.3.2 Thermoplastic-welded joints. Joint surfaces shall be cleaned by an approved procedure. Joints shall be welded according to the manufacturer's instructions.

1210.3.4 CPVC plastic pipe. Joints for CPVC plastic piping and fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1210.3.5 Cross-linked polyethylene (PEX) plastic tubing. Joints for cross-linked polyethylene plastic piping and fittings shall conform to Sections 1210.3.5.1 and 1210.3.5.2. Mechanical joints shall conform to Section 1210.3.3.

1210.3.5.1 Compression-type fittings. Where compression- type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1210.3.5.2 Plastic-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PEX pipe.

1210.3.6 Polyethylene plastic pipe and tubing for ground source heat pump loop systems. Joints for polyethylene plastic piping and fittings for ground source heat pump loop systems shall be heat-fusion joints conforming to Section 1210.3.6.1, electrofusion joints conforming to Section 1210.3.6.2, or stab-type insertion joints conforming to Section 1210.3.6.3.

1210.3.6.1 Heat-fusion joints. Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.

1210.3.6.2 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.

1210.3.6.3 Stab-type insert fittings. Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.

1210.3.7 Polypropylene (PP) plastic. Joints for PP plastic piping and fittings shall comply with Sections 1210.3.7 and 1210.3.7.2.

1210.3.7.1 Heat-fusion joints. Heat-fusion joints for polypropylene (PP) piping joints shall be installed with socket-type heat-fused polypropylene fittings, electrofusion polypropylene fittings or by butt-fusion. Joint surfaces shall be clean and free from moisture. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM F 2389.

1210.3.7.2 Mechanical and compression sleeve joints. Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer's instructions.

1210.3.8 Raised temperature polyethylene (PE-RT) plastic tubing. Joints for raised temperature polyethylene piping and fittings shall conform to Sections 1210.3.8.1 and 1210.3.8.2. Mechanical joints shall conform to Section 1210.3.3.

1210.3.8.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1210.3.8.2 PE-RT-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PE-RT pipe.

1210.3.9 PVC plastic pipe. Joints for PVC plastic pipe and fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1210.4 Shutoff valves. Shutoff valves shall be installed in ground source heat pump loop systems in the locations indicated in Sections 1210.4.1 through 1210.4.6. Pressure relief valves shall be installed in accordance with Section 1210.4.7.

1210.4.1 Heat exchangers. Shutoff valves shall be installed on the supply and return side of a heat exchanger.

> **Exception:** Shutoff valves shall not be required where heat exchangers are integral with a boiler; or are a component of a manufacturer's boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section 1005.1.

1210.4.2 Central systems. Shutoff valves shall be installed on the building supply and return of a central utility system.

1210.4.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

1210.4.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

1210.4.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical *equipment* and appliances. This requirement does not apply to components of a ground source heat pump loop system such as pumps, air separators, metering devices, and similar *equipment*.

1210.4.6 Expansion tanks. Shutoff valves shall be installed at connections to nondiaphragm-type expansion tanks.

1210.4.7 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section 1006.

1210.5 General. Piping, valves, fittings, and connections shall be installed in accordance with the conditions of approval and Sections 1210.5.1 through 1210.5.10.

1210.5.1 Protection of potable water. The potable water system shall be protected from backflow in accordance with the *International Plumbing Code*.

1210.5.2 Pipe penetrations. Openings for pipe penetrations in walls, floors and ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with the *International Building Code*.

1210.5.3 Clearance to combustibles. Where the exterior temperature of piping in a geothermal piping system exceeds 250°F (121°C), such piping shall have a minimum *clearance* of 1 inch (25 mm) to combustible materials.

1210.5.4 Contact with building material. A ground source heat pump loop system shall not be in direct contact with building materials that cause the piping material to degrade or corrode, or that interfere with the operation of the system.

1210.5.5 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

1210.5.6 Flood hazard. Piping located in a flood hazard area shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the *design flood elevation*.

1210.5.7 Pipe support. Pipe shall be supported in accordance with Section 305.

1210.5.8 Velocities. Flow velocities in ground source heat pump loop systems shall be designed to not exceed the maximum flow velocity recommended by the pipe and fitting manufacturer and shall be controlled to reduce the possibility of water hammer.

1210.5.9 Labeling and marking. Ground source heat pump loop system piping shall be marked with tape, metal tags or other method where it enters a building indicating "GROUND SOURCE HEAT PUMP LOOP SYSTEM". The marking shall indicate any antifreeze used in the system by name and concentration.

1210.5.10 Chemical compatibility. Antifreeze and other materials used in a ground source heat pump loop system shall be chemically compatible with the pipe, tubing, fittings, and mechanical systems.

1210.6 Makeup water. The transfer fluid used in ground source heat pump loop systems shall be compatible with the makeup water supplied to the system.

1210.7 Ground source heat pump loop systems tests. Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the cause shall be identified and corrective action taken.

1210.7.1 Pressurizing during installation. Ground source heat pump loop piping to be embedded in concrete shall be pressure tested prior to pouring concrete. During pouring, the pipe shall be maintained at the proposed operating pressure.

6. Add new standards to Chapter 15 as follows:

ASTM

D 2464-06	Standard Specification for Threaded Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
D 2466-06	Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40
D 2467-06	Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
D 2609-02	Standard Specification for Plastic Insert Fittings for Polyethylene (PE) Plastic Pipe
D 2737-03	Standard Specification for Polyethylene (PE) Plastic Tubing
F 437-06	Standard Specification for Threaded Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80
F 714-08	Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) Based on Outside Diameter

F 1807-08	Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing
F1960-08	Standard Specification for Cold Expansion Fittings with PEX Reinforcing Rings for Use with Cross-linked Polyethylene (PEX) Tubing
F 2080-08	Standard Specification for Cold-Expansion Fittings with Metal Compression-Sleeves for Cross-Linked Polyethylene (PEX) Pipe
F 2098-08	Standard Specification for Stainless Steel Clamps for Securing SDR9 Cross-linked Polyethylene (PEX) Tubing to Metal Insert and Plastic Insert Fittings
F 2159-05	Standard Specification for Plastic Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing
F 2434-08	Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing and SDR9 Crosslinked Polyethylene/Aluminum/Cross-linked Polyethylene (PEX-AL-PEX) Tubing

AWWA

C901-08	Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13 mm) through 3 In. (76 mm), for Water Service

CSA

B137.1-02	Polyethylene Pipe, Tubing and Fittings for Cold Water Pressure Services
B137.2-02	PVC Injection-moulded Gasketed Fittings for Pressure Applications
B137.3-02	Rigid Poly (Vinyl Chloride) (PVC) Pipe for Pressure Applications
B137.5-02	Cross-linked Polyethylene (PEX) Tubing Systems for Pressure Applications— with Revisions through September 1992
B137.6-02	CPVC Pipe, Tubing and Fittings for Hot and Cold Water Distribution Systems— with Revisions through May 1986
B137.11-02	Polypropylene (PP-R) Pipe and Fittings for Pressure Applications

Reason: Water based ground-source heat pump loop PE piping is currently placed in the hydronics section where it doesn't quite fit. This special and growing application should have its own section, and it should cover other materials that could potentially be used. Green building rating systems are strongly promoting ground-source heat pump loop heating and cooling systems, and the code should have more information. I am introducing this proposal to accomplish that and would hope it would act to encourage further development. While HDPE dominates the technology with an expected 95% of the systems, other materials can and are be utilized in water based ground loop systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard AWWA C901-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009. All other standards proposed for inclusion are already referenced standards of the International Plumbing Code (IPC).

ICCFILENAME: CUDAHY-M-1-1202-1210

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC staff, the standard did comply with ICC standards criteria.

Committee Action: Disapproved

Committee Reason: Some of the proposed standards allow alloys that promote dezincification. Some of the referenced standards are not currently in Chapter 15. Copper and other materials need to be added.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Michael Cudahy representing PPFA (Plastic Pipe and Fittings Association), requests Approval as Submitted.

Commenter's Reason: Water based ground-source heat pump loop PE piping is currently placed in the hydronics section where it doesn't quite fit. This special and growing application should have its own section, and it should cover other materials that could potentially be used.

PPFA introduced this proposal to accomplish that and we would hope it would act to encourage further development. While HDPE dominates the technology with an expected 95% of the systems, other materials can and are be utilized in water based ground loop systems.

At the initial hearing this proposal had strong support of many in the audience and on the committee. The comment that “Some of the proposed standards allow alloys that promote dezincification.” is not a suitable rational to reject this language.

PPFA would hope that this language be accepted at the FAH and updated as needed to give better guidance on this application. We would not oppose any amendments to add additional materials if suitable for these water based geothermal systems. As with other greenbuilding technologies, the codes are falling behind.

Final Action: AS AM AMPC____ D

M141-09/10, Part I
Table 1202.5

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED ONLY FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

Proposed Change as Submitted

Proponent: Andrew Granzow, Viega, LLC

PART I – IMC

Revise table as follows:

1202.5 TABLE
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
Brass	ASTM F 1974
Bronze	ASME B16.24
Copper and copper alloys	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29; <u>ASTM F 877 ; ASTM F 1807</u>
Ductile iron and gray iron	ANSI/AWWA C110/A21.10
Ductile iron	ANSI/AWWA C153/A21.53;
Gray iron	ASTM A 126
Malleable iron	ASME B16.3;
Plastic	ASTM D 2466; ASTM D 2467; ASTM D 2468; ASTM F 438; ASTM F 439; ASTM F 877; <u>ASTM F 2159;</u> ASTM F 2389
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28 ASTM A 420

Reason: To include nationally recognized standards for piping materials currently being used for hydronic applications.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: GRANZOW-M-1-T. 1202.5-RM-T. M2101.1

Public Hearing Results

PART I - IMC
Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent’s printed reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Woestman, Kellen Company, representing Copper Development Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1202.5 TABLE
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
Brass	ASTM F 1974
Bronze	ASME B16.24
Copper and copper alloys	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29; ~~ASTM F 877 ; ASTM F 1807~~
Ductile iron and gray iron	ANSI/AWWA C110/A21.10
Ductile iron	ANSI/AWWA C153/A21.53;
Gray iron	ASTM A 126
Malleable iron	ASME B16.3;
PEX fittings	ASTM F 877 ; ASTM F 1807 ASTM F 2159
Plastic	ASTM D 2466; ASTM D 2467; ASTM D 2468; ASTM F 438; ASTM F 439; ASTM F 877; ~~ASTM F 2159~~; ASTM F 2389
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28 ASTM A 420

Commenter's Reason: Fittings for PEX systems commonly are made of combinations of materials (e.g. plastic fittings with copper crimp rings). This proposed modification to M141 creates a row in Table 1202.5 specifically for PEX fittings, and then moves the standards recommended for approval by the committee into that row in the table. Each of these three standards are specific to PEX systems (including fittings), or for fittings used in PEX systems.
Commenter's Reason:

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

M141-09/10, PART II – IRC MECHANICAL

Revise table as follows:

TABLE M2101.1
HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
Brass pipe	1	ASTM B 43	Brazed, welded, threaded, mechanical and flanged fittings	
Brass tubing	1	ASTM B 135	Brazed, soldered and mechanical fittings	
Chlorinated poly (vinyl chloride) (CPVC) pipe and tubing	1, 2, 3	ASTM D 2846	Solvent cement joints, compression joints and threaded adapters	
Copper pipe	1	ASTM B 42, B 302	Brazed, soldered and mechanical fittings threaded, welded and flanged	

Copper tubing (type K, L or M)	1, 2	ASTM B 75, B 88, B 251, B 306	Brazed, soldered and flared mechanical fittings	Joints embedded in concrete
Cross-linked polyethylene (PEX)	1, 2, 3	ASTM F 876, F 877	(See PEX fittings)	Install in accordance with manufacturer's instructions.
Cross-linked polyethylene/aluminum/ cross-linked polyethylene-(PEX-AL-PEX) pressure pipe	1, 2	ASTM F 1281 or CAN/ CSA B137.10	Mechanical, crimp/insert	Install in accordance with manufacturer's instructions.
PEX Fittings		ASTM F 877 ASTM F 1807 ASTM F 1960 ASTM F 2098 ASTM F 2159	Copper-crimp/insert fittings, cold expansion fittings, stainless steel clamp, insert fittings, plastic-crimp/insert fittings	Install in accordance with manufacturer's instructions
~~Plastic fittings PEX~~		~~ASTM F 1807~~		
Polybutylene (PB) pipe and tubing	1, 2, 3	ASTM D 3309	Heat-fusion, crimp/insert and compression	Joints in concrete shall be heat-fused.
Polyethylene (PE) pipe, tubing and fittings (for ground source heat pump loop systems)	1, 2, 4	ASTM D 2513; ASTM D 3350; ASTM D 2513; ASTM D 3035; ASTM D 2447; ASTM D 2683; ASTM F 1055; ASTM D 2837; ASTM D 3350; ASTM D 1693	Heat-fusion	
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	1, 2, 3	ASTM F 1282 CSA B 137.9	Mechanical, crimp/insert	
Polyproplylene (PP)	1, 2, 3	ISO 15874 ASTM F 2389	Heat-fusion joints, mechanical fittings, threaded adapters, compression joints	
Raised temperature polyethylene (PE-RT)	1, 2, 3	ASTM F 2623	Copper crimp/insert fitting stainless steel clamp, insert fittings	
Soldering fluxes	1	ASTM B 813	Copper tube joints	
Steel pipe	1, 2	ASTM A 53, A 106	Brazed, welded, threaded, flanged and mechanical fittings	Joints in concrete shall be welded. Galvanized pipe shall not be welded or brazed.
Steel tubing	1	ASTM A 254	Mechanical fittings, welded	

For SI: ºC = [(ºF)-32]/1.8.

a. Use code:
   1. Above ground.
   2. Embedded in radiant systems.
   3. Temperatures below 180°F only.
   4. Low temperature (below 130°F) applications only.

b. Standards as listed in Chapter 44.

Reason: (Row #8-PEX Fittings-ASTM F877) The added standard reference clearly identifies a nationally recognized standard for PEX fittings and allows installers the option to utilize products under this standard for use in residential PEX hydronic applications.

"ASTM F877 - 07 Standard Specification for Crosslinked Polyethylene (PEX) Plastic Hot- and Cold-Water Distribution Systems"

(Row #8-PEX Fittings-ASTM F2159) The added standard reference clearly identifies a nationally recognized standard for PEX fittings and allows installers the option to utilize products under this standard for use in residential PEX hydronic applications.

"ASTM F2159 - 05 Standard Specification for Plastic Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing"

(Row #9-Plastic Fittings PEX) The standard identified above makes no reference to plastic fittings and therefore the code reference is not consistent with the intent of the standard. This proposed code change has no impact on the use of product manufactured to this standard as this standard is already referenced in the appropriate section of the table under "PEX fittings". Below is the title and scope of F1807

"ASTM F1807 - 08 Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing"

"1. Scope

1.1 This specification covers metal insert fittings and copper crimp rings for use with cross-linked polyethylene (PEX) tubing in $^3/_8$, ½, $^5/_8$, ¾, and 1 in. and 1 $^1/_4$ nominal diameters that meet the requirements for Specifications F 876 and F 877. These fittings are intended for use in 100 psi (689.5 kPa) cold- and hot-water distribution systems operating at temperatures up to, and including, 180°F (82°C). The requirements for materials, workmanship, dimensions, and markings to be used on the fittings and rings are also included.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are mathematical conversions to SI units which are provided for information only and are not considered the standard.

1.3 Compliance with this specification requires that these fittings be tested and certified to Specification F 877.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.
"

Cost Impact: The code change proposal will not increase the cost of construction.

PART II - IRC
Committee Action: **Approved as Submitted**

Committee Reason: Approval was based on the proponent's printed reason.

Assembly Action: **None**

M148-09/10, Part I
1203.20 (New)

Proposed Change as Submitted

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C.

PART I – IMC

Add new text as follows:

1203.20 Listed joints and connections. Joints and connections that are not otherwise addressed in Section 1203 shall be certified by a third party agency as acceptable for hydronic piping systems. The joints and connections shall be installed in accordance with their certification and manufacturer's installation instructions.

Reason: There are various types of joints and connections utilized in water distribution and water supply systems that are not listed in Section 605. However, these joints or connections are listed by a third party agency as being acceptable for water distributions systems. This new section will indicate that such joints and connections are acceptable. Some examples of these types of joints and connections are unions, rolled groove fittings, and cut groove fittings.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: BALLANCO-M-2-1203.20-M1204.5

Public Hearing Results

PART I - IMC
Committee Action: **Disapproved**

Committee Reason: The proposed text is not product specific and is not tied to a specific standard, thus, confusion can result. Current Section 1201.3 allows ASME B31.9 as an option. The text "certified by a third party agency" is unique to the IPC and is not defined in the IMC. The codes should be consistent in referencing an "approved agency."

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julius Ballanco, PE, JB Engineering and Code Consulting, PC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1203.20 Listed joints and connections. Joints and connections that are not otherwise addressed in Section 1203 shall be ~~certified by a third party~~ <u>listed by an approved</u> agency as acceptable for hydronic piping systems. The joints and connections shall be installed in accordance with their <u>listing</u> and manufacturer's installation instructions.

Commenter's Reason: The proposed modification is based on the Committee's comment for consistency in language. The modification uses language that is found in Chapter 3 and throughout the Code.

Final Action: AS AM AMPC____ D

M148-09/10, Part II

IRC M2104.5 (New)

<u>Proposed Change as Submitted</u>

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C.

PART II – IRC MECHANICAL

Add new text as follows:

<u>**M2104.5 Listed joints and connections.** Joints and connections that are not otherwise addressed in Section 2104 of the *International Mechanical Code* shall be certified by a third party agency as acceptable for hydronic piping systems. The joints and connections shall be installed in accordance with their certification and manufacturer's installation instructions.</u>

Reason: There are various types of joints and connections utilized in water distribution and water supply systems that are not listed in Section 605. However, these joints or connections are listed by a third party agency as being acceptable for water distributions systems. This new section will indicate that such joints and connections are acceptable. Some examples of these types of joints and connections are unions, rolled groove fittings, and cut groove fittings.

Cost Impact: The code change proposal will not increase the cost of construction.

<u>Public Hearing Results</u>

PART II - IRC
Committee Action: **Approved as Submitted**

Committee Reason: Approval was based on the proponent's printed reason.

Assembly Action: **Disapproved**

<u>Individual Consideration Agenda</u>

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. Note that the assembly action, Disapproved, will be the initial motion on the floor for consideration when this item is called.

Final Action: AS AM AMPC____ D

M149-09/10

Table 1302.3, Chapter 15

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise table as follows:

TABLE 1302.3
FUEL OIL PIPING

PIPE OR TUBING TYPE ~~MATERIAL~~	STANDARD (see Chapter 15)
Brass pipe	ASTM B43
Brass tubing	ASTM B135
Copper or copper-alloy pipe	ASTM B42; ASTM B302
Copper or copper-alloy tubing (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280
~~Labeled~~ Nonmetallic pipe	(See Section 1302.4)
~~Nonmetallic pipe~~	~~ASTM D2996~~
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254; ~~ASTM A539~~
Metallic Underground Fuel Pipe	UL 971A
Nonmetallic Underground Fuel Pipe	UL 971

2. Add new standards to Chapter 15 as follows:

UL
971-95 Nonmetallic Underground Piping For Flammable Liquids – with revisions through March 2006
971A-06 Outline of Investigation for Metallic Underground Fuel Pipe

Reason: This proposal accomplishes the following:

1. The first column of the table is not material, but specific pipe and tubing types.
2. The reference to "Labeled pipe" requirements in the table applies to 'Nonmetallic pipe', the title of section 1302.4.
3. ASTM D2996 is limited to only FRP pipe, so it does not reflect other forms of 'nonmetallic pipes' used in fuel applications today. In addition this standard does not contain any physical assembly, use/misuse tests or fuel compatibility tests, such as those found in UL971, which would make it suitable for use in fuel oil piping applications.
4. ASTM A539 was withdrawn without replacement in 1999.
5. *The proposed new standard (UL 971) for nonmetallic underground fuel pipe and the Outline of Investigation (UL 971A) for metallic underground fuel pipe include a comprehensive set of construction and performance requirements, including tests to address physical abuse and misuse, and long-term compatibility with fuels and fluids.*

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards, UL 971-95 and UL 971A-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: EUGENE-M-31-T. 1302.3-CH 15

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC staff, the standards did not comply with ICC standards criteria, Section 3.6.3.2.

Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent's printed reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble (Chairman) representing ICC Reference Standards Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE 1302.3
FUEL OIL PIPING

PIPE OR TUBING TYPE	STANDARD (see Chapter 15)
Brass pipe	ASTM B43
Brass tubing	ASTM B135
Copper or copper-alloy pipe	ASTM B42; ASTM B302
Copper or copper-alloy tubing (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280
Nonmetallic pipe	(See Section 1302.4)
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254
~~Metallic Underground Fuel Pipe~~	~~UL 971A~~
~~Nonmetallic Underground Fuel Pipe~~	~~UL 971~~

UL
~~971-95~~ ~~Nonmetallic Underground Piping For Flammable Liquids – with revisions through March 2006~~
~~971A-06~~ ~~Outline of Investigation for Metallic Underground Fuel Pipe~~

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically Section 3.6.3, which requires standards be promulgated according to a consensus process.

We therefore propose to have deleted the reference standards and subsequent reference to those standards as part of this proposal to modify the original proposal.

Final Action: AS AM AMPC____ D

M150-09/10
1302.4, Chapter 15

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

1302.4 Nonmetallic pipe. All nonmetallic pipe <u>and connectors</u> shall be *listed* and *labeled* as being acceptable for the intended application for flammable and combustible liquids. Nonmetallic pipe shall be installed only ~~outside~~ <u>outdoors</u>, underground.

> <u>**Exception:** Nonmetallic flexible connectors listed and labeled for aboveground use in accordance with UL 2039 shall be permitted to be installed aboveground.</u>

2. Add new standard to Chapter 15 as follows:

UL
<u>2039-02</u> <u>Outline of Investigation for Flexible Connectors for Flammable Liquids</u>

Reason: This proposal clarifies that both nonmetallic pipe and connectors need to be listed and labeled. In addition it allows flexible nonmetallic connectors listed in accordance with UL 2039 to be installed aboveground.

The Subject 2039 Outline of Investigation includes a comprehensive set of performance requirements for evaluating metallic and nonmetallic connectors for aboveground and underground transfer of noncorrosive, stable, flammable and combustible liquids. The connectors have a maximum length of eight feet.

Connectors listed in accordance with 2039 are fabricated, inspected, and tested for leakage before shipment from the factory as completely assembled vessels.

The intended use of these connectors is for the transfer of flammable and combustible liquids in, among other applications, underground carrier piping to a dispenser, carrier piping in an open dispenser sump to a dispenser, carrier piping in an open tank sump to a tank pump, and aboveground carrier piping to an aboveground tank.

Six companies currently have listings for these products.

In the second sentence, the intent is "outdoors" and the word "outside" does not necessarily mean outdoors.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 22039-02, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: EUGENE-M-32-1302.4-CH 15

Committee Reason: Approval is based upon the proponent's printed reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble (Chairman) representing ICC Reference Standards Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1302.4 Nonmetallic pipe. All nonmetallic pipe and connectors shall be *listed* and *labeled* as being acceptable for the intended application for flammable and combustible liquids. Nonmetallic pipe shall be installed only outdoors, underground.

> **Exception:** Nonmetallic flexible connectors listed and labeled for aboveground use ~~in accordance with UL 2039~~ shall be permitted to be installed aboveground.

UL

~~2039-02 Outline of Investigation for Flexible Connectors for Flammable Liquids~~

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically Section 3.6.3, which requires standards be promulgated according to a consensus process.

We therefore propose to have deleted the reference standard and subsequent reference to that standard as part of this proposal to modify the original proposal.

Final Action: AS AM AMPC____ D

M156-09/10, Part I
401.2

Proposed Change as Submitted

Proponent: Mike Moore, Newport Ventures, representing Broan NuTone

PART I –IMC

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. <u>Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 33.5 psf (50 Pa) in accordance with Section 402.4.2.1 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403.</u>

Reason: Everyone can agree that when dwelling units become “too” tight, they need mechanical ventilation. The question is, “how tight is too tight?” This code change proposal offers five air changes per hour at 50 Pascal as the “too tight” limit, and directs builders to provide mechanical ventilation at this point.

Why is whole-house mechanical ventilation needed?
Indoor air quality has direct impact on the health of building occupants. Poor indoor air quality is listed by the EPA as being the fourth largest environmental threat to our country.[1] A 2007 California study revealed formaldehyde exposure in most new homes is beyond limits recommended by the California Air Resources Board. Multiple studies have shown that relying on window operation to provide ventilation is not sufficient in practice.[2,3] If unchecked, pollutants from cleaning chemicals, finishes, furniture, and occupant activities can cause serious health effects on building occupants. Whole-house mechanical ventilation reduces occupant exposure to such pollutants.

Why 5 ACH 50?
Traditionally, 0.35 natural air changes per hour has been the consensus ventilation rate at which it is believed that sufficient fresh air is being provided to building occupants. This ventilation rate was typically achieved without mechanical ventilation because homes were built without an effective air barrier. As building practices have improved, homes have become tighter, and as homes become tighter, mechanical ventilation must be introduced to provide sufficient levels of ventilation.

ASHRAE Standard 136 was developed to enable calculation of natural air changes per hour as a function of air changes at various pressures. By following the calculation procedures in this standard, it can be shown that a natural infiltration rate of 0.35 air changes per hour is equivalent to somewhere between 7 ACH 50 to 10 ACH 50, depending on the local climatic conditions of the home. Because most dwellings are built this tight, ASHRAE 62.2 requires mechanical ventilation for all homes, with few exceptions. However, based on ASHRAE 136, a conservative code might prescribe whole-house mechanical ventilation for any home with an infiltration leakage rate of 10 ACH 50 or less.

As a second point of reference, California’s 2005 Title 24 Chapter 6 requires that, “Continuous mechanical ventilation (either exhaust or supply ventilation) must be installed when the target SLA is below 3.0”. California’s SLA of 3.0 is roughly equivalent to 6 ACH 50. As a third point of reference, NAHB’s National Green Building Standard requires whole-house mechanical ventilation when the infiltration rate falls below 5.0 ACH 50. This requirement provides clear recognition from a consensus standard that whole-house mechanical ventilation should be provided for all homes that meet this threshold.

Based on the previous references, there is broad consensus across states and within consensus standards that whole-house mechanical ventilation should be required when a dwelling’s infiltration falls below 5.0 ACH 50.

What states are now requiring whole-house mechanical ventilation?
Several states now require mechanical ventilation in dwellings, including MN, VT, WA, CA, and ME.

2. Price, P.N. and M.H. Sherman "Ventilation Behavior and Household Characteristics in New California Houses," April 2006. LBNL-59620 http://epb.lbl.gov/Publications/lbnl-59620.pdf
3. Offermann, F.J., et al., "Window usage, ventilation, and formaldehyde concentrations in new California homes: summer field sessions", in IAQ 2007, Healthy and Sustainable Buildings. 2007, American Society of Heating Refrigerating, and Air Conditioning Engineers, Inc.: Baltimore, MD. p. 497-526 (preprints); http://www.iee-sf.com/pdf/SummerFieldResults.pdf

Cost Impact: Where homes have infiltration rates less than 5.0 ACH 50, and those homes are not already providing whole-house mechanical ventilation, the cost of construction will increase.

ICCFILENAME:MOORE-M1-401.2

Public Hearing Results

PART I - IMC
Committee Action: **Approved as Submitted**

Committee Reason: The tightening of the thermal envelope necessitates mechanical ventilation in some cases. The proposal does not require that a blower door test be conducted, but rather, acts on the results of any such test that is conducted by choice. If Section 403 is applied by choice, no testing is required.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Mike Moore, Newport Ventures, representing Broan NuTone, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of ~~33.5 psf~~ 0.2 inch w.c. (50 Pa) in accordance with Section 402.4.2.1 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403.

Commenter's Reason: This proposed modification is essentially editorial, in that it corrects the English units of pressure that are equivalent to 50 Pa. Parts II and III of this proposal were approved by the IBC and IRC committees with this modification.

Public Comment 2:

Craig Conner, Building Quality, representing self, requests Disapproval.

Commenter's Reason: M156 Parts I and II specify a residential air-tightness test for application to commercial buildings. M156 Parts I and II do not actually require the test even be done. M156 applies only to the dwelling units in commercial buildings, a very limited subset of the commercial buildings.

Any commercial ventilation requirement should be based on air-tightness or ventilation requirements for commercial buildings (IECC Chapter 5, IBC Section 1203, or IMC Chapter 4 or Section 505).

M156 Parts I and II are inconsistent with EC147, which was approved at the first hearing. EC147 includes commercial air-tightness requirement and criteria.

M156 Part III applies to residential (IRC). M165 Part III will be unworkable as written. Based on the approved EC13 residential buildings will be allowed to test the air-tightness of a sample of homes produced by one builder, rather than all homes (presuming the approved EC13 stands). Many jurisdictions many test only a minority of the residences produced by a specific builder. However the lack of testing will make that section of code unusable.

A better way to exempt less air tight residences from the ventilation requirements is to make the exemption apply only houses tested and shown to have higher air-change rate. (Most residences will require ventilation.) Untested residences would require ventilation. EC13 references the ventilation requirements in IRC M1507. A ventilation exception based on a test is integrated into my comment on RM17 in IRC section M1507.

Final Action: AS AM AMPC____ D

M156-09/10, Part II
1203.1

<u>Proposed Change as Submitted</u>

Proponent: Mike Moore, Newport Ventures, representing Broan NuTone

PART II – IBC

Revise as follows:

1203.1 General. Buildings shall be ventilated with natural ventilation in accordance Section 1203.4, or mechanical ventilation in accordance with the International Mechanical Code.

<u>Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 33.5 psf (50 Pa) in accordance with Section 402.4.2.1 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403 of the International Mechanical Code.</u>

Reason: Everyone can agree that when dwelling units become "too" tight, they need mechanical ventilation. The question is, "how tight is too tight?" This code change proposal offers five air changes per hour at 50 Pascal as the "too tight" limit, and directs builders to provide mechanical ventilation at this point.

Why is whole-house mechanical ventilation needed?
Indoor air quality has direct impact on the health of building occupants. Poor indoor air quality is listed by the EPA as being the fourth largest environmental threat to our country.[1] A 2007 California study revealed formaldehyde exposure in most new homes is beyond limits recommended by the California Air Resources Board. Multiple studies have shown that relying on window operation to provide ventilation is not sufficient in practice.[2,3] If unchecked, pollutants from cleaning chemicals, finishes, furniture, and occupant activities can cause serious health effects on building occupants. Whole-house mechanical ventilation reduces occupant exposure to such pollutants.

Why 5 ACH 50?
Traditionally, 0.35 natural air changes per hour has been the consensus ventilation rate at which it is believed that sufficient fresh air is being provided to building occupants. This ventilation rate was typically achieved without mechanical ventilation because homes were built without an effective air barrier. As building practices have improved, homes have become tighter, and as homes become tighter, mechanical ventilation must be introduced to provide sufficient levels of ventilation.

ASHRAE Standard 136 was developed to enable calculation of natural air changes per hour as a function of air changes at various pressures. By following the calculation procedures in this standard, it can be shown that a natural infiltration rate of 0.35 air changes per hour is equivalent to somewhere between 7 ACH 50 to 10 ACH 50, depending on the local climatic conditions of the home. Because most dwellings are built this tight, ASHRAE 62.2 requires mechanical ventilation for all homes, with few exceptions. However, based on ASHRAE 136, a conservative code might prescribe whole-house mechanical ventilation for any home with an infiltration leakage rate of 10 ACH 50 or less.

As a second point of reference, California's 2005 Title 24 Chapter 6 requires that, "Continuous mechanical ventilation (either exhaust or supply ventilation) must be installed when the target SLA is below 3.0". California's SLA of 3.0 is roughly equivalent to 6 ACH 50. As a third point of reference, NAHB's National Green Building Standard requires whole-house mechanical ventilation when the infiltration rate falls below 5.0 ACH 50. This requirement provides clear recognition from a consensus standard that whole-house mechanical ventilation should be provided for all homes that meet this threshold.

Based on the previous references, there is broad consensus across states and within consensus standards that whole-house mechanical ventilation should be required when a dwelling's infiltration falls below 5.0 ACH 50.

What states are now requiring whole-house mechanical ventilation?
Several states now require mechanical ventilation in dwellings, including MN, VT, WA, CA, and ME.

M156-09/10, Part III
R303.4

<u>Proposed Change as Submitted</u>

Proponent: Mike Moore, Newport Ventures, representing Broan NuTone

PART III – IRC

Insert new section as follows (renumber current Section 303.4 and those following as appropriate):

R303.4 Mechanical ventilation. <u>Where the air infiltration rate of a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch w.c. (50 Pa) in accordance with Section N1102.4.2.1, the dwelling unit shall be provided with whole-house mechanical ventilation in accordance with Section M1507.3.</u>

(Renumber remaining text)

Reason: Everyone can agree that when dwelling units become "too" tight, they need mechanical ventilation. The question is, "how tight is too tight?" This code change proposal offers five air changes per hour at 50 Pascal as the "too tight" limit, and directs builders to provide mechanical ventilation at this point.

Why is whole-house mechanical ventilation needed?
Indoor air quality has direct impact on the health of building occupants. Poor indoor air quality is listed by the EPA as being the fourth largest environmental threat to our country.[1] A 2007 California study revealed formaldehyde exposure in most new homes is beyond limits recommended by the California Air Resources Board. Multiple studies have shown that relying on window operation to provide ventilation is not sufficient in practice.[2,3] If unchecked, pollutants from cleaning chemicals, finishes, furniture, and occupant activities can cause serious health effects on building occupants. Whole-house mechanical ventilation reduces occupant exposure to such pollutants.

Why 5 ACH 50?
Traditionally, 0.35 natural air changes per hour has been the consensus ventilation rate at which it is believed that sufficient fresh air is being provided to building occupants. This ventilation rate was typically achieved without mechanical ventilation because homes were built without an effective air barrier. As building practices have improved, homes have become tighter, and as homes become tighter, mechanical ventilation must be introduced to provide sufficient levels of ventilation.

ASHRAE Standard 136 was developed to enable calculation of natural air changes per hour as a function of air changes at various pressures. By following the calculation procedures in this standard, it can be shown that a natural infiltration rate of 0.35 air changes per hour is equivalent to somewhere between 7 ACH 50 to 10 ACH 50, depending on the local climatic conditions of the home. Because most dwellings are built this tight, ASHRAE 62.2 requires mechanical ventilation for all homes, with few exceptions. However, based on ASHRAE 136, a conservative code might prescribe whole-house mechanical ventilation for any home with an infiltration leakage rate of 10 ACH 50 or less.

As a second point of reference, California's 2005 Title 24 Chapter 6 requires that, "Continuous mechanical ventilation (either exhaust or supply ventilation) must be installed when the target SLA is below 3.0". California's SLA of 3.0 is roughly equivalent to 6 ACH 50. As a third point of reference, NAHB's National Green Building Standard requires whole-house mechanical ventilation when the infiltration rate falls below 5.0 ACH 50. This requirement provides clear recognition from a consensus standard that whole-house mechanical ventilation should be provided for all homes that meet this threshold.

Based on the previous references, there is broad consensus across states and within consensus standards that whole-house mechanical ventilation should be required when a dwelling's infiltration falls below 5.0 ACH 50.

What states are now requiring whole-house mechanical ventilation?
Several states now require mechanical ventilation in dwellings, including MN, VT, WA, CA, and ME.

3. Offermann, F.J., et al., "Window usage, ventilation, and formaldehyde concentrations in new California homes: summer field sessions", in IAQ 2007, Healthy and Sustainable Buildings. 2007, American Society of Heating Refrigerating, and Air Conditioning Engineers, Inc.: Baltimore, MD. p. 497-526 (preprints); http://www.iee-sf.com/pdf/SummerFieldResults.pdf

Cost Impact: Where homes have infiltration rates less than 5.0 ACH 50, and those homes are not already providing whole-house mechanical ventilation, the cost of construction will increase.

ICCFILENAME:MOORE-M1-401.2

Public Hearing Results

PART III – IRC

Modify the proposal as follows:

R303.4 Mechanical ventilation. Where the air infiltration rate of a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of <u>0.2 inch w.c.</u> (50 Pa) in accordance with Section N1102.4.2.1, the dwelling unit shall be provided with whole-house mechanical ventilation in accordance with Section M1507.3.

Committee Action: Approved as Modified

Committee Reason: The proposed threshold is appropriate for determining where mechanical ventilation is required. This provides the builder with options. The modification corrects the pressure to be consistent with 50 Pa.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Craig Conner, Building Quality, representing self, requests Disapproval.

Commenter's Reason: M156 Parts I and II specify a residential air-tightness test for application to commercial buildings. M156 Parts I and II do not actually require the test even be done. M156 applies only to the dwelling units in commercial buildings, a very limited subset of the commercial buildings.

Any commercial ventilation requirement should be based on air-tightness or ventilation requirements for commercial buildings (IECC Chapter 5, IBC Section 1203, or IMC Chapter 4 or Section 505).

M156 Parts I and II are inconsistent with EC147, which was approved at the first hearing. EC147 includes commercial air-tightness requirement and criteria.

M156 Part III applies to residential (IRC). M165 Part III will be unworkable as written. Based on the approved EC13 residential buildings will be allowed to test the air-tightness of a sample of homes produced by one builder, rather than all homes (presuming the approved EC13 stands). Many jurisdictions many test only a minority of the residences produced by a specific builder. However the lack of testing will make that section of code unusable.

A better way to exempt less air tight residences from the ventilation requirements is to make the exemption apply only houses tested and shown to have higher air-change rate. (Most residences will require ventilation.) Untested residences would require ventilation. EC13 references the ventilation requirements in IRC M1507. A ventilation exception based on a test is integrated into my comment on RM17 in IRC section M1507.

Final Action: AS AM AMPC____ D

INTERNATIONAL RESIDENTIAL CODE – MECHANICAL

RM4-09/10
M1406.1, M1406.5, Chapter 44 (New)

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M1406.1 General. Electric radiant heating systems shall be installed in accordance with the manufacturer's installation instructions and Chapters 34 through 43 of this code <u>and shall be listed for the application</u>. <u>Electric radiant heating panels and heating panel sets shall comply with UL 1693. Electric space heating cables shall comply with UL 1673.</u>

2. Delete without substitution:

~~**M1406.5 Gypsum panels.** Where radiant heating systems are used on gypsum assemblies, operating temperatures shall not exceed 125°F (52°C).~~

3. Add new standards to Chapter 44 as follows:

UL

<u>1673-96</u>	<u>Electric Space Heating Cables – with revisions through July 2003</u>
<u>1693-02</u>	<u>Electric Radiant Heating Panels and Heating Panel Sets</u>

Reason: UL 1673 and UL 1693 include a comprehensive set of construction and performance requirements that are used to evaluate and list electric space heating cables and electric radiant heating panels. Over 20 companies currently have heating cables and radiant heating panels listed. UL 1673 and UL 1693 do not require a temperature rating to be marked on the surface of the product or in the instructions. Instead, the product is specifically evaluated to the application and surfaces to which it is to be in contact. The instructions detail the surface (e.g. in concrete, on gypsum, above subfloor covered in tile, etc.). Note also that different surfaces have different temperature allowances in accordance with the standard, so all of these applications would all need to be itemized if temperatures limits are to continue to be maintained.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: EUGENE-RM-5-M1406.1-CH 44

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at <u>http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf</u> :

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC staff, the standards did not comply with ICC standards criteria, Section (3.6.3.2)

Committee Action: **Disapproved**

Committee Reason: The proposed standards do not comply with ICC Council policy # 28.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene representing Underwriters Laboratories Inc, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1406.1 General. Electric radiant heating systems shall be installed in accordance with the manufacturer's installation instructions and Chapters 34 through 43 of this code and shall be listed for the application. ~~Electric radiant heating panels and heating panel sets shall comply with UL 1693. Electric space heating cables shall comply with UL1673.~~

UL
~~1673-96~~ ~~Electric Space Heating Cables – with revisions through July 2003~~
~~1693-02~~ ~~Electric Radiant Heating Panels and Heating Panel Sets~~

Commenter's Reason: In the opinion of ICC staff, the standards did not comply with ICC standards criteria, Section (3.6.3.2). Reference to the standards is deleted, but the proposed requirement for listing is maintained.

Final Action: AS AM AMPC____ D

RM10-09/10
M1501.1, M1506, M1506.2 (New), M1507.2

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

1. Revise as follows:

M1501.1 Outdoor discharge. The air removed by every mechanical exhaust system shall be discharged to the outdoors in accordance with Section M1506.2. ~~Air shall not be exhausted into an attic, soffit, ridge vent or crawl space~~.

> **Exception:** Whole-house ventilation-type attic fans that discharge into the attic space of dwelling units having private attics shall be permitted.

SECTION M1506
EXHAUST DUCTS AND EXHAUST OPENINGS

2. Add new text as follows:

M1506.2 Exhaust openings. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and non-operable openings into the building and 10 (3048 mm) feet from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake. Openings shall comply with Sections R303.4.2 and R303.5.

3. Revise as follows:

M1507.2 Recirculation of air. Exhaust air from bathrooms and toilet rooms shall not be re-circulated within a residence or to another dwelling unit and shall be exhausted directly to the outdoors. ~~Exhaust air from bathrooms and toilet rooms shall not discharge into an attic, crawl space or other areas inside the building.~~

Reason: The logic in this proposal is consistent with the approval of M-22 last cycle which concluded that ventilation openings belong in the ventilation chapter and exhaust openings belong in the exhaust chapter. This handles all exhaust that would be encountered in residences and includes nothing new.

The stricken text in M1501.1 and M1507.2 is redundant and not needed as it will be covered under M1506.2.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-RB-2-R303.4.2-M1501-M1506

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent's printed reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace of Fairfax County representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1501.1 Outdoor discharge. The air removed by every mechanical exhaust system shall be discharged to the outdoors in accordance with Section M1506.2. <u>Air shall not be exhausted into an attic, soffit, ridge vent or crawl space.</u>

Exception: Whole-house ventilation-type attic fans that discharge into the attic space of dwelling units having private attics shall be permitted.

SECTION M1506

EXHAUST DUCTS AND EXHAUST OPENINGS

M1506.2 Exhaust openings. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and non-operable openings into the building and 10 (3048 mm) feet from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake. Openings shall comply with Sections R303.4.2 and R303.5.

M1507.2 Recirculation of air. Exhaust air from bathrooms and toilet rooms shall not be re-circulated within a residence or to another dwelling unit and shall be exhausted directly to the outdoors. <u>Exhaust air from bathrooms and toilet rooms shall not discharge into an attic, crawl space or other areas inside the building.</u>

Commenter's Reason: The proponent of this change had stricken this language stating that this was covered in the new section M1506.2, however there in no language in M1506.2 that prohibits the installation of exhaust air into an attic, crawl space or other areas inside the building. This change simply reinstates important enforceable language.

Final Action: AS AM AMPC____ D

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: RM12-09/10 is redundant with RM11-09/10 and is therefore unnecessary. RM11-09/10 already changes the length to 35 feet.

Assembly Action: **Approved as Submitted**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. Note that the assembly action, Approved as Submitted, will be the initial motion on the floor for consideration when this item is called.

Final Action: AS AM AMPC____ D

RM17-09/10

R202 (New), R303.1, R303.3, M1507.1, M1507.3 (New), M1507.3.1 (New), M1507.3.2 (New), M1507.3.3 (New), Table M1507.3.3(1) (New), Table M1507.3.3(2) (New), M1507.4, Table M1507.4

Proposed Change as Submitted

Proponent: Mike Moore, Newport Ventures, Inc., representing Broan NuTone

1. Add new definitions as follows:

LOCAL EXHAUST. An exhaust system that uses one or more fans to exhaust air from a specific room or rooms within a dwelling

WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM. An exhaust system, supply system, or combination thereof that is designed to mechanically exchange indoor air for outdoor air for the purpose of diluting and removing indoor air contaminants within a dwelling. The system is designed to provide ventilation air continuously or through a programmed intermittent schedule to satisfy the ventilation rates required for the whole house. Local exhaust or supply fans can serve as such a system.

2. Revise as follows:

R303.1 Habitable rooms. All habitable rooms shall have an aggregate glazing area of not less than 8 percent of the floor area of such rooms. Natural *ventilation* shall be through windows, doors, louvers or other *approved* openings to the outdoor air. Such openings shall be provided with ready access or shall otherwise be readily controllable by the building occupants. The minimum openable area to the outdoors shall be 4 percent of the floor area being ventilated.

Exceptions:

1. The glazed areas need not be openable where the opening is not required by Section R310 and ~~an *approved* mechanical *ventilation* system capable of producing 0.35 air change per hour in the room is installed or~~ a whole-house mechanical *ventilation* system is installed ~~capable of supplying outdoor *ventilation* air of 15 cubic feet per minute (cfm) (78 L/s) per occupant computed on the basis of two occupants for the first bedroom and one occupant for each additional bedroom~~ in accordance with Section M1507.
2. The glazed areas need not be installed in rooms where Exception 1 above is satisfied and artificial light is provided capable of producing an average illumination of 6 footcandles (65 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.
3. Use of sunroom *additions* and patio covers, as defined in Section R202, shall be permitted for natural *ventilation* if in excess of 40 percent of the exterior sunroom walls are open, or are enclosed only by insect screening.

R303.3 Bathrooms. Bathrooms, water closet compartments and other similar rooms shall be provided with aggregate glazing area in windows of not less than 3 square feet (0.3 m2), one-half of which must be openable.

Exception: The glazed areas shall not be required where artificial light and a ~~mechanical ventilation~~ local exhaust system are provided. The minimum local exhaust ~~ventilation~~ rates shall be determined in accordance with Section M1507.4. ~~50 cubic feet per minute (24 L/s) for intermittent ventilation or 20 cubic feet per minute (10 L/s) for continuous ventilation~~. ~~Ventilation~~ Exhaust air from the space shall be exhausted directly to the ~~outside~~ outdoors.

M1507.1 General. Where local exhaust or whole-house mechanical ventilation is provided ~~toilet rooms, and bathrooms are mechanically ventilated,~~ the ~~ventilation~~ equipment shall be designed in accordance with this section.

3. Add new text and tables as follows:

M1507.3 Whole-house mechanical ventilation system. Whole-house mechanical ventilation systems shall be designed in accordance with Sections M1507.3.1 through M1507.3.3.

M1507.3.1 System design. The whole-house ventilation system shall consist of one or more supply or exhaust fans or a combination of such and associated ducts and controls. Where local supply or exhaust fans are used as part of such a system, they shall be tested and rated in accordance with HVI 916, and the fans' rated flow at 0.25 in w.c. static pressure shall equal or exceed the required ventilation rate determined by Section M1507.3.3. Outdoor air ducts connected to the return side of an air handler shall be considered to provide supply ventilation.

M1507.3.2 System Controls. The whole-house mechanical ventilation system shall be provided with controls that enable manual override.

M1507.3.3 Mechanical ventilation rate. The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate not less than that determined in accordance with Table M1507.3.3(1).

> **Exception:** The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25% of each 4 hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

TABLE M1507.3.3(1)
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

Dwelling Unit Floor Area (square feet)	**Number of Bedrooms**				
	0-1	**2-3**	**4-5**	**6-7**	**>7**
	Airflow in CFM				
<1500	30	45	60	75	90
1501-3000	45	60	75	90	105
3001-4500	60	75	90	105	120
4501-6000	75	90	105	120	135
6001-7500	90	105	120	135	150
>7500	105	120	135	150	165

TABLE M1507.3.3(2)
INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE FACTORS[a, b]

Run-Time Percentage In Each 4 Hour Segment	**25%**	**33%**	**50%**	**66%**	**75%**	**100%**
Factor[a]	4	3	2	1.5	1.3	1.0

a. For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.
b. Extrapolation beyond the table is prohibited.

4 Revise as follows:

M1507.4~~3~~ Local exhaust rates ~~Ventilation rate.~~ Local exhaust ~~Ventilation~~ systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.4~~3~~.

TABLE M1507.4~~3~~
MINIMUM REQUIRED LOCAL EXHAUST RATES FOR
ONE- AND TWO-FAMILY DWELLINGS

AREA TO BE ~~VENTILATED~~ EXHAUSTED	**~~VENTILATION~~ EXHAUST RATES**
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms—Toilet Rooms	Mechanical exhaust capacity of 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.4719 L/s.

Reason: This proposal is intended to provide clear guidance to builders and code officials on the design and specification of mechanical ventilation systems for homes IF such systems are installed. Instead of mandating mechanical ventilation, it provides much needed guidance on both whole-house mechanical ventilation systems and local exhaust, including definitions of the same. The language proposed serves to streamline the code by placing all requirements for mechanical ventilation systems within the current M1507, which is aptly titled "Mechanical Ventilation".

Language that is proposed for M1507 is basically a distilled version of ASHRAE 62.2. The proposed language is intended to take ASHRAE's ten page standard and reduce it to the nuts and bolts of mechanical ventilation that are simple and straightforward. ASHRAE has issued a copyright release for the table of whole-house ventilation rates. Not only are these the same rates in ASHRAE 62.2, but they are also the same rates that are now referenced in the state building codes of California and Maine as well as being referenced within the National Green Building Standard.

Similarly, the intermittent multipliers are sourced from ASHRAE 62.2 and are included to provide builders with more options for delivering equivalent ventilation.

Cost Impact: Because this language does not require whole house mechanical ventilation or local exhaust, it will not in itself increase the cost of construction.

ICCFILENAME: MOORE-RB-1-R202-R303-M1507

Public Hearing Results

Committee Action: Approved as Modified

Modify proposal as follows:

LOCAL EXHAUST. An exhaust system that uses one or more fans to exhaust air from a specific room or rooms within a dwelling

WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM. An exhaust system, supply system, or combination thereof that is designed to mechanically exchange indoor air for outdoor air ~~for the purpose of diluting and removing indoor air contaminants within a dwelling.~~ when operating ~~The system is designed to provide ventilation air~~ continuously or through a programmed intermittent schedule to satisfy the whole-house ventilation rate~~s required for the whole house. Local exhaust or supply fans can serve as such a system~~.

R303.1 Habitable rooms. All habitable rooms shall have an aggregate glazing area of not less than 8 percent of the floor area of such rooms. Natural *ventilation* shall be through windows, doors, louvers or other *approved* openings to the outdoor air. Such openings shall be provided with ready access or shall otherwise be readily controllable by the building occupants. The minimum openable area to the outdoors shall be 4 percent of the floor area being ventilated.

Exceptions:

1. The glazed areas need not be openable where the opening is not required by Section R310 and a whole-house mechanical *ventilation* system is installed in accordance with Section M1507.
2. The glazed areas need not be installed in rooms where Exception 1 above is satisfied and artificial light is provided capable of producing an average illumination of 6 footcandles (65 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.
3. Use of sunroom *additions* and patio covers, as defined in Section R202, shall be permitted for natural *ventilation* if in excess of 40 percent of the exterior sunroom walls are open, or are enclosed only by insect screening.

R303.3 Bathrooms. Bathrooms, water closet compartments and other similar rooms shall be provided with aggregate glazing area in windows of not less than 3 square feet (0.3 m2), one-half of which must be openable.

Exception: The glazed areas shall not be required where artificial light and a local exhaust system are provided. The minimum local exhaust rates shall be determined in accordance with Section M1507.4 Exhaust air from the space shall be exhausted directly to the outdoors.

M1507.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the equipment shall be designed in accordance with this section.

M1507.3 Whole-house mechanical ventilation system. Whole-house mechanical ventilation systems shall be designed in accordance with Sections M1507.3.1 through M1507.3.3.

M1507.3.1 System design. The whole-house ventilation system shall consist of one or more supply or exhaust fans or a combination of such and associated ducts and controls. ~~Where local supply or exhaust fans are used as part of such a system, they shall be tested and rated in accordance with HVI 916, and the fans' rated flow at 0.25 in w.c. static pressure shall equal or exceed the required ventilation rate determined by Section M1507.3.3~~. Local exhaust or supply fans are permitted to serve as such a system. Outdoor air ducts connected to the return side of an air handler shall be considered to provide supply ventilation.

M1507.3.2 System Controls. The whole-house mechanical ventilation system shall be provided with controls that enable manual override.

M1507.3.3 Mechanical ventilation rate. The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate not less than that determined in accordance with Table M1507.3.3(1).

Exception: The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25% of each 4 hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

TABLE M1507.3.3(1)

CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

Dwelling Unit Floor Area (square feet)	Number of Bedrooms				
	0-1	2-3	4-5	6-7	>7
	Airflow in CFM				
<1500	30	45	60	75	90
1501-3000	45	60	75	90	105
3001-4500	60	75	90	105	120
4501-6000	75	90	105	120	135
6001-7500	90	105	120	135	150
>7500	105	120	135	150	165

TABLE M1507.3.3(2)
INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE FACTORS[a, b]

Run-Time Percentage In Each 4 Hour Segment	25%	33%	50%	66%	75%	100%
Factor[a]	4	3	2	1.5	1.3	1.0

a. For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.
b. Extrapolation beyond the table is prohibited.

4 Revise as follows:

M1507.4 Local exhaust rates. Local exhaust systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.4.

TABLE M1507.4
MINIMUM REQUIRED LOCAL EXHAUST RATES FOR
ONE- AND TWO-FAMILY DWELLINGS

AREA TO BE EXHAUSTED	EXHAUST RATES
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms—Toilet Rooms	Mechanical exhaust capacity of 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.4719 L/s.

Committee Reason: The current ventilation rate of 0.35 ACH is overkill and the proposed text provides more realistic rates and options. The proposal is consistent with the IECC.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Craig Conner, Building Quality, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1507.1 General. ~~Where local exhaust or~~ a whole-house mechanical ventilation system ~~is~~ shall be provided and ~~the equipment~~ shall be designed in accordance with this section.

Exception: This shall not apply to a dwelling that has been tested in accordance with Section 402.4.1.2 of the IECC and such testing demonstrates that the air leakage rate is greater than five ACH 50.

Commenter's Reason: RM17 adds ventilation requirements that will be important in new energy-efficient homes. The new IECC requires residences be more airtight to save energy (presuming the approved EC13 stands). In order to maintain healthy indoor air, airtight residences will require mechanical ventilation. The IECC sets the threshold for airtightness, based on which mechanical ventilation is required, or not required.

The new IECC also allows testing of only an approved sample of residences for air tightness, rather than testing all residences. With sampling only a minority of an individual builders residences may be tested. For the tested residences, the mechanical ventilation requirement will be based on that residence's tested airtightness. As approved RM17 is unclear how the ventilation requirements apply to residences that are not tested. For example in a sample of homes, if some tested homes require ventilation and other tested homes do not, do the untested homes require ventilation? For untested residences the code should error on the side of caution by requiring mechanical ventilation. Only residences tested and shown not to require ventilation should be exempt from the health-related ventilation.

Final Action: AS AM AMPC____ D

RM19-09/10
R303.4.1

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County, CO, representing the CO Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

R303.4.1 Intake openings. Mechanical and gravity outdoor air intake openings shall be located a minimum of 10 feet (3048 mm) from any hazardous or noxious contaminant, such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks, except as otherwise specified in this code. Where a source of contaminant is located within 10 feet (3048 mm) of an intake opening, such opening shall be located a minimum of ~~2~~ 3 feet (~~610~~ 914 mm) below the contaminant source.

For the purpose of this section, the exhaust from *dwelling* unit toilet rooms, bathrooms and kitchens shall not be considered as hazardous or noxious.

Reason: This dimension is inconsistent with many other code books such as IMC-401.4 #3; IRC-G2427.6.6 and G2427.8 #1; IFGC-503.6.7; IFGC-618.5 and IFGC-503.8 #1. This 3-foot dimension has been around for years and was also found in the legacy codes. It's important that sources of contamination don't make its way into building openings and there have still been issues where 2 feet doesn't work. This dimension was also changed last cycle in M22. Also, proposals have been submitted to the plumbing to complete the transition.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-RB-1-R303.4.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: No justification was provided demonstrating that the 2 foot dimension is improper. Consistency with the IMC is not sufficient justification.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann of Jefferson County, Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: The committee approved RM-10 which states that exhaust openings (a contaminant source) are required to be 3 feet above intake openings which is consistent with 8 other code sections. It's vital that this section be revised to fall within the balance of codes from a consistency standpoint.

Final Action: AS AM AMPC____ D

RM20-09/10
M1601.1, M1601.1.1

Proposed Change as Submitted

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

M1601.1 Duct design. Duct systems serving heating, cooling and ventilation equipment shall be ~~fabricated~~ <u>installed</u> in accordance with the provisions of this section and ACCA Manual D or other approved methods

M1601.1.1 Above-ground duct systems. Above-ground duct systems shall conform to the following:

1. Equipment connected to duct systems shall be designed to limit discharge air temperature to a maximum of 250°F (121°C).
2. Factory-made air ducts shall be constructed of Class 0 or Class 1 materials as designated in Table M1601.1.1(1)
3. Fibrous duct construction shall conform to the SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.
4. Minimum thickness of metal duct material shall be as listed in Table M1601.1.1(2). <u>Metallic ducts shall be fabricated in accordance with *SMACNA Duct Construction Standards Metal and Flexible*.</u> Galvanized steel shall conform to ASTM A 653.
5. Use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
   - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   - 7.3. Stud wall cavities shall not convey air from more than one floor level.
   - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight fitting fire blocking in accordance with Section R602.8.

Reason: Ducts are not fabricated according to Manual D, they are installed according to that standard. Ducts in general are fabricated according to the SMACNA Standard. This is a simple clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: DARDANO-RM-1-M1601.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed standard may not apply to residential construction.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann of Jefferson County, Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: The committee reason for disapproval was that the SMACNA Standard *may* not apply to residential construction. The Standard most definitely does apply. The IRC states that residential heating systems must conform to ACCA Manual D. Manual D states that duct construction shall be according to the SMACNA Standard.

Final Action: AS AM AMPC____ D

RM21-09/10
M1601.1.1

Proposed Change as Submitted

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground duct systems shall conform to the following:

1. Equipment connected to duct systems shall be designed to limit discharge air temperature to a maximum of 250°F (121°C).
2. Factory-made air ducts shall be constructed of Class 0 or Class 1 materials as designated in Table M1601.1.1(1)
3. Fibrous duct construction shall conform to the SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.
4. Minimum thickness of metal duct material shall be as listed in Table M1601.1.1(2). Galvanized steel shall conform to ASTM A 653.
5. Use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.

~~6. *Duct systems* shall be constructed of materials having a flame spread index not greater than 200.~~

~~7~~6. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   - ~~7.1.~~ 6.1. These cavities or spaces shall not be used as a plenum for supply air.
   - ~~7.2.~~ 6.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   - ~~7.3.~~ 6.3. Stud wall cavities shall not convey air from more than one floor level.
   - ~~7.4.~~ 6.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight fitting fire blocking in accordance with Section R602.8.

Reason: # 6 is broken. It doesn't say or qualify what kind of duct system it's referring to. This is a great example of poor code language that's not enforceable or able to be explained with any certainty. What makes this stand out is that it does not have to meet a 25 flame-spread rating as # 2 requires?

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: DARDANO-RM-4-M1601.1.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed revision would eliminate a product line that has no apparent problems.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann of Jefferson County, Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: Item 6 conflicts with Item 2. Duct systems include factory made air ducts which are required to have a maximum flame spread of 25. Item 6 turns around and says never mind, it can be 200 if its part of a "duct system" meaning a factory made air-duct with a higher flame spread could be utilized. Item 6 is intended to address above ground plastic systems but doesn't come out and say it resulting in an interpretation problem for code officials because no one knows what kind of duct system is being referred to here. This needs to be deleted until a proposal comes forward using the word "plastic" in front of "duct systems" and see if the committee will approve it. Words mean things and the lack of words have consequences. The committee's reason for disapproval was deleting # 6 would delete a product line but there is no product line stated in the text.

Final Action: AS AM AMPC____ D

RM23-09/10
1601.4.1

Proposed Change as Submitted

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete and substitute as follows:

~~**M1601.4.1 Joints and seams**. Joints of duct systems shall be made substantially airtight by means of tapes, mastics, liquid sealants gasketing or other approved closure systems. Closure systems used with rigid fibrous glass ducts shall comply with UL 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Closure systems used with flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181B-FX" for pressure-sensitive tape or "181B-M" for mastic. Duct connections to flanges of air distribution system equipment or sheet metal fittings shall be mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metal ducts shall have a contact lap of at least 1½ inches (38 mm) and shall be mechanically fastened by means of at least three sheet-metal screws or rivets equally spaced around the joint. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturers' instructions.~~

~~**Exceptions:**~~

1. ~~Spray polyurethane foam shall be permitted to be applied without additional joint seals.~~
2. ~~Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.~~
3. ~~Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~

<u>**M1601.4.1 Joints, seams and connections.** All longitudal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC Duct Construction Standards—Metal and</u>

Flexible and NAIMA Fibrous Glass Duct Construction Standards. All joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems or tapes. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked “181 B-FX” for pressure sensitive tape or “181 B-M” for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturers’ instructions. Round metallic ducts shall be mechanically fastened by means of at least three sheet metal screws or rivets spaced equally around the joint. Unlisted duct tape shall not be permitted as a sealant on any duct.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Reason: This text is being replaced with that of the IMC. The IMC language is more concise and complete. The language covering contact lap is deliberately deleted as it is inconsistent with the SMACNA Standard which calls for a one inch lap. Also language covering unlisted tape is not present in the IRC text. This is strictly editorial in nature with no new content.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: DARDANO-RM-2-M1601.4.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee did not have the opportunity to review the proposed new standards. It is not clear what standard is being referenced.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann of Jefferson County, Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1601.4.1 Joints, seams and connections. All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC Duct Construction Standards—Metal and Flexible and NAIMA Fibrous Glass Duct Construction Standards. All joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems or tapes. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked “181 B-FX” for pressure sensitive tape or “181 B-M” for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metallic ducts shall have a contact lap of at least 1 inch (25 mm) and shall be mechanically fastened by means of at least three sheet-metal screws or rivets equally spaced around the joint. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturers’ instructions. Round metallic ducts shall be mechanically fastened by means of at least three sheet metal screws or rivets spaced equally around the joint. Unlisted duct tape shall not be permitted as a sealant on any duct.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Commenter's Reason: The committee reason for disapproval was that they didn't have the opportunity to review the standard. This standard has been part of the code for years. Dwellings constructed under the IMC must adhere to the SMACNA Standard. Dwellings under the IRC should be held to the same standard for consistency sake and uniform enforcement of the code. There is no cost increase in utilizing the standard. The code tells us that residential systems must be installed according to ACCA Manual D and that document states that duct construction should be in accordance with the SMACNA Standard. The Tables in the IRC for duct construction are the same gages found in the standard. There is no technical reason to construct a duct system differently between the two codes. The committee mentioned that they would like to see the reference to joint lapping reinstated. It was done so with the dimension found in the standard.

Final Action: AS AM AMPC____ D

RM32-09/10
M1901.3 (New)

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Add new text as follows:

M1901.3 Prohibited location. Cooking appliances designed, tested, listed and labeled for use in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

Reason: Commercial cooking appliances are prohibited by the IMC (Sections 917.2 and 917.3) in dwelling units due to the difference in temperature requirements and operations between commercial and household appliances. This prohibition should also be in the IRC for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Sections G2447.2 and G2447.3 address the issue for gas-fired cooking appliances.

ICCFILENAME: EUGENE-RM-18-1901.3

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed text is already covered in Chapter 24 and the proposed text in RM31-09/10.

Assembly Action: **Approved as Submitted**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action and a public comment. Note that the assembly action, Approved as Submitted, will be the initial motion on the floor for consideration when this item is called.

Public Comment:

Miriam McGiver representing New York State Department of State Division of Code Enforcement and Administration, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1901.3 Prohibited location. Cooking appliances designed, tested, listed and labeled for use only in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

Commenter's Reason: The proposal as written would not allow use of a cooking appliance that is listed for use both in a household and a commercial occupancy. This public comment change will allow cooking appliances that are dual listed, for residential and commercial use, to be used in residential settings.

RM31, if approved, requires that cooking appliances in dwellings shall be listed for household use.

Final Action: AS AM AMPC____ D

RM33-09/10
M1902.2, Chapter 44 (New)

<u>Proposed Change as Submitted</u>

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M1902.2 Installation. Sauna heaters shall be installed in accordance with the manufacturer's installation instructions. <u>Sauna heaters shall comply with UL 875.</u>

2. Add new standard to Chapter 44 as follows:

UL
<u>875-09</u> <u>Electric Dry-Bath Heaters</u>

Reason: UL 875 is already referenced in Section 914.2 of the International Mechanical Code, and includes a comprehensive set of construction and performance requirements that are specifically used to evaluate and list sauna heaters. Four companies currently have listings for sauna heaters.

Cost Impact: The code change proposal will not increase the cost of construction.

<u>Public Hearing Results</u>

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at <u>http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf</u> :

Analysis: The proposed new standard is currently referenced in the IMC and was not reviewed by staff

Committee Action: **Approved as Submitted**

Committee Reason: Approval is based upon the proponent's printed reason.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Miriam McGiver representing New York State Department of State Division of Code Enforcement and Administration, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1902.2 Installation. Sauna heaters shall be installed in accordance with the manufacturer's installation instructions. <u>Electric</u> sauna heaters shall comply with UL 875.

Commenter's Reason: This modification is proposed to add clarity. The UL standard 875 is applies only to electric heaters. As the current proposal is written, it appears the standard would apply to sauna heaters that are not electric. This public comment change is intended to limit the requirement to comply with UL 875, Electric Dry-Bath Heaters, to sauna heaters that are electric.

Final Action: AS AM AMPC____ D

RM38-09/10

M2301, M2301.1, M2302 (New), M2302.1 (New), M2302.2 (New), M2302.2.1 (New), M2302.2.2 (New), M2302.2.3 (New), M2302.2.4 (New), M2302.3 (New), M2302.4 (New), Chapter 44

Proposed Change as Submitted

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

SECTION M2301
THERMAL SOLAR ENERGY SYSTEMS

M2301.1 General. This section provides for the design, construction, installation, alteration and repair of equipment and systems using thermal solar energy to provide space heating or cooling, hot water heating and swimming pool heating.

2. Add new text as follows:

SECTION M2302
PHOTOVOLTAIC SOLAR ENERGY SYSTEMS

M2302.1 General. This section provides for the design, construction, installation, alteration and repair of photovoltaic equipment and systems.

M2302.2 Installation. The installation of photovoltaic systems shall comply with the manufacturer's installation instructions, Sections M2302.2.1 through M2302.2.4 and NFPA 70.

M2302.2.1 Access. Photovoltaic panels, modules, inverters, converters, and combiner boxes shall be accessible for inspection, maintenance, repair and replacement.

M2302.2.2 Roof-mounted panels and modules. Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as a roof covering shall conform to the requirements for roof coverings in Chapter 9. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire-retardant-treated wood equivalent to that required for the roof construction.

M2302.2.3 Roof and wall penetrations. Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 to prevent entry of water, rodents and insects.

M2302.2.4 Ground-mounted panels and modules. Ground-mounted panels and modules shall be installed in accordance with the manufacturer's installation instructions.

M2302.3 Photovoltaic panels and modules. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703

M2302.4 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

3. Add new standards to Chapter 44 as follows:

UL

1703-02	Flat-Plate Photovoltaic Modules and Panels – with revisions through April 2008
1741-99	Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources – with revisions through November 2005

Reason: The purpose of the code change is to distinguish between two types of solar systems – thermal and photovoltaic – and provide basic safety requirements for photovoltaic systems.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: EUGENE-RM-19-2301-2302-CH 44

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of the proposed new standard UL 1703-02 indicated that, in the opinion of ICC staff, the standard did comply with ICC standards criteria.

Analysis: Review of the proposed new standard UL 1741-99 indicated that, in the opinion of ICC staff, the standard did not comply with ICC standards criteria, Section (3.6.3.2)

Committee Action: Approved as Submitted

Committee Reason: The proposal adds coverage for PV solar systems and provides the needed standards.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joann Surma representing he Dow Chemical Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION M2301
THERMAL SOLAR ENERGY SYSTEMS

M2301.1 General. This section provides for the design, construction, installation, alteration and repair of equipment and systems using thermal solar energy to provide space heating or cooling, hot water heating and swimming pool heating.

SECTION M2302
PHOTOVOLTAIC SOLAR ENERGY SYSTEMS

M2302.1 General. This section provides for the design, construction, installation, alteration and repair of photovoltaic equipment and systems.

M2302.2 ~~Installation~~ Requirements. The installation, inspection, maintenance, repair and replacement of photovoltaic systems and all system components shall comply with the manufacturer's ~~installation~~ instructions, Sections M2302.2.1 through M2302.2. ~~4~~ 3 and NFPA 70.

~~**M2302.2.1 Access.** Photovoltaic panels, modules, inverters, converters, and combiner boxes shall be accessible for inspection, maintenance, repair and replacement.~~

M2302.2.~~2~~ 1 Roof-mounted panels and modules. Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as a roof covering shall conform to the requirements for roof coverings in Chapter 9. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire-retardant-treated wood equivalent to that required for the roof construction.

M2302.2.~~3~~ 2 Roof and wall penetrations. Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 to prevent entry of water, rodents and insects.

M2302.2. ~~4~~ 3 Ground-mounted panels and modules. Ground-mounted panels and modules shall be installed in accordance with the manufacturer's installation instructions.

M2302.3 Photovoltaic panels and modules. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703

M2302.4 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

3. Add new standards to Chapter 44 as follows:
UL 1703-02 Flat-Plate Photovoltaic Modules and Panels – with revisions through April 2008 UL 1741-99 Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed

Energy Resources – with revisions through November 2005

Commenter's Reason: This code change helps to distinguish between two types of solar systems – thermal and photovoltaic. It provides for needed direction on the use of photovoltaic systems.

This public comment further clarifies the requirements for these systems by creating a specific section; **M2302.2 Requirements** and including all important parameters in that section. The issues of installation, inspection, maintenance, repair, replacement, and accessibility have all been combined in this one section. The text referencing the other remaining subsections and NFPA 70 remains intact. This new language eliminates conflicts between NFPA 70 requirements and the original proposal wording. Also, rather than calling out specific individual pieces of the photovoltaic system (i.e. panels, modules, inverters, converters, and combiner boxes) the entire photovoltaic system and system components are referenced. This will provide more inclusive language, such that no elements are missed.

Final Action: AS AM AMPC____ D

INTERNATIONAL PLUMBING CODE

P2-09/10, Part I
202

Proposed Change as Submitted

Proponent: James Anjam, Arlington County, Virginia Plumbing and Mechanical Inspectors Association (VPMIA)

PART I - IPC

Revise as follows:

PLUMBING FIXTURE. A receptacle or device that is ~~either permanently or temporarily~~ directly or indirectly connected to the ~~water~~ ~~distribution system~~ building drainage system. Such receptacles or devices typically, but do not always require a connection to a supply of water. ~~of the premises~~ ~~and demands a supply of water therefrom; discharges wastewater, liquid-borne waste materials or sewage either directly or indirectly to the drainage system of the premises; or requires both a water supply connection and a discharge to the drainage system of the premises.~~

Reason: The current plumbing fixture definition is confusing and out of date. According to the current code, waterless urinals and floor drains are not considered to be plumbing fixtures. This proposal updates and simplifies the code.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: ANJAM-P1-202

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: Testimony of opponent indicated that ASME A112.19.2 has a better definition.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII requests Approval as Modified by this Public Comment:

Replace the proposal as follows:

~~PLUMBING FIXTURE. A receptacle or device that is either permanently or temporarily connected to the water distribution system of the premises and demands a supply of water there from; discharges wastewater, liquid-borne waste materials or sewage either directly or indirectly to the drainage system of the premises; or requires both water supply connection and a discharge to the drainage system of the premises.~~

PLUMBING FIXTURE. A receptacle or device that is connected to a water supply system or discharges to a drainage system or both. Such receptacles or devices require a supply of water; or discharge liquid waste or liquid-borne solid waste; or require-a supply of water and discharge waste to a drainage system.

Commenter's Reason: The current IPC definition lacks the inclusion of code approved waterless type urinals, foor drains, stand pipes, and waste receptors. The original public comment submission failed to include hose connections or eyewash fixtures with a water supply only. The as modified language includes all fixtures whether they are water supplied or waste discharge only or both.

Final Action: AS AM AMPC____ D

P2-09/10, Part II
IRC 202

Proposed Change as Submitted

Proponent: James Anjam, Arlington County, Virginia Plumbing and Mechanical Inspectors Association (VPMIA)

PART II – IRC

Delete and substitute as follows:

~~**PLUMBING FIXTURE.** A receptor or device that requires both a water-supply connection and a discharge to the drainage system, such as water closets, lavatories, bathtubs and sinks. Plumbing *appliances* as a special class of fixture are further defined.~~

<u>**PLUMBING FIXTURE.** A receptacle or device that is directly or indirectly connected to the building drainage system. Such receptacles or devices typically, but do not always require a connection to a supply of water.</u>

Reason: The current plumbing fixture definition is confusing and out of date. According to the current code, waterless urinals and floor drains are not considered to be plumbing fixtures. This proposal updates and simplifies the code.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: ANJAM-P1-202

Public Hearing Results

PART II- IRC
Committee Action: **Approved as Submitted**

Committee Reason: Agreed with proponent's reason statement that the definition is out of date and doesn't include waterless urinals.

Assembly Action: **Disapproved**

Individual Consideration Agenda

This item is on the agenda for individual consideration because an assembly action was successful and a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

~~PLUMBING FIXTURE. **A receptor or device that requires both a water-supply connection and a discharge to the drainage system, such as water closets, lavatories, bathtubs and sinks. Plumbing *appliances* as a special class of fixture are further defined.**~~

<u>PLUMBING FIXTURE. **A receptacle or device that is connected to a water supply system or discharges to a drainage system or both. Such receptacles or devices require a supply of water; or discharge liquid waste or liquid-borne solid waste; or require a supply of water and discharge waste to a drainage system.**</u>

Commenter's Reason: The current IRC definition lacks the inclusion of floor drains, stand pipes, and waste receptors. The original public comment submission failed to include hose connections with a water supply only. The as modified language includes all fixtures whether they are water supplied or waste discharge only or both.

Final Action: AS AM AMPC____ D

P7-09/10, Part I
303.1, 303.4, Table 303.4

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA, PART II IS REPRODUCED ONLY FOR INFORMATION PURPOSES FOLLOWING ALL OF PART I

Proposed Change as Submitted

Proponent: Becky Baker, Jefferson County Colorado, representing the Colorado Association of Plumbing Mechanical Officials

PART I - IPC

1. Revise as follows:

303.1 Identification. Each length of pipe and each pipe fitting, trap, fixture, material and device utilized in a plumbing system shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

303.4 Third-party ~~testing and~~ certification. All plumbing products and materials shall ~~comply~~ be listed by a third-party certification agency as complying with the referenced standards, specifications and performance criteria of this code. ~~and shall be identified in accordance with Section 303.1. When required by Table 303.4, plumbing products and materials shall either be tested by an approved third – party testing agency or certified by an approved third – party certification agency.~~ Products and materials shall be identified in accordance with Section 303.1.

2. Delete table without substitution:

~~TABLE 303.4~~
~~PRODUCTS AND MATERIALS REQUIRING THIRD-PARTY TESTING AND THIRD-PARTY CERTIFICATION~~

~~PRODUCT OR MATERIAL~~	~~THIRD-PARTY CERTIFIED~~	~~THIRD-PARTY TESTED~~
~~Potable water supply system components and potable water fixture fittings~~	~~Required~~	~~-~~
~~Sanitary drainage and vent system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Waste fixture fittings~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Storm drainage system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Plumbing fixtures~~	~~-~~	~~Required~~
~~Plumbing appliances~~	~~Required~~	~~-~~
~~Backflow prevention devices~~	~~Required~~	~~-~~
~~Water distribution system safety devices~~	~~Required~~	~~-~~
~~Special waste system components~~	~~-~~	~~Required~~
~~Subsoil drainage system components~~	~~-~~	~~Required~~

Reason: The revision to IPC Section 303.1 (IRC Section P2608.1)
1. To make it clear that the code intends that the identification requirements in any referenced standard(s) be met.
2. To require that the mark of the third-party certification agencies be applied to listed products. This is needed so that the inspector knows that the product has been certified by a third party agency.

The revision to IPC Section 303.4 (IRC Section P22608.4) and the deletion of IPC Table 303.4 (IRC Table P2608.1)
1. To make the job of the easier since inspectors don't have time to review test reports and
2. To create a more uniform means to enforce code requirements among the various products governed by the code.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: BAKER-P1-303.1

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: Requires testing of items that really don't need to be tested.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Becky Baker, Jefferson County, Colorado representing the Colorado Association of Plumbing and Mechanical Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

303.1 Identification. Each length of pipe and each pipe fitting, trap, fixture, material and device utilized in a plumbing system shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

303.4 Third-party certification. All plumbing products and materials shall be listed by a third-party certification agency as complying with the referenced standards~~, specifications and performance criteria of this code~~. Products and materials shall be identified in accordance with Section 303.1.

Commenter's Reason: This modification will accomplish the intent of the original proposal and maintain consistency between the IPC and IRC.

Public Comment 2:

Julius Ballanco, PE, JB Engineering and Code Consulting, representing self, requests Approval as Modified by this public comment.

Modify the proposal as follows:

303.1 Identification. Each length of pipe and each pipe fitting, trap, fixture, material and device utilized in a plumbing system shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

303.4 Third-party certification. All plumbing products and materials shall be listed by a third-party certification agency as complying with the referenced standards~~, specifications and performance criteria of this code~~. Products and materials shall be identified in accordance with Section 303.1.

Commenter's Reason: This change was a good attempt by the Colorado Association of Plumbing and Mechanical Officials. Just a slight modification is necessary. The third party certification is to the referenced standard. It is unnecessary to add a statement regarding "specifications and performance criteria of this code".

The standard practice in the industry is for products to be tested and listed to the appropriate standard. The code lists the standards that are applicable for each application.

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

P7-09/10, PART II - IRC

1. Revise as follows:

P2608.1 Identification. Each length of pipe and each pipe fitting, trap, fixture, material and device utilized in a plumbing system shall bear the identification of the manufacturer <u>and any markings required by the applicable referenced standards</u>.

P2608.4 Third-party ~~testing and~~ certification. All plumbing products and materials shall ~~comply~~ be listed by a third-party certification agency as complying with the referenced standards, specifications and performance criteria of this code. ~~and shall be identified in accordance with Section P2608.1. When required by Table P2608.4, plumbing products and materials shall either be tested by an approved third party testing agency or certified by an approved third party certification agency.~~ Products and materials shall be identified in accordance with Section P2608.1.

2. Delete table without substitution:

~~**TABLE P2608.4**~~
~~**PRODUCTS AND MATERIALS REQUIRING THIRD-PARTY TESTING AND THIRD-PARTY CERTIFICATION**~~

~~**PRODUCT OR MATERIAL**~~	~~**THIRD-PARTY CERTIFIED**~~	~~**THIRD-PARTY TESTED**~~
~~Potable water supply system components and potable water fixture fittings~~	~~Required~~	~~-~~
~~Sanitary drainage and vent system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Waste fixture fittings~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Storm drainage system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Plumbing fixtures~~	~~-~~	~~Required~~
~~Plumbing appliances~~	~~Required~~	~~-~~
~~Backflow prevention devices~~	~~Required~~	~~-~~
~~Water distribution system safety devices~~	~~Required~~	~~-~~
~~Special waste system components~~	~~-~~	~~Required~~
~~Subsoil drainage system components~~	~~-~~	~~Required~~

Reason: The revision to IPC Section 303.1 (IRC Section P2608.1)
1. To make it clear that the code intends that the identification requirements in any referenced standard(s) be met.
2. To require that the mark of the third-party certification agencies be applied to listed products. This is needed so that the inspector knows that the product has been certified by a third party agency.

The revision to IPC Section 303.4 (IRC Section P22608.4) and the deletion of IPC Table 303.4 (IRC Table P2608.1)
1. To make the job of the easier since inspectors don't have time to review test reports and
2. To create a more uniform means to enforce code requirements among the various products governed by the code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II- IRC-P
Committee Action: **Approved as Modified**

Modify the proposal as follows:

P2608.4 Third-party certification. All plumbing products and materials shall be listed by a third-party certification agency as complying with the referenced standards ~~specifications and performance criteria of this code~~. Products and materials shall be identified in accordance with Section P2608.1.

Committee Reason: Modification made to clarify that products must be certified to referenced standards. Provides for a more uniform method to enforce code requirements and reduces the number of test reports required to be reviewed by code officials.

Assembly Action: **None**

P11-09/10
308.9 (New)

Proposed Change as Submitted

Proponent: Gregory A. Farmer, PE representing ASPE Legislative Committee, ASPE

Revise as follows:

308.9 Parallel water distribution systems. Piping bundles for manifold systems shall be supported in accordance with Table 308.5. Support at changes in direction shall be in accordance with the manufacturer's installation instructions. ~~Hot and~~ ~~c~~Cold water and uninsulated hot water piping shall not be grouped in the same bundle.

Reason: The purpose of separation between the hot water and cold water piping is to prevent heat transfer. Insulation on the hot water piping accomplishes the same objective. Allowing the insulated piping to be in the same pipe bundle will reduce labor and material costs.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: FARMER-P1-308.9

Public Hearing Results

Committee Action: Approved as Submitted

Committee Reason: It is logical not to want hot water piping transferring heat to cold water piping in a piping bundle.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gary Klein, Affiliated International Management, LLC., representing self, requests Approval as Modified by this Public Comment.

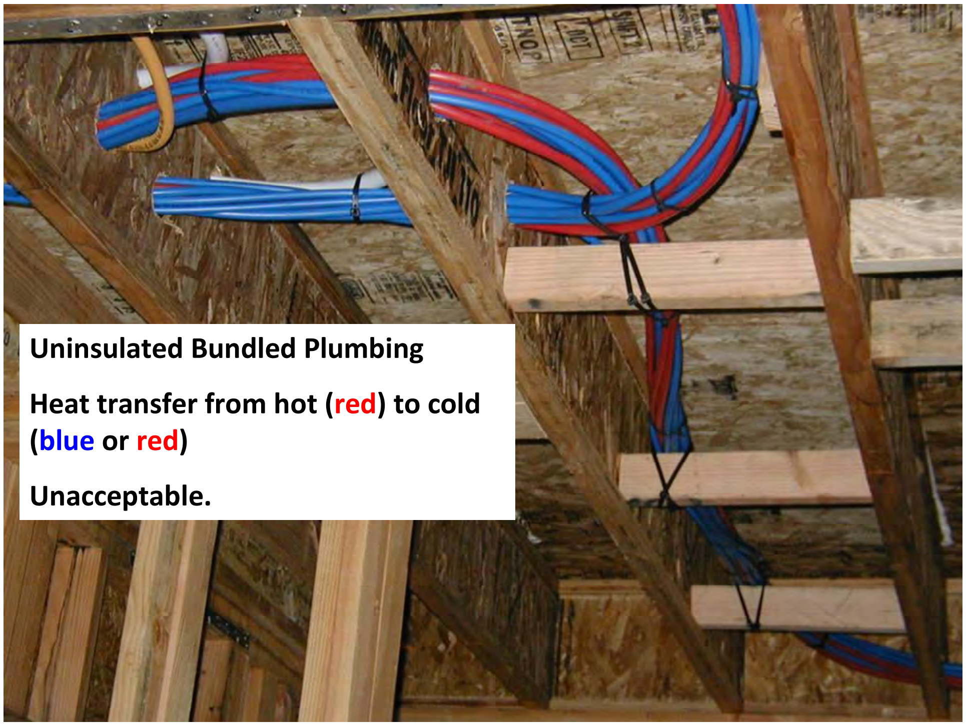
Modify the proposal as follows:

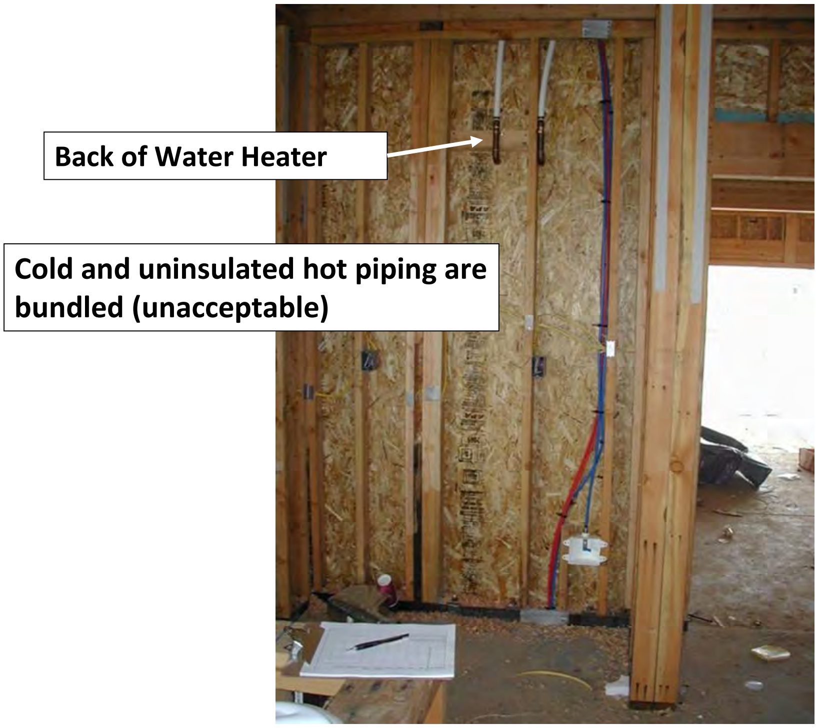
308.9 Parallel water distribution systems. Piping bundles for manifold systems shall be supported in accordance with Table 308.5. Support at changes in direction shall be in accordance with the manufacturer's installation instructions. ~~Cold water and uninsulated hot water piping shall not be grouped in the same bundle.~~ Where hot water piping is bundled with cold or hot water piping, each hot water pipe shall be insulated.

Commenter's Reason: The proposal that was approved was good, but there is another problem that the proposal does not appear to clearly address. What about a bundle that includes only "hot water" piping. In the majority of instances only one of the hot water pipes in a parallel water distribution system actually has hot water running through it at any given time. The other "hot water" pipes have cold water sitting in them and there will be heat transfer between the hot pipe being used and the other "not-hot" pipes in the bundle. The hot water piping should not be grouped into a bundle either, whether or not this bundle is insulated. Each hot water pipe needs to be insulated separately.

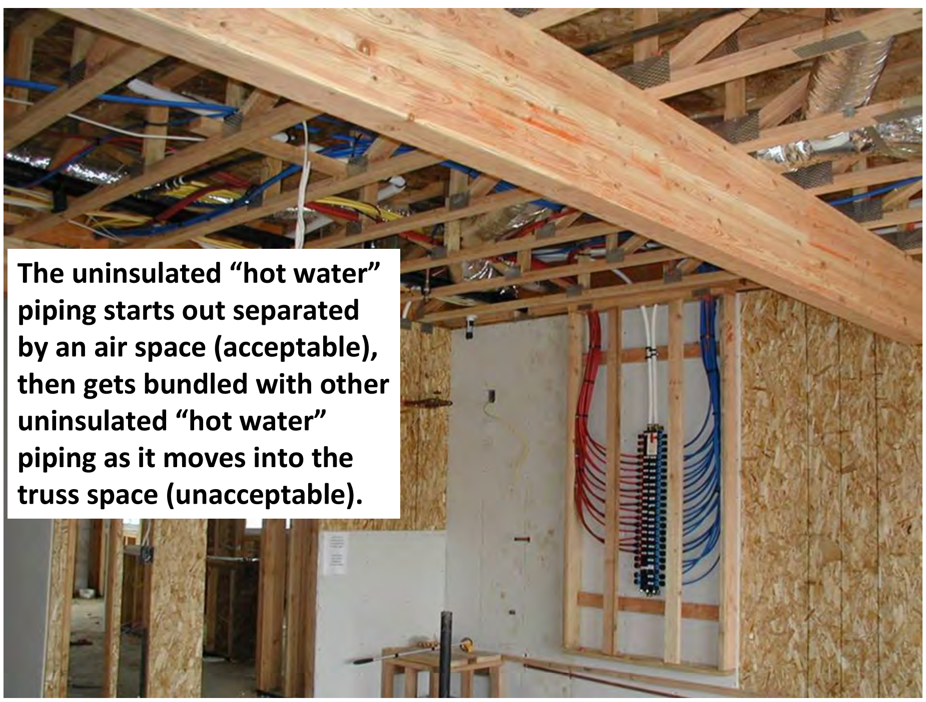
An air space around each pipe is better than being in a bundle, but insulation is significantly better. According to research conducted by the California Energy Commission, uninsulated plastic piping performs worse than copper piping. The testing was done with hot water temperatures in the range of 110-140F and air temperatures in the range of 55-75F, typical of those found in hot water systems and the buildings in which they are installed. When insulated, all hot water piping was found to have very similar performance.

The following six pictures describe the various cases that this code change should address. I believe that the proposed revisions address all of these cases. I recommend that you accept this revised proposal. Thank you.

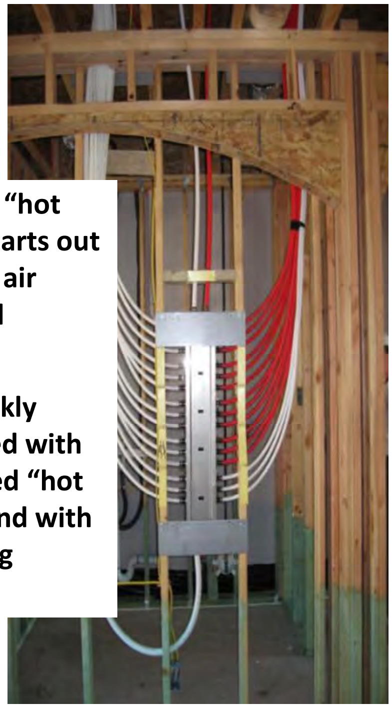




Back of Water Heater
Cold and uninsulated hot piping are bundled (unacceptable)

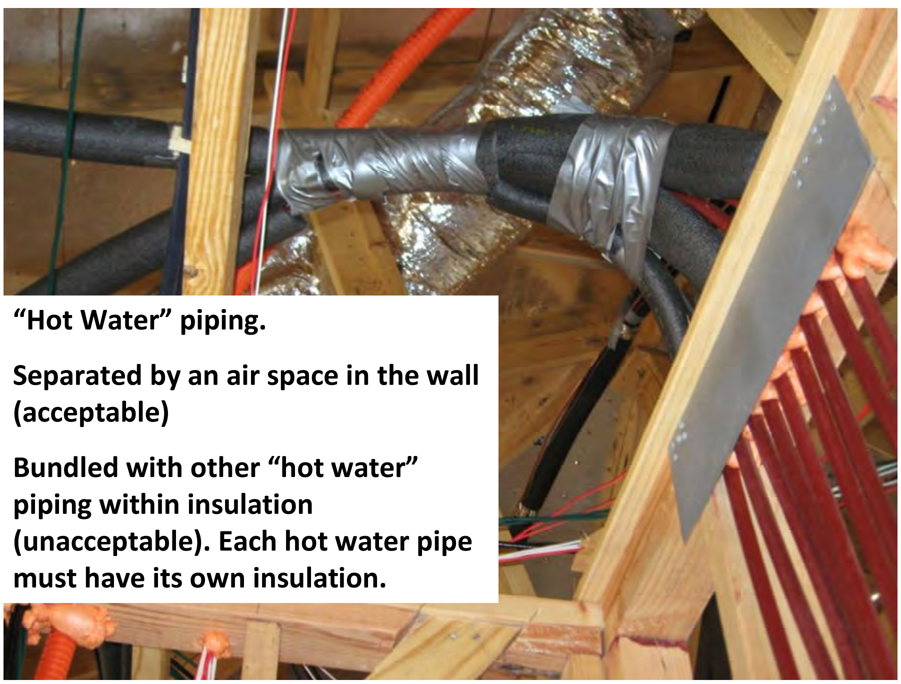


The uninsulated "hot water" piping starts out separated by an air space (acceptable), then gets bundled with other uninsulated "hot water" piping as it moves into the truss space (unacceptable).



The uninsulated “hot Water” piping starts out separated by an air space in the wall (acceptable).

However, it quickly becomes bundled with other uninsulated “hot water” piping and with cold water piping (unacceptable).



“Hot Water” piping.

Separated by an air space in the wall (acceptable)

Bundled with other “hot water” piping within insulation (unacceptable). Each hot water pipe must have its own insulation.

Final Action: AS AM AMPC____ D

P12-09/10
310.4 (New)

Proposed Change as Submitted

Proponent: Marcelo M. Hirschler (GBH International) representing the American Fire Safety Council

Add new text as follows:

310.4 Exposed insulation. Where insulating materials are installed on exposed elements within toilet rooms, the materials shall comply with Section 719 of the International Building Code.

(Renumber subsequent sections)

Reason: This proposal appears to state the obvious but there has been some discussion as to whether the IBC applies when it is not explicitly referenced in the IPC and this language will help clarify. This proposal is intended to build on the language in existing Section 310.3 of the IPC. **"310.3 Interior finish.** Interior finish surfaces of toilet rooms shall comply with the *International Building Code*."

It is my belief that Section 310.3, although it contains vague code language, is important because it directs the IPC code user to the appropriate requirements for interior finish in the IBC. This includes not only the information on the requirements in Section 1210 of the IBC (related to the use of impervious floors, walls, caulking, etc. so that sanitation can be maintained) but also the information on the fire properties of interior finish in the IBC. For example it is essential that the users of the IPC be aware that toilet partitions (or other interior finish) made of some smooth and impervious surfaces that potentially have very poor fire performance, such as HDPE (high density polyethylene), must comply with the fire safety requirements of Chapter 8 of the IBC. I have also made a proposal to the IBC in this cycle to upgrade the fire safety requirements for another material used as interior finish (often via toilet partitions) for bathrooms: polypropylene. Both HDPE and polypropylene ignite easily and generate very high heat release when they burn.

In the same way as 310.3 appropriately directs the IPC code user to the requirements of Sections 1210 and Chapter 8 of the IBC, this proposal is intended to direct the IPC code user to Section 719 of the IBC, on thermal and sound insulating materials. In particular, my concern is fire safety and the compliance with Section 719.7, to ensure that exposed insulating materials exhibit adequate fire properties.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: HIRSCHLER-P4-310.4

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Based upon committee's action of disapproval of P13 and P14.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Howard Ahern, representing Plumberex Specialty Products Inc., requests Approval as Modified by this Public Comment.

Replace original proposal as follows:

310.4 Accessible fixture insulation. Where water supply and drain piping under accessible lavatories and sinks is insulated in accordance with the requirements of ICC/ANSI A117.1, the materials shall comply with Section 807 of the IBC.

Commenter's Reason: The ADA 4.19.4 & ANSI A117.1-2003 Section 606.6 requirement to insulate the pipes under lavatories and sinks to protect people in wheelchairs should be addressed in the IPC. Plumbing Engineers specify this requirement and Plumbing contractors install the insulation coverings on the drain piping and water supplies below lavatories and sinks. Plumbing inspectors work most closely with Plumbing contractors & engineers to ensure that this accessibility requirement has been complied with. This proposal would simply allow the IPC code user's to reference the correct IBC section for materials.

Plastic Thermal Insulation material is not plastic pipe, fittings or valve material both are clearly defined and regulated by the IBC and IPC. The IPC references Insulation for hot water to the IECC. This proposal simply refers insulation covering used for ANSI A117.1-2003 Section 606.6 to the appropriate code section of the IBC.

Chapter 8 of the IBC "Interior Finish" section 807 regulates Thermal and Sound insulation.

The U.S. Access Board issued a letter stating the requirement is "To prevent burns exposed hot water & drain pipes must be insulated." In addition to preventing burns and thermal shock from hot water pipes, the cold water supply must also be insulated to prevent thermal shock as well as protect from sharp surfaces.

The National Mechanical Insulation Committee (NMIC) and the National Insulation Association (NIA) and the mechanical insulation industry has generally adopted the following category definitions:

Category	*Definition*
Cryogenic Applications	*-50 F & Below*
***Thermal Applications**:*	
Refrigeration, chill water and below ambient applications	***-49 F to +75** F*
Medium to high temperature applications	*+**76 F to 1,200 F***
Refractory Applications	*+ 1,200 F & Above*

Thermal Applications is defined as -49F to +75F for below ambient applications and +76F to 1,200F for mid to high.

Insulation that is required by the ADA, ADAAG, ANSI A117.1 and the ABA for exposed drain and water pipes to prevent "thermal Shock" have a service temperature which are classified as within the Thermal Application and therefore requires Thermal Insulation and coverings on the pipe.

This proposal would simply allow the IPC code user's who currently design, specify, install and inspect for this ANSI A117.1 requirement to be able to reference the correct IBC section for materials.

Final Action: AS AM AMPC____ D

P15-09/10

404.2 (New), Chapter 13

Proposed Change as Submitted

Proponent: Sid Cavanaugh, Cavanaugh Consulting representing Truebro/IPS Corporation

1. Add new text as follows:

404.2 Waste and supply pipe protective covers. Where the waste piping and water supply piping beneath accessible lavatories and sinks are required by ICC A117.1 to be fitted with protective coverings, the products shall be in compliance to ASME A112.18.9.

2. Add standard to Chapter 13 as follows:

ASME

A112.18.9-2010 Barrier Free Insulated Protectors for Exposed Waste and Supplies

Reason: Item #1: The code needs clarification regarding accessible fixtures which are under the jurisdiction of the plumbing code and proper protection of exposed waste and supplies that are covered under the new ANSI/ASME standard under development which should be finished by early 2010. This code change will clear up confusion over enforcement of appropriate requirements for exposed waste and supplies used with accessible fixtures.

Item #2: It is important to add this new standard for proper protection of exposed waste and supplies that are covered under the new ANSI/ASME standard under development which should be finished by early 2010. This code change will clear up confusion over enforcement of appropriate requirements for exposed waste and supplies used with accessible fixtures.

Cost Impact: None, because the code currently requires both accessible fixtures and waste/supply pipe protection for users of such fixtures.

Analysis: Review of proposed new standard, ASME A112.18.9-2010, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: CAVANAUGH-P2-404.2 NEW

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of proposed new standard ASME A112.18.9-2010 indicated that in the opinion of ICC staff, the standard did comply with ICC standards criteria. Standard was submitted in draft form.

Committee Action: Disapproved

Committee Reason: Proponent stated that the standard would not be completed in time to be published and available by the ICC deadline.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Sidney Cavanaugh, Cavanaugh Consulting, representing TrueBro, requests Approval as Submitted.

Commenter's Reason: The proposal was rejected because the standard was not completed at that time (ASME A112.18.9) but it is hopeful that it will be approved by the time of the hearings.

Public Comment 2:

Judson Collins, JULYCO, Manford, OK, representing self, requests Disapproval.

Commenter's Reason: The standard proposed for inclusion in the code was submitted in draft form. As of January 25, 2010, the standard was not yet available. If this is still the case and the proposed change was included on the consent agenda, the code would reference a non-existent standard.

Final Action: AS AM AMPC____ D

P16-09/10, Part I
305.4

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA, PART II IS REPRODUCED ONLY FOR INFORMATION PURPOSES FOLLOWING ALL OF PART I.

Proposed Change as Submitted

Proponent: Shawn Strausbaugh, Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

PART I - IPC

Revise as follows:

305.4 ~~Sleeves~~ Sealing of annular spaces. The annular space~~s~~ between the outside of a pipe and the inside of a pipe sleeve~~s~~, ~~and pipes~~ or between the outside of a pipe and an opening in a building envelope wall, floor, or ceiling assembly penetrated by a pipe shall be ~~filled or tightly caulked in an approved manner~~ sealed with caulking material or closed with a gasketing system. The caulking material or gasketing system shall be suitable for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces ~~between~~ created by pipes penetrating ~~sleeves and pipes in~~ fire resistance-rated assemblies or membranes of such assemblies shall be ~~filled or tightly caulked~~ sealed or closed in accordance with Section 713 of the *International Building Code*.

Reason: This proposal addresses a number of shortcomings of the existing old and vague text. This change also better aligns the IPC with the intent of IECC Section 504.3 Sealing of building envelope, and the IRC plumbing section with IRC N1102.4.1 Air leakage.

The reasons for the changes in the first sentence of this section are: 1) Clarifies that only the ends annular spaces need to be sealed or closed. Filling of the entire annular space cavity is pointless. 2) Eliminates the term 'tightly caulked' as it is archaic language from the era of "packing and pouring" lead joints. It would be a rare situation where it would be desired to have a pipe so rigidly fixed in a through-penetration. 3) Clarifies what "sleeves" are to be considered by adding the word "pipe" in reference to the pipe sleeves as required by IPC Section 305.5 (IRC Section P2603.5) . Some inspectors have mistaken the existing language to require sealing between pipe and flexible plastic sleeving used for corrosion protection. 4) Adds the requirement that pipe penetrations of building envelope wall, floor or ceiling assemblies (as some penetrations might not require pipe sleeves) must also be sealed to reduce the loss of conditioned air as required by International Energy Conservation Code. Although this sealing requirement is energy related, it is important to have this text in this section because piping installers typically are the ones who cut holes in the building envelope for the passage of pipes and as such they should be the ones responsible for sealing or closing off annular spaces. They are already familiar with the requirement for sealing pipes in pipe sleeves. All trades must do their part for energy conservation. Otherwise, the sealing just doesn't get accomplished resulting in more leakage paths through the building envelope.

The reasons for the changes in the second sentence of this section are to add the requirements for sealing material compatibility to all items that the sealing material contacts and that the material is suitable for the weather and temperature conditions of the application. While this seems like something that should be obvious, there have been instances where solvent based caulking has affected plastic piping and where a caulking material was inappropriate for wet (outdoor) conditions resulting is rainwater damage to the building.

The last sentence was changed to stress and clarify the importance of making sure that where fire resistance rated assemblies are being penetrated by pipes, specific materials and methods in accordance with the IBC (or building portion of the IRC) must be used. Proper fire stopping methods are critical for fire safety.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: STRAUSBAUGH-P4-305.4

Public Hearing Results

PART I- IPC
Committee Action: Approved as Modified

Modify the proposal as follows:

305.4 Sealing of annular spaces. The annular space between the outside of a pipe and the inside of a pipe sleeve or between the outside of a pipe and an opening in a building envelope wall, floor, or ceiling assembly penetrated by a pipe shall be sealed in an approved manner with caulking material or closed with a gasketing system. The caulking material or gasketing system shall be ~~suitable~~ designed for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces created by pipes penetrating fire resistance-rated assemblies or membranes of such assemblies shall be sealed or closed in accordance with Section 713 of the *International Building Code*.

Committee Reason: Eliminates ambiguity about sealing of pipe penetrations through the walls, ceilings and floors of the building envelope to seal against air leakage and for pipe penetrations through fire-resistance-rated assemblies.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joann Surma, The Dow Chemical Company, Midland, MI, representing The Dow Chemical Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

305.4 Sealing of annular spaces. The annular space~~s~~ between the outside of a pipe and the inside of a pipe sleeve or between the outside of a pipe and an opening in a building envelope wall, floor, or ceiling assembly penetrated by a pipe shall be sealed in approved manner with caulking material, foam sealant or closed with a gasketing system. The caulking material, foam sealant or gasketing system shall be designed for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces created by pipes penetrating fire resistance-rated assemblies or membranes of such assemblies shall be sealed or closed in accordance with Section 713 of the *International Building Code*.

Commenter's Reason: This is one part of a two part code change. The parallel IRC mechanical code change included the addition of foam sealant. The IRC committee's reason was: foam sealants are also viable materials used for sealing these types of spaces and are commonly available. Adding in foam sealant will make it clear that these products can continue their successful use in these applications. This code change is a good clarification to this section of the code and this public comment adds further clarity by specifically including foam sealant as a code approved product option.

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATION PURPOSES ONLY – SEE ABOVE

P16-09/10, PART II - IRC

Revise as follows:

P2603.4 ~~Sleeves~~ Sealing of annular spaces. The annular space~~s~~ between the outside of a pipe and the inside of a pipe sleeve~~s~~, ~~and pipes~~ or between the outside of a pipe and an opening in a building envelope wall, floor, or ceiling assembly penetrated by a pipe shall be ~~filled or~~

~~tightly caulked as approved by the building official.~~ sealed with caulking material or closed with a gasketing system. The caulking material or gasketing system shall be suitable for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces ~~between~~ created by pipes penetrating ~~sleeves and pipes in~~ fire resistance-rated assemblies or membranes of such assemblies shall be ~~filled or tightly caulked~~ sealed or closed in accordance with the building portion of this code.

Reason: This proposal addresses a number of shortcomings of the existing old and vague text. This change also better aligns the IPC with the intent of IECC Section 504.3 Sealing of building envelope, and the IRC plumbing section with IRC N1102.4.1 Air leakage.

The reasons for the changes in the first sentence of this section are: 1) Clarifies that only the ends annular spaces need to be sealed or closed. Filling of the entire annular space cavity is pointless. 2) Eliminates the term 'tightly caulked' as it is archaic language from the era of "packing and pouring" lead joints. It would be a rare situation where it would be desired to have a pipe so rigidly fixed in a through-penetration. 3) Clarifies what "sleeves" are to be considered by adding the word "pipe" in reference to the pipe sleeves as required by IPC Section 305.5 (IRC Section P2603.5) . Some inspectors have mistaken the existing language to require sealing between pipe and flexible plastic sleeving used for corrosion protection. 4) Adds the requirement that pipe penetrations of building envelope wall, floor or ceiling assemblies (as some penetrations might not require pipe sleeves) must also be sealed to reduce the loss of conditioned air as required by International Energy Conservation Code. Although this sealing requirement is energy related, it is important to have this text in this section because piping installers typically are the ones who cut holes in the building envelope for the passage of pipes and as such they should be the ones responsible for sealing or closing off annular spaces. They are already familiar with the requirement for sealing pipes in pipe sleeves. All trades must do their part for energy conservation. Otherwise, the sealing just doesn't get accomplished resulting in more leakage paths through the building envelope.

The reasons for the changes in the second sentence of this section are to add the requirements for sealing material compatibility to all items that the sealing material contacts and that the material is suitable for the weather and temperature conditions of the application. While this seems like something that should be obvious, there have been instances where solvent based caulking has affected plastic piping and where a caulking material was inappropriate for wet (outdoor) conditions resulting is rainwater damage to the building.

The last sentence was changed to stress and clarify the importance of making sure that where fire resistance rated assemblies are being penetrated by pipes, specific materials and methods in accordance with the IBC (or building portion of the IRC) must be used. Proper fire stopping methods are critical for fire safety.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II- IRC-P
Committee Action: **Approved as Modified**

Modify the proposal as follows:

P2603.4 Sealing of annular spaces. The annular space between the outside of a pipe and the inside of a pipe sleeve or between the outside of a pipe and an opening in a building envelope wall, floor, or ceiling assembly penetrated by a pipe shall be sealed with caulking material, foam sealant or closed with a gasketing system. The caulking material, foam sealant or gasketing system shall be ~~suitable~~ designed for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces created by pipes penetrating fire resistance-rated assemblies or membranes of such assemblies shall be sealed or closed in accordance with the building portion of this code.

Committee Reason: Modification made because foam sealant is also a viable material to be used for sealing these types of spaces and is commonly available. Proposed language eliminates ambiguity about sealing of pipe penetrations through the walls, ceilings and floors of the building envelope to seal against air leakage and for pipe penetrations through fire-resistance-rated assemblies.

P17-09/10
312.2, 312.3, 702.5

Proposed Change as Submitted

Proponent: Robert Burke, University of Colorado representing (CAPMO) Colorado Association of Plumbing and Mechanical Officials

1. Delete and substitute as follows:

~~**312.2 Drainage, waste and vent water test.** A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a 10-foot (3048 mm) head of water. In testing successive sections, at least the upper 10 feet (3048 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost 10 feet (3048 mm) of the system, shall have been submitted to a test of less than a 10-foot (3048 mm) head of water. This pressure shall be held for at least 15 minutes. The system shall then be tight at all points.~~

~~**312.3 Drainage and vent air test.** An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi (34.5 kPa) or sufficient to balance a 10-inch (254 mm) column of mercury. This pressure shall be held for a test period of at least 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperature or the seating of gaskets shall be made prior to the beginning of the test period.~~

<u>**312.2 Water testing of drain, waste and vent piping.** The design of test setups for leak testing of drain and waste piping systems shall consider the pressure requirements and limitations of Section 702.5. The test pressure for drain and waste piping systems, or portions thereof, shall not be less than the greatest possible in-service pressure or 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa), whichever is greater. Vent piping shall be tested at a pressure not less than 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa), except for vent piping sections that are within 10 feet of elevation below a vent system's final outdoor termination point. The upper 10 feet of a vent system terminating to the outdoors shall be permitted to be tested by a pressure ranging from 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa) at a point 10 feet in elevation below the outdoor termination point to zero pressure at the elevation of the outdoor termination point. Test pressures shall be developed by filling the closed piping system (or portion thereof) completely with water and pressurizing the system to the required test pressure using a water pump or applying the required head of water above the highest elevation of the system (or portion thereof) under test. Where piping systems are tested in sections, the joints between tested sections shall be tested at a pressure not less than the required test pressures for the sections on either side of the joint. The test pressure in the system, as evidenced by a test gauge connected to the system, shall hold steady for not less than 15 minutes, without any addition of water to the system. Where the entire piping section under test can be visually observed for water leaks and the required test pressure is developed by the required head of water above the section under test, connection of a test gauge to the system shall not be required.</u>

<u>**312.3 Air testing of drain, waste and vent piping.** The design of test setups for leak testing of drain and waste piping systems shall consider the pressure requirements and limitations of Section 702.5. The test pressure for drain, waste and vent piping systems, or portions thereof, shall not be less than the greatest possible in-service pressure or 5 psi (34.5 kPa), whichever is greater. Test pressures shall be developed by forcing air into the closed piping system (or portion thereof). Where piping systems are tested in sections, the joints between tested sections shall be tested at a pressure not less than the required test pressures for the sections on either side of the joint. The test pressure in the system, as evidenced by a test gauge connected to the system, shall hold steady for not less than 15 minutes, without any addition of air to the system.</u>

2. Add new text:

<u>**702.5 Pipe, fitting and joint selection for pressure conditions.** The selection of pipe, fittings and joints of drain, waste and sewer systems shall consider the greatest internal pressure that could occur during testing or service. The allowable pressure in drain, waste and sewer piping systems that are pressurized in service by pumps or ejectors shall be the pressure rating of the system component having the lowest pressure rating. Where system pressure is created by liquid-filled vertical sections of pipe, system components shall be pressure-rated for not less than the system pressure at the component's installed elevation.</u>

(Renumber subsequent sections)

Reason: This code change proposal was prompted by the failure of a roof drain conductor (piping) system inside of a basketball arena building here at the University of Colorado. Many 100s of thousands of dollars of water damage occurred and we were lucky that no one was hurt. An 8 inch cast iron no-hub elbow blew off the piping system due to the pressure caused by a blockage in the storm drain system outside the building. In evaluating why this particular event happened, I realized that the existing code sections concerning testing of drain and waste piping fail to properly consider building designs having drain piping systems that do not have any fixture connections for many consecutive stories in a row. Consider the following arrangement: A sports arena with sky box toilet facilities. The drain piping system serving those toilet facilities is many "stories" tall without any fixture connections between the sky box elevation and the elevation of the building drain (or the nearest level down where fixtures are connected) to relieve pressure should the system become clogged at a lower elevation. The existing code section for testing allows for such a piping system to be tested in sections as short as every 10 feet as the building construction rises from the ground. If there is a clog in the system well below sky box elevation, the drainage system could fill up to the point of overflow at the fixtures in the skybox. This creates a pressure in the lower sections of the system that is many times greater than what the piping system was tested for when 10 foot sections are tested.

Since then, I have made numerous evaluations of the drain piping systems in several multi-story buildings here at the University of Colorado and discovered that the real problem is not just in the testing but in the proper selection of piping system components for these multi-story systems that do not have fixture connections for many consecutive stories. One example of improper component selection for this type of "tall system" application could be the use of shielded couplings for no-hub cast iron pipe. ASTM standards C1540 and C1277 cover these couplings and indicate the allowable pressure ratings for different sizes. The unrestrained hydrostatic pressure for standard shielded couplings is 20 psi (46 foot of head) for 1 ½ thru 5 inch, 18 psi (42 foot of head) for 6 inch, 10 psi (23 foot of head) for 8 inch, 6 psi (14 foot of head) for 12 inch. It is obvious that the larger coupling sizes would be unsuitable for systems that are over two stories of normal height, let alone structures with tall stories. Because plastic drain, waste and vent fittings as well as "not for pressure" plastic pipe is not "pressure rated", these components could also prove to be problematic in certain applications where either testing or service conditions create pressures in excess of the component ratings.

Code officials should not have to become expert in evaluating the pressure capabilities of individual components of the drain and waste systems. This is the designer's or engineer's responsibility. However, the code requirements for design and test procedures should reflect what could be the expected actual in-service or test condition pressure, whichever is greater, in order to verify that the system has been designed properly for the intended conditions. Therefore, I have submitted new section 702.5 and re-written sections 312.2 and 312.3 to eliminate any confusion as to the pressure requirements for system components as well as the requirements for testing. The existing test sections are outdated for the type of large buildings being built today and need these changes.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Burke-P1-312.2

Public Hearing Results

Committee Action: Disapproved

Committee Reason: The proposed language does not require tests to be performed.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Robert Burke, University of Colorado, representing CAPMO, requests Approval as Modified by this Public Comment.

1. Replace the proposal as follows:

~~**312.2 Drainage, waste and vent water test.** A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a 10-foot (3048 mm) head of water. In testing successive sections, at least the upper 10 feet (3048 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost 10 feet (3048 mm) of the system, shall have been submitted to a test of less than a 10-foot (3048 mm) head of water. This pressure shall be held for at least 15 minutes. The system shall then be tight at all points.~~

312.2 Water testing of drain, waste and vent piping. The design of test setups for leak testing of drain and waste piping systems shall consider the pressure requirements and limitations of Section 702.5. The test pressure for drain and waste piping systems, or portions thereof, shall not be less than the greatest possible in-service pressure or 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa), whichever is greater. Vent piping shall be tested at a pressure not less than 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa), except for vent piping sections that are within 10 feet of elevation below a vent system's final outdoor termination point. The upper 10 feet of a vent system terminating to the outdoors shall be permitted to be tested by a pressure ranging from 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa) at a point 10 feet in elevation below the outdoor termination point to zero pressure at the elevation of the outdoor termination point. Test pressures shall be developed by filling the closed piping system (or portion thereof) completely with water and pressurizing the system to the required test pressure using a water pump or applying the required head of water above the highest elevation of the system (or portion thereof) under test. Where piping systems are tested in sections, the joints between tested sections shall be tested at a pressure not less than the required test pressures for the sections on either side of the joint. The test pressure in the system, as evidenced by a test gauge connected to the system, shall hold steady for not less than 15 minutes, without any addition of water to the system. Where the entire piping section under test can be visually observed for water leaks and the required test pressure is developed by the required head of water above the section under test, connection of a test gauge to the system shall not be required.

2. Add new text:

702.5 Pipe, fitting and joint selection for pressure conditions. The selection of pipe, fittings and joints of drain, waste and sewer systems shall consider the greatest internal pressure that could occur during testing or service. The allowable pressure in drain, waste and sewer piping systems that are pressurized in service by pumps or ejectors shall be the pressure rating of the system component having the lowest pressure rating. Where system pressure is created by liquid-filled vertical sections of pipe, system components shall be pressure-rated for not less than the system pressure at the component's installed elevation.

Commenter's Reason: The code change proposal P17-09/10 was denied because air testing is not allowed on PVC piping. The intent was to test storm water piping with water from the point of discharge to the point of overflow. Therefore Section 312.3 from the code change proposal.

Final Action: AS AM AMPC____ D

P22-09/10
Table 403.1 (IBC [P] Table 2902.1)

Proposed Change as Submitted

Proponent: Eirene Oliphant, MCP, Building Official, City of Leawood, KS

Revise table as follows:

Table 403.1 (IBC [P] Table 2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)	
				MALE	FEMALE
2	Business	B	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses	1 per 25 for the first 50 and 1 per ~~50~~ <u>100</u> for the remainder exceeding 50	1 per 25 for the first 50 and 1 per 50 for the remainder exceeding 50

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)		LAVATORIES	
				MALE	FEMALE	MALE	FEMALE
6	Mercantile	M	Retail stores, service stations, shops, salesroom, markets and shopping centers	1 per ~~500~~ <u>25 for the first 50 and 1 per 600 for the remainder exceeding 50</u>	1 per ~~500~~ <u>25 for the first 50 and 1 per 400 for the remainder exceeding 50</u>	1 per ~~750~~ <u>200 for the first 400 and 1 per 750 for the remainder exceeding 400</u>	

(Portions of table note shown remain unchanged)

Reason: The purpose of the change is to substitute revised material for current provisions of the code. The IPC requires 1 WC per sex for mercantile occupancies between 51-1000. The UPC[1] requires between 2 to 6 WC per sex between 51 – 800. Based on an American Restroom Association (ARA)/Wall Street Journal investigation[2], this low IPC minimum has not caused problems because a majority of the public is not aware that they are allowed to use sanitation facilities in small to midsize mercantile establishments. Media awareness campaigns like the Wall Street Journal story and Section 403.5.1 Directional Signs (P34-06/07) will change the public's awareness.

Unlike multi-stalled toilets, single WC toilets are typically user locked and the WC is not available to the next patron until the toilet door is unlocked. While studies such as the Cohen report[4,5] have shown that the average user typically needs less then 2 minutes to use a WC, there appears to be no studies of the impact of single WC, user lockable toilets. Information is available, however, via the experience of those American cities that have installed automated public toilets (APT). Every municipality has found that for legitimate reasons (wheel chair, express breast milk, change colostomy bag, absorbent pads or a child's diaper) users occasionally have a legitimate need to be in the toilet for at least 15 minutes and at least one city now allows more then 20 minutes before an alarm sounds. This same 'occasional long use' problem occurs in buildings with user lockable toilets and the problem is exacerbated because these user lockable toilets also accommodate activities not related to sanitation. A retail store with 1000 people will sometimes include more then 15 employees. OHSA requires 2 WC for 16 on site employees[3]. It is likely that those 16 employees competing with 984 other occupants does not satisfy the intent of the OSHA requirement. In the process of reviewing the requirement for M it was noted that if adjusted for gender the increase in toilet fixtures slope for males in B (Business) could be reduced.

Bibliography:

[1]2006 Uniform Plumbing Code Table 4.1 'Retail or Wholesale Stores
[2]Wall Street Journal 'Bathroom Backlash Arrives on Main Street ' July 26, 2005
[3]29CFR1910.141(c)(1)(i) Table J-1
[4]ASPE report 95-01 Cohen 'Queuing theory approach to plumbing design research'
[5]ASPE report 92-02 Cohen 'Plumbing fixture requirements for office buildings research report'

Cost Impact: The code change proposal will increase the cost of construction at lower occupancies but may reduce cost for larger occupant loads.

ICCFILENAME: Oliphant-P1-T403.1

Public Hearing Results

Committee Action: Approved as Submitted

Committee Reason: A single user toilet room per gender for up to 250 persons is not adequate when one considers that single user toilet rooms can be locked by the occupant for significant periods of time leaving no available facilities for up to 249 other persons.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International, requests Disapproval.

Commenter's Reason: This change should be disapproved for the following reasons:

1. It significantly increases the requirement for the number of fixtures (and the overall size of restrooms) in small mercantile occupancies.
2. Current code allows a single water closet for mercantile occupancies of up to 1500 square feet (50 occupants). It appears this would still be permitted by the proposal.
3. Current code, mercantile occupancies of 1,501-3,000 square feet require only a single water closet in the men's room and in the women's room. The proposal doubles this. It makes no sense to allow a single water closet at 1,500 square feet and then require a total of 4 at 1,501 square feet.
4. The need for 'potty parity' scoping in mercantile occupancies has not been established. While there is a valid need for additional fixtures in women's rooms in high use, peak demand facilities (such as assembly facilities like theaters and sports arenas), there isn't documentation to warrant increasing the required fixtures in mercantile occupancies.
5. For smaller mercantile facilities, doubling the number of water closets in each toilet room has a significant negative impact on the overall income-producing space available. The accessibility requirements for a multiple-fixture restroom require it to be quite large; each toilet room would likely be at least double the size if required to have twice the fixtures. For a 1,600 square foot mercantile occupancy, it is not reasonable to remove another 100 square feet or more from the income-producing space available.
6. The proponent cites the large number of 'occupants' who must compete for access to the 'small' number of fixtures currently required. Note that the occupant load factors for mercantile occupancies are established for a 'worst case' (e.g., Christmas Eve shopping) scenario, and it has long been documented that the actual occupant load in these facilities tends to be far less than the code establishes for egress purposes.

Final Action: AS AM AMPC____ D

P23-09/10
Table 403.1 (IBC Table [P]2902.1)

Proposed Change as Submitted

Proponent: Robert J. Heil, Code Inspections, Inc. representing the Pennsylvania Association of Building Code Officials, Inc.

Revise table as follows:

TABLE 403.1 (IBC Table [P]2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]
(See Sections 403.2 and 403.3)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION					OTHER
2	Business	B	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses					1 service sink[h]
6	Mercantile	M	Retail stores, service stations, shops, salesrooms, markets and shopping centers					1 service sink [h]

h. For business and mercantile occupancies an occupant load of 15 or fewer, service sinks shall not be required.

(Portions of table and footnotes not shown remain unchanged.)

Reason: In a small facility with limited occupancy, such as a retail store with a size of less than 450 square feet or an office with less than 1,500 square feet, a service sink and the associated closet occupy a disproportionate amount of floor space, with rare requirements for use by the occupants.

Note: A similar exception was added in the 2009 Code for drinking fountains, with occupancies of 15 persons or less, under Footnote “f” of the “drinking fountain” column in Table 403.1.

Cost Impact: This code change proposal will not increase the cost of construction**.**

ICCFILENAME: Heil-P2-403.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Service sinks are very important to the occupancies regardless of the number of occupants.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Eirene Oliphant, MCP, City of Leawood, representing Metropolitan Kansas City Chapter of the ICC, requests Approval as Submitted.

Commenter's Reason: The proponent offers a valid argument about providing relief to small tenant spaces. A small space such as a 1,500 square foot retail facility should not be held to the same level of expectation on service sinks as a restaurant or hospital. As a building official, I would prefer to make as few changes by ordinance to the code whenever possible, as it provides for a more universal adoption process when brought before my governing body. I have already changed our code language to reflect the language the proponent has offered; and it has been welcomed with relief by our smaller tenants.

Public Comment 2:

Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International, requests Approval as Submitted.

Commenter's Reason: This code change offers a reasonable exception for very small business and mercantile occupancies. In very small businesses, there isn't a need for a service sink, and the sink and surrounding space required eats up valuable space. As noted by the proponent, this exception would be consistent with an exception already provided for drinking fountains in very small businesses.

Final Action: AS AM AMPC____ D

P24-09/10

Table 403.1 (IBC [P] Table 2902.1)

Proposed Change as Submitted

Proponent: Eirene Oliphant, MCP, Building Official, City of Leawood, KS

Revise table as follows:

Table 403.1 (IBC [P] Table 2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2) MALE	WATER CLOSETS (URINALS SEE SECTION 419.2) FEMALE	LAVATORIES MALE	LAVATORIES FEMALE
1	Assembly	A-2[d]	Nightclubs, bars, taverns, dance halls and buildings for similar purposes	1 per ~~40~~ 25 for the first 25 and 1 per 90 for the remainder exceeding 25	1 per ~~40~~ 25 for the first 25 and 1 per 75 for the remainder exceeding 25	1 per ~~75~~ 40 for the first 40 and 1 per 200 for the remainder exceeding 40	
			Restaurants, banquet halls and food courts	1 per ~~75~~ 25 for the first 25 and 1 per 100 for the remainder exceeding 25	1 per ~~75~~ 25 for the first 25 and 1 per 80 for the remainder exceeding 25	1 per ~~200~~ 40 for the first 40 and 1 per 200 for the remainder exceeding 40	

(Portions of table not shown remain unchanged)

Reason: The purpose of the change is to substitute revised material for current provisions of the code. The American Restroom Association (ARA) is often questioned by the public and by reporters doing stories about the problems people face finding proper toilet facilities when away from home. One of the problems relates to having to wait too long for a restaurant toilet to free. To the degree that respondent recall details and also based on informal observation by ARA advocates, when more then 50 people are in a restaurant one will begin to see occasional toilet queuing when only 1 single occupant per sex toilet is available. Above 100, multiple person lines will appear. This problem is addressed in the UPC[1], which requires between 2 & 3 WC per sex between 15 – 150 occupants. The IPC requires only 1 WC per sex for A-2 restaurant occupancies between 16-150 occupants. This problem is particularly onerous in venues where people handle food. While those with an urgent need to void bowel or bladder will queue, those needing to wash their hands before eating may defer.

The low IPC A-2 minimum is made worse by the typical no-stall implementation of a single WC toilet. Unlike multi-stalled toilets, single WC toilets are typically user locked and the WC is not available to the next patron until the toilet door is unlocked. While studies such as the APSE Cohen reports[2,3] have shown that the average user typically needs less than 2 minutes to use a WC, there appears to be no studies of the impact of single WC, user lockable toilets. Information is available, however, via the logs generated by automated public toilets (APT). Every American municipality, that has installed single occupant APT's has found that for legitimate reasons (wheel chair, express breast milk, change colostomy bag, absorbent pads or a child's diaper) users occasionally have a legitimate need to be in the toilet for at least 15 minutes and one city now allows more then 20 minutes before a misuse alarm sounds. This same 'occasional long use' problem occurs in buildings with user lockable toilets and the problem is exacerbated because these lockable toilets also facilitate activities not related to sanitation. A-2 Pubs and Lounges suffers the same 1 locked toilet at lower occupancies but the attempt to address the problem by requiring 1 toilet per 40 results in excessive minimums at higher occupancies.

Bibliography:
[1]2006 Uniform Plumbing Code Table 4.1 'Retail or Wholesale Stores
[2]ASPE report 95-01 Cohen 'Queuing theory approach to plumbing design research'
[3]ASPE report 92-02 Cohen 'Plumbing fixture requirements for office buildings research report'

Cost Impact: The code change proposal will increase the cost of construction at lower occupancies but may reduce cost for larger occupant

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Oliphant-P4-T403.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Proponent's reason stated that she and other restroom availability advocates have seen occasional queuing at toilet facilities when there are more than 50 persons in a restaurant. The proposal will adjust the required fixtures at these low occupant numbers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International, requests Disapproval.

Commenter's Reason: This change should be disapproved for the following reasons:

1. The significant increase in the number of toilet fixtures, and therefore, the space required to be allocated to restrooms, in small A-2 facilities has not been justified.
2. The need for 'potty parity' scoping in small assembly occupancies has not been established. While there is a valid need for additional fixtures in women's rooms in high use, peak demand facilities (such as assembly facilities like theaters and sports arenas), there isn't documentation to warrant increasing the required fixtures in all small dining-type assembly occupancies.
3. For smaller assembly facilities, doubling the number of water closets in each toilet room has a significant negative impact on the overall income-producing space available. The accessibility requirements for a multiple-fixture restroom require it to be quite large; each toilet room would likely be at least double the size if required to have twice the fixtures. For a 1,600 square foot assembly occupancy, it is not reasonable to remove another 100 square feet or more from the income-producing space available.

Final Action: AS AM AMPC____ D

P30-09/10
403.3.5 (IBC [P] 2902.3.5) (New)

Proposed Change as Submitted

Proponent: Eirene Oliphant, MCP, Building Official, City of Leawood, KS

Add new text as follows:

403.3.5 ([P]2902.3.5) Door locking. Where a toilet room is designed for multiple occupants, the egress door for the room shall not be lockable from the inside of the room. This section does not apply to family or assisted-use toilet rooms.

Reason: To prevent a toilet user from restricting access to a toilet facility intended to satisfy the sanitation needs of multiple persons. To also reduce misuse such as employee smoke breaks, drug dealing or other inappropriate activities that are more likely when an occupant can lock entry to the toilet.

Cost Impact: The code change will not increase the cost of construction.

ICCFILENAME: Oliphant-P3-403.3.5

Public Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

403.3.5 ([P]2902.3.5) Door locking. Where a toilet room is ~~designed~~ provided for the use of multiple occupants, the egress door for the room shall not be lockable from the inside of the room. This section does not apply to family or assisted-use toilet rooms.

Committee Reason: Modification was made to replace "designed" as this might create conflict with the last sentence of the section. Toilet rooms that are lockable from the inside provide too much availability for misuse and inappropriate activities however, family/assisted-use rooms need to be exempt as privacy is a key element to having those types of toilet rooms.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International requests Disapproval.

Commenter's Reason: This code change proposal should be disapproved for the following reasons:

1. The prohibition from locking rooms from the inside has a major unintended downside; for many common installations, it will also prohibit the capability of being able to unlock the door from the inside. It is common in facilities with large restrooms to use simple push/pull hardware. When the restrooms are not in use (after hours), the doors are locked with deadbolts. Not allowing the current common thumbturn inside the restroom could result in persons being locked in the restroom, with no means of escape.
2. No evidence of the supposed cited problems (employee smoke breaks, drug dealing or other inappropriate activities) was provided, and therefore this is no justification for such a blanket requirement across all occupancies.
3. Locking on the 'exterior' side of the restroom door is frequently needed or expected for security purposes. While it is possible to provide locking from the exterior and maintain free access from inside, it limits the type of hardware that could be utilized.

Final Action: AS AM AMPC____ D

P31-09/10
403.5 (IBC [P]2902.5) (New)

Proposed Change as Submitted

Proponent: Don Davies representing the Utah Chapter of ICC

Add new text as follows:

403.5 (IBC [P]2902.5) Required drinking fountains. A required drinking fountain for a tenant space shall be located in the tenant space or external to the tenant space provided that the travel distance from the most remote point in the tenant space to the drinking fountain is within 500 feet or for covered malls, within 300 feet.

Reason: The sharing of public restroom facilities is currently allowed in the code in Section 403.3 (IBC Section 2902.3) but the code is silent on sharing of drinking fountains even though that is what is generally done. If employees and the public can share restroom facilities then they can certainly share drinking fountains when located within the prescribed travel distances.

Cost Impact: There will be a cost savings with shared drinking fountains.

ICCFILENAME: Davies-P1-403.5 NEW

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Proposed language does not include "floor above or below" or the requirement for an accessible route.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Don Davies, representing the Salt Lake City Corporation, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

403.5(IBC[P]2902.5) Drinking fountain location. Drinking fountains shall not be required to be located in individual tenant spaces provided that public drinking fountains are located within a travel distance of 500 feet of the most remote location in the tenant space and not more than one story above or below the tenant space. Where the tenant space is in a covered mall, such distance shall not exceed 300 feet. Drinking fountains shall be located on an accessible route.

Commenter's Reason: The Plumbing Code Change Committee generally liked this code change, except that the proposed language didn't include the requirement that the drinking fountain be located on an accessible route and be located on a floor above or below the individual tenant space. The requirement for an accessible route was already addressed in the code change. The provisions for the facility being located not more than one story above or below the space served has been added, as requested by the Plumbing Code Change committee. We have tried to keep this requirement in the simplest form possible by stating the requirements, rather than referencing some other part of the code.

Public Comment 2:

Eirene Oliphant, MCP, representing the Metropolitan Kansas City Chapter of the ICC, requests Approval as Modified by this Public Comment:

Modify the proposal as follows:

403.5 (IBC [P]2902.5) Required drinking fountains. ~~A required drinking fountain for a tenant space shall be located in the tenant space or external to the tenant space provided that the travel distance from the most remote point in the tenant space to the drinking fountain is within 500 feet or for covered malls, within 300 feet.~~ Customers, patrons and visitors shall be provided with *public* drinking fountains in structures and tenant spaces intended for public utilization. The number of drinking fountains shall be provided in accordance with Section 403 for all users.

403.5.1 Access. The route to the *public* drinking fountain required by Section 403.5 shall not pass through kitchens, storage rooms or closets. Access to the public drinking fountains shall be from within the building or from the exterior of the building. All routes shall comply with the accessibility requirements of the *International Building Code*. The public shall have access to the required drinking fountain at all times that the building is occupied.

403.5.2 Location of drinking fountains in occupancies other than covered malls. In occupancies other than covered mall buildings, the required *public* drinking fountain shall be located not more than one story above or below the space required to be provided with a drinking fountain, and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m).

> **Exception:** The location and maximum travel distances to required employee drinking fountains in factory and industrial *occupancies* are permitted to exceed that required by this section, provided that the location and maximum travel distance are *approved*.

403.5.3 Location of drinking fountains in covered malls. In covered mall buildings, the required drinking fountains shall be located not more than one story above or below the space required to be provided with drinking fountains, and the path of travel to such drinking fountains shall not exceed a distance of 300 feet (91.44 m).

Commenter's Reason: The proponent has provided a code change which provides specific direction on the location of drinking fountains. The committee disapproved the code change because it did not address the issue of accessibly or the "floor above or below". The proposed modification provides for the language for drinking fountains to be consistent with toilet facilities in terms of their locations and access.

Final Action: AS AM AMPC____ D

P35-09/10
403.3.2 (IBC [P] 2902.3.2)

Proposed Change as Submitted

Proponent: Patrick Vandergriff***,*** Vandergriff Code Consulting Services representing himself.

Revise as follows:

403.3.2 (IBC [P]2902.3.2) Location of toilet facilities in occupancies other than covered mall buildings. In occupancies other than *covered mall buildings,* the required public and employee toilet facilities shall be located not more than one *story* above or below the space required to be provided with toilet facilities and the path of travel to such facilities shall not exceed a distance of 500 feet (152 400 mm). <u>Where multiple buildings on a single lot are under the same control, public and employee toilet facilities shall not be required to be located in each building provided that all other requirements of this section are met, the total number of plumbing fixtures within such buildings complies with the aggregate number of fixtures required for all buildings and the toilet facilities are available for use when any one building on the lot is occupied.</u>

> **Exception:** The location and maximum travel distances to required employee facilities in factory and industrial occupancies are permitted to exceed that required by this section, provided that the location and maximum travel distance are *approved*.

Reason: Although this proposal is aimed at allowing the toilet facilities in a permanent school building to serve as the required toilet facilities for semi-permanent portable classroom buildings adjacent to the school but on the same property (lot), the allowance provides for reasonable accommodations at shopping centers, strip centers and individual commercial properties having multiple buildings under the same control. For example, consider a small business offices building with several separate buildings serving as warehouses for the business, all of which are on the same lot. If the travel and elevation location requirements are met, what is the harm in all of the required toilet facilities being located in the business office building? Other examples widely exist across the country as it is commonplace for strip centers and outdoor shopping centers to have central toilet facilities for the entire center. For schools that need fast expansion of classroom space, portable buildings are often brought in and used for several years or more until funds are available to build larger permanent buildings or additions. The decision to add these semi-permanent class room modules should not be required to be burdened by the expense of installing toilet facilities in each classroom module, especially where adequate toilet facilities exist within the required travel distance and elevation.

Cost Impact: Cost savings in some areas of the country.

ICCFILENAME: VANDERGRIFF-P1-403.3.2

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: An outdoor travel distance of up to 500 feet in winter or rainy conditions is too difficult for employees or the public to travel.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Patrick Vandergriff, Vandergriff Code Consulting Services, representing MBI, requests Approval as Submitted.

Commenter's Reason: When this item was being considered, testimony was given regarding issues of what would be allowed. A motion to approve and a second were received from the committee. Then a statement was made by a committee that I would require "wanting to require his people to go out in the cold to go to the restroom." This was not germane to any testimony provided and was after public discussion had been completed. This statement could have easily been answered had it been brought up in public comment. The vote fell directly along the lines of the makeup of the committee which was not a balanced committee and had a vast majority of the members from states along the northern border with Canada.

In reality, the code proposal would provide that a restroom meeting the distance requirement could be provided in another building under the same control and on the same site. This is often the manner of design around the country at this time, especially in southern and southwestern climates. And the idea of going outside of a building is not foreign to the code. Currently, typical designs for gasoline stations may have the patron go outside the building and back into a restroom facility. Many sports arenas particularly outside football and baseball stadiums have bathroom facilities not directly associated with the bleachers. Numerous schools in the southwest and western United States have classrooms where you would go outside under a covered walkway to go to a bathroom located within distance but requiring the students to go outside. Numerous warehousing operations have a series of warehouses, but use common restroom facilities. This may be a design issue in Michigan or Minnesota however, it should not preclude the use of such design other areas of the country. The code is for generalized use and should establish the minimum design requirements for the generalized use. It should not apply the most egregious conditions to the whole where such is not necessary.

Final Action: AS AM AMPC____ D

P49-09/10
413.3

Proposed Change as Submitted

Proponent: Sid Cavanaugh, Cavanaugh Consulting representing In Sink Erator

Revise as follows:

413.3 Commercial food waste grinder outlets. Commercial food waste grinders shall be connected to a drain not less than 1 ½ inches (38mm) in diameter. Commercial food waste grinders shall be connected and trapped separately from any other fixtures or sink compartments. <u>The connection of a commercial food waste grinder to the sanitary drainage system shall be downstream of all grease interceptors unless the code official approves or requires food waste grinders to discharge into a grease interceptor.</u>

Reason: This code change will clarify the intent of the code regarding commercial food waste grinders. Code officials have in the past and continue to allow food waste grinders to connect directly to the sanitary drainage system of buildings. Research has shown that food waste does not cause build up or blockage of sewer lines. Food waste has the same specific gravity as fecal matter and behaves similarly in the sewer system. Finally, while this code change will allow most installations to by-pass an interceptor it will still recognize Section 1003.3.2 where it can be required/allowed by a jurisdiction to connect to an interceptor.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: CAVANAUGH-P8-413.3

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Food waste grinders are not normally used for the disposal of grease so the option of whether disposals need to connect to a grease interceptor (or not) should be left open.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Rand H. Ackroyd, Rand Technical Consulting, representing himself, requests Approval as Modified by this Public Comment.

Modify the proposal as follows

413.3 Commercial food waste grinder outlets. Commercial food waste grinders shall be connected to a drain not less than 1 ½ inches (38mm) in diameter. Commercial food waste grinders shall be connected and trapped separately from any other fixtures or sink compartments. The connection of a commercial food waste grinder to the sanitary drainage system shall be downstream of all grease interceptors unless the code official approves or requires food waste grinders to discharge into a ~~grease~~ <u>solids</u> interceptor.

Commenter's Reason: The Code should never refer to a grease interceptor for directly receiving food waste. Grinders must discharge into a solids interceptor before the discharging into a greased interceptor.

Public Comment 2:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

413.3 Commercial food waste grinder outlets. Commercial food waste grinders shall be connected to a drain not less than 1 ½ inches in diameter. Commercial food waste grinders shall be connected and trapped separately from any other fixtures or sink compartments. The connection of a commercial food waste grinder to the sanitary drainage system shall be downstream of all grease interceptors unless <u>the interceptors are specifically designed and certified for handling food waste grinder discharge.</u> ~~the code official approves or requires food waste grinders to discharge into a grease interceptor.~~

Commenter's Reason: The text that was approved during the Public Hearing creates many new problematic issues. First and foremost it should not be the code official's responsibility to determine when a waste grinder discharges to an interceptor or not. These type decisions are usually based on the wastewater treatment facility or the private sewage disposal system capability, not the code official's opinion. The next issue is that a designer may a justified technical reason to want to discharge through an interceptor but the original language would allow the code official to override that technical determination with no just cause.

The consensus at the public hearing was that waste grinders should not discharge through interceptors for a number of reasons. However, there may be some instances where the designer, treatment facility or just a local ordinance that may require discharge through an interceptor. Many large facilities actually have a large interceptor the size of an average septic tank that may very well be able to accommodate a waste grinder discharge.

Lastly, this was originally proposed into the wrong section. Chapter 4 is titled "fixtures" and appropriately discusses food waste grinders. There was no connection between the requirements of Chapter, titled "traps, interceptors and separators" and this new requirement. We have slightly modified the format and inserted the trigger to connect the user to the correct sections of the code while maintaining the original intent.

Public Comment 3:

Judson Collins, JULYCO, Mannford, OK, representing self, requests Disapproval.

Commenter's Reason: The proposed language for this section is not necessary. No section of the current code requires a food waste grinder to discharge into a grease interceptor. Section 1003.3.2 only addresses situations "where" food waste grinders connect to grease interceptors. It does not require the connection. The proposed language says the code official can require a food waste grinder to discharge to a grease interceptor. The code official already has that authority. It is not necessary to repeat it.

Final Action: AS AM AMPC____ D

P51-09/10
416.5

<u>*Proposed Change as Submitted*</u>

Proponent: Guy Tomberlin of Virginia representing himself.

Revise as follows:

416.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from <u>lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors</u>. ~~*public* hand-washing facilities.~~ *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3.

Reason: This is an attempt to clarify that employee or private toilet rooms, not for public use, are not required to be supplied with tempered water. Section 403.3 clearly mandates where "public toilet facilities" are to be installed. This new definition specifically works in conjunction with the provisions of 403, so wherever facilities are installed for "public utilization" the hand washing fixtures are required to be provided with tempered water.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: TOMBERLIN-P1-416.5

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Agreed with the proponent's reason statement which stated that employee and private toilet rooms (not for public use) do not require tempered water.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tim Pate representing the Colorado Chapter of ICC, requests Disapproval.

Commenter's Reason: I am requesting disapproval of this code change. I believe that the language in 2003 IPC Section 607.1 was very specific in requiring tempered water for any accessible sink. Code change P66 03/04 was approved as modified which took out the specific wording about accessible sinks and used the more general wording for public sinks. It does not appear in the reason statement for code change P66 03/04 that there was specific intent to not require tempered water for employee bathrooms. By approving P51 09/10 employee bath sinks will not be required to have tempered water.

The basis behind requiring tempered water is to make sure that people – both able bodied and disabled – are not able to scald their hands. It does not make sense to restrict the requirement to bath sinks used only for customers, patrons, and visitors. While there is a requirement for protection from possible contact for the pipes under all accessible lavatories (for public and employees), this does not protect someone from possible scalding in the water coming out of the tap.

Final Action: AS AM AMPC____ D

P52-09/10, Part I
417.4.2

Proposed Change as Submitted

Proponent: Christopher Birch, Executive Vice President, Bath Enclosure Manufacturers Association

PART I - IPC

Revise as follows:

417.4.2 Access. The shower compartment access and egress opening shall have a ~~minimum~~ clear and unobstructed width of <u>not less than</u> ~~22~~ <u>18</u> inches (~~559~~ <u>457</u> mm).

Reason: In writing safety standards for the shower enclosure industry the Bath Enclosure Manufacturers Association determined that the minimum access width for shower enclosures should be 18" to accommodate shower enclosure units being manufactured. This will allow the standard bases to be fit with enclosures that are not allowed by the current code. For example, the current code does not consider overlap and jamb width in a 42 inch slider or a neo angle base with a 24 inch centerline. The 22 inch minimum has led to arbitrary and inconsistent enforcement. The industry's association has determined that 18 inches allows for functional accessibility, service and maintenance, emergency egress and response and rescue. The 18 inch minimum will be consistent with the safety and installation standards being developed by ASTM.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: BIRCH-P1-417.4.2

Public Hearing Results

PART I- IPC

Committee Action: **Disapproved**

Committee Reason: Rescue personnel need the 22 inches to access someone who needs help.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Christopher Birch, representing the Bath Enclosure Manufacturers Association, requests Approval as Submitted.

Commenter's Reason: The reasoning for leaving the 22 inch egress is out of touch, is illogical in the thought process and has led to arbitrary and inconsistent enforcement. Remember that the majority of shower enclosures will not be affected and most homeowners will make their purchases based upon their specifications. For the units that are affected, there is no recourse for a by the book inspector. Many dealers have customers for which they have installed bi-pass shower enclosure in their 44" fiberglass opening, thousands over the years. With the size of the jamb and the overlap, it is mathematically impossible to meet 22 inches. The local building inspector recites out of the uniform plumbing code a discrepancy for not meeting a minimum width of 22" for egress. The same goes for a neo-angle door. They rarely have a centerline that would allow a door with a 22" finished net width. There are other applications that are affected as well including but not limited to mobile homes, boats, R.V., ect. that would rule out a door but we will not address those at this time.

One could say that no one really walks into a shower "squared away" with the entry. The natural motion is move into a shower with one hand on the door handle and opposite shoulder first. This would tend to support a dimension measured from back of shoulder blade to tip of the tummy (or breast); more like 16'-18" on average. And one can also say that if a person is in need of rescue personnel in a neo angle unit or a bi-pass, the person is going to be on the floor and there will be no room for reasonable help in any situation. Common sense tells us that something needs to be changed. The industry has determined the minimum access width for shower enclosures should be 18" to accommodate all shower enclosure units being manufactured. This will allow the standard shower base to be fit with enclosures that are not allowed by the current code and still allow for functional accessibility, service and maintenance, emergency egress in response and rescue. Again, the 22" minimum egress is out of touch and has no solid basis to remain unless someone can prove to the industry that this is a TRUE safety concern. To date, we have not seen this documentation

Final Action: AS AM AMPC____ D

P52-09/10, PART II
IRC P2708.1

Proposed Change as Submitted

Proponent: Christopher Birch, Executive Vice President, Bath Enclosure Manufacturers Association

PART II - IRC

Revise as follows:

P2708.1.1 Access. The shower compartment access and egress opening shall have a ~~minimum~~ clear and unobstructed width of <u>not less than</u> ~~22~~ <u>18</u> inches (~~559~~ <u>457</u> mm).

Reason: In writing safety standards for the shower enclosure industry the Bath Enclosure Manufacturers Association determined that the minimum access width for shower enclosures should be 18" to accommodate shower enclosure units being manufactured. This will allow the standard bases to be fit with enclosures that are not allowed by the current code. For example, the current code does not consider overlap and jamb width in a 42 inch slider or a neo angle base with a 24 inch centerline. The 22 inch minimum has led to arbitrary and inconsistent enforcement. The industry's association has determined that 18 inches allows for functional accessibility, service and maintenance, emergency egress and response and rescue. The 18 inch minimum will be consistent with the safety and installation standards being developed by ASTM.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: BIRCH-P1-417.4.2

Public Hearing Results

PART II- IRC-P
Committee Action: **Disapproved**

Committee Reason: Lessening of the dimension would make it difficult for the average human to get into and out of the shower.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Christopher Birch, representing the Bath Enclosure Manufacturers Association, requests Approval as Submitted.

Commenter's Reason: See P52, Part II

Final Action: AS AM AMPC____ D

P57-09/10

419.1, Chapter 13

Proposed Change as Submitted

Proponent: John M. Halliwill, Halliwill and Associates, representing Caroma

1. Revise as follows:

419.1 Approval. Urinals shall conform to ANSI Z124.9, ASME A112.19.2M, ASME A112.19.19, CSA B45.1, ~~or~~ CSA 45.5 or IAPMO IGC 161. Urinals shall conform to the water consumption requirements of Section 604.4. Water-supplied urinals shall conform to the hydraulic performance requirements of ASME A112.19.6, CSA 45.1 or CSA B45.5.

2. Add standard to Chapter 13 as follows:

International Association of Plumbing and Mechanical Inspectors
5001 E. Philadelphia St.
Ontario, CA 91761

IAPMO

IGC 161-2007 Guide Criteria for Waterless Urinals

Reason: The proposed IAPMO IGC (standard) provides for materials and testing requirements for waterless urinals that are not covered in the current standards. One of which is stainless steel. The purpose statement in the proposed IGC states in part "The purpose of this standard is to provide the minimum design and performance criteria for waterless urinals. This standard is not intended to be a specification guide nor is it intended to restrict design. Its purpose is to serve as a guide for producers, distributors, architects, engineers, contractors, inspectors, and users; to promote understanding regarding materials, manufacture and installation; and to provide for identifying waterless urinals that conform with this standard."

Urinals that have been evaluated to this standard are currently in use using the Waterless Urinal with Liquid Trap technology.

This standard contains requirements for a new trap sealing method that has been evaluated and products listed for use in jurisdictions around the world. Products using this technology are currently manufactured by a number of manufacturers in this and other countries around the world. Additionally, it was noted while testing products using this new technology that should a negative pressure develop in the DWV system. Air will be introduced through the device until equilibrium is established. This feature will help maintain the trap seals of liquid seal traps so that odors, vapors and possibly injurious materials will not enter the building.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, IAPMO IGC 161-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: HALLIWILL-P1-419.1

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of proposed new standard IGC 161-2007 indicated that in the opinion of ICC staff, the standard did not comply with ICC standards criteria.

Committee Action: Disapproved

Committee Reason: IGC 161 is not a standard.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John M. Halliwell, Halliwell and Associates, Beaumont, CA, representing Caroma, requests Approval as Submitted.

Commenter's Reason: Staff, has indicated the standard submitted does not comply with the ICC Standards Policy "**3.6.3.2** The standard shall be developed and maintained through a consensus process such as ASTM or ANSI." The following information was given to staff to support the acceptance of this proposed new standard. (The standard is proposed as a new standard or as a revision is proposed. The proposal is advertised "posted for public review and comment, the committee meets in the open with public present, appeals can be made to the committees action should anyone have a problem with what was done. While this is not reviewed as an ANSI consensus document the process does allow for open and public review with comment and appeal procedures. It should be noted that there are currently none ANSI consensus documents accepted and referenced in the Code." Additionally it should be noted that not all ASTM standards have been reviewed and accepted under the ANSI standards process and that other standards were accepted by the committee at their last meeting that are not ASTM and or ANSI accepted standards.

The Committee indicated that IGC-161 was not a standard. It should be noted that the Staff did not indicate IGC-161 is not a standard and it has been noted while reviewing the committee actions that the term Standard is not defined in *Chapter 2 Definitions* of this code. While looking at other codes and dictionaries it is felt that IGC 161 does meet the definition of a standard. IGC does provide how the product is to be used, what materials are to be used in the manufacture of the products, how to test the product for compliance with the standard and how the product is to be marked to show compliance with the standard.

Final Action: AS AM AMPC____ D

P64-09/10, Part I
504.6

Proposed Change as Submitted

Proponent: Tom Hedges, representing the Arizona Building Officials

Part I - IPC

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater except where the discharge is to the outdoors, not subject to freezing and the piping terminates not less than 6 inches (152mm) and not more than 12 inches (305mm) above grade.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.

5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Not terminate more than 6 inches (152 mm) above the floor or waste receptor.
11. Not have a threaded connection at the end of such piping
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and approved for such use in accordance with ASME A112.4.1.
14. Direct the discharge in a downward direction.

Reason: This change will allow the P & T relief drain pipe to extend direct from the water heater to an exterior location where no freeze potential exists. This is consistent with the IPC Section 504.6 (IRC Section P2803.6.1), Item no. 5 which allows the discharge to go to the outdoors. The 6" minimum termination height provides the required air gap. This proposed change also establishes a maximum termination height of 12" for outdoor termination. This method of drainage and termination is very common in locations that have previously utilized the Uniform Plumbing Code for over 50 years. No data exists to suggest this method has created unsafe conditions. The Committee reason for disapproval of Item P50-07/08 clarifies that the code allows a discharge pipe to terminate over a water heater drip pan. The code currently establishes drip pan drain terminations at 6" minimum and 24" maximum termination heights in IPC Section 504.7.2 (IRC Section P2801.5.2). If it's safe to drain a discharge pipe from a drip pan using these heights, then it certainly would be no more harmful to use the similar heights for an outdoors termination.

This proposal improves the termination requirements.

This method is also more energy efficient by not creating a direct open pipe for air flow from and to the out doors as will occur where an untrapped waste receptor for the P & T relief valve discharge drains to the outdoors.

In many commercial tenant spaces it is common practice to locate a water heater above the lay-in ceiling in an attic or interstitial space. Many times these locations are above a restroom or storage room. IPC Section 802.3 prohibits a waste receptor in such locations. A drain pipe needs to extend beyond the room or space containing the water heater.

Also, IPC 802.3 prohibits waste receptors in rest rooms and IPC Section 504.6 Item no. 2 requires an air gap in the same room as the water heater, thereby prohibiting water heaters in rest rooms. This change would allow a reasonable option where the need exists.

Cost Impact: The code change proposal will not increase the cost of construction and may decrease cost.

ICCFILENAME: HEDGES-P1-504.6

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: Air gap needs to be in room with the water heater in case piping downstream of air gap is compromised.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tom Hedges, representing the Arizona Building Officials; Bruce Dimmig, representing the Arizona Building Officials, requests Approval as Submitted.

Commenter's Reason: The proposed code change represents a plumbing method allowed in a majority of jurisdictions west of the Mississippi River for at least 50 years. This is an opportunity for the voting members of ICC to again recognize and acknowledge a safe and cost effective method for piping the discharge from a water heater pressure-temperature relief valve.

The current IPC & IRC requires the water heater pressure-temperature relief valve drain line to have an air gap and such air gap shall be located in the same room as the water heater. If one chooses to extend the drain line to another room or the exterior of the building, an air gap is still required to be located in the same room as the water heater. This will necessitate the addition of an air gap fitting in the drain line near the P & T valve before extending the line out of the room. Since the typical discharge piping is ¾ inch, if a ¾ inch air gap fitting is installed in the discharge piping, the discharge piping will no longer be capable of carrying the flow from a P & T valve discharging at full pressure. A discharge at full pressure will also discharge from the air gap fitting's vent, flowing into the room. A ¾ inch discharge pipe under normal pressure will have a flow of about 12 GPM. Based on IPC 709.3, 12 GPM will result in an equivalent flow of 24 fixture units. This will require a 3 or 4 inch waste line, which is not practical.

The current code provisions will allow the discharge to terminate at a water heater pan. As can be deduced from the expected full flow noted above, this method will also likely allow flooding. The proposed change will result in a safe alternative that will be much less likely to cause flooding.

This code change would do 3 things; allow an option to locate the air gap at the termination of the relief valve discharge pipe, define the physical limits of the air gap and to clarify that all relief valve discharge pipes shall be pointed downward to better define "discharge in a manor that does not cause personal injury".

The air gap at the termination must also comply with the Section 504.6 requirement to "discharge to a termination point that is readily observable by the building occupants.

IMC, Section 1004.1 and 1006 related to water/steam boilers contains no similar stipulations that would mandate the air gap needs to be in the same room with the water boiler in case piping downstream of air gap is compromised. The upper limit of 12" for the air gap was a compromise to past committee criticism on previous proposed changes (P51-07/08) that 24" was too high and we agreed and recommended a lower limit.

Final Action: AS AM AMPC____ D

P64-09/10, Part II
P2803.6.1

Proposed Change as Submitted

Proponent: Tom Hedges, representing the Arizona Building Officials

Part II – IRC-P

Revise as follows:

P2803.6.1 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater <u>except where the discharge is to the outdoors, not subject to freezing and the piping terminates not less than 6 inches (152mm) and not more than 12 inches (305mm) above grade.</u>
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Not terminate more than 6 inches (152 mm) above the floor or waste receptor.
11. Not have a threaded connection at the end of such piping
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section P2904.5 or materials tested, rated and approved for such use in accordance with ASME A112.4.1.
14. <u>Direct the discharge in a downward direction.</u>

Reason: This change will allow the P & T relief drain pipe to extend direct from the water heater to an exterior location where no freeze potential exists. This is consistent with the IPC Section 504.6 (IRC Section P2803.6.1), Item no. 5 which allows the discharge to go to the outdoors. The 6" minimum termination height provides the required air gap. This proposed change also establishes a maximum termination height of 12" for outdoor termination. This method of drainage and termination is very common in locations that have previously utilized the Uniform Plumbing Code for over 50 years. No data exists to suggest this method has created unsafe conditions. The Committee reason for disapproval of Item P50-07/08 clarifies that the code allows a discharge pipe to terminate over a water heater drip pan. The code currently establishes drip pan drain terminations at 6" minimum and 24" maximum termination heights in IPC Section 504.7.2 (IRC Section P2801.5.2). If it's safe to drain a discharge pipe from a drip pan using these heights, then it certainly would be no more harmful to use the similar heights for an outdoors termination.

This proposal improves the termination requirements.

This method is also more energy efficient by not creating a direct open pipe for air flow from and to the out doors as will occur where an untrapped waste receptor for the P & T relief valve discharge drains to the outdoors.

In many commercial tenant spaces it is common practice to locate a water heater above the lay-in ceiling in an attic or interstitial space. Many times these locations are above a restroom or storage room. IPC Section 802.3 prohibits a waste receptor in such locations. A drain pipe needs to extend beyond the room or space containing the water heater.

Also, IPC 802.3 prohibits waste receptors in rest rooms and IPC Section 504.6 Item no. 2 requires an air gap in the same room as the water heater, thereby prohibiting water heaters in rest rooms. This change would allow a reasonable option where the need exists.

Cost Impact: The code change proposal will not increase the cost of construction and may decrease cost.

ICCFILENAME: HEDGES-P1-504.6

Public Hearing Results

PART II- IRC-P
Committee Action: **Disapproved**

Committee Reason: There needs to be an observable point near the water heater before the piping goes outside the room where the water heater is located. Proposed text conflict with the 24 inches in Section P2803.5.2.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tom Hedges, representing the Arizona Building Officials; Bruce Dimmig, representing the Arizona Building Officials, requests Approval as Submitted.

Commenter's Reason: See P64-09/10, Part I

Final Action: AS AM AMPC____ D

P65-09/10, Part I
504.7

Proposed Change as Submitted

Proponent: Shawn Strausbaugh–Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

PART I – IPC

Revise as follows:

504.7 Required pan. Where a storage tank-type water heater~~s~~ or a hot water storage tank~~s~~ ~~are~~ is installed in a location~~s~~ where water leakage from ~~of~~ the tank~~s~~ ~~or connections will~~ could cause damage, the tank ~~or water heater~~ shall be installed in a galvanized steel pan having a material thickness of not less than 0.236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use.

Reason: The existing text is not clear about whether tankless-type water heaters require a pan. A tankless water heater does not have a storage tank and does not present any greater risk of water leakage than a water distribution piping system that has been installed and pressure tested in accordance with this code. This proposal changes the text to make the pan requirement specific to storage tank water heaters and hot water storage tanks. This section is in the code because it is a well known fact that the majority of storage-type water heater tanks and hot water storage tanks have a relatively short life span that often ends in causing catastrophic damage to the building. Tankless water heaters are constructed of materials that are much more corrosion resistant than the materials (glass-lined carbon steel) of most water heater tanks and hot water tanks. Tankless water heaters should not be required to have drip pans installed.

The language concerning connections was removed because connections made in accordance with this code have no greater risk of leakage than any other connection in the water distribution system. Finally, the language of this section has been cleaned up to read better.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: STRAUSBAUGH-P1-504.7

Public Hearing Results

PART I- IPC
Committee Action: **Approved as Submitted**

Committee Reason: Proposed text clarifies that the pans are not required under tankless water heaters or connections to tankless water heaters

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing and Mechanical Inspectors Assoc. requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

504.7 Required pan. Where a storage tank-type water heater or a hot water storage tank is installed in a location where water leakage from the tank will ~~could~~ cause damage, the tank shall be installed in a galvanized steel pan having a material thickness of not less than .0.236 inch (0.6010) (No. 24 gage), or other pans approved for such use.

Commenter's Reason: Part I was approved as submitted however the word could was unintentionally placed in the change. The use of could is not proper code language and this modification is to remove the word could and use will instead. No other modifications have been made.

Public Comment 2:

Gary Klein, Affiliated International Management LLC., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

504.7 Required pan. Where a tankless water heater, storage tank~~-type~~ water heater or a hot water storage tank is installed in a location where water leakage ~~of~~ from the water heater or tank could cause damage, the water heater or tank shall be installed in a galvanized steel pan having a material thickness of not less than 0.236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use. Listed pans shall comply with CSA LC3. Tankless water heaters having an input rating not exceeding 12kW and storage water heaters having a volume not exceeding 3 gallons shall not require a pan.

Commenter's Reason: The reasoning used to support this proposal at the first hearing did not present a full picture of the problem. What was missing is the fact that we do not yet have data regarding the long term failure rates and modes of failure for tankless water heaters. This is because they have only been installed in large numbers in the US for less than 10 years. Most manufacturers offer a limited 10-15 year warranty, and we are only now approaching this number of years for the vast majority of the installed base.

While it is true that there is only a very small tank in a gas tankless water heater (in the heat exchanger and in the piping internal to the unit), the most likely mid-long term failure mode is leakage through the heat exchangers themselves. These are intentionally thin-walled devices, so that heat is transferred efficiently from the combustion gases to the water. The regular maintenance schedule stipulated by the manufacturer to flush out any sediment and calcification build-up in the heat exchanger depends on local water quality, which varies widely around the US. In areas with very hard water, it is necessary to accelerate the maintenance schedule in order to maintain proper performance. Each time the heat exchanger is flushed, some of the material comes away with the sediment, making the walls thinner is some places. Based on our experiences with pin-hole leaks in copper tubing, we can expect to see similar problems develop in the heat exchangers. While such leaks can start out small, they can quickly become quite large.

There is still another reason to adopt this revised proposal. We are beginning to see a wide variety of new water heater combinations coming on to the US market. Some of these have 0.5 gallon tanks, some tankless electric water heaters have about 1 gallon, others have 4-6 gallons and I expect to see some in the 2-3 gallon range. Also, what about the expansion tank; which all systems with a back-flow prevention device that prevents pressure from going back into the mains should have? These are at least 2.5 gallons. At what point does a water heater become a storage water heater?

To make enforcement easier, it seems prudent to require that all water heater installations in locations where a leak could cause damage should have a pan that enables the control of a major leak.

It is very premature to remove this building safety requirement at this time. I recommend that you disapprove the proposal that was adopted by the Committee. Thank you.

Final Action: AS AM AMPC____ D

P65-09/10, Part II
IRC P2801.5

Proposed Change as Submitted

Proponent: Shawn Strausbaugh–Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

PART II – IRC

Revise as follows:

P2801.5 Required pan. Where a storage tank-type water heater~~s~~ or a hot water storage tank~~s~~ ~~are~~ is installed in a location~~s~~ where water leakage from ~~of~~ the tank~~s~~ ~~or connections will~~ could cause damage, the tank ~~or water heater~~ shall be installed in a galvanized steel pan having a material thickness of not less than 0.236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use. Listed pans shall comply with CSA LC3.

Reason: The existing text is not clear about whether tankless-type water heaters require a pan. A tankless water heater does not have a storage tank and does not present any greater risk of water leakage than a water distribution piping system that has been installed and pressure tested in accordance with this code. This proposal changes the text to make the pan requirement specific to storage tank water heaters and hot water storage tanks. This section is in the code because it is a well known fact that the majority of storage-type water heater tanks and hot water storage tanks have a relatively short life span that often ends in causing catastrophic damage to the building. Tankless water heaters are constructed of materials that are much more corrosion resistant than the materials (glass-lined carbon steel) of most water heater tanks and hot water tanks. Tankless water heaters should not be required to have drip pans installed.

The language concerning connections was removed because connections made in accordance with this code have no greater risk of leakage than any other connection in the water distribution system. Finally, the language of this section has been cleaned up to read better.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: STRAUSBAUGH-P1-504.7

Public Hearing Results

PART II- IRC-P
Committee Action: **Approved as Submitted**

Committee Reason: There are clearly differences between tank type and tankless water heaters such that tankless should not require pans. Consistency with the action of the IPC committee.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing and Mechanical Inspectors Assoc., requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P2801.5 Required pan. Where a storage tank-type water heater or a hot water storage tank is installed in a location where water leakage from the tank will ~~could~~ cause damage, the tank shall be installed in a galvanized steel pan having a material thickness of not less than .0.236 inch (0.6010) (No. 24 gage), or other pans approved for such use. Listed pans shall comply with CSA LC3.

Commenter's Reason: Part I & II were both approved as submitted however the word could was unintentionally placed in the change. The use of could is not proper code language and this modification is to remove the word could and use will instead. No other modifications have been made.

Public Comment 2:

Gary Klein, Affiliated International Management, LLC., representing himself, requests Approval as Modified by this Public Comment.

P2801.5 Required pan. Where a <u>tankless water heater</u>, storage tank~~-type~~ water heater or a hot water storage tank is installed in a location where water leakage ~~of~~ from the <u>water heater or</u> tank could cause damage, the <u>water heater</u> or tank shall be installed in a galvanized steel pan having a material thickness of not less than 0.236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use. Listed pans shall comply with CSA LC3. <u>Tankless water heaters having an input rating not exceeding 12kW and storage water heaters having a volume not exceeding 3 gallons shall not require a pan.</u>

Proposed Change as Submitted

Proponent: Rand Ackroyd, Rand Technical Consulting, representing The Plumbing and Drainage Institute

Part I - IPC

1. Revise as follows:

604.9 Water hammer. The velocity of the water distribution system shall be controlled to reduce the possibility of water hammer. A water-hammer arrestor shall be installed where quick-closing valves are utilized. Water hammer arrestors shall be installed in accordance with the manufacturer's specifications. Water-hammer arrestors shall conform to ASSE1010 <u>or PDI WH201</u>.

2. Add standard to Chapter 13 as follows:

PDI
<u>WH201-2006</u> <u>Water Hammer Arrestors</u>

Reason: PDI WH201 is the original US standard for water hammer arrestors first published over 40 ago. With copywriter permission the PDI performance requirements were allowed to be duplicated in the equivalent standard that is currently referenced in the Code, ASSE standard 1010. PDI WH201 was updated in 2006. This standard PDI WH201 is available to the public at no cost on www.pdionline.org .

Cost Impact: The code change will not increase the cost of construction.

Analysis: Review of proposed new standard, PDI WHI201-2006, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: Ackroyd-P5-604.9

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at <u>http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf</u> :

Analysis: Review of proposed new standard PDI WH201-2006 indicated that in the opinion of ICC staff, the standard did not comply with ICC standards criteria.

PART I- IPC
Committee Action: **Approved as Submitted**

Committee Reason: The PDI standard is equivalent to ASSE 1010.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble, ICC Referenced Standards Committee Chair representing the ICC Referenced Standards Committee, requests Disapproval.

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically Section 3.6.3, which requires standards be promulgated according to a consensus process.

We therefore request disapproval.

Final Action: AS AM AMPC____ D

P79-09/10
607.2

Proposed Change as Submitted

Proponent: Guy Tomberlin of Virginia representing himself.

Revise as follows:

607.2 H<u>ot</u> <u>or tempered</u> water <u>supply to fixtures</u> ~~supply temperature maintenance~~. ~~Where the developed length of hot water piping from the source of hot water supply to the furthest fixture exceeds 100 feet (30 480 mm), the hot water supply system shall be provided with a method of maintaining the temperature in accordance with the International Energy Conservation Code.~~ <u>The developed length of hot or tempered water piping, from the source of hot water to the fixtures that require hot or tempered water, shall not exceed 40 feet (12192mm). Recirculating system piping and heat traced piping shall be considered to be sources of hot or tempered water.</u>

Reason: Energy conservation needs to be observed in the IPC. Hot water supply is an area where design is critical. Either locate the water heating source near the fixtures or install a circulating system or heat trace system. This is in attempt to minimize the time it takes to get hot water to a fixture. I believe that 100 feet is entirely too much distance between the fixture and the water heating source. A huge amount of water and energy is wasted while running the water and waiting for the heated water to get to the outlet.

Current text in the IPC is easily manipulated to permit unwanted systems, that comply with the language as written, but that fail to serve the intended purpose. This proposal changes the text to say what it means, and maintain the original intent which is to get hot water to the fixture without wasting unnecessary energy and water.

In essence, this is in attempt to minimize the time it takes to get hot water to a fixture. Energy conservation must be observed in the IPC/IRC. Hot water supply is an area where design is critical to enable huge energy and water savings.

Cost Impact: This proposal may increase the cost of construction.

ICCFILENAME: TOMBERLIN-P3-607.2

Public Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

607.2 Hot or tempered water supply to fixtures The developed length of hot or tempered water piping, from the source of hot water to the fixtures that require hot or tempered water, shall not exceed ~~40~~ <u>50</u> feet (~~12192~~ <u>15240</u>mm). Recirculating system piping and heat traced piping shall be considered to be sources of hot or tempered water.

Committee Reason: Modification and action consistent with P80.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gary Klein, Affiliated International Management, LLC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

607.2 Hot or tempered water delivery ~~supply~~ to fixtures. The developed length of hot or tempered water piping, from the source of hot water to the fixtures that require hot or tempered water, shall not exceed 50 feet (15240mm). ~~Recirculating system piping and heat traced piping shall be considered to be sources of hot or tempered water.~~ Where a water heater or a hot water storage tank is the nearest source of hot or tempered water, the volume of water in hot or tempered water piping between a water heater or a hot water storage tank and the water outlet of a shower, sink or lavatory fixture fitting shall not exceed 87 ounces (2.6 L). Where circulating hot water loop system piping or electrically heat-traced piping is the nearest source of hot or tempered water, the volume of water in hot or tempered water piping between the circulating hot water loop system piping or electrically heat-traced piping and the water outlet of a shower, sink or lavatory fixture fitting shall not exceed 32 ounces (0.96 L). The volume shall be calculated in accordance with Section 607.2.1.

607.2.1 Volume calculation. For the purpose of this section, water heaters, hot water storage tanks, circulating hot water loop system piping, and electrically heat-traced piping shall be considered to be sources of hot or tempered water. The volume of water between the source of hot or tempered water and the water outlet of a shower sink or lavatory fitting shall be calculated by adding the internal volume of all piping, fittings, valves, meters, and manifolds between the source and the outlet. Where the source of hot water is a circulating hot water loop system pipe or an electrically heat-traced pipe, the calculated volume shall include the volume of the portion of the fitting on the loop or heat-traced pipe that connects to the piping leading to the fixture fitting. Piping volumes shall be calculated using Table 607.2.1.

(Renumber subsequent sections)

TABLE 607.2.1
INTERNAL VOLUME OF
VARIOUS TYPES OF WATER DISTRIBUTION PIPE AND TUBING

Nominal Pipe or Tube Size (inch)	PIPE OR TUBING MATERIAL							
	COPPER (Type)			CPVC			PEX	
	M	L	K	CTS SDR 11	SCH 40	SCH 80	CTS SDR 9	-AL-PEX
	LIQUID OUNCES PER FOOT OF LENGTH							
3/8	1.06	0.97	0.84	NA	1.17	0.86	0.64	0.63
1/2	1.69	1.55	1.45	1.25	1.89	1.46	1.18	1.31
3/4	3.43	3.22	2.90	2.67	3.38	2.74	2.35	3.39
1	5.81	5.49	5.17	4.43	5.53	4.56	3.91	5.56
1 1/4	8.70	8.36	8.09	6.61	9.66	8.24	5.81	8.49
1 1/2	12.18	11.83	11.45	9.22	13.20	11.38	8.09	13.88
2	21.08	20.58	20.04	15.79	21.88	19.11	13.86	21.48

For SI: 1 ounces = 0.030 liter

Commenter's Reason: The reasoning used to support this proposal at the first hearing correctly points out that limiting the length of pipe between the source of hot water and the hot water fixtures will reduce the waste of water, energy and time while waiting for hot water to arrive. It will also reduce the energy used during the use phase of each hot water event and it will reduce the energy that is lost when the water in the non-recirculated or heat traced piping eventually cools down.

However, the proposal did not do enough to get at the core of the problem, which is to limit the volume. As it stands, it is possible to have piping with an unknown diameter between the source of hot water and the fixtures so long as it does not exceed 50 feet. This is twice as good as a pipe that does not exceed 100 feet, but since the diameter is not specified, the actual volume is unknown. Using the table above and using Type L Copper as tubing, the volume in a 50 foot pipe will range from 48.5 – 1,029 ounces (roughly 1/3 to over 8 gallons). The greater the volume, the greater the waste.

One of the most important reasons to focus on the pipe volume, rather than the length is that many fixture flow rates are below 1 gpm, in particular those for lavatory faucets, which are currently at 0.5 gpm of full flow. The faucets that temper the water at the valve actually have flow rates on the hot side that are around 0.25 gpm. At 0.5 gpm, it will take a minimum of 45 seconds for hot water to travel through 50 feet of 3/8 pipe and more than 1.5 minutes if the flow rate was 0.25 gpm. Neither of these times-to-tap is acceptable according to ASPE. At the other extreme, in a 2 inch pipe, it will take at least16 minutes for hot water to travel 50 feet. In fact, because of the relatively small face-velocity of the water, it will take significantly longer than that, even if the pipe is insulated. This helps explain why the faucets in public restrooms in conference hotels often take an exceedingly long time to get hot water, even if there are many people using them.

I believe that this proposal is consistent with the scope of the original code change proposal and the reasoning is germane because it builds on the logic used in the reasoning for the original proposal and will enable more effective implementation of the desired intent.

I recommend that you accept this revised proposal. Thank you.

Final Action: AS AM AMPC____ D

P84-09/10, Part I
605.16.2

Proposed Change as Submitted

Proponent: Paul Coble, Lewis Pipe Company, Ardmore, TN

PART I - IPC

Revise as follows:

605.16.2 Solvent cementing. Joint surfaces shall be clean and free from moisture, and an approved primer shall be applied. Solvent cement, orange in color and conforming to ASTM F 493, shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the conditions apply:

1. The solvent cement is third party certified as conforming to ASTM F-493.
2. The solvent cement used is yellow <u>or blue</u> in color.
3. The solvent cement is used only for joining ½ (12.7 mm) inch through 2 inch (51 mm) diameter pipe and fittings.
4. The CPVC pipe and fittings are manufactured in accordance with ASTM D2846.

Reason: The yellow color indicated matches a competitor products trademark color. The blue indicated would match our trademark color. This is the only code which gives a single company or product a competitive advantage in the market. This color has actually been used against our product in the market with representatives from our competitor in at least 5 states claiming yellow one step cement would not work with a blue pipe system. The products in question are FLOWGUARD GOLD marketed by Lubrizol and Lewis Blue marketed by Lewis Pipe Company. We have developed a blue one step and would like to market this accordingly. The same standards for the cement would still apply.

Cost Impact: There will be no cost impact to builders, plumbers, or home buyers as the products will be virtually the same price and represent a very small portion of the building process.

ICCFILENAME: Coble-P1-605.16.2

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: Blue color appears to be promoting a proprietary product.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing and Mechanical Inspectors Assoc. requests Approval as Modified by this Public Comment:

Modify the proposal as follows:

605.16.2 Solvent cementing. Joint surfaces shall be clean and free from moisture, and an approved primer shall be applied. Solvent cement, orange in color and conforming to ASTM F 493, shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the conditions apply:

1. The solvent cement is third party certified as conforming to ASTM F-493.
~~2. The solvent cement used is yellow or blue in color.~~
~~3~~2. The solvent cement is used only for joining ½ (12.7 mm) inch through 2 inch (51 mm) diameter pipe and fittings.
~~4~~3. The CPVC pipe and fittings are manufactured in accordance with ASTM D2846.

Commenter's Reason: Part I of this proposed change was disapproved by committee and Part II was approved as submitted. In order not to have the IPC and the IRC conflicting the exception #2 from both proposals should be removed. The committee reason for Part I disapproval was that the color may be promoting a proprietary product which is why we believe colors should not be included neither blue nor yellow or any future color solvent cement that is produced. If the solvent cement conforms to ASTM F-493, the CPVC pipe and fittings are manufactured in accordance with ASTM D2846 and the solvent cement is used for joining ½ (12.7 mm) inch through 2 inch (51mm) diameter pipe and fittings then the solvent cement should conform no matter what the color.

Proposed Change as Submitted

Proponent: Julius Ballanco, P.E., CPD, FASPE/JB Engineering and Code Consulting, P.C. representing himself

Errata: The following correction of the monograph is noted. This errata was discovered after the public hearing errata book was published. Proposal P85 in its entirety was published in error. The correct P85 follows:

PART I - IPC

Add new text as follows:

<u>**605.25 Listed joint or connection.** Joints and connections that are not otherwise addressed in Section 605 and are certified by a third party agency as acceptable for water service or water distribution systems shall be permitted. The joints and connections shall be installed in accordance with their certification and manufacturer's installation instructions.</u>

Reason: There are various types of joints and connections utilized in water distribution and water supply systems that are not listed in Section 605. However, these joints or connections are listed by a third party agency as being acceptable for water distributions systems. This new section will indicate that such joints and connections are acceptable. Some examples of these types of joints and connections are unions, rolled groove fittings, and cut groove fittings.

Cost Impact: This code change will not increase the cost of construction.

ICCFILENAME: BALLANCO-P4-711.2

Public Hearing Results

PART I- IPC
Committee Action: Disapproved

Committee Reason: Additional information about the type of fitting is necessary. Products can always be submitted to the code official for alternate approval.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self, requests Approval as Submitted.

Commenter's Reason: The reason for disapproving this change is the reason I submitted the change. The Committee has stated that special joints can be approved as an alternative. Of course one can always seek an alternative approval, but why go through that in every local jurisdiction when a joining method has been listed for a given application.

NPFA 13 has long permitted listed joints to be installed. The International Fuel Gas Code has a similar provision for gas piping joints. So, why not have the same requirement in the Plumbing Code.

There are currently a number of joining methods that are listed but not in the plumbing code. I listed some of these examples in my supporting statement. These joining methods have become so common place, that most inspectors don't even realize that every time they are used, the contractor or engineer should be submitting a written request for alternative approval and the inspector must rule on that request.

When is the last time an inspector had such a written request for a union fitting. Yet that would be necessary since unions connections (the thread pattern of the union) are not listed in the code. Additionally, when is that last time this occurred for grooved fittings.

Most jurisdiction are already allowing listed fitting without going through the alternative approval process. It is time to recognize that what these jurisdictions are doing is correct and proper.

Final Action: AS AM AMPC____ D

P85-09/10, Part II
IRC P2905.19 (New)

Proposed Change as Submitted

Errata: The following correction of the monograph is noted. This errata was discovered after the public hearing errata book was published. Proposal P85 in its entirety was published in error. The correct P85 follows:

PART II - IRC

Add new text as follows:

P2905.19 Listed joint or connection. Joints and connections that are not otherwise addressed in Section P2905 and are certified by a third party agency as acceptable for water service or water distribution systems shall be permitted. The joints and connections shall be installed in accordance with their certification and manufacturer's installation instructions.

Reason: There are various types of joints and connections utilized in water distribution and water supply systems that are not listed in Section 605. However, these joints or connections are listed by a third party agency as being acceptable for water distributions systems. This new section will indicate that such joints and connections are acceptable. Some examples of these types of joints and connections are unions, rolled groove fittings, and cut groove fittings.

Cost Impact: This code change will not increase the cost of construction.

P86-09/10, Part I
608.7, 608.15.4.2

Proposed Change as Submitted

Proponent: Judson Collins, JULYCO, representing Woodford Manufacturing Co.

PART I – IPC

Revise as follows:

608.7 Valves and outlets prohibited below grade. Potable water out lets and combination stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground are considered to be stop-and-waste valves.

> **Exception:** Freezeproof yard hydrants that drain the riser into the ground shall be permitted to be installed, provided that the potable water supply to such hydrants is protected upstream of the hydrants <u>with a field testable backflow preventer assembly</u> in accordance with Section 608 and the hydrants are permanently identified as nonpotable outlets by approved signage that reads as follows: "Caution, Nonpotable Water. Do Not Drink."

608.15.4.2 Hose connections. Sillcocks, hose bibs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric-type vacuum breaker, <u>a</u> pressure-type vacuum breaker<u>,</u> <u>a two-check type backflow preventer</u> or a permanently attached hose connection vacuum breaker. <u>All devices used for such protection shall be field testable</u>.

Reason: A study that evaluated vacuum breakers after they were installed found that the frost proof sillcocks, conforming to ASSE 1019 that had been installed for 5 or more years, have a high probability of failure of the vacuum breaker. Therefore, property owners have no guarantee of backflow protection from ASSE 1019 devices and no way of testing to determine if the devices are working properly. Requiring a field testable backflow preventer, other than atmospheric-type vacuum breakers, for protection of hose connections will allow owners to determine if proper protection is being provided.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: COLLINS-P10-608.7

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: Field testing rarely, if ever, occurs so why require a field testable device?

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Judson Collins, JULYCO, representing Woodford Manufacturing, requests Approval as Modified by this public comment.

Modify the proposal as follows:

Section 608.7 Valves and outlets prohibited below grade. Potable water out lets and combination stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground are considered to be stop-and-waste valves.

Exception: Freezeproof yard hydrants that drain the riser into the ground shall be permitted to be installed, provided that the potable water supply to such hydrants is protected upstream of the hydrants ~~with a field testable backflow preventer assembly~~ in accordance with Section 608 and the hydrants are permanently identified as nonpotable outlets by approved signage that reads as follows: "Caution, Nonpotable Water. Do Not Drink."
Section 608.15.4.2 Hose connections. Sillcocks, hose bibs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric-type or pressure-type vacuum breaker, a two-check type backflow preventer or a permanently attached hose connection vacuum breaker. All devices used for such protection shall be field testable.

Commenter's Reason: Woodford Manufacturing commissioned a study that evaluated vacuum breakers in frost proof sillcocks conforming to ASSE 1019. The study dealt with frost proof sillcocks that had been installed for 5 or more years. It was determined that the vacuum breakers in the study, had a high probability of failure. Therefore property owners have no guarantee of backflow protection from ASSE 1019 devices and no way of testing to determine if the devices are working properly. Requiring a field testable backflow preventer for protection of hose connections will allow owners to determine if proper protection is being provided.

The following table and summary (listed on the next page) are taken from the report on the study.

Table 7
Complete Test Results For Each Sillcock
(An X indicates that the valve passed the particular test.)

Id. #	Backsiphonage Test	Low Head Back Pressure Test	Atmospheric Vent, Hydrostatic, and Water Flow & Pressure Loss Test	Complete Test Results
01	X	X	X	Passed
02	X			Failed
03	X			Failed
04	X		X	Failed
05				Failed
06	X			Failed
07	X			Failed
08	X		X	Failed
09				Failed
10				Failed
11	X			Failed
12	X		X	Failed
13	X	X		Failed
14				Failed
15	X	X		Passed[1]
16	X			Failed
17	X			Failed

Note 1. Because of the split tube, the sillcock could not be tested to the final three tests.

Summary: Testing of 17 frostproof sillcocks, removed after being installed for 5 or more years, in 3 different states, indicates that the ASSE 1019 standard does not provide an adequate test protocol to provide the minimum level of protection against backflow. The piston-type frostproof sillcocks, with backflow protection conforming to ASSE 1019, cannot be considered reliable after being installed for a period of 5 years. The public cannot be assured that the frostproof sillcocks will protect the potable water supply against backflow contamination.

The American Society of Sanitary Engineering and their Product Standards Committee should be notified of these test results. A request to either revise, or withdraw, the standard should be proposed to ASSE. Likewise, the model plumbing code organizations should be informed of the test results.

Public Comment 2:

Sidney Cavanaugh, Cavanaugh Consulting, representing Woodford, requests Approved as Submitted.

Commenter's Reason: The whole philosophy behind backflow protection is that it will always protect against the appropriate degree of hazard. This is done by field testing on an annual basis by qualified testers who also make repairs as needed during testing or by consumer field testing that can indicate whether the device is working properly or not. Independent testing has shown that many devices currently being used are not field testable and will fail unless repaired or replaced. It is time for the code to recognize this failure and demand proper protection of the potable water outlets covered.

Final Action: AS AM AMPC____ D

P86-09/10 – Part II
IRC P2902.4.3, P2903.9.5

Proposed Change as Submitted

Proponent: Judson Collins, JULYCO, representing Woodford Manufacturing Co.

PART II – IRC

Revise as follows:

P2902.4.3 Hose connection. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric-type ~~or~~ vacuum breaker, a pressure-type vacuum breaker , a two-check type backflow preventer or a permanently attached hose connection vacuum breaker. All devices used for such protection shall be field testable.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

P2903.9.5 Valves and outlets prohibited below grade. Potable water outlets and combination stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground are considered to be stop-and-waste valves.

Exception: Installation of freezeproof yard hydrants that drain the riser into the ground shall be permitted if the potable water supply to such hydrants is protected upstream of the hydrants with a field testable backflow preventer assembly in accordance with Section P2902 and the hydrants are permanently identified as nonpotable outlets by *approved* signage that reads as follows: "Caution, Nonpotable Water. Do Not Drink."

Reason: A study that evaluated vacuum breakers after they were installed found that the frost proof sillcocks, conforming to ASSE 1019 that had been installed for 5 or more years, have a high probability of failure of the vacuum breaker. Therefore, property owners have no guarantee of backflow protection from ASSE 1019 devices and no way of testing to determine if the devices are working properly. Requiring a field testable backflow preventer, other than atmospheric-type vacuum breakers, for protection of hose connections will allow owners to determine if proper protection is being provided.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: COLLINS-P10-608.7

Public Hearing Results

PART II- IRC-P

Committee Action: **Disapproved**

Committee Reason: Testimony given indicated that ASSE 1019 device failure rate is 9 out of 10. While this points to a problem that needs to be looked into by the industry, it is too early to decide to make the code require a different type of backflow device for hose bibs.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment 1:

Judson Collins, JULYCO, representing Woodford Manufacturing, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P2902.4.3 Hose connection. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric-type vacuum breaker, a pressure-type vacuum breaker , a two-check type backflow preventer or a permanently attached hose connection vacuum breaker. All devices used for such protection shall be field testable.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

P2903.9.5 Valves and outlets prohibited below grade. Potable water outlets and combination stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground are considered to be stop-and-waste valves.

Exception: Installation of freezeproof yard hydrants that drain the riser into the ground shall be permitted if the potable water supply to such hydrants is protected upstream of the hydrants ~~with a field testable backflow preventer assembly~~ in accordance with Section P2902 and the hydrants are permanently identified as nonpotable outlets by approved signage that reads as follows: "Caution, Nonpotable Water. Do Not Drink."

Commenter's Reason: See P86-09/10, Part I

Public Comment 2:

Sidney Cavanaugh, Cavanaugh Consulting, representing Woodford, requests Approval as Submitted.

Commenter's Reason: See P86-09/10, Part I

Final Action: AS AM AMPC____ D

P92-09/10, Part I
202

Proposed Change as Submitted

Proponent: Michael S. Moss, American Backflow Prevention Association

PART I – IPC

1. Revise as follows:

BACKFLOW PREVENTER. A backflow prevention assembly, a device or other ~~means~~ methods to prevent backflow into the potable water supply.

CONTAMINATION. An impairment of the quality of potable water that creates a~~n~~ ~~actual~~ ~~hazard to the~~ public health risk through poisoning, ~~or~~ ~~through~~ the spread of disease ~~by~~ or contact with sewage, industrial fluids, ~~or~~ waste or radioactivity. See "*Pollution*".

POLLUTION. An impairment of the quality of potable water ~~to a degree~~ that does not create a ~~hazard to the~~ public health risk but that does adversely and unreasonably affect the aesthetic qualities of ~~such~~ potable water intended for ~~domestic use~~ drinking, bathing or culinary purposes. See "*Contamination*".

REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENT~~ER~~ION ASSEMBLY. A backflow prevention ~~device~~ assembly consisting of two independently acting check valves, internally ~~force-~~loaded to a normally closed position and separated by an intermediate chamber with a ~~(or~~ zone~~)~~ of reduced pressure. ~~in which there is~~ The reduced pressure zone is provided with an automatic ~~relief~~ means of venting to the atmosphere, internally loaded to a normally open position between two tightly closing shutoff valves and with a means for testing for tightness of the checks and opening of the relief means.

2. Add new definitions as follows:

HAZARD, DEGREE OF

High or Health. A condition or arrangement that could cause contamination of a potable water supply or system supply. See "*Contamination*".

Low or Non-health. A condition or arrangement that could cause pollution of a potable water supply or system supply. See "*Pollution*".

Reason: BACKFLOW PREVENTER: The change in this term's definition is necessary to better understand the use of Table 608.1(IRC Table P2902.3) APPLICATION OF BACKFLOW PREVENTERS. I have submitted a companion proposal for rearranging the information in Table 608.1 to show that BACKFLOW PREVENTERS are categorized in three groups: Backflow Prevention Assemblies, Backflow Devices, and Other Methods. The purpose of the three groupings is to illustrate that Backflow Prevention Assemblies are field testable (having shutoff valves and test cock fittings), Backflow Devices are not field testable; and Other Methods are not field testable but by observation, can be determined that proper backflow protection exists.

CONTAMINATION and POLLUTION: Table 608.1 (IRC Table P2902.3) has a footnote concerning the relationship between the terms "high" and "low" hazard and the defined terms of CONTAMINATION and POLLUTION, respectively. The backflow prevention community also uses the terms "health hazard" and "non-health hazard" in describing applications and connections. The proposed amendments to these definitions are necessary so that code officials, backflow prevention specialists, plumbers and plumbing system designers clearly understand the relationships between these terms and are able to properly select appropriate backflow preventers in accordance with the table.

REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENTION ASSEMBLY: This definition needs changed to be in alignment with the 3 groups of Backflow Preventers that are identified in the proposed amended definition of BACKFLOW PREVENTER and the proposed rearrangement of Table 608.1. For the IRC, the term "REDUCED PRESSURE-ZONE BACKFLOW PREVENTER" is not found in the IRC text, therefore, the term is being corrected to match terminology corrections that are being proposed by companion proposals for numerous code sections.

All proposed changes in the above definitions have no technical impact. These changes, along with other proposed companion changes are necessary to provide meaningful and consistent terminology throughout the code for better understanding of the application of backflow preventers.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Moss-P1-202

Public Hearing Results

PART I- IPC

Committee Action: **Disapproved**

Committee Reason: Conflicts with existing code language and will cause confusion.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Michael S. Moss, representing American Backflow Prevention Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

CONTAMINATION. An impairment of the quality of potable water that creates public health risk through poisoning, the spread of disease or contact with sewage, industrial fluids, waste or radioactivity. ~~See "Pollution".~~ An arrangement that could cause contamination of potable water to occur is referred to as a high hazard or health hazard condition.

POLLUTION. An impairment of the quality of the potable water that does not create public health risk but that does adversely and unreasonably affect the aesthetic qualities of potable water intended for drinking, bathing or culinary purposes. ~~See "Contamination".~~ An arrangement that could cause pollution of potable water to occur is referred to as a low hazard or non-health hazard condition.

Commenter's Reason: There was considerable confusion during the code hearing concerning the ASSE Standards. An individual provided testimony against the proposal to the Committee and was in error. The ASSE Plumbing Standards Magazine provides that organizations standardized titles and approval dates. The representative's error appeared to take credibility from the proposals presented. The titles for assemblies and devices used for the code proposals have been published for several years and have been current for a considerable period of time. I do not believe the representative had read the ABPA "reasoning" which was clearly published in the ICC information provided to all who were in the hearings. On the other hand, had the representative read the published information and had other reasons to make his statements this should definitely be brought to the attention of both the ICC Committee and THE PUBLIC for open clarification of the matter. However, after the fourth proposal, the committee approved the remaining code proposals. All of the proposals received are consistent, as submitted, as a package. Part II of the P95 proposal was approved by the respective committee. This is inconsistent as both parts are the same language in their respective code. The terminology is consistent with industry, the code and those who utilize the code. I recommend that this proposal and those additional proposals be accepted as submitted or as modified.

Final Action: AS AM AMPC____ D

P92-09/10-Part II
IRC 202

Proposed Change as Submitted

Proponent: Michael S. Moss, American Backflow Prevention Association

PART II – IRC

1. Revise as follows:

BACKFLOW PREVENTER. A backflow prevention assembly, a device or other ~~means~~ methods to prevent backflow into the potable water supply.

CONTAMINATION. An impairment of the quality of potable water that creates a~~n~~ ~~actual~~ ~~hazard to the~~ public health risk through poisoning, ~~or~~ ~~through~~ the spread of disease ~~by~~ or contact with sewage, industrial fluids, ~~or~~ waste or radioactivity. See "*Pollution*".

POLLUTION. An impairment of the quality of potable water ~~to a degree~~ that does not create a ~~hazard to the~~ public health risk but that does adversely and unreasonably affect the aesthetic qualities of ~~such~~ potable water intended for ~~domestic use~~ drinking, bathing or culinary purposes. See "*Contamination*".

REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENT~~ER~~ION ASSEMBLY. A backflow prevention ~~device~~ assembly consisting of two independently acting check valves, internally ~~force-~~loaded to a normally closed position and separated by an intermediate chamber with a ~~(or~~ zone~~)~~ of reduced pressure. ~~in which there is~~ The reduced pressure zone is provided with an automatic ~~relief~~ means of venting to the atmosphere, internally loaded to a normally open position between two tightly closing shutoff valves and with a means for testing for tightness of the checks and opening of the relief means.

2. Add new definitions as follows:

HAZARD, DEGREE OF

High or Health. A condition or arrangement that could cause contamination of a potable water supply or system supply. See "*Contamination*".

Low or Non-health. A condition or arrangement that could cause pollution of a potable water supply or system supply. See "*Pollution*".

Reason: BACKFLOW PREVENTER: The change in this term's definition is necessary to better understand the use of Table 608.1(IRC Table P2902.3) APPLICATION OF BACKFLOW PREVENTERS. I have submitted a companion proposal for rearranging the information in Table 608.1 to show that BACKFLOW PREVENTERS are categorized in three groups: Backflow Prevention Assemblies, Backflow Devices, and Other Methods. The purpose of the three groupings is to illustrate that Backflow Prevention Assemblies are field testable (having shutoff valves and test cock fittings), Backflow Devices are not field testable; and Other Methods are not field testable but by observation, can be determined that proper backflow protection exists.

CONTAMINATION and POLLUTION: Table 608.1 (IRC Table P2902.3) has a footnote concerning the relationship between the terms "high" and "low" hazard and the defined terms of CONTAMINATION and POLLUTION, respectively. The backflow prevention community also uses the terms "health hazard" and "non-health hazard" in describing applications and connections. The proposed amendments to these definitions are necessary so that code officials, backflow prevention specialists, plumbers and plumbing system designers clearly understand the relationships between these terms and are able to properly select appropriate backflow preventers in accordance with the table.

REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENTION ASSEMBLY: This definition needs changed to be in alignment with the 3 groups of Backflow Preventers that are identified in the proposed amended definition of BACKFLOW PREVENTER and the proposed rearrangement of Table 608.1. For the IRC, the term "REDUCED PRESSURE-ZONE BACKFLOW PREVENTER" is not found in the IRC text, therefore, the term is being corrected to match terminology corrections that are being proposed by companion proposals for numerous code sections.

All proposed changes in the above definitions have no technical impact. These changes, along with other proposed companion changes are necessary to provide meaningful and consistent terminology throughout the code for better understanding of the application of backflow preventers.

Cost Impact: The code change proposal will not increase the cost of construction.

Final Action: AS AM AMPC____ D

P93-09/10, Part I
Table 608.1, 608.13.6

Proposed Change as Submitted

Proponent: Michael S. Moss of the American Backflow Prevention Association

PART I - IPC

1. Revise table as follows:

TABLE 608.1
APPLICATION OF BACKFLOW PREVENTERS

BACKFLOW PREVENTION ASSEMBLIES			
DEVICE	**DEGREE OF HAZARD**[a]		**APPLICABLE STANDARDS**
Double check backflow prevention assembly ~~and~~ Double check fire protection backflow prevention assembly	Low hazard		ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1
Double check detector fire protection backflow prevention assembl~~ies~~y	Low hazard		ASSE 1048
Pressure vacuum breaker assembly	High or low hazard		ASSE 1020, CSA B64.1.2
Reduced pressure principle backflow prevent~~er~~ion assembly ~~and~~ Reduced pressure principle fire protection backflow prevent~~er~~ion assembly	High or low hazard		ASSE 1013, AWWA C511, CAN/CSA B64.4, CSA B64.4.1
Reduced pressure detector fire protection backflow prevention assembly	High or low hazard		ASSE 1047
Spill~~proof~~ –resistant vacuum breaker assembly	High or low hazard		ASSE 1056

BACKFLOW PREVENTER DEVICES			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Antisiphon~~-type~~ fill valve~~s~~ for gravity water closet flush tanks	High hazard		ASSE 1002, CSA B125.3
~~Pipe-applied~~ Atmospheric vacuum breaker	High or low hazard		ASSE 1001, CAN/CSA B64.1.1
Backflow preventer for ~~carbonated~~ beverage dispensing equipment ~~machines~~	Low hazard		ASSE 1022
Backflow preventer with intermediate atmospheric vents	Low hazard		ASSE 1012, CAN/CSA B64.3
Dual check valve type backflow preventer	Low hazard		ASSE 1024, CSA B64.6
Hose connection backflow preventer	~~High or~~ Low hazard		ASSE 1052, CSA B64.2.1.1
Hose connection vacuum breaker	~~High or~~ Low hazard		ASSE 1011, CAN/CSA B64.2, CSA B64.2.1
Laboratory faucet backflow preventer	~~High or~~ Low hazard		ASSE 1035, CSA B64.7
Vacuum breaker wall hydrant~~s~~, ~~frost~~ freeze-resistant, automatic draining type	~~High or~~ Low hazard		ASSE 1019, CAN/CSA B64.2.2
OTHER METHODS			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Air gap	High or low hazard		ASME A112.1.2
Air gap fitting~~s~~ for use with plumbing fixtures, appliances and appurtenances	High or low hazard		ASME A112.1.3
Barometric loop	High or low hazard		(See Section 608.13.4)

(Portions of table not shown remain unchanged)

2. Revise as follows:

608.13.6 Atmospheric~~-type~~ vacuum breakers. ~~Pipe-applied~~ Atmospheric~~-type~~ vacuum breakers shall conform to ASSE 1001 or CAN/CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CAN/CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CAN/CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height.

Reason: There is much confusion concerning protection provided by any 'backflow preventer'. This table would better identify proper and correct applications by identifying the different protection methods: assemblies, plumbing devices and other methods. The existing table gives the mistaken understanding that "any of the above provides adequate protection for any job". This is not true. Adequate protection is based on hazard classification, application and proper installation. Backflow prevention assemblies are specifically recognized and accepted as separate and distinct units based on Section 312.10.2 because of their requirement for periodic testing to ensure proper and reliable operation in order to protect public health. Titles are in accordance with ASSE Standards listing from Plumbing Standards magazine January-March 2009.

No new assemblies, devices or means have been added to Table 608.1 and none have been deleted. The assemblies, devices and methods are simply grouped in 3 categories for simplicity and better understanding as to how they are to be applied. The HIGH hazard was taken off the hose connection backflow preventer, the hose connection vacuum breaker and the laboratory faucet vacuum breaker as these devices are never suitable for high hazard applications. Section 608.13.6 (IRC Section P2902.3.2) was revised to align the terminology to the standards and Table 608.1 (IRC Table P2902.3) as well as eliminate the confusing term "pipe-applied".

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MOSS-P18-605.3.1

Public Hearing Results

PART I- IPC
Committee Action: Disapproved

Committee Reason: Proponent stated that he wants to clean up table at a later date. There was some concern about "high hazard" being removed from some entries.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Michael S. Moss representing the American Backflow Prevention Association requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

TABLE 608.1
APPLICATION OF BACKFLOW PREVENTERS

DEVICE	DEGREE OF HAZARD[a]	APPLICATION[b]	APPLICABLE STANDARDS
Air gap	High or low hazard	Backsiphonage or backpressure	ASME A112.1.2
Air gap fitting~~s~~ for use with plumbing fixtures, appliances and appurtenances	High or low hazard	Backsiphonage or backpressure	ASME A112.1.3
Antisiphon fill valve~~s~~ for ~~gravity~~ water closet tank~~s~~	High hazard	Backsiphonage only	ASSE 1002, CSA B125.3
Backflow preventer for ~~carbonated~~ beverage ~~machines~~ dispensing equipment	Low hazard	Backpressure or backsiphonage Sizes 1/4" - 3/8 "	ASSE 1022
Backflow preventer with intermediate atmospheric vents	Low hazard	Backpressure or backsiphonage Sizes 1/4" - 3/4"	ASSE 1012, CAN/CSA B64.3
Barometric loop	High or low hazard	Backsiphonage only	(See Section 608.13.4)
Double check backflow prevention assembly and double check fire protection backflow prevention assembly	Low hazard	Backpressure or backsiphonage Sizes 3/8" - 16"	ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1
Double check detector fire protection backflow prevention assembl~~ies~~y	Low hazard	Backpressure or backsiphonage (Fire sprinkler systems) Sizes 2" - 16"	ASSE 1048
~~Dual-check-valve-type~~ Dual check backflow preventer	Low hazard	Backpressure or backsiphonage Sizes 1/4" - 1"	ASSE 1024, CSA B64.6
Hose connection backflow preventer	High or low hazard	Low head backpressure, rated working pressure, backpressure or backsiphonage Sizes 1/2", 1"	ASSE 1052, CSA B64.2.1.1
Hose connection vacuum breaker	High or low hazard	Low head backpressure or backsiphonage Sizes 1/2", 3/4", 1"	ASSE 1011, CAN/CSA B64.2, CSA B64.2.1
Laboratory faucet backflow preventer~~s~~	High or low hazard	Low head backpressure and backsiphonage	ASSE 1035, CSA B64.7
~~Pipe-applied~~ Atmospheric-type vacuum breaker	High or low hazard	Backsiphonage only Sizes 1/4" - 4"	ASSE 1001, CAN/CSA B64.1.1
Pressure vacuum breaker assembly	High or low hazard	Backsiphonage only Sizes 1/2" - 2"	ASSE 1020, CSA B64.1.2
Reduced pressure detector fire protection backflow prevention assembl~~ies~~y	High or low hazard	Backsiphonage or backpressure (Fire sprinkler systems)	ASSE 1047

Reduced pressure principle backflow prevent~~er~~ion assembly and reduced pressure principle fire protection backflow prevent~~er~~ion assembly	High or low hazard	Backpressure or backsiphonage Sizes 3/8" - 16"	ASSE 1013, AWWA C511, CAN/CSA B64.4, CSA B64.4.1
Spill~~proof~~ resistant vacuum breaker assembly	High or low hazard	Backsiphonage only Sizes 1/4" -2"	ASSE 1056
Vacuum breaker wall hydrant~~s~~, fr~~ost~~eeze-resistant, automatic draining type	High or low hazard	Low head backpressure or backsiphonage Sizes 3/4", 1"	ASSE 1019, CAN/CSA B64.2.2

For SI: 1 inch = 25.4 mm

a. Low Hazard - See Pollution (Section 202)
High Hazard - See Contamination (Section 202)

b. See Backpressure (Section 202)
See Backpressure, low head (Section 202)
See Backsiphonage (Section 202)

608.13.6 Atmospheric-type vacuum breakers. ~~Pipe-applied~~ Atmospheric-type vacuum breakers shall conform to ASSE 1001 or CAN/CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height.

Commenter's Reason: There was considerable confusion during the code hearing concerning the ASSE Standards. An individual provided testimony against the proposal to the Committee and was in error. The ASSE Plumbing Standards Magazine provides that organizations standardized titles and approval dates. The representative's error appeared to take credibility from the proposals presented. The titles for assemblies and devices used for the code proposals have been published for several years and have been current for a considerable period of time. I do not believe the representative had read the ABPA "reasoning" which was clearly published in the ICC information provided to all who were in the hearings. On the other hand, had the representative read the published information and had other reasons to make his statements this should definitely be brought to the attention of both the ICC Committee and THE PUBLIC for open clarification of the matter. However, after the fourth proposal, the committee approved the remaining code proposals. All of the proposals received are consistent, as submitted, as a package. Part II of this proposal was approved by the respective committee. This is inconsistent as both parts are the same language in their respective code. The terminology is consistent with industry, the code and those who utilize the code. I recommend that this proposal and those additional proposals be accepted as modified.

Final Action: AS AM AMPC____ D

P93-09/10-PART II

IRC Table P2902.3, P2902.3.2

Proposed Change as Submitted

Proponent: Michael S. Moss of the American Backflow Prevention Association

PART II – IRC

1. Revise table as follows:

TABLE P2902.3
APPLICATION OF BACKFLOW PREVENTERS

BACKFLOW PREVENTION ASSEMBLIES			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Double check backflow prevention assembly ~~and~~ Double check fire protection backflow prevention assembly	Low hazard		ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1
Double check detector fire protection backflow prevention assembl~~ies~~y	Low hazard		ASSE 1048
Pressure vacuum breaker assembly	High or low hazard		ASSE 1020, CSA B64.1.2
Reduced pressure principle backflow prevent~~er~~ion assembly ~~and~~ Reduced pressure principle fire protection backflow prevent~~er~~ion	High or low hazard		ASSE 1013, AWWA C511, CAN/CSA B64.4, CSA B64.4.1

assembly			
Reduced pressure detector fire protection backflow prevention assembly	High or low hazard		ASSE 1047
Spill~~proof~~ –resistant vacuum breaker assembly	High or low hazard		ASSE 1056
BACKFLOW PREVENTER DEVICES			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Antisiphon~~-type~~ fill valve~~s~~ for gravity water closet flush tanks	High hazard		ASSE 1002, CSA B125.3
~~Pipe-applied~~ Atmospheric vacuum breaker	High or low hazard		ASSE 1001, CAN/CSA B64.1.1
Backflow preventer with intermediate atmospheric vents	Low hazard		ASSE 1012, CAN/CSA B64.3
Dual check valve type backflow preventer	Low hazard		ASSE 1024, CSA B64.6
Hose connection backflow preventer	~~High or~~ Low hazard		ASSE 1052, CSA B64.2.1.1
Hose connection vacuum breaker	~~High or~~ Low hazard		ASSE 1011, CAN/CSA B64.2, CSA B64.2.1
Laboratory faucet backflow preventer	~~High or~~ Low hazard		ASSE 1035, CSA B64.7
OTHER METHODS			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Air gap	High or low hazard		ASME A112.1.2
Air gap fitting~~s~~ for use with plumbing fixtures, appliances and appurtenances	High or low hazard		ASME A112.1.3

(Portions of table not shown remain unchanged)

2. Revise as follows:

P2902.3.2 Atmospheric~~-type~~ vacuum breakers. ~~Pipe-applied~~ Atmospheric~~-type~~ vacuum breakers shall conform to ASSE 1001 or CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height.

Reason: There is much confusion concerning protection provided by any 'backflow preventer'. This table would better identify proper and correct applications by identifying the different protection methods: assemblies, plumbing devices and other methods. The existing table gives the mistaken understanding that "any of the above provides adequate protection for any job". This is not true. Adequate protection is based on hazard classification, application and proper installation. Backflow prevention assemblies are specifically recognized and accepted as separate and distinct units based on Section 312.10.2 because of their requirement for periodic testing to ensure proper and reliable operation in order to protect public health. Titles are in accordance with ASSE Standards listing from Plumbing Standards magazine January-March 2009.

No new assemblies, devices or means have been added to Table 608.1 and none have been deleted. The assemblies, devices and methods are simply grouped in 3 categories for simplicity and better understanding as to how they are to be applied. The HIGH hazard was taken off the hose connection backflow preventer, the hose connection vacuum breaker and the laboratory faucet vacuum breaker as these devices are never suitable for high hazard applications. Section 608.13.6 (IRC Section P2902.3.2) was revised to align the terminology to the standards and Table 608.1 (IRC Table P2902.3) as well as eliminate the confusing term "pipe-applied".

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MOSS-P18-605.3.1

Final Action: AS AM AMPC____ D

P94-09/10-PART I
608.13.7, 608.15.4.1, 608.15.4.2

Proposed Change as Submitted

Proponent: Michael S. Moss of the American Backflow Prevention Association

PART I - IPC

Revise as follows:

608.13.7 Double check~~-valve~~ backflow prevention assemblies. Double check~~-valve~~ backflow prevention assemblies shall conform to ASSE 1015, CSA B64.5, CSA B64.5.1 or AWWA C510. Double~~-detector~~ check~~-valve~~ detector backflow prevention assemblies shall conform to ASSE 1048. These devices shall be capable of operating under continuous pressure conditions.

608.15.4.1 Deck-mounted and integral vacuum breakers. *Approved* deck-mounted or equipment-mounted vacuum breakers and faucets with integral atmospheric vacuum breakers or integral spill~~proof~~ –resistant vacuum breaker~~s~~ assemblies shall be installed in accordance with the manufacturer's instructions and the requirements for labeling.~~ with~~ The critical level of the breakers and assemblies shall be located at not less than 1 inch (25 mm) above the *flood level rim*.

608.15.4.2 Hose connections. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric~~-type~~ vacuum breaker, ~~or~~ a pressure~~-type~~ vacuum breaker assembly or a permanently attached hose connection vacuum breaker.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

IRC P2902.3.6, P2902.4, P2902.4.2, P2904.4.3, P2902.5.5

Proposed Change as Submitted

Proponent: Michael S. Moss of the American Backflow Prevention Association

PART II – IRC

Revise as follows:

P2902.3.6 Double check~~-valve~~ backflow prevention assemblies. Double check~~-valve~~ backflow prevention assemblies shall conform to ASSE 1015, CSA B64.5, CSA B64.5.1 or AWWA C510. Double~~-detector~~ check~~-valve~~ detector backflow prevention assemblies shall conform to ASSE 1048. These devices shall be capable of operating under continuous pressure conditions.

P2902.4 Protection of potable water outlets. Potable water openings and outlets shall be protected by an air gap, a reduced pressure principle backflow prevent~~er~~ion assembly ~~with atmospheric vent~~, an atmospheric~~-type~~ vacuum breaker, a pressure~~-type~~ vacuum breaker assembly or a hose connection backflow preventer.

P2902.4.2 Deck-mounted and integral vacuum breakers. *Approved* deck-mounted or equipment-mounted vacuum breakers and faucets with integral atmospheric vacuum breakers or integral spill~~proof~~ –resistant vacuum breaker~~s~~ assemblies shall be installed in accordance with the manufacturer's instructions and the requirements for labeling.~~-with~~ The critical level of the breakers and assemblies shall be located at not less than 1 inch (25 mm) above the *flood level rim*.

P2902.4.3 Hose connections. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection threads shall be protected by an atmospheric~~-type~~ vacuum breaker, ~~or~~ a pressure~~-type~~ vacuum breaker assembly or a permanently attached hose connection vacuum breaker.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

P2902.5.5 Solar systems. The potable water supply to a solar system shall be equipped with a backflow preventer with intermediate atmospheric vents complying with ASSE 1012 or a reduced pressure principle backflow prevent~~er~~ion assembly complying with ASSE 1013. Where chemicals are used, the potable water supply shall be protected by a reduced pressure principle backflow prevent~~er~~ion assembly.

> **Exception:** Where all solar system piping is a part of the potable water distribution system, in accordance with the requirements of the *International Plumbing Code*, and all components of the piping system are listed for potable water use, ~~cross-connection protection measures~~ backflow protection shall not be required.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MOSS-P19-608.13.7

P95-09/10, PART II- IRC

Revise as follows:

P2902.3.5 Reduced pressure principle backflow prevent~~ers~~ion assemblies. Reduced pressure principle backflow prevent~~ers~~ion assemblies and reduced pressure principle fire protection backflow prevent~~ers~~ion assemblies shall conform to ASSE 1013, AWWA C511, CSA B64.4 or CSA B64.4.1. Reduced pressure detector fire protection ~~assembly~~ backflow prevent~~ers~~ion assemblies shall conform to ASSE 1047. These devices shall be permitted to be installed where subject to continuous pressure conditions. The relief opening shall discharge by air gap and shall be prevented from being submerged.
Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II- IRC-P
Committee Action: **Approved as Submitted**

Committee Reason: Agreed with the proponent's reason statement which was to provide for consistent terminology throughout the code.

Assembly Action: **None**

P102-09/10, Part I
608.6

Proposed Change as Submitted

Proponent: Michael S. Moss of the American Backflow Prevention Association

PART I - IPC

Revise as follows:

608.6 Cross-connection control. Cross connections shall be prohibited, except where approved ~~protective~~ backflow preventers ~~devices~~ are installed to protect the potable water supply.

Reason: Because the term "Protective devices" is not included in the definitions, this change clarifies the intent of Section 608.6. The change for the definition of "Backflow preventer" makes the definition more descriptive and precise.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Moss-P2-608.6

Public Hearing Results

PART I- IPC
Committee Action: **Approved as Submitted**

Committee Reason: Eliminates cloudy wording and clearly specifies that a backflow device is needed where cross connections are made.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julius Ballanco, PE, JB Engineering and Code Consulting, PC, representing the Home Ventilating Institute, requests Approval as Modified by this public comment.

Modify the proposal as follows:

608.6 Cross-connection control. Cross connections shall be prohibited, except where approved ~~backflow preventers~~ methods are installed to protect the potable water supply.

Commenter's Reason: While I agree with the proponent that the language needs correcting, it would appear that the use of the term, "backflow preventers" would be inappropriate. The most common method of preventing backflow is an air gap. This would not be considered a backflow preventer, but would be considered and approved method of backflow protection. Another method identified that is not a backflow preventer is a barometric loop.

Final Action: AS AM AMPC____ D

P102-09/10, Part II
IRC P2902.1

Proposed Change as Submitted

Proponent: Michael S. Moss of the American Backflow Prevention Association

PART II - IRC

Revise as follows:

P2902.1 General. A potable water supply system shall be designed and installed as to prevent contamination from nonpotable liquids, solids or gases being introduced into the potable water supply. Connections shall not be made to a potable water supply in a manner that could contaminate the water supply or provide a cross-connection between the supply and a source of contamination ~~unless an *approved* backflow-prevention device~~ <u>except where approved backflow preventers are installed to protect the potable water supply.</u> ~~is provided.~~ Cross-connections between an individual water supply and a potable public water supply shall be prohibited.

Reason: Because the term "Protective devices" is not included in the definitions, this change clarifies the intent of Section 608.6. The change for the definition of "Backflow preventer" makes the definition more descriptive and precise.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Moss-P2-608.6

Public Hearing Results

PART II- IRC-P
Committee Action: **Approved as Submitted**

Committee Reason: Proposed language makes the terminology of the code consistent with the standards.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julius Ballanco, PE, JB Engineering and Code Consulting, PC, representing the Home Ventilating Institute, requests Approval as Modified by this public comment.

Modify the proposal as follows:

P2902.1 General. A potable water supply system shall be designed and installed as to prevent contamination from nonpotable liquids, solids or gases being introduced into the potable water supply. Connections shall not be made to a potable water supply in a manner that could contaminate the water supply or provide a cross-connection between the supply and a source of contamination except where approved ~~backflow preventers~~ <u>methods</u> are installed to protect the potable water supply. Cross-connections between an individual water supply and a potable public water supply shall be prohibited

Commenter's Reason: See P102-09/10, Part I

Final Action: AS AM AMPC____ D

P105-09/10
608.15.2

Proposed Change as Submitted

Proponent: Michael S. Moss of the American Backflow Prevention Association

Revise as follows:

608.15.2 Protection by ~~a~~ reduced pressure principle backflow prevent~~er~~ion assembly. Openings and outlets shall be protected by a reduced pressure principle backflow prevent~~er~~ion assembly on potable water supplies or by a reduced pressure principle fire protection backflow prevention assembly on dedicated fire line water supplies.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Agreed with the proponent's reason statement which stated that the change was needed for consistency in terminology throughout the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julius Ballanco, PE, JB Engineering and Code Consulting, PC, representing the Home Ventilating Institute, requesting Approval as Modified by this public comment.

Modify the proposal as follows:

608.15.2 Protection by reduced pressure principle backflow prevention assembly. Openings and outlets shall be protected by a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly on potable water supplies ~~or by a reduced pressure principle fire protection backflow prevention assembly on dedicated fire line water supplies~~.

Commenter's Reason: The proponent is correct in identifying a reduce pressure principle fire protection backflow prevention assembly, however, this valve is not limited to dedicated fire line water supplies. The valve can be used on any water supply. Furthermore a reduced pressure principle backflow preventer can be used on a fire sprinkler or standpipe water supply. The difference between the two valves is in the pressure loss at high rates of flow. The backflow performance is the same for both valves.

Final Action: AS AM AMPC____ D

P107-09/10
608.18

Proposed Change as Submitted

Proponent: Robert Burke University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

608.18 Dead ends. Dead ends exceeding 4 feet in developed length shall be prohibited unless protected by an approved backflow preventer .

Reason: Stagnant water is unhealthy and a prime cause of Legionella disease. ASHRAE Standard 12-200 addresses this issue; minimizing the risk of Legionellosis associated with building water system.

Cost Impact: The cost impact to construction will be minimal.

ICCFILENAME: Burke-P3-608.18

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: A backflow preventer will not work under these conditions. There are other ways to isolate dead ends such as valve.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Robert Burke, University of Colorado, representing CAPMO requests Approval As Modified by this public comment.

Modify the proposal as follows:

Dead ends exceeding 4 feet in developed length shall be prohibited ~~unless protected by an approved backflow preventer~~.

Proposed Change as Submitted

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

PART I – IPC

Revise as follows:

705.8.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D2564, CSA B137.3, CSA B181.2 or CSA B182.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.
3. The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.

705.14.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D2564, CSA B137.3, CSA B181.2 or CSA B182.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

<u>Exception:</u> <u>A primer is not required where all of the following conditions apply:</u>

1. <u>The solvent cement used is third-party certified as conforming to ASTM D 2564.</u>
2. <u>The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.</u>
3. <u>The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.</u>

Reason: To introduce an exception in IPC Chapter 7 (IRC Chapter 30), Sanitary Drainage, allowing for the practice of one-step solvent cementing of non-pressure DWV systems 4" and under.

This exception allows for an optional one-step procedure for joining non-pressure DWV PVC piping systems 4" in diameter and below with solvent cement conforming to ASTM D 2564. This method is practiced, and the code should include specific language to indicate when it is acceptable.

Pressure testing completed by NSF International has shown that solvent cement conforming to ASTM D 2564, when used without primer on PVC DWV pipe and fittings, both solid wall and cell core, generates bonding forces well in excess of what is required for these systems. The strength of the joint often exceeds the pipe and fitting pressure capacity.

Bibliography: NSF International report J-00036842.can be found on the PPFA website, www.ppfahome.org//ICC09/PPFA_NSF_J-00036842.pdf

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: CUDAHY-P1-705.8.2

<u>Public Hearing Results</u>

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: A primed joint works best and many manufacturers require priming before solvent cementing.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Michael Cudahy, **PPFA (Plastic Pipe and Fittings Association), requests Approval as Submitted**

Commenter's Reason: This exception allows for an <u>optional</u> one-step procedure for joining non-pressure DWV PVC piping systems 4" in diameter and below with solvent cement conforming to ASTM D 2564. This method is practiced, and the code should include specific language to indicate when it is acceptable.

Pressure testing completed by NSF International has shown that solvent cement conforming to ASTM D 2564, when used without primer on PVC DWV pipe and fittings, both solid wall and cell core, generates bonding forces well in excess of what is required for these systems.

The strength of the joint often exceeds the pipe and fitting pressure capacity with the pipe of fitting failing before the joint in the "hundreds of psi" range of pressures.

Since these are non-pressure systems, the one step PVC practice is completely suitable – as is one step ABS and one step CPVC solvent welding.

PPFA urges the FAH to support this change as submitted.

Bibliography: NSF International report J-00036842.can be found on the PPFA website, <u>www.ppfahome.org/ICC09/PPFA_NSF_J-00036842.pdf</u>

Final Action: AS AM AMPC____ D

P110-09/10, Part II
IRC P3003.9.2, P3003.14.2

Proposed Change as Submitted

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

PART II – IRC

Revise as follows:

P3003.9.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D 2564, CSA B137.3 or CSA B181.2 shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.
3. The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.

P3003.14.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D 2564, CSA B137.3 or CSA B181.2 shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.
3. The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.

Reason: To introduce an exception in IPC Chapter 7 (IRC Chapter 30), Sanitary Drainage, allowing for the practice of one-step solvent cementing of non-pressure DWV systems 4" and under.

This exception allows for an optional one-step procedure for joining non-pressure DWV PVC piping systems 4" in diameter and below with solvent cement conforming to ASTM D 2564. This method is practiced, and the code should include specific language to indicate when it is acceptable.

Pressure testing completed by NSF International has shown that solvent cement conforming to ASTM D 2564, when used without primer on PVC DWV pipe and fittings, both solid wall and cell core, generates bonding forces well in excess of what is required for these systems. The strength of the joint often exceeds the pipe and fitting pressure capacity.

Bibliography: NSF International report J-00036842.can be found on the PPFA website, www.ppfahome.org//ICC09/PPFA_NSF_J-00036842.pdf

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: CUDAHY-P1-705.8.2

Public Hearing Results

PART II- IRC-P
Committee Action: **Disapproved**

Committee Reason: A primed joint is easier to inspect. Strength of a primed joint is better.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Michael Cudahy, **PPFA (Plastic Pipe and Fittings Association) requests Approval as Submitted.**

Commenter's Reason: See P110-09/10, Part I

Bibliography: See P110-09/10, Part I

Final Action: AS AM AMPC____ D

P116-09/10, Part I
712.3.5

Proposed Change as Submitted

Proponent: John T.E. Walters, Prince William County, VA., representing the Virginia Plumbing and Mechanical Inspectors Association

PART I - IPC

Revise as follows:

712.3.5 Ejector connection to the drainage system. Pumps connected to the drainage system shall connect to ~~the~~ a *building sewer*, ~~or shall connect to a wye fitting in the~~ *building drain*, soil stack, waste stack or horizontal branch drain. ~~a minimum of 10 feet (3048 mm) from the base of any soil *stack*, waste *stack* or *fixture drain*.~~ Where the discharge line connects into horizontal drainage piping, the connect~~or~~ion shall be made through a wye fitting into the top of the drainage piping and such wye fitting shall be located not less than 10 feet (3048 mm) from the base of any soil stack, waste stack or fixture drain.

Reason: In addition to building sewers and building drains, soil stacks, waste stacks and horizontal branch drains are acceptable points of termination for ejector discharge lines. Fittings acceptable for changes of direction are already addressed in Table 706.3.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: WALTERS-P1-712.3.5

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: Good proposal except last line of added text needs to be changed to say 10 pipe diameters instead of 10 feet.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, representing VA Plumbing and Mechanical Inspectors Assoc. and ICC Region 7, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

712.3.5. Ejector connection to the drainage system. Pumps connected to the drainage system shall connect to a building sewer, building drain, soil stack, waste stack or horizontal branch drain. Where the discharge line connects into horizontal drainage piping, the connection shall be made through a wye fitting into the top of the drainage piping and such wye fitting shall be located not less than 10 ~~feet (3048 mm)~~ pipe diameters from the base of any soil stack, waste stack or fixture drain.

Commenter's Reason: Part I of the above code change was denied by the committee due to the language of 10 feet. This was existing wording in this code section however the language per this proposal is to remove feet and replace with pipe diameters. In order to keep this change consistent with the IPC and IRC both part I and part II have been modified. Part II had been approved as submitted by the IRC committee.

Final Action: AS AM AMPC____ D

P116-09/10, Part II
IRC P3007.3.5

<u>Proposed Change as Submitted</u>

Proponent: John T.E. Walters, Prince William County, VA., representing the Virginia Plumbing and Mechanical Inspectors Association

PART II- IRC

Revise as follows:

P3007.3.5 Ejector connection to the drainage system. Pumps connected to the drainage system shall connect to ~~the~~ <u>a</u> *building sewer*<u>,</u> ~~or shall connect to a wye fitting in the~~ *building drain*<u>, soil stack, waste stack or horizontal branch drain</u>. ~~a minimum of 10 feet (3048 mm) from the base of any soil *stack*, waste *stack* or *fixture drain*.~~ Where the discharge line connects into horizontal drainage piping, the connect~~or~~<u>ion</u> shall be made through a wye fitting into the top of the drainage piping <u>and such wye fitting shall be located not less than</u> <u>10 feet (3048 mm) from the base of any soil stack, waste stack or fixture drain.</u>

Reason: In addition to building sewers and building drains, soil stacks, waste stacks and horizontal branch drains are acceptable points of termination for ejector discharge lines. Fittings acceptable for changes of direction are already addressed in Table 706.3.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: WALTERS-P1-712.3.5

<u>Public Hearing Results</u>

PART II- IRC-P
Committee Action: **Approved as Submitted**

Committee Reason: Agreed with the proponent's reason statement which stated that soil stacks, waste stacks and horizontal branch drains are also acceptable points of termination of an ejector discharge line.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, representing VA Plumbing and Mechanical Inspectors Assoc. and ICC Region 7, requests Approval as Modified by this Public Comment

Modify the proposal as follows:

P3007.3.5 Ejector connection to the drainage system. Pumps connected to the drainage system shall connect to a building sewer, building drain, soil stack, waste stack or horizontal branch drain. Where the discharge line connects into horizontal drainage piping, the connect~~or~~ion shall be made through a wye fitting into the top of the drainage piping and such wye fitting shall be located not less than 10 ~~feet (3048 mm)~~ pipe diameters from the base of any soil stack, waste stack or fixture drain.

Commenter's Reason: See P116-09/10, Part I

Final Action: AS AM AMPC____ D

P119-09/10
802.1.8

Proposed Change as Submitted

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, State of Michigan

Revise as follows:

802.1.8 Food utensils, dishes, pots and pans sinks. Sinks used for the washing, rinsing or sanitizing of utensils, dishes, pots, pans or service ware used in the preparation, serving or eating of food shall discharge indirectly through an air gap or an air break ~~or directly connect~~ to the drainage system.

Reason: The insertion of the new section into the 09 edition of the code attempted to list the three options for connections of the named fixtures. While any one of the three options may be accepted in different jurisdictions, the lead in clarification of "indirectly" obviates the direct connection choice. If a code change was to be submitted removing the directive "indirectly" the choice of three methods would be merely a laundry list which is contrary to modern code text processes.

Cost Impact: The clarification will not increase the cost of construction from that of the present language.

ICCFILENAME: KONYNDYK-P2-802.1.8

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Creates a safer environment in a kitchen.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rand H. Ackroyd representing self, requests Approval as Modified by this public comment.

Modify the proposal as follows:

802.1.8 Food utensils, dishes, pots and pans sinks. Sinks used for the washing, rinsing or sanitizing of utensils, dishes, pots, pans or service ware used in the preparation, serving or eating of food shall discharge indirectly through an air gap or an air break <u>or directly connect</u> to the drainage system. <u>Where such sinks are directly connected, the next fixture connected downstream of the sink fixture drain connection to the drainage system shall be a floor drain.</u>

Commenter's Reason: The concern was the backup of the drainage system to a sink. The requirement of a floor drain addresses this issue.

Final Action: AS AM AMPC____ D

P120-09/10
802.2

Proposed Change as Submitted

Proponent: Cort Strain University of Colorado representing (CAPMO) Colorado Association of Plumbing and Mechanical Officials

Revise as follows:

802.2 Installation. All indirect waste piping shall discharge through an air gap or air break into a waste receptor ~~or standpipe~~. Waste receptors and standpipes shall be trapped and vented and shall connect to the building drainage system. All indirect waste piping that exceeds ~~2 feet~~ <u>30 inches (762mm)</u> in developed length measured horizontally, or ~~4 feet~~ <u>54 inches (1372mm)</u> in total developed length, shall be trapped.

> <u>**Exception:** Where a waste receptor receives only clear water waste and does not directly connect to a sanitary drainage system, the receptor shall not require a trap.</u>

Reason: Because the IPC allows 30 inches center-to-center for a combination fixture (see Section 1002.1 exception 2), horizontal continuous waste tubing of up to 30 inches in length is allowed by the code. Therefore, a horizontal indirect waste pipe should be allowed to be 30 inches long elsewhere, so as to be consistent. The 54 inch total developed length allowance is simply the 30 inches horizontal length allowance plus the 24 inches vertical distance allowed from a fixture to it's trap (see Section 1002.1) The proposed lengths seem to make a lot more sense and will be consistent with other allowances in the code. The added exception should be self evident; no traps are necessary with clear water waste in an indirect piping system.

Cost Impact: The code change proposal will not increase the cost of construction

ICCFILENAME: Strain-P1-802.2

Public Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

802.2 Installation. All indirect waste piping shall discharge through an air gap or air break into a waste receptor Waste receptors and standpipes shall be trapped and vented and shall connect to the building drainage system. All indirect waste piping that exceeds 30 inches (762mm) in developed length measured horizontally, or 54 inches (1372mm) in total developed length, shall be trapped.

> ~~**Exception:** Where a waste receptor receives only clear water waste and does not directly connect to a sanitary drainage system, the receptor shall not require a trap.~~

Committee Reason: Modification was made because some equipment might require a trap. Agreed with the proponent's reason statement which indicated that the distances are aligned with the same distances allowed for waste piping from a combination sink before connection to a trap.

Assembly Action: **Approved as Submitted**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. Note that the assembly action, Approved as Submitted, will be the initial motion on the floor for consideration when this item is called.

Final Action: AS AM AMPC____ D

P123-09/10

901.3, 917.8, Chapter 13

Proposed Change as Submitted

Proponent: Jack Beuschel, Studor, Inc. representing himself.

1. Revise as follows:

901.3 Chemical waste vent systems. The vent system for a chemical waste system shall be independent of the sanitary vent system and shall terminate separately through the roof to the ~~open air~~ outdoors or to an air admittance valve that complies with ASSE 1049. Air admittance valves for chemical waste systems shall be constructed of materials approved in accordance with Section 702.5 and shall be tested for chemical resistance in accordance with ASTM F1412.

917.8 Prohibited installations. Air admittance valves shall not be installed in non-neutralized special waste systems as described in Chapter 8 except where such valves are in compliance with ASSE 1049, are constructed of materials approved in accordance with Section 702.5 and are tested for chemical resistance in accordance with ASTM F1412. Air admittance valves shall not be located in spaces utilized as supply or return air plenums.

2. Add standards to Chapter 13 as follows:

ASSE

1049-2009 Performance Requirements for Individual and Branch Type Air Admittances Valves for Chemical Waste Systems.

ASTM

F1412-01 Standard Specification for Polyolefin Pipe and Fittings for Corrosive Waste Drainage Systems.

Reason: The purpose of this code change is to add new provisions to the code to allow air admittance valves that are chemically-resistant (AAVCs) to serve as vents for a chemical waste system as an option to chemical waste vent piping terminating outdoors.

Laboratory sinks into which acids and chemicals are dumped are usually located in islands in the middle of rooms. To vent the traps for these sinks using vent piping that can only terminate outdoors requires extensive labor and material. Because acid- and chemically-resistant pipe and fittings are very costly (as compared to materials used in sanitary drainage systems), allowing the use of AAVCs will significantly reduce material costs for installing chemical waste systems. A reduction in the amount of required material vent piping material will result in reduced labor costs for installing chemical waste systems.

ASSE has recently developed ANSI/ASSE Standard 1049 - *Performance Requirements for Individual and Branch Type Air Admittance Valves for Chemical Waste Systems*. Section 702.5 of the IPC requires that drainage systems for chemical wastes and vent pipes shall be of an approved material that is resistant to corrosion and degradation for the concentrations of chemicals involved. Therefore, AAVs that comply with ANSI/ASSE 1049 and are manufactured from materials that meet recognized industry standards for chemical and acid resistant material in compliance with Section 702.5 and tested to ASTM F1412 for chemical resistance must be permitted to serve as the vent for nonneutralized special waste systems.

Referenced Standards:

ASSE 1049
ASTM F1412-01
ASTM D4104-05

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards, ASSE 1049-2009 and ASTM F1412-01, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: BEUSCHEL-P1-901.3

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of proposed new standards ASSE 1049-2009 and ASTM F 1412-01 indicated that in the opinion of ICC staff, the standards did comply with ICC standards criteria. Standard was submitted in draft form.

Committee Action: **Approved as Submitted**

Committee Reason: Past committees have turned this same proposal because no standard existed for chemical air admittance valves. Now that the standard is in place, it is time that the proposal is approved.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), ICC Region VII, requests Disapproval.

Commenter's Reason: The opposition to this application is not based on the approval of a Standard or even if the material is compatible with the materials contained within the piping system, it is based solely on the fact that the Air Admittance Valves (AAV) have a life expectancy. This is not the same application as a typical plumbing system. This application would be serving venting systems for some of the most dangerous materials know to man. So even if the AAV maintains good operating condition for several years, the fact remains that, inevitably, one day it is going to fail. When that happens it could be a deadly event. In most instances the vapors produced by hazardous fluids are far more dangerous that the fluid itself.

These need to remain as a viable option for the industry just as the current code permits now, through a code modification. That way proper assessment of each application can be reviewed and evaluated on its own merit, not a blanket approval for any and all.

Final Action: AS AM AMPC____ D

P126-09/10
912.1

Proposed Change as Submitted

Proponent: Robert Burke, University of Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

912.1 Type of fixtures. A combination drain and vent system shall not serve fixtures other than floor drains, sinks, lavatories, and drinking fountains. Combination drain and vent systems shall not receive ~~discharge from a food waste grinder or clinical sink~~ grease laden waste or solid waste.

Reason: By design, combination drain and vent systems are intended for clear and gray water waste. See 2006 IPC code commentary.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Burke-P2-912.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Combination drain and vent systems are used extensively in commercial kitchens. Proposal would eliminate that type venting system to be used in commercial kitchens.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Robert Burke, University of Colorado, representing CAPMO, requests Approval as Submitted.

Commenter's Reason: By design, combination drain and vent systems are intended for clear and gray water waste. See IPC code commentary.

Final Action: AS AM AMPC____ D

P127-09/10, Part II
IRC P3111.3

Proposed Change as Submitted

Proponent: John R. Addario, PE, New York State Department of State - Division of Code Enforcement and Administration

PART II- IRC

Revise as follows:

P3111.3 Size. The minimum size of a combination drain and vent pipe shall be in accordance with Table 3111.3. <u>The horizontal length of a combination drain and vent system shall be unlimited.</u>

Reason: This proposed change clarifies the intent of the code by adding that a combination drain and vent system, sized per code, shall be unlimited in horizontal length. Combination drain and vent systems are critical when used in piping systems serving floor drains, especially in large commercial kitchens. It is a source of confusion as to whether the length of the combination drain and vent is limited in length; this proposed change clarifies the intent of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Addario-P1-912.3

Public Hearing Results

PART II- IRC-P
Committee Action: **Approved as Submitted**

Committee Reason: No limit allows for greater design possibilities. There doesn't appear to be any downside to allowing unlimited length.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John R. Addario requests Approval as Modified by this public comment.

Modify the proposal as follows:

Part II – IRC-P

P3111.3 Size. The minimum size of a combination waste and vent pipe shall be in accordance with Table P3111.3. ~~The horizontal length of a combination drain and vent system shall be unlimited.~~

P3111.2 Installation. The only vertical pipe of a combination drain and vent system shall be the connection between the fixture drain and the horizontal combination waste and vent pipe. The maximum vertical distance shall be 8 feet (2438 mm). <u>The horizontal length of a combination drain and vent system shall be unlimited.</u>

Commenter's Reason: This proposed modification simply moves the committee approved language to a more appropriate section.
This change also provides consistency between the Residential Code and the Plumbing Code.
This same change, along with the approved language and corresponding code section, was approved, this code cycle, by the IPC committee for inclusion into the plumbing code.

Final Action: AS AM AMPC____ D

NOTE: PART I REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

P127-09/10, PART I - IPC

Revise as follows:

912.3 Size. The minimum size of a combination drain and vent pipe shall be in accordance with Table 912.3. <u>The horizontal length of a combination drain and vent system shall be unlimited.</u>

Reason: This proposed change clarifies the intent of the code by adding that a combination drain and vent system, sized per code, shall be unlimited in horizontal length. Combination drain and vent systems are critical when used in piping systems serving floor drains, especially in large commercial kitchens. It is a source of confusion as to whether the length of the combination drain and vent is limited in length; this proposed change clarifies the intent of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I- IPC
Committee Action: **Approved as Modified**

Modify the proposal as follows:

~~912.3~~ <u>912.2.2</u> Size. The minimum size of a combination drain and vent pipe shall be in accordance with Table ~~912.3~~ <u>912.2.2</u>. The horizontal length of a combination drain and vent system shall be unlimited.

(Renumber Table 912.3 to Table 912.2.2)

(Renumber subsequent sections)

Committee Reason: Modification was made to make the section tie to the existing dry vent connection section (912.2) as that is more logical for the subject matter of Section 912.3. Proposal eliminates the question about whether there is a limit to the maximum length of the combination drain and vent system.

Assembly Action: **None**

P134-09/10
1002.1

<u>Proposed Change as Submitted</u>

Proponent: Donald R. Monahan, PE, Walker Parking Consultants, representing the National Parking Association and the Automated & Mechanical Parking Association

Revise as follows:

1002.1 Fixture traps. Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.4. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the *developed length* of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).
4. Where floor drains in multi-level parking structures are required to discharge to a combined building sewer system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

Reason: Floor drain traps in unheated multi-level parking structures are problematic because the traps can be damaged during freezing conditions. The liquid in traps for floor drains in covered parking levels usually evaporates as there is little, if any, water runoff on the covered levels. Heat tracing and insulation are not reliable in these locations. A main trap for the parking structure floor drain system is typically required as many jurisdictions require a sand/oil separator prior to discharge to the sanitary sewer.

Cost Impact: The code change will not increase the cost of construction. There will be a construction cost savings to install only a main trap at the lowest level as opposed to traps at all floor drains on the upper levels.

ICCFILENAME: MONAHAN-P1-1002.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Agreed with the proponent's reason statement which stated that parking garage floor drains do not require traps if there is a main trap provided prior to connection to a combined sewer.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing and Mechanical Inspectors Assoc., requests Disapproval.

Commenter's Reason: Even though this language is existing in Chapter 11 we believe it needs to stay in Chapter 11 only. By adding this language into Chapter 10 it appears to make this system part of a sanitary drainage system when in essence it is a storm drainage system discharging to a combined building sewer or drain. The existing language of "main trap" is undefined in the IPC and the proponent in his reasoning is inferring that a sand/oil interceptor will serve as a "main trap". However depending upon the construction of the sand/oil interceptor it may or may not act as a trap and may allow sewer gases into the untrapped storm drainage system and ultimately into the building/structure. It is also imperative that if this section is to be placed in chapter 10 that it also references that no other sanitary drainage system connections be permitted into a storm drainage system which is discharging into a combined building sewer or drain unless it is downstream of the "main trap".

Final Action: AS AM AMPC____ D

P136-09/10, Part I
1002.4

Proposed Change as Submitted

Proponent: Julius Ballanco, P.E./JB Engineering and Code Consulting,P.C. representing Sure Seal

PART I - IPC

1. Revise as follows:

1002.4 Trap seals. Each fixture trap shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm), or deeper for special designs relating to accessible fixtures. Where a trap seal is subject to loss by evaporation, a trap seal primer shall be connected to the trap ~~valve~~ or a trap seal protection device shall be installed. The discharge pipe from a trap seal primer ~~valves~~ shall connect to the trap at a point above the level of the trap seal. Trap seal protection devices shall be installed in accordance with the manufacturer's installation instructions. ~~A~~ Potable water-type trap seal primers ~~valve~~ shall conform to ASSE 1018. ~~or~~ Drainage waste-type and nonpotable water-type trap seal primers shall conform to ASSE 1044. Trap seal protection devices shall conform to ASSE 1072.

2. Add standard to Chapter 13 as follows:

ASSE
1072-06 Performance Requirements for Barrier Type Floor Drain Trap Seal Protection Devices.

Reason:

Part I- The current code text does not distinguish between nonpotable water-type/ waste-type trap seal primers and potable water-type trap seal primers. This change will make that distinction clear. This is necessary for where municipal-reclaimed water will be used for trap seal priming. The proposed text also includes the standard for trap seal protection devices. This standard regulates a new form of trap seal protection that does not rely on water or drainage waste-type primers. Trap seal protection devices are a green design concept that provides an effective means of preventing evaporation of the trap seal without the use of water.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard ASSE 1072-06 indicated that, in the opinion of ICC staff, the standard did comply with ICC standards criteria.

ICCFILENAME: BALLANCO-P1-1002.4

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of proposed new standard ASSE 1072-06 indicated that in the opinion of ICC staff, the standard did comply with ICC standards criteria.

PART I- IPC
Committee Action: Disapproved

Committee Reason: There is concern that the floor drain strainer already restricts flow into the drain so installation of another device that would further restrict the flow would create problems. New text "shall be connected to the trap" is not accurate. There is a potential for device to be installed for the wrong application due to device identification issues that could be encountered at a later time.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julius Ballanco, P.E. JB Engineering and Code Consulting, P.C. representing Sure-Seal, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1002.4 Trap seals. Each fixture trap shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm), or deeper for special designs relating to accessible fixtures. Where a trap seal is subject to loss by evaporation, a trap seal primer ~~shall be connected to the trap~~ or a trap seal protection device shall be installed. The discharge pipe from a trap seal primer shall connect to the trap at a point above the level of the trap seal. Trap seal protection devices shall be installed in accordance with the manufacturer's installation instructions. Potable water-type trap seal primers shall conform to ASSE 1018. Drainage waste-type and nonpotable water-type trap seal primers shall conform to ASSE 1044. Trap seal protection devices shall conform to ASSE 1072.

Commenter's Reason: The reason given by the Committee for disapproving this change is technically inaccurate. I testified to this inaccuracy. A claim was made that a floor drain trap seal protection device restricts the flow into the drain. The devices do not. There is even a test in the ASSE 1072 to verify this.

What I testified was that the grate for a floor drain restricts the flow, whereby the trap seal protection device does not. Others provided anecdotal testimony that the devices restrict flow. Yet, none of these testifiers reviewed the standard or data that proved otherwise. Their testimony should have been ruled out of order. Testimony at public hearing should be accurate, not hearsay.

As for the language, this was an easy modification if the Committee did not like the term, "shall be connect to the trap." I have reverted that text back to the original text.

The IPC must recognize green methods of accomplishing protection of the trap seal. The current method of using a water supply trap seal primer wastes precious water. Having the option to use a trap seal protection device saves water and is a green alternative.

Furthermore, there is no maintenance required for trap seal protection devices. This is another green feature to the concept. Water supply trap seal primers are notorious for failing and requiring maintenance. Engineers and contractors should be given the option to use a trap seal protection device to protect the trap seal.

Thousands of these devices have been installed in area where trap seal primers have either failed or where not installed. They have an excellent track record and are often the method of choice by the engineers for protecting the trap seal in floor drains.

Final Action: AS AM AMPC____ D

P136-09/10, Part II
IRC P3201.2

Proposed Change as Submitted

Proponent: Julius Ballanco, P.E./JB Engineering and Code Consulting, P.C. representing Sure Seal

PART II - IRC

1. Revise as follows:

P3201.2 Trap seals and trap seal protection. Traps shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm). Traps for floor drains shall be ~~fitted with~~ connected to a trap seal primer, fitted with a trap seal protection device or be of deep seal design. The discharge pipe from a trap seal primer ~~valves~~ shall connect to the trap at a point above the level of the trap seal. Trap seal protection devices shall be installed in accordance with the manufacturer's installation instructions. Trap seal protection devices shall conform to ASSE 1072.

2. Add standard to Chapter 44 as follows:

ASSE
1072-06 Performance Requirements for Barrier Type Floor Drain Trap Seal Protection Devices.

Reason:
Part I- The current code text does not distinguish between nonpotable water-type/ waste-type trap seal primers and potable water-type trap seal primers. This change will make that distinction clear. This is necessary for where municipal-reclaimed water will be used for trap seal priming. The proposed text also includes the standard for trap seal protection devices. This standard regulates a new form of trap seal protection that does not rely on water or drainage waste-type primers. Trap seal protection devices are a green design concept that provides an effective means of preventing evaporation of the trap seal without the use of water.

Part II- The proposed text includes trap seal protection devices as a means to prevent trap evaporation. The added standard regulates this new form of trap seal protection that does not rely on water or drainage waste-type primers. Trap seal protection devices are a green design concept that provides an effective means of preventing evaporation of the trap seal without the use of water.
Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard ASSE 1072-06 indicated that, in the opinion of ICC staff, the standard did comply with ICC standards criteria.

ICCFILENAME: BALLANCO-P1-1002.4

Public Hearing Results

PART II- IRC-P
Committee Action: Disapproved

Committee Reason: Consistent with action taken by IPC committee. Standard does not comply with ICC criteria.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C representing Sure-Seal requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P3201.2 Trap seals and trap seal protection. Traps shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm). Traps for floor drains shall be fitted with ~~connected to~~ a trap seal primer, fitted with a trap seal protection device or be of deep seal design. The discharge pipe from a trap seal primer shall connect to the trap at a point above the level of the trap seal. Trap seal protection devices shall be installed in accordance with the manufacturer's installation instructions. Trap seal protection devices shall conform to ASSE 1072.

Commenter's Reason: The reason given by the Committee for disapproving this change is technically inaccurate. I testified to this inaccuracy. A claim was made that a floor drain trap seal protection device restricts the flow into the drain. The devices do not. There is even a test in the ASSE 1072 to verify this.

What I testified was that the grate for a floor drain restricts the flow, whereby the trap seal protection device does not. Others provided anecdotal testimony that the devices restrict flow. Yet, none of these testifiers reviewed the standard or data that proved otherwise. Their testimony should have been ruled out of order. Testimony at public hearing should be accurate, not hearsay.

As for the language, this was an easy modification if the Committee did not like the term, "shall be connect to the trap." I have reverted that text back to the original text.

The IPC must recognize green methods of accomplishing protection of the trap seal. The current method of using a water supply trap seal primer wastes precious water. Having the option to use a trap seal protection device saves water and is a green alternative.

Furthermore, there is no maintenance required for trap seal protection devices. This is another green feature to the concept. Water supply trap seal primers are notorious for failing and requiring maintenance. Engineers and contractors should be given the option to use a trap seal protection device to protect the trap seal.

Thousands of these devices have been installed in area where trap seal primers have either failed or where not installed. They have an excellent track record and are often the method of choice by the engineers for protecting the trap seal in floor drains.

The Committee was inaccurate when stating that the standard did not comply with the ICC policy. The staff had issued a statement indicating that the standard did comply. This should not have been given as a reason for disapproval since it was incorrect.

Final Action: AS AM AMPC____ D

P137-09/10
1003.1

Proposed Change as Submitted

Proponent: Judson Collins, JULYCO, representing himself.

Delete and substitute as follows:

~~**1003.1 Where required.** Interceptors and separators shall be provided to prevent the discharge of oil, grease, sand and other substances harmful or hazardous to the building drainage system, the public sewer, the private sewage disposal system or the sewage treatment plant or processes.~~

1003.1 Where required. Interceptors shall be provided and installed as required by Sections 1003.3, 1003.4, 1003.6, 1003.7 and 1003.8. In other occupancies or locations where fixtures discharge substances that could be detrimental to the drainage system, the sewer system or wastewater treatment processes, an approved interceptor shall be provided and installed.

Reason: The current text says "provide interceptors and separators to prevent discharge." It does not say where the discharge is to go. The intent of the text is to keep waste that is harmful to drainage systems, sewer systems or wastewater treatment processes from reaching them. Revising the section as proposed will clarify the intent of the section, give reference to the appropriate sections and reiterate that approved interceptors are required. The word "separators" is not used in the proposed text since the definition of the word is the same as that for "interceptor". Since the two words are used interchangeably and the code only defines "interceptor", "separators" was deleted.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: COLLINS-P11-1003.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Agreed with the proponent's reason statement which stated that the current language is saying that interceptors and separators should be installed to prevent discharge. The proposed language states the intent (capturing detrimental substances) better.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Judson Collins, JULYCO, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1003.1 Where required. ~~Interceptors shall be provided and installed as required by Sections 1003.3, 1003.4, 1003.6, 1003.7 and 1003.8. In other occupancies or locations where fixtures discharge substances that could be detrimental to the drainage system, the sewer system or wastewater treatment processes; an approved interceptor shall be provided and installed.~~ Interceptors and separators shall be installed in accordance with Sections 1003.3, 1003.4, 1003.6, 1003.7 and 1003.8. Interceptors and separators of an approved type shall also be installed where the waste flow contains hazardous or harmful substances that are detrimental to the building drainage system, public sewer system, private sewage disposal system, public sewage treatment system or sewage treatment processes. Interceptors and separators shall be required to be located so as to prevent the hazardous or harmful materials from entering the building drainage system and the building sewer.

Commenter's Reason: Although the original proposed code change was recommended for approval as submitted by the committee, it did not accomplish what was intended. The intent of this section is to have waste with substances detrimental to the building drainage system, public sewer system, private sewage system or sewage treatment plant or processes discharge through an approved interceptor to keep those substances from entering those systems. This modification better explains the intent than the original proposal did.

Staff Analysis: Action taken on this public should be coordinated with the action on P138.

Public Comment 2:

Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: A public comment was submitted for P138 that has merged some of the wording from this change into it. Leaving both changes approved will provide for contradiction in the code.

Staff Analysis: Action taken on this public should be coordinated with the action on P138.

Final Action: AS AM AMPC____ D

P138-09/10
1003.1

Proposed Change as Submitted

Proponent: Richard Grace/Fairfax County/ VA Plumbing and Mechanical Inspectors/VA Building and Code Officials

Revise as follows:

1003.1 Where required. Interceptors and separators shall be provided to prevent the discharge of oil, grease, sand and other substances harmful or hazardous to the ~~building drainage system,~~ the public sewer, the private sewage system or the sewage treatment plant or processes.

Reason: With the incorporation of the new exception to Section 1003.3.4 it is abundantly clear that waste is permitted to flow within the building drainage system. This concept has always been the intent because in almost every application the waste must travel through some portion of the building drainage system in order to get to the interceptor. If the actual code text were applied literally the interceptors would need to attach directly to fixture outlets. That is not the intent. Striking this text will remove the misconception that a device is required to install adjacent to each and every fixture that discharges any liquid that may need to be separated prior to entering the public or private systems.

Cost Impact: None. There will be a cost savings.

ICCFILENAME: GRACE-P6-1003.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Because some jurisdictions require outdoor grease interceptors, the current section creates a conflict for those applications. Elimination of the indicated text solves those conflicts.

Assembly Action: **None**

Individual Consideration Agenda

These items are on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Richard Grace, Fairfax County representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA) requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1003.1 Where required. Interceptors and separators shall be provided and installed as required by Sections 1003.3, 1003.4, 1003.6, 1003.7 and 1003.8 ~~Interceptors and separators shall be provided~~ to prevent the discharge of oil, grease, sand and other harmful or hazardous substances ~~harmful or hazardous~~ to the public sewer, the private sewage system, or the sewage treatment plant or processes.

Commenter's Reason: P137 and P138 were both approved by the plumbing committee. If left as is, the two would have contradicting language. This proposed language takes the two and merges them together to provide specific requirements that are not contradicting. The relocation of the terms "harmful or hazardous" clarifies the intent of what cannot be discharged into these drainage systems.

Staff Analysis: Action on this public comment should be coordinated with the action on P137.

Public Comment 2:

Judson Collins, JULYCO, representing self, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

~~**1003.1 Where required.** Interceptors and separators shall be provided to prevent the discharge of oil, grease, sand and other substances harmful or hazardous to the public sewer, the private sewage system or the sewage treatment plant or processes.~~

<u>**1003.1 Where required.** As required by Sections 1003.3, 1003.4, 1003.6, 1003.7 and 1003.8 and where waste contains substances that are hazardous or harmful to the building drainage system, public sewer, private sewage system or sewage treatment plant or processes, such waste shall discharge to these systems through an approved interceptor.</u>

Commenter's Reason: Although the original proposed code change was recommended for approval as submitted by the committee, it did not accomplish what was intended. The intent of this section is to have waste with substances detrimental to the building drainage system, public sewer system, private sewage system or sewage treatment plant or processes discharge through an approved interceptor to keep those substances from entering those systems. This modification better explains the intent than the original proposal did.

Staff Analysis: Action on this public comment should be coordinated with the action on P137.

Final Action: AS AM AMPC____ D

P140-09/10

1003.3.2

<u>Proposed Change as Submitted</u>

Proponent: Sid Cavanaugh, Cavanaugh Consulting representing In Sink Erator

Revise as follows:

1003.3.2 Food Waste Grinders. Where food waste grinders connect to grease interceptors, ~~a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptor and~~ <u>the</u> grease interceptor shall be sized for the discharge of the food waste grinder. Emulsifiers, chemicals, enzymes and bacteria shall not discharge into the food waste grinder.

Reason: Current language implies solids interceptors are used in conjunction with the installation of all food waste grinders, but food waste grinders are connected to grease interceptors only when required by the authority having jurisdiction, and this should be the exception not the rule. Data indicates it is impractical to discharge food waste grinders into interceptors. Language that specifies using a solids interceptor upstream of all grease interceptors is illogical since none are manufactured large enough to accommodate food waste grinder

The intent of grease interceptors is to reduce the introduction of fats, oils and greases (FOG) into sewers. Sewer clogs associated with FOG are well documented, and results from a collaborative research project undertaken by the Water Environment Research Foundation published in the fall 2008 characterized the composition of sewer deposits and provided much insight on these blockages.[1] The data revealed that 84% of the FOG deposit samples analyzed contained high concentrations of saturated fatty acids and calcium, higher than normal background levels, and appeared to be metallic salts of fatty acids. One of the researchers, Dr. Kevin Keener, has reported that no food waste particles were evident in these deposits. The report suggests a chemical reaction is occurring in the sewers, saponification, with calcium chemically selected over sodium. These insoluble deposits are difficult to remove and provide significant challenges for sewage collection system managers and plumbers as well. A supplemental report to the FROG study provided additional insight on the effluent of grease interceptors. 90% of flows though interceptors are on average 1/3 the peak design flow, which equates to detention times in the order of hours, not minutes, interceptors are mainly acidic, with pH's in the range of 4-8, and dissolved oxygen concentrations are less than 0.5 mg/L.

Together, the information provided in these studies suggests FOG deposits may indeed be the result of free fatty acids from the effluent of grease interceptors reacting with calcium. If pumped and maintained infrequently, or retained solids digest anaerobically, or if interceptors are improperly sized, conditions are conducive for promoting the formation of FOG deposits. While it is inappropriate to introduce grease into sewers without remediation through such devices as interceptors, ground food waste should only be discharged directly to sanitary sewers, bypassing interceptors.

Ducoste, Joel J., Kevin M. Keener, John W. Groninger, Leon M. Holt. "Fats, Roots, Oils and Grease (FROG) in Centralized and Decentralized Systems." WERF. 2008

Cost Impact: Minimal.

ICCFILENAME: CAVANAUGH-P7-1003.3.2

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Grease interceptors cannot be sized to take the discharge of a food waste grinder without a solids interceptor upstream of the grinder.

Assembly Action: **None**

Individual Consideration Agenda

This items is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Sidney Cavanaugh, Cavanaugh Consulting, representing In-sink-erator, requests Approval as Submitted.

Commenter's Reason: The proposal was supported by the restaurant/kitchen industry and by all food waste grinder manufacturers. The current code wording is impractical and illogical since none of the solids interceptors currently available in the market are large enough to accommodate commercial food waste grinders and are therefore not used when food waste grinders are mandated or allowed to connect to large gravity type grease interceptors.

Public Comment 2:

Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self, requests Approval as Modified by this Public Comment

Modify the proposal as follows:

1003.3.1 Grease interceptors and automatic grease removal devices required. A grease interceptor or automatic grease removal device shall be required to receive the drainage from fixtures and equipment with grease-laden waste located in food preparation areas, such as in restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers without prerinse sinks. Grease interceptors and automatic grease removal devices shall receive waste only from fixtures and equipment that allow fats, oils or grease to be discharged. Food waste grinders shall not discharge through a grease interceptor.

> **Exception:** Where required by the local jurisdiction or health authority, food waste grinders shall be permitted to discharge through a grease interceptor.

1003.3.2 Food Waste Grinders. Where a food waste grinder~~s~~ is required by the exception to Section 1003.3.1 to connect to a grease interceptor~~s~~, a solids interceptor shall separate the discharge before connecting to the grease interceptor. The solids interceptor and the grease interceptor shall be sized for the discharge of the food waste grinder. Emulsifiers, chemicals, enzymes and bacteria shall not discharge into the food waste grinder.

Commenter's Reason: A food waste grinder should not discharge through a grease interceptor. The purpose of a food waste grinder is to reduce the food waste to small enough particles, such that they can discharge directly to the sanitary drainage system. If they discharge to a grease interceptor, it defeats the purpose of having a food waste grinder. The food particles would be separated by the solids interceptor and grease interceptor.

Unfortunately, some health authorities and local jurisdictions are requiring food waste grinders to discharge through a grease interceptor. This has been done because installations are allowing grease to discharge to the POTW. The response has been to require everything to pass through the grease interceptor. This is unnecessary when there is a properly installed and maintained sanitary drainage system with grease interceptor.

By adding an exception, this allows the local jurisdictions and health authority to still require food waste grinders to discharge through a grease interceptor. Section 1003.3.2 is wordsmithed to address when a food waste grinder must discharge through a grease interceptor.

Staff Analysis: Section 102.10 of the code addresses situations where local, state or federal codes might override the code.

Final Action: AS AM AMPC____ D

P141-09/10
202, 1003.3.4, Chapter 13

Proposed Change as Submitted

Proponent: Rand Ackroyd, Rand Technical Consulting, representing The Plumbing and Drainage Institute

1. Delete and substitute as follows:

~~**GREASE INTERCEPTOR.** A plumbing appurtenance that is installed in a sanitary drainage system to intercept oily and greasy wastes from a wastewater discharge. Such device has the ability to intercept free-floating fats and oils.~~

GREASE INTERCEPTOR.

HYDRO-MECHANICAL. Plumbing appurtenances that are installed in the sanitary drainage system to intercept free-floating fats, oils and grease from wastewater discharge. Continuous separation is accomplished by air entrainment, buoyancy and interior baffling.

GRAVITY. Plumbing appurtenances of not less than 500 gallons (1893 L) capacity that are installed in the sanitary drainage system to intercept free-floating fats, oils and grease from wastewater discharge. Separation is accomplished by gravity during a retention time of not less than 30 minutes.

2. Revise as follows:

1003.3.4 Hydromechanical grease interceptors and automatic grease removal devices. Hydromechanical grease interceptors and automatic grease removal devices shall be sized in accordance with PDI G101, ASME.14.3 Appendix A or ASME A112.14.4. Hydromechanical grease interceptors and automatic grease removal devices shall be designed and tested in accordance with PDI G101, PDI G102, ASME.14.3 Appendix A or ASME A112.14.4. Hydromechanical grease interceptors and automatic grease removal devices shall be installed in accordance with the manufacturer's instructions. The section shall not apply to gravity grease interceptors.

~~**Exception:** Interceptors that have a volume of not less than 500 gallons (1893 L) and that are located outdoors shall not be required to meet the requirements of this section.~~

3. Add standard to Chapter 13 as follows:

PDI
G102 Testing and Certification for Grease Interceptors with FOG Sensing and Alarm Devices

Reason: The industry has standardized on the terms "Hydro-Mechanical" and "Gravity" for the two general types of grease interceptors in the plumbing industry. The requirements in Section 1003.3.4 and its subsections were never intended to apply to gravity grease interceptors. The new terminology makes a clear distinction between the two types in order for the code to be clear about which type of grease interceptor the requirements apply to.

PDI G102 covers the Testing and Certification for Grease Interceptors with FOG Sensing and Alarm Devices. This standard expands on the already recognized PDI G101 by including testing and certification of alarm devices that can be provided on interceptors already complying with PDI G101. The alarm device on a hydromechanical grease interceptor monitors the level of the grease captured in the unit and provides both a loud audible signal and a visible signal when the accumulated grease (FOG) in the interceptor needs to be removed. Standard PDI G102 is available for free downloading from the PDI website www.pdionline.org.

The exception to this section that was put in last cycle by another proponent was an attempt to distinguish between the two general types of grease interceptors in order to clarity that Section 1003.3.4 did not apply to gravity grease interceptors. The new proposed terminology provides the necessary clarification and thus, the exception is no longer needed. However, in the spirit of the exception, the last line of text was added to reinforce that the reader should not try to apply the requirements of this section (including the subsections that follow) to gravity grease interceptors.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: Ackroyd-P3-1003.3.4

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of proposed new standard PDI G102 indicated that in the opinion of ICC staff, the standard did not comply with ICC standards criteria.

Committee Action: **Approved as Submitted**

Committee Reason: New terms and definitions are in alignment with product standards and industry terminology.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble, representing the ICC Referenced Standards Committee, requests Approval as Modified by this public comment.

Modify the proposal as follows:

1**003.3.4 Hydromechanical grease interceptors and automatic grease removal devices.** Hydromechanical grease interceptors and automatic grease removal devices shall be sized in accordance with PDI G101, ASME.14.3 Appendix A or ASME A112.14.4. Hydromechanical grease interceptors and automatic grease removal devices shall be designed and tested in accordance with PDI G101, ~~PDI G102,~~ ASME.14.3 Appendix A or ASME A112.14.4. Hydromechanical grease interceptors and automatic grease removal devices shall be installed in accordance with the manufacturer's instructions. The section shall not apply to gravity grease interceptors.

Remove standard in Chapter 13 as follows:

PDI
~~G102~~ ~~Testing and Certification for Grease Interceptors with FOG Sensing and Alarm Device~~

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically, and 3.6.2.1 which requires standards be written in mandatory language.

We therefore propose to have deleted the reference standard and subsequent reference to that standard as part of this proposal to modify the original proposal.

Final Action: AS AM AMPC____ D

P143-09/10
1003.4.2

Proposed Change as Submitted

Proponent: Bob Eugene/Underwriters Laboratories Inc/Underwriters Laboratories Inc

1. Revise as follows:

1003.4.2 Oil separator design. Oil separators shall be listed and labeled in accordance with UL 2215, or designed in accordance with Sections 1003.4.2.1 and 1003.4.2.2.

2. Add standards to Chapter 13 as follows:

UL
<u>2215-00</u> <u>Outline of Investigation for Oil/Water Separators</u>

Reason: This proposal provides an alternative for the use of listed oil/water separators that are built on-site. UL's Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list oil/water separators used in garages and service stations. These requirements cover stationary gravity or pump fed aboveground and underground, atmospheric type oil/water separator systems intended to remove oil suspended in water from rainwater runoff or normal washdown of streets, highways, and parking lots at an inlet rate not exceeding the marked maximum influent concentration and flow rate. Oil/water separator systems covered by these requirements are fabricated, inspected, and tested for leakage before shipment from the factory as completely assembled units, or with instructions for field assembly of minor components. Over 20 companies currently have oil/water separators listed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of the proposed new requirement UL 2215-00 indicated that, in the opinion of ICC staff, the requirement did not comply with ICC standards criteria.

ICCFILENAME: EUGENE-P1-1003.4.2

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of proposed new standard UL 2215-00 indicated that in the opinion of ICC staff, the standard did not comply with ICC standards criteria.

Committee Action: **Approved as Submitted**

Committee Reason: The UL outline provides a needed method for sizing criteria for oil separators.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble, ICC Referenced Standards Chair, representing the ICC Reference Standards Committee, requests Approved as Modified by this Public Comment.

Modify the proposal as follows:

1003.4.2 Oil separator design. Oil separators shall be listed and labeled ~~in accordance with UL 2215,~~ or designed in accordance with Sections 1003.4.2.1 and 1003.4.2.2.

UL
~~2215-00~~ ~~Outline of Investigation for Oil/Water Separators~~

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically Sections 3.6.2.1 which requires standards to be written in mandatory language, and 3.6.3 which requires standards be promulgated according to a consensus process.

We therefore propose to have deleted the reference standard and subsequent reference to that standard as part of this proposal to modify the original proposal.

Final Action: AS AM AMPC____ D

P144-09/10
1003.9, 1003.10 (New)

Proposed Change as Submitted

Proponent: Cort Strain University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO).

1. Revise as follows:

1003.9 Venting of interceptors and separators. Interceptors and separators shall be designed so as not to become air bound where tight covers are utilized. ~~Each interceptor or separator shall be vented where subject to a loss of trap seal.~~ <u>The pipe connected to the outlet of an interceptor or separator shall be vented in accordance with the fixture trap venting requirements of Chapter 9. The invert of the outlet fitting of the interceptor or separator shall be considered as the trap weir elevation for the purposes of determining the maximum allowable distance from the outlet to the vent connection to the outlet pipe.</u>

2. Add new text as follows:

<u>**1003.10 Cleanout for outlet pipe of interceptors or separators.** A two-way cleanout arrangement shall be installed on the outlet pipe of interceptors and separators. The cleanout arrangement shall enable rodding of the outlet pipe in both the upstream and downstream directions.</u>

(Renumber subsequent sections)

Reason: Although interceptor or separator manufacturer's installation instructions might state that a vent is not required on outlet pipe of the unit, the fact is that most instructions are silent on the issue. So how is the code official supposed to know if a particular unit in a specific installation arrangement could develop siphon action? The truth is, no one really knows. Therefore, the words in Section 1003.9 are deleted because there really isn't any way to know if siphonage will occur. In our experience, a fair number of interceptors and separators do develop siphons which result in the discharge of collected contents into drain and sewer systems. The outlet pipes of interceptors and separators should be vented to prevent siphoning from occurring. The need for outlet pipe venting is supported by Section 10.3 of standard PDI-101 (a code referenced standard) that states: "Grease interceptors shall have a vented waste on the outlet side, sized in accordance with code requirements for venting traps to retain water seal and prevent siphoning". The text added to Section 1003.9 brings this requirement to light and provides the details for properly locating and sizing the vent.

Unlike a fixture trap that can be easily removed for access to rod a fixture drain, interceptors and separators are not easily removed and rarely have the provisions necessary to gain adequate access for rodding of the pipe connected to the outlet. This is a location that can require frequent rodding especially if the interceptor or separator is not cleaned at the necessary intervals. In many cases, as a necessity, cleanouts are often added after installation. Unfortunately, many of these after-the-fact cleanout installations do not get permitted or inspected resulting problems. The new section 1003.10 adds text to require a two way cleanout arrangement on the outlet pipe of interceptors and separators.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME: Strain-P2-1003.9

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Not every interceptor or separator has a "trap seal" or acts like a trap so the requirement for venting the outlet of every interceptor or separator is questionable. Installing two-way cleanouts on interceptor and separator outlets might introduce problems of damage to internal separator and interceptor components.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Cort Strain, University of Colorado, representing CAPMO, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1003.9 Venting of interceptors and separators. Interceptors and separators shall be designed so as not to become air bound where tight covers are utilized. The outlet pipe ~~connected to the outlet of~~ from an interceptor or separator shall be vented within the distance as indicated in Table 1003.9 ~~in accordance with the fixture trap venting requirements of Chapter 9.~~ by the connection of a dry vent to the outlet pipe. ~~The invert of the outlet fitting of the interceptor or separator shall be considered as the trap weir elevation for the purposes of determining the maximum allowable distance from the outlet to the vent connection to the outlet pipe~~. Dry vent piping shall be installed in accordance with Sections 905.1 though 905.5.

TABLE 1003.9
MAXIMUM DISTANCE FROM
INTERCEPTOR OR SEPARATOR OUTLET TO VENT

SIZE OF OUTLET PIPE (inches)	MAXIMUM SLOPE OF OUTLET PIPE (inch per foot)	MAXIMUM DISTANCE FROM OUTLET TO VENT (feet)
$1^1/_2$	$^1/_4$	6
2	$^1/_4$	8
3	$^1/_8$	12
4	$^1/_8$	16
5	$^1/_8$	20
6	$^1/_8$	24
8	$^1/_8$	32
10	$^1/_8$	40

(Underlining omitted in table for clarity)

1003.10 Cleanout for outlet pipe of interceptors or separators. A ~~two-way~~ cleanout ~~arrangement~~ shall be installed on the outlet pipe of interceptors and separators at a point not greater than 24 inches in developed pipe length from the outlet of the interceptor or separator. The cleanout ~~arrangement~~ shall enable rodding of the outlet pipe only in ~~both the upstream and downstream directions~~ the direction of flow.

Commenter's Reason: Although interceptor or separator manufacturer's installation instructions might state that a vent is not required on outlet pipe of the unit, the fact is that most instructions are silent on the issue. So how is the code official supposed to know if a particular unit in a specific installation arrangement could develop siphon action? The truth is, no one really knows. Therefore, the words in Section 1003.9 are deleted because there really isn't any way to know if siphonage will occur. In our experience, a fair number of interceptors and separators do develop siphons which result in the discharge of collected contents into drain and sewer systems. The outlet pipes of interceptors and separators should be vented to prevent siphoning from occurring. The need for outlet pipe venting is supported by Section 10.3 of standard PDI-101 (a code referenced standard) that states: "Grease interceptors shall have a vented waste on the outlet side, sized in accordance with code requirements for venting traps to retain water seal and prevent siphoning". The text added to Section 1003.9 brings this requirement to light and provides the details for properly locating and sizing the vent.

Unlike a fixture trap that can be easily removed for access to rod a fixture drain, interceptors and separators are not easily removed and rarely have the provisions necessary to gain adequate access for rodding of the pipe connected to the outlet. This is a location that can require frequent rodding especially if the interceptor or separator is not cleaned at the necessary intervals. In many cases, as a necessity, cleanouts are often added after installation. Unfortunately, many of these after-the-fact cleanout installations do not get permitted or inspected resulting problems. The new section 1003.10 adds text to require a cleanout on the outlet pipe of interceptors and separators.

Final Action: AS AM AMPC____ D

P151-09/10

1107 (New), 1107.1 (New), Chapter 13

Proposed Change as Submitted

Proponent: Robert Evans, CPD/ASPE Legislative Committee/ASPE

1. Add a new section as follows:

Section 1107
Siphonic Roof Drainage Systems

1107.1 General. Siphonic roof drainage systems shall be designed in accordance with ASPE 45.

2. Add standard to Chapter 13 as follows:

American Society of Plumbing Engineers
8614 Catalpa Avenue, Suite 1007
Chicago, IL 60656-1116

ASPE

45-2007	Siphonic Roof Drainage Systems

Reason: This section will add requirements for the design of siphonic roof drainage systems. ASPE developed a standard for the plumbing engineers to use when designing these systems. This is a complex design that needs to be properly addressed in the code. Without the reference to the proper standard, the plumbing official has no requirements by which to evaluate siphonic roof drainage systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, ASPE 45-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: EVANS-P1-1107 NEW

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of proposed new standard ASPE 45-2007 indicated that in the opinion of ICC staff, the standards did not comply with ICC standards criteria.

Committee Action: **Approved as Modified**

Modify the proposal as follows:

1107.1 General. Siphonic roof drains and drainage systems shall be designed in accordance with ASME A112.6.9 and ASPE 45.

Add standard to Chapter 13 as follows:

ASPE

A112.6.9-2005	Siphonic Roof Drains

Committee Reason: Agreed with the proponent's reason statement which stated that siphonic roof drain systems because of their complexity, need to have a standard for design and need to use a roof drain that meets a specific referenced standard.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble, ICC Referenced Standards Chair, representing the ICC Reference Standards Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Section 1107
Siphonic Roof Drainage Systems

1107.1 General. Siphonic roof drains and drainage systems shall be designed in accordance with ~~ASME A112.6.9 and ASPE 45~~ an approved manner.

~~American Society of Plumbing Engineers~~
~~8614 Catalpa Avenue, Suite 1007~~
~~Chicago, IL 60656-1116~~

~~**ASPE**~~
~~45-2007~~ ~~Siphonic Roof Drainage Systems~~

Commenter's Reason: The ICC Reference Standards Committee is a committee that was organized "to support the codes development committees through the review of reference standards for the International Codes." We submit this code challenge to provide an opinion regarding code change.

It is the reference standards committee's view that the proposal currently lacks sufficient information concerning the promulgation process. We would preface this opinion that it is not our view to state that the proposed document is technically deficient or that the proposal does not have technical merit, but rather to state that the document development process and maintenance process do not comply with ICC Council Policy 28, specifically Section 3.6.3, which requires standards be promulgated according to a consensus process.

We therefore propose to have deleted the reference standard and subsequent reference to that standard as part of this proposal to modify the original proposal.

Final Action: AS AM AMPC____ D

P152-09/10, Part I
202 (New), 301.3, Chapter 13 (New), Appendix C

Proposed Change as Submitted

Proponent: Guy Tomberlin of Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors, Virginia Building and Code Officials and ICC Region 7.

PART I – IPC

1. Add definition as follows:

GRAY WATER. Waste discharged from lavatories, bathtubs, showers, clothes washers and laundry trays.

2. Revise as follows:

301.3 Connections to drainage system. ~~All~~ Plumbing fixtures, drains, appurtenances and appliances used to receive or discharge liquid wastes or sewage shall be directly connected to the sanitary drainage system of the building or premises, in accordance with the requirements of this code. This section shall not be construed to prevent indirect waste systems required by Chapter 8.

Exception: Bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to discharge to the sanitary drainage system where such fixtures discharge to an approved gray water system for flushing of water closets and urinals or for subsurface landscape irrigation.

3. Delete Appendix C in its entirety without substitution

(Renumber subsequent appendices)

4. Add new chapter and text as follows:

Chapter 13
Gray Water Recycling Systems

SECTION 1301
GENERAL

1301.1 Scope. The provisions of Chapter 13 shall govern the materials, design, construction and installation of gray water systems for flushing of water closets and urinals and for subsurface landscape irrigation. See Figures 1301.1(1) and 1301.1(2).

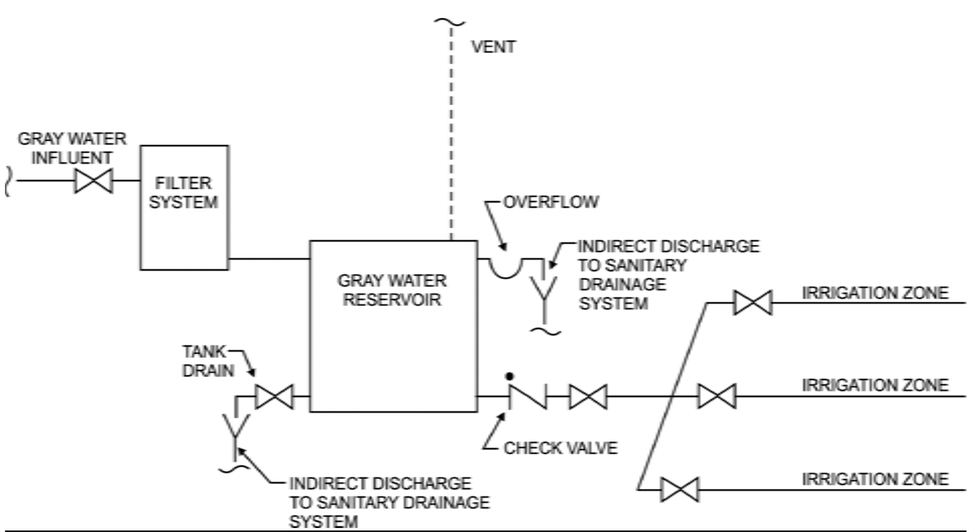

FIGURE 1301.1 (1)
GRAY WATER RECYCLING SYSTEM FOR SUBSURFACE LANDSCAPE IRRIGATION

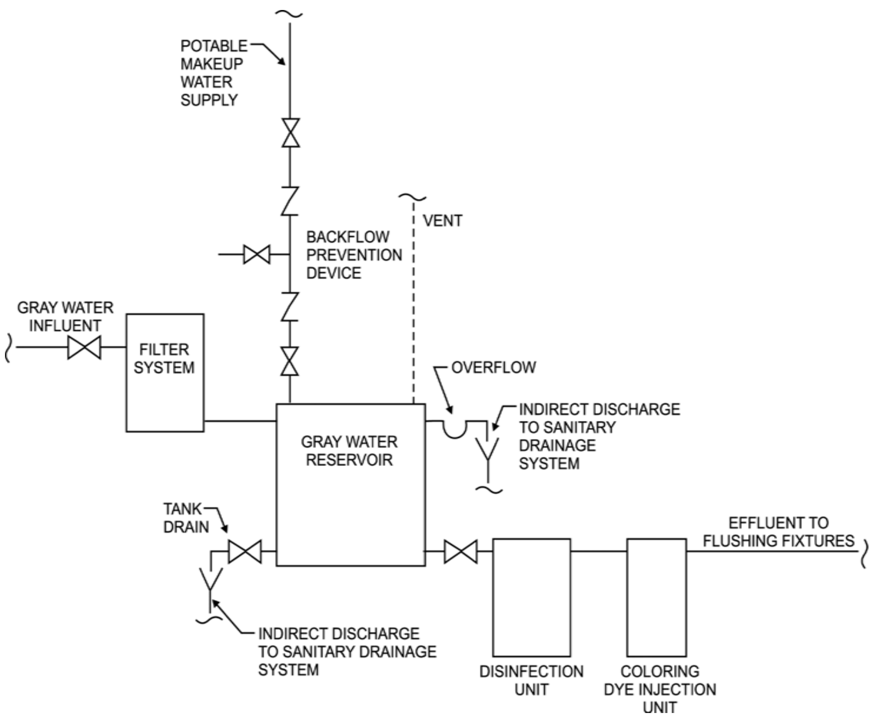

FIGURE 1301.1(2)
GRAY WATER RECYCLING SYSTEM FOR
FLUSHING WATER CLOSETS AND URINALS

1301.2 Installation. In addition to the provisions of Section 1301, systems for flushing of water closets and urinals shall comply with Section 1302 and systems for subsurface landscape irrigation shall comply with Section 1303. Except as provided for in this chapter, all systems shall comply with the provisions of the other chapters of this code.

1301.3 Materials. Above-ground drain, waste and vent piping for gray water systems shall conform to one of the standards listed in Table 702.1. Gray water underground building drainage and vent pipe shall conform to one of the standards listed in Table 702.2.

1301.4 Tests. Drain, waste and vent piping for gray water systems shall be tested in accordance with Section 312.

1301.5 Inspections. Gray water systems shall be inspected in accordance with Section 107.

1301.6 Potable water connections. Only connections in accordance with Section 1302.3 shall be made between a gray water recycling system and a potable water system.

1301.7 Waste water connections. Gray water recycling systems shall receive only the waste discharge of bathtubs, showers, lavatories, clothes washers or laundry trays.

1301.8 Collection reservoir. Gray water shall be collected in an approved reservoir constructed of durable, nonabsorbent and corrosion-resistant materials. The reservoir shall be a closed and gas-tight vessel. Access openings shall be provided to allow inspection and cleaning of the reservoir interior.

1301.9 Filtration. Gray water entering the reservoir shall pass through an approved filter such as a media, sand or diatomaceous earth filter.

1301.9.1 Required valve. A full-open valve shall be installed downstream of the last fixture connection to the gray water discharge pipe before entering the required filter.

1301.10 Overflow. The collection reservoir shall be equipped with an overflow pipe having the same or larger diameter as the influent pipe for the gray water. The overflow pipe shall be trapped and shall be indirectly connected to the sanitary drainage system.

1301.11 Drain. A drain shall be located at the lowest point of the collection reservoir and shall be indirectly connected to the sanitary drainage system. The drain shall be the same diameter as the overflow pipe required in Section 1301.10.

1301.12 Vent required. The reservoir shall be provided with a vent sized in accordance with Chapter 9 and based on the diameter of the reservoir influent pipe.

SECTION 13 02
SYSTEMS FOR FLUSHING WATER CLOSETS AND URINALS

1302.1 Collection reservoir. The holding capacity of the reservoir shall be a minimum of twice the volume of water required to meet the daily flushing requirements of the fixtures supplied with gray water, but not less than 50 gallons (189 L). The reservoir shall be sized to limit the retention time of gray water to a maximum of 72 hours.

1302.2 Disinfection. Gray water shall be disinfected by an approved method that employs one or more disinfectants such as chlorine, iodine or ozone that are recommended for use with the pipes, fittings and equipment by the manufacturer of the pipes, fittings and equipment.

1302.3 Makeup water. Potable water shall be supplied as a source of makeup water for the gray water system. The potable water supply shall be protected against backflow in accordance with Section 608. There shall be a full-open valve located on the makeup water supply line to the collection reservoir.

1302.4 Coloring. The gray water shall be dyed blue or green with a food grade vegetable dye before such water is supplied to the fixtures.

1302.5 Materials. Distribution piping shall conform to one of the standards listed in Table 605.4.

1302.6 Identification. Distribution piping and reservoirs shall be identified as containing nonpotable water. Piping identification shall be in accordance with Section 608.8.

SECTION 1303
SUBSURFACE LANDSCAPE IRRIGATION SYSTEMS

1303.1 Collection reservoir. Reservoirs shall be sized to limit the retention time of gray water to a maximum of 24 hours.

1303.1.1 Identification. The reservoir shall be identified as containing nonpotable water.

1303.2 Valves required. A check valve and a full-open valve located on the discharge side of the check valve shall be installed on the effluent pipe of the collection reservoir.

1303.3 Makeup water. Makeup water shall not be required for subsurface landscape irrigation systems. Where makeup water is provided, the installation shall be in accordance with Section 1302.3.

1303.4 Disinfection. Disinfection shall not be required for gray water used or subsurface landscape irrigation systems.

1303.5 Coloring. Gray water used for subsurface landscape irrigation systems shall not be required to be dyed.

1303.6 Estimating gray water discharge. The system shall be sized in accordance with the gallons-per-day-per-occupant number based on the type of fixtures connected to the gray water system. The discharge shall be calculated by the following equation:

$C = A \times B$

A = Number of occupants:
Residential–Number of occupants shall be determined by the actual number of occupants, but not less than two occupants for one bedroom and one occupant for each additional bedroom.
Commercial–Number of occupants shall be determined by the *International Building Code*®.

B = Estimated flow demands for each occupant:
Residential–25 gallons per day (94.6 lpd) per occupant for showers, bathtubs and lavatories and 15 gallons per day (56.7 lpd) per occupant for clothes washers or laundry trays.
Commercial–Based on type of fixture or water use records minus the discharge of fixtures other than those discharging gray water.

C = Estimated gray water discharge based on the total number of occupants.

1303.7 Percolation tests. The permeability of the soil in the proposed absorption system shall be determined by percolation tests or permeability evaluation.

1303.7.1 Percolation tests and procedures. At least three percolation tests in each system area shall be conducted. The holes shall be spaced uniformly in relation to the bottom depth of the proposed absorption system. More percolation tests shall be made where necessary, depending on system design.

1303.7.1.1 Percolation test hole. The test hole shall be dug or bored. The test hole shall have vertical sides and a horizontal dimension of 4 inches to 8 inches (102 mm to 203 mm). The bottom and sides of the hole shall be scratched with a sharp-pointed instrument to expose the natural soil. All loose material shall be removed from the hole and the bottom shall be covered with 2 inches (51 mm) of gravel or coarse sand.

1303.7.1.2 Test procedure, sandy soils. The hole shall be filled with clear water to a minimum of 12 inches (305 mm) above the bottom of the hole for tests in sandy soils. The time for this amount of water to seep away shall be determined, and this procedure shall be repeated if the water from the second filling of the hole seeps away in 10 minutes or less. The test shall proceed as follows: Water shall be added to a point not more than 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, water levels shall be measured at 10-minute intervals for a period of 1 hour. Where 6 inches (152mm) of water seeps away in less than 10 minutes, a shorter interval between measurements shall be used, but in no case shall the water depth exceed 6 inches (152 mm). Where 6 inches (152 mm) of water seeps away in less than 2 minutes, the test shall be stopped and a rate of less than 3 minutes per inch (7.2 s/mm) shall be reported. The final water level drop shall be used to calculate the percolation rate. Soils not meeting the above requirements shall be tested in accordance with Section 1303.7.1.3.

1303.7.1.3 Test procedure, other soils. The hole shall be filled with clear water, and a minimum water depth of 12 inches (305mm) shall be maintained above the bottom of the hole for a 4-hour period by refilling whenever necessary or by use of an automatic siphon. Water remaining in the hole after 4 hours shall not be removed. Thereafter, the soil shall be allowed to swell not less than 16 hours or more than 30 hours. Immediately after the soil swelling period, the measurements for determining the percolation rate shall be made as follows: Any soil sloughed into the hole shall be removed and the water level shall be adjusted to 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, the water level shall be measured at 30-minute intervals for a period of 4 hours, unless two successive water level drops do not vary by more than $^{1}/_{16}$ inch (1.59 mm). At least three water level drops shall be observed and recorded. The hole shall be filled with clear water to a point not more than 6 inches (152 mm) above the gravel or coarse sand whenever it becomes nearly empty. Adjustments of the water level shall not be made during the three measurement periods except to the limits of the last measured water level drop. When the first 6 inches (152 mm) of water seeps away in less than 30 minutes, the time interval between measurements shall be 10 minutes and the test run for 1 hour. The water depth shall not exceed 5 inches (127 mm) at any time during the measurement period. The drop that occurs during the final measurement period shall be used in calculating the percolation rate.

1303.7.1.4 Mechanical test equipment. Mechanical percolation test equipment shall be of an approved type.

1303.7.2 Permeability evaluation. Soil shall be evaluated for estimated percolation based on structure and texture in accordance with accepted soil evaluation practices. Borings shall be made in accordance with Section 1303.7.1 for evaluating the soil.

1303.8 Subsurface landscape irrigation site location. The surface grade of all soil absorption systems shall be located at a point lower than the surface grade of any water well or reservoir on the same or adjoining property. Where this is not possible, the site shall be located so surface water drainage from the site is not directed toward a well or reservoir. The soil absorption system shall be located with a minimum horizontal distance between various elements as indicated in Table 1303.8. Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.

TABLE 1303.8
LOCATION OF GRAY WATER SYSTEM

ELEMENT	MINIMUM HORIZONTAL DISTANCE	
	HOLDING TANK (feet)	IRRIGATION DISPOSAL FIELD (feet)
Buildings	5	2
Property line adjoining private property	5	5
Water wells	50	100
Streams and lakes	50	50
Seepage pits	5	5
Septic tanks	0	5
Water service	5	5
Public water main	10	10

For SI: 1 foot = 304.8 mm.

1303.9 Installation. Absorption systems shall be installed in accordance with Sections 1303.9.1 through 1303.9.5 to provide landscape irrigation without surfacing of gray water.

1303.9.1 Absorption area. The total absorption area required shall be computed from the estimated daily gray water discharge and the design-loading rate based on the percolation rate for the site. The required absorption area equals the estimated gray water discharge divided by the design-loading rate from Table 1303.9.1.

TABLE 1303.9.1
DESIGN LOADING RATE

PERCOLATION RATE (minutes per inch)	DESIGN LOADING FACTOR (gallons per square foot per day)
0 to less than 10	1.2
10 to less than 30	0.8
30 to less than 45	0.72
45 to 60	0.4

For SI: 1 minute per inch = min/25.4 mm,
1 gallon per square foot = 40.7 L/m^2.

1303.9.2 Seepage trench excavations. Seepage trench excavations shall be a minimum of 1 foot (304 mm) to a maximum of 5 feet (1524 mm) wide. Trench excavations shall be spaced a minimum of 2 feet (610 mm) apart. The soil absorption area of a seepage trench shall be computed by using the bottom of the trench area (width) multiplied by the length of pipe. Individual seepage trenches shall be a maximum of 100 feet (30 480 mm) in developed length.

1303.9.3 Seepage bed excavations. Seepage bed excavations shall be a minimum of 5 feet (1524 mm) wide and have more than one distribution pipe. The absorption area of a seepage bed shall be computed by using the bottom of the trench area. Distribution piping in a seepage bed shall be uniformly spaced a maximum of 5 feet (1524mm) and a minimum of 3 feet (914 mm) apart, and a maximum of 3 feet (914mm) and a minimum of 1 foot (305 mm) from the sidewall or headwall.

1303.9.4 Excavation and construction. The bottom of a trench or bed excavation shall be level. Seepage trenches or beds shall not be excavated where the soil is so wet that such material rolled between the hands forms a soil wire. All smeared or compacted soil surfaces in the sidewalls or bottom of seepage trench or bed excavations shall be scarified to the depth of smearing or compaction and the loose material removed. Where rain falls on an open excavation, the soil shall be left until sufficiently dry so a soil wire will not form when soil from the excavation bottom is rolled between the hands. The bottom area shall then be scarified and loose material removed.

1303.9.5 Aggregate and backfill. A minimum of 6 inches of aggregate ranging in size from $^1/_2$ to $2^1/_2$ inches (12.7 mm to 64 mm) shall be laid into the trench below the distribution piping elevation. The aggregate shall be evenly distributed a minimum of 2 inches (51 mm) over the top of the distribution pipe. The aggregate shall be covered with approved synthetic materials or 9 inches (229mm) of uncompacted marsh hay or straw. Building paper shall not be used to cover the aggregate. A minimum of 9 inches (229 mm) of soil backfill shall be provided above the covering.

1303.10 Distribution piping. Distribution piping shall be not less than 3 inches (76mm) in diameter. Materials shall comply with Table 1303.10. The top of the distribution pipe shall be not less than 8 inches (203mm) below the original surface. The slope of the distribution pipes shall be a minimum of 2 inches (51 mm) andamaximumof4inches (102 mm) per 100 feet (30 480 mm).

TABLE 1303.10
DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F 405
Polyvinyl chloride (PVC) plastic pipe	ASTM D 2729
Polyvinyl chloride (PVC) plastic pipe with a 3.5 inch O.D. and solid cellular core or composite wall.	ASTM F 1488

1303.11 Joints. Joints in distribution pipe shall be made in accordance with Section 705 of this code.

(Renumber subsequent chapters and sections)

Reason: The purpose of this proposal is to bring the gray water recycling systems information in the appendix of the code out of obscurity so the technology can be implemented. The use of gray water as an alternative water source is becoming highly desirable and popular due to the water huge water savings and the shortage of potable water supplies in some areas of the country. This new chapter will promote the reuse of gray water for subsurface irrigation use and the flushing of water closets and urinals. Utilizing the provisions contained within this new chapter will advance the LEED point system for the owners benefit. The unfortunate reality is where provisions are located within an Appendix they are typically subject to adoption at the local level. Moving the current provisions to be included in the body of the code will eliminate the undesirable situation where a locality my not promote this “Green” concept based on the fact that is not code, only an Appendix.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: TOMBERLIN-P5-Chapter 13 NEW

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: Proposal lowers the safety within the building. Makes building owners wastewater purveyors. No standards exist for graywater quality. No approvals exist for equipment needed for graywater processing.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Guy Tomberlin, Fairfax County, representing VA Plumbing and Mechanical Inspectors Association, VA Building and Code Officials Association and ICC Region VII, requests Approval as Submitted.

Commenter’s Reason: I want to first point out two very important facts related to this proposal. The first is this is the exact language taken from the current appendices of these two codes. This language was updated recently to incorporate mandatory, enforceable and easy to implement regulations to take advantage of the “green” technology that has been utilized successfully for century’s. The second is, the only 3 places that gray/recycled water is permitted to be used is for flushing water closets and urinals, and for lawn irrigation.

The testimony in opposition to this proposal was focused on 3 points: 1. The use of gray water to flush water closets could increase unsafe bacteria levels in a toilet tank and further this proposal did not require any type mandatory sampling of the water quality. Current code does not require bacteria level testing in water closet tanks and I would suggest after many years of continued use the water quality in the average toilet tank is not suitable for human consumption and nor should it be used as such. But the fact is this proposal does require colored dye be added to the gray water prior to its use. This was done for a very good reason, to make it absolutely clear that no one should attempt to consume the water. 2. Other provisions need to be added to these regulations. The current appendices are not 100% all inclusive and do not cover all the possible applications but they are a perfect groundwork that this technology can be built upon. There were approximately 2,200 code changes submitted to the International codes this cycle, I would submit that there will always be room for improvement to any code. 3. The Green Code is going to address this topic. That is correct, however the Green Code is currently in draft form and its widespread adoption is not confirmed just yet. These provisions are ready to implement today and have already been used in many applications successfully.

The truth is if we wait and do not adopt this environmentally friendly “green” technology now the industry will pass us by. Industry will continue to improve on the various applications associated with this technology and code modifications will continue to be the status quo, leaving it up to the code official to determine when and where these systems should be allowed. Many areas across the country suffer from drought and potable water shortages right now, this proposal only make sense. We have come full circle with water use and rediscovered its value. This is a huge step in the right direction to help preserve the environment for generations to come.

Public Comment 2:

Judson Collins, JULYCO, representing himself, requests Approval as Submitted.

Commenter’s Reason: The committee said there are other ways to handle gray water as a reason for disapproval. Granted there are other ways but no one is bringing any of them forward. This language already exists in the appendix of the code. However, since the majority of jurisdictions do not adopt an appendix, it is seldom used. Moving these requirements into the code does not make them mandatory. If someone wants to install a gray water system, these methods have been successfully used in areas of water conservation. If someone wants to use methods other than these, they always have the option of alternative materials, methods and equipment in Section 105.2.

Final Action: AS AM AMPC____ D

P152-09/10, Part II
IRC R202 (New), P2601.2, Section P3009 (New), Appendix O

Proposed Change as Submitted

Proponent: Guy Tomberlin of Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors, Virginia Building and Code Officials and ICC Region 7.

PART II - IRC

1. Add definition as follows:

GRAY WATER. Waste discharged from lavatories, bathtubs, showers, clothes washers and laundry trays.

2. Revise as follows:

P2601.2 Connections to drainage system. Plumbing fixtures, drains, appurtenances and appliances used to receive or discharge liquid wastes or sewage shall be directly connected to the sanitary drainage system of the building or premises, in accordance with the requirements of this code. This section shall not be construed to prevent indirect waste systems.

> **Exception:** Bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to discharge to the sanitary drainage system where such fixtures discharge to an approved gray water system for flushing of water closets and urinals or for subsurface landscape irrigation.

3. Delete Appendix O in its entirety without substitution

(Renumber subsequent appendices)

4. Add new section and text as follows:

SECTION P3009
GRAY WATER RECYCLING SYSTEMS

P3009.1 Scope. The provisions of Section P3009 shall govern the materials, design, construction and installation of gray water systems for flushing of water closets and urinals and for subsurface landscape irrigation. See Figures P3009.1(1) and P3009.1(2).

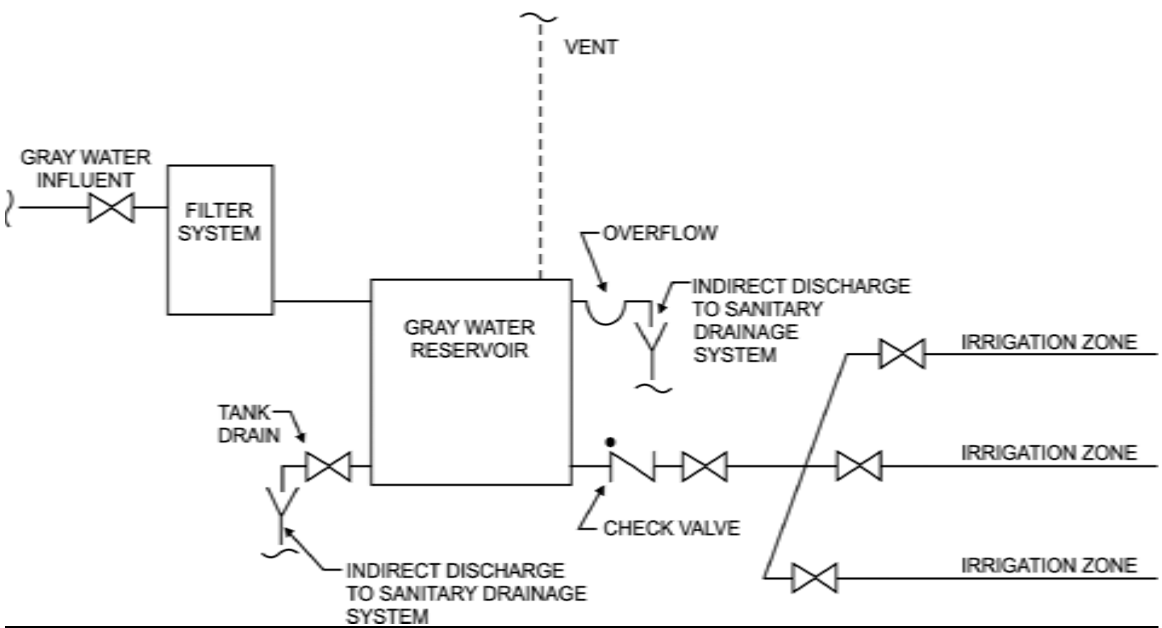

FIGURE P3009.1(1)
GRAY WATER RECYCLING SYSTEM FOR SUBSURFACE LANDSCAPE IRRIGATION

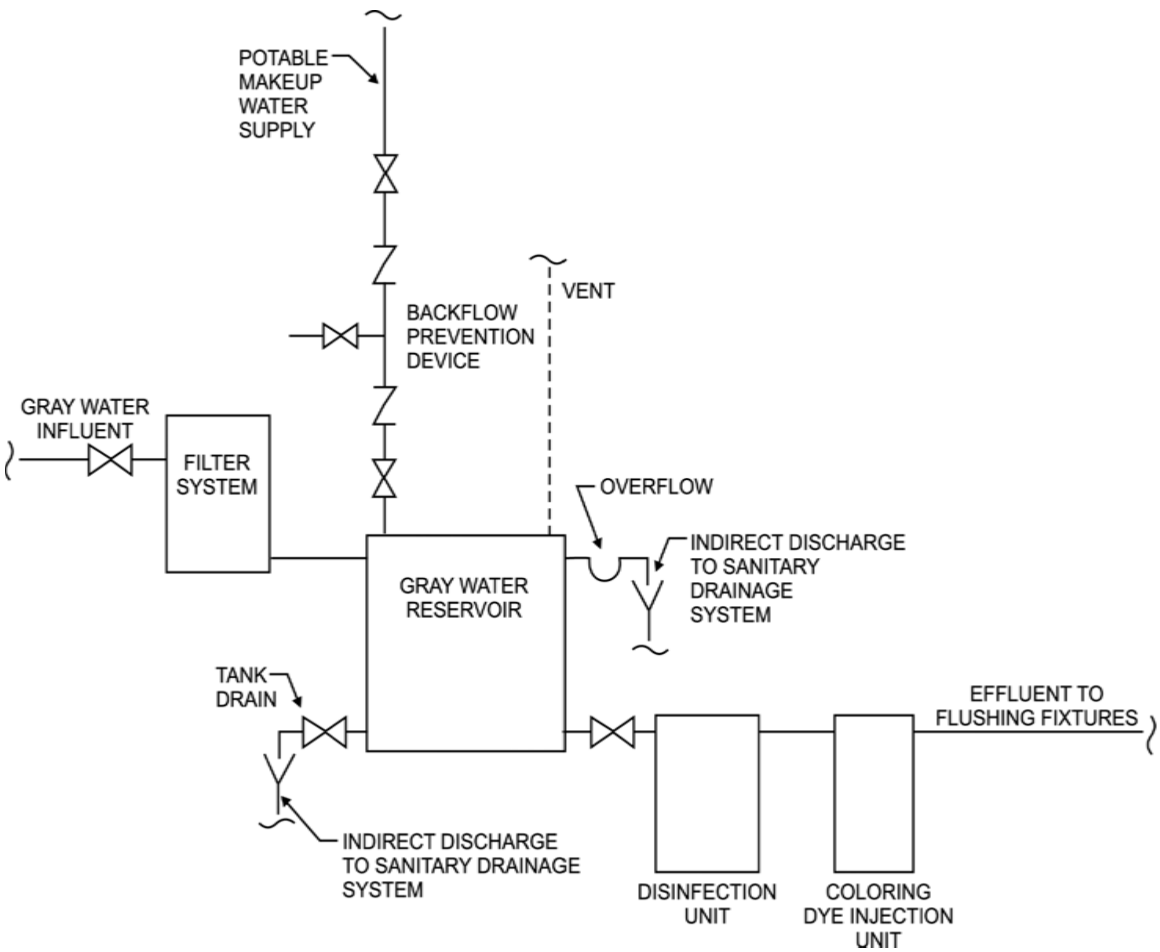

FIGURE P3009.1(2)
GRAY WATER RECYCLING SYSTEM FOR
FLUSHING WATER CLOSETS AND URINALS

P3009.2 Installation. In addition to the provisions of Section P3009, systems for flushing of water closets and urinals shall comply with Section P3009.13 and systems for subsurface landscape irrigation shall comply with Section P3009.14. Except as provided for in Section P3009, all systems shall comply with the provisions of the other sections of this code.

P3009.3 Materials. Above-ground drain, waste and vent piping for gray water systems shall conform to one of the standards listed in Table P3002.1(1). Gray water underground building drainage and vent pipe shall conform to one of the standards listed in Table P3002.1(2).

P3009.4 Tests. Drain, waste and vent piping for gray water systems shall be tested in accordance with Section P2503.

P3009.5 Inspections. Gray water systems shall be inspected in accordance with Section P2503.

P3009.6 Potable water connections. Only connections in accordance with Section 3009.13.1 shall be made between a gray water recycling system and a potable water system.

P3009.7 Waste water connections. Gray water recycling systems shall receive only the waste discharge of bathtubs, showers, lavatories, clothes washers or laundry trays.

P3009.8 Collection reservoir. Gray water shall be collected in an approved reservoir constructed of durable, nonabsorbent and corrosion-resistant materials. The reservoir shall be a closed and gas-tight vessel. Access openings shall be provided to allow inspection and cleaning of the reservoir interior.

P3009.9 Filtration. Gray water entering the reservoir shall pass through an approved filter such as a media, sand or diatomaceous earth filter.

P3009.9.1 Required valve. A full-open valve shall be installed downstream of the last fixture connection to the gray water discharge pipe before entering the required filter.

P3009.10 Overflow. The collection reservoir shall be equipped with an overflow pipe having the same or larger diameter as the influent pipe for the gray water. The overflow pipe shall be trapped and shall be indirectly connected to the sanitary drainage system.

P3009.11 Drain. A drain shall be located at the lowest point of the collection reservoir and shall be indirectly connected to the sanitary drainage system. The drain shall be the same diameter as the overflow pipe required in Section P3009.10.

P3009.12 Vent required. The reservoir shall be provided with a vent sized in accordance with Chapter 31 and based on the diameter of the reservoir influent pipe.

P3009.13 Flushing water systems. Systems for flushing water closets and urinals shall comply with Sections P3009.13.1 through P3009.13.6

P3009.13.1 Collection reservoir. The holding capacity of the reservoir shall be a minimum of twice the volume of water required to meet the daily flushing requirements of the fixtures supplied with gray water, but not less than 50 gallons (189 L). The reservoir shall be sized to limit the retention time of gray water to a maximum of 72 hours.

P3009.13.2 Disinfection. Gray water shall be disinfected by an approved method that employs one or more disinfectants such as chlorine, iodine or ozone that are recommended for use with the pipes, fittings and equipment by the manufacturer of the pipes, fittings and equipment.

P3009.13.3 Makeup water. Potable water shall be supplied as a source of makeup water for the gray water system. The potable water supply shall be protected against backflow in accordance with Section P2902. There shall be a full-open valve located on the makeup water supply line to the collection reservoir.

P3009.13.4 Coloring. The gray water shall be dyed blue or green with a food grade vegetable dye before such water is supplied to the fixtures.

P3009.13.5 Materials. Distribution piping shall conform to one of the standards listed in Table P2905.4.

P3009.13.6 Identification. Distribution piping and reservoirs shall be identified as containing nonpotable water. Piping identification shall be in accordance with Section P2901.1.

P3009.14 Landscape irrigation systems. Subsurface landscape irrigation systems shall comply with Sections P3009.14.1 through P3009.14.11

P3009.14.1 Collection reservoir. Reservoirs shall be sized to limit the retention time of gray water to a maximum of 24 hours.

P3009.14.1.1 Identification. The reservoir shall be identified as containing nonpotable water.

P3009.14.2 Valves required. A check valve and a full-open valve located on the discharge side of the check valve shall be installed on the effluent pipe of the collection reservoir.

P3009.14.3 Makeup water. Makeup water shall not be required for subsurface landscape irrigation systems. Where makeup water is provided, the installation shall be in accordance with Section 3009.13.3.

P3009.14.4 Disinfection. Disinfection shall not be required for gray water used or subsurface landscape irrigation systems.

P3009.14.5 Coloring. Gray water used for subsurface landscape irrigation systems shall not be required to be dyed.

P3009.14.6 Estimating gray water discharge. The system shall be sized in accordance with the gallons-per-day-per-occupant number based on the type of fixtures connected to the gray water system. The discharge shall be calculated by the following equation:

C = $A \times B$

A = Number of occupants:

Number of occupants shall be determined by the actual number of occupants, but not less than two occupants for one bedroom and one occupant for each additional bedroom.

B = Estimated flow demands for each occupant:

Residential–25 gallons per day (94.6 lpd) per occupant for showers, bathtubs and lavatories and 15 gallons per day (56.7 lpd) per occupant for clothes washers or laundry trays.

C = Estimated gray water discharge based on the total number of occupants.

P3009.14.7 Percolation tests. The permeability of the soil in the proposed absorption system shall be determined by percolation tests or permeability evaluation.

P3009.14.7.1 Percolation tests and procedures. At least three percolation tests in each system area shall be conducted. The holes shall be spaced uniformly in relation to the bottom depth of the proposed absorption system. More percolation tests shall be made where necessary, depending on system design.

P3009.14.7.1.1 Percolation test hole. The test hole shall be dug or bored. The test hole shall have vertical sides and a horizontal dimension of 4 inches to 8 inches (102 mm to 203 mm). The bottom and sides of the hole shall be scratched with a sharp-pointed instrument to expose the natural soil. All loose material shall be removed from the hole and the bottom shall be covered with 2 inches (51 mm) of gravel or coarse sand.

P3009.14.7.1.2 Test procedure, sandy soils. The hole shall be filled with clear water to a minimum of 12 inches (305 mm) above the bottom of the hole for tests in sandy soils. The time for this amount of water to seep away shall be determined, and this procedure shall be repeated if the water from the second filling of the hole seeps away in 10 minutes or less. The test shall proceed as follows: Water shall be added to a point not more than 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, water levels shall be measured at 10-minute intervals for a period of 1 hour. Where 6 inches (152mm) of water seeps away in less than 10 minutes, a shorter interval between measurements shall be used, but in no case shall the water depth exceed 6 inches (152 mm). Where 6 inches (152 mm) of water seeps away in less than 2 minutes, the test shall be stopped and a rate of less than 3 minutes per inch (7.2 s/mm) shall be reported. The final water level drop shall be used to calculate the percolation rate. Soils not meeting the above requirements shall be tested in accordance with Section 3009.14.7.1.3.

P3009.14.7.1.3 Test procedure, other soils. The hole shall be filled with clear water, and a minimum water depth of 12 inches (305mm) shall be maintained above the bottom of the hole for a 4-hour period by refilling whenever necessary or by use of an automatic siphon. Water remaining in the hole after 4 hours shall not be removed. Thereafter, the soil shall be allowed to swell not less than 16 hours or more than 30 hours. Immediately after the soil swelling period, the measurements for determining the percolation rate shall be made as follows: Any soil sloughed into the hole shall be removed and the water level shall be adjusted to 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, the water level shall be measured at 30-minute intervals for a period of 4 hours, unless two successive water level drops do not vary by more than $^{1}/_{16}$ inch (1.59 mm). At least three water level drops shall be observed and recorded. The hole shall be filled with clear water to a point not more than 6 inches (152 mm) above the gravel or coarse sand whenever it becomes nearly empty. Adjustments of the water level shall not be made during the three measurement periods except to the limits of the last measured water level drop. When the first 6 inches (152 mm) of water seeps away in less than 30 minutes, the time interval between measurements shall be 10 minutes and the test run for 1 hour. The water depth shall not exceed 5 inches (127 mm) at any time during the measurement period. The drop that occurs during the final measurement period shall be used in calculating the percolation rate.

P3009.14.7.1.4 Mechanical test equipment. Mechanical percolation test equipment shall be of an approved type.

P3009.14.7.2 Permeability evaluation. Soil shall be evaluated for estimated percolation based on structure and texture in accordance with accepted soil evaluation practices. Borings shall be made in accordance with Section P3009.14.7.1 for evaluating the soil.

P3009.14.8 Subsurface landscape irrigation site location. The surface grade of all soil absorption systems shall be located at a point lower than the surface grade of any water well or reservoir on the same or adjoining property. Where this is not possible, the site shall be located so surface water drainage from the site is not directed toward a well or reservoir. The soil absorption system shall be located with a minimum horizontal distance between various elements as indicated in Table P3009.14.8. Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.

TABLE P3009.14.8
LOCATION OF GRAY WATER SYSTEM

ELEMENT	MINIMUM HORIZONTAL DISTANCE	
	HOLDING TANK (feet)	IRRIGATION DISPOSAL FIELD (feet)
Buildings	5	2
Property line adjoining private property	5	5
Water wells	50	100
Streams and lakes	50	50
Seepage pits	5	5
Septic tanks	0	5
Water service	5	5
Public water main	10	10

For SI: 1 foot = 304.8 mm.

P3009.14.9 Installation. Absorption systems shall be installed in accordance with Sections P3009.14.9.1 through P3009.14.9.5 to provide landscape irrigation without surfacing of gray water.

P3009.14.9.1 Absorption area. The total absorption area required shall be computed from the estimated daily gray water discharge and the design-loading rate based on the percolation rate for the site. The required absorption area equals the estimated gray water discharge divided by the design-loading rate from Table P3009.14.9.1.

TABLE P3009.14.9.1
DESIGN LOADING RATE

PERCOLATION RATE (minutes per inch)	DESIGN LOADING FACTOR (gallons per square foot per day)
0 to less than 10	1.2
10 to less than 30	0.8
30 to less than 45	0.72
45 to 60	0.4

For SI: 1 minute per inch = min/25.4 mm,
1 gallon per square foot = 40.7 L/m^2.

P3009.14.9.2 Seepage trench excavations. Seepage trench excavations shall be a minimum of 1 foot (304 mm) to a maximum of 5 feet (1524 mm) wide. Trench excavations shall be spaced a minimum of 2 feet (610 mm) apart. The soil absorption area of a seepage trench shall be computed by using the bottom of the trench area (width) multiplied by the length of pipe. Individual seepage trenches shall be a maximum of 100 feet (30 480 mm) in developed length.

P3009.14.9.3 Seepage bed excavations. Seepage bed excavations shall be a minimum of 5 feet (1524 mm) wide and have more than one distribution pipe. The absorption area of a seepage bed shall be computed by using the bottom of the trench area. Distribution piping in a seepage bed shall be uniformly spaced a maximum of 5 feet (1524mm) and a minimum of 3 feet (914 mm) apart, and a maximum of 3 feet (914mm) and a minimum of 1 foot (305 mm) from the sidewall or headwall.

P3009.14.9.4 Excavation and construction. The bottom of a trench or bed excavation shall be level. Seepage trenches or beds shall not be excavated where the soil is so wet that such material rolled between the hands forms a soil wire. All smeared or compacted soil surfaces in the sidewalls or bottom of seepage trench or bed excavations shall be scarified to the depth of smearing or compaction and the loose material removed. Where rain falls on an open excavation, the soil shall be left until sufficiently dry so a soil wire will not form when soil from the excavation bottom is rolled between the hands. The bottom area shall then be scarified and loose material removed.

P3009.14.9.5 Aggregate and backfill. A minimum of 6 inches of aggregate ranging in size from $^1/_2$ to $2^1/_2$ inches (12.7 mm to 64 mm) shall be laid into the trench below the distribution piping elevation. The aggregate shall be evenly distributed a minimum of 2 inches (51 mm) over the top of the distribution pipe. The aggregate shall be covered with approved synthetic materials or 9 inches (229mm) of uncompacted marsh hay or straw. Building paper shall not be used to cover the aggregate. A minimum of 9 inches (229 mm) of soil backfill shall be provided above the covering.

P3009.14.10 Distribution piping. Distribution piping shall be not less than 3 inches (76mm) in diameter. Materials shall comply with Table P3009.14.10. The top of the distribution pipe shall be not less than 8 inches (203mm) below the original surface. The slope of the distribution pipes shall be a minimum of 2 inches (51 mm) andamaximumof4inches (102 mm) per 100 feet (30 480 mm).

TABLE P3009.14.10
DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F 405
Polyvinyl chloride (PVC) plastic pipe	ASTM D 2729
Polyvinyl chloride (PVC) plastic pipe with a 3.5 inch O.D. and solid cellular core or composite wall.	ASTM F 1488

P3009.14.11 Joints. Joints in distribution pipe shall be made in accordance with Section P3003.

(Renumber subsequent chapters and sections)

Reason: The purpose of this proposal is to bring the gray water recycling systems information in the appendix of the code out of obscurity so the technology can be implemented. The use of gray water as an alternative water source is becoming highly desirable and popular due to the water huge water savings and the shortage of potable water supplies in some areas of the country. This new chapter will promote the reuse of gray water for subsurface irrigation use and the flushing of water closets and urinals. Utilizing the provisions contained within this new chapter will advance the LEED point system for the owners benefit. The unfortunate reality is where provisions are located within an Appendix they are typically subject to adoption at the local level. Moving the current provisions to be included in the body of the code will eliminate the undesirable situation where a locality my not promote this “Green” concept based on the fact that is not code, only an Appendix.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: TOMBERLIN-P5-Chapter 13 NEW

Public Hearing Results

PART II- IRC-P
Committee Action: **Disapproved**

Committee Reason: Proposed language is too restrictive as to the method that must be used. There are other ways to successfully process gray water.

Assembly Action: **None**

Individual Consideration Agenda

This items is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Guy Tomberlin, Fairfax County, representing VA Plumbing and Mechanical Inspectors Association, VA Building and Code Officials Association and ICC Region VII, requests Approval as Submitted.

Commenter’s Reason: See P152-09/10, Part I

Public Comment 2:

Judson Collins, JULYCO, representing self, requests Approval as Submitted.

Commenter's Reason: See P152-09/10, Part I

Final Action: AS AM AMPC____ D

P156-09/10, Part I
312.3

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA, PART II IS REPRODUCED FOR INFORMATION PURPOSES ONLY FOLLOWING ALL OF PART I

Proposed Change as Submitted

Proponent: Judson Collins, JULYCO, representing himself.

PART I - IPC

Revise as follows:

312.3 Drainage and vent air test. Plastic piping shall not be tested using air. An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi (34.5 kPa) or sufficient to balance a 10-inch (254 mm) column of mercury. This pressure shall be held for a test period of at least 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperatures or the seating of gaskets shall be made prior to the beginning of the test period.

Reason:
PART I- Section 312.1 does not allow air to be used for testing any plastic piping plumbing system. Section 312.5 repeats the prohibition for water system testing. Section 312.3 does not. This proposal will identify the prohibition in Section 312.3.

Cost Impact: None

COLLINS-P7-312.3

Public Hearing Results

PART I- IPC
Committee Action: **Approved as Submitted**

Committee Reason: Proposed language is already in Section 312.1 but needs to be in this section to reinforce this important safety requirement.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Don Surrena, CBO, representing National Association of Home Builders (NAHB), requests Disapproval.

Commenter's Reason: This prohibition for air testing plastic pipe is already in the IPC two subsections before the proposed change, in section 312.1. It states: "All plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air." There is no need to repeat code requirements for a particular product. If this is permitted where does it end? How many other products will need to be explained again within the code and how many times? Is it always necessary to go to the lowest denominator to give instructions? How will the code user learn how the code works or where different parts of the code are relative to the topic being looked at? Will each section need to have any and all cross references shown? How much redundant information is needed to be put into the code?

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

P156-09/10- PART II- IRC

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or air with no evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than 10 feet (3048 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. <u>Plastic piping shall not be tested using air.</u> The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

Reason: PART II- The IRC should reflect the same concern for safety during testing as does the IPC.

Cost Impact: None

PART II- IRC-P
Committee Action: Disapproved

Committee Reason: No concrete data provided on failures and injuries. If air testing of plastic piping is performed properly, it is safe.

Assembly Action: None

P158-09/10, Part I
504.7.3 (New)

<u>Proposed Change as Submitted</u>

Proponent: Douglas Sabbag, Resource Conservation Technologies, Inc.

PART I – IPC

Revise as follows:

<u>**504.8 Leak detector required.** Upon water heater installation, an alarm device shall be installed in the drain pan. The alarm shall sense when the water level in the drain pan exceeds ½ inch in depth and shall produce an audible alert.</u>

Reason: Water Heaters are generally considered a maintenance-free appliance, but they are also one of the single most damaging appliances in the home. Because water heaters are continually under pressure, even small pressurized leaks can quickly flood and devastate a home. Whether at home or at work, these flooding events can go undetected for hours or even days.

It is a common occurrence that water heaters leak, especially near the end of their standard or expected life cycle. Leaking water heaters are usually found months or years after their initial installation with their associated damages. One common cause of leaking is when the first two to three courses of galvanized threads begin to deteriorate since water is in contact with the copper and galvanized piping. This corrosion at the connections into the water heater, eventually lead to leaks.

A slow leak can cause a water heater to rust and the surrounding floors and walls to decay. The price tag from such damage can be significant: water heater failures cost an average of more than $4,444 per incident. (http://www.disastersafety.org/text.asp?id=water_heaters)

Besides the frequently extensive damages to the surrounding building materials caused from the leaking water, there is also a very substantial loss of water occurring nationally and internationally from leaking hot water tanks. In just one county in Florida, i.e., Manatee County, it is estimated that there are currently 1,282 leaking water heaters, with a conservative water loss, (at one drop per second), of 2,700 gallons per year, per leaking water heater, or a total of 3,461,400 gallons of wasted water per year. At the ¼ GPM of loss rate, which given the pressurized water condition is frequently the case, the same number of leaking water heaters: (1,282) cause 572,351 gallons of lost water in one day; which extends to 208,908,229 gallons in a year.

On a national level, it is estimated that there are 957,788 leaking hot water heaters. At the ¼ GPM rate of leakage, that equals 156,058,166,261 gallons wasted in a year. One hundred and fifty six BILLION GALLONS of WASTED WATER.

The associated energy which was required to provide that wasted potable water is likewise, extensive.

Cost Impact: A simple to install audible alarm costs under $30.

ICCFILENAME: SABBAAG-P1-504.7.3 NEW

<u>Public Hearing Results</u>

PART I- IPC
Committee Action: Disapproved

Committee Reason: Adding an alarm to a pan would appear to be redundant. The required pan provides sufficient safety for the application.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Daniel Fish, representing Fish Construction, requests Approval as Modified by this public comment.

Modify the proposal as follows:

504.8 Leak <u>detection</u> ~~detector required~~. Upon <u>installation of a</u> water heater ~~installation~~, an alarm device shall be installed ~~in the drain pan~~ <u>in the pan's waste pipe.</u> The alarm shall sense when ~~the water level in the drain pan exceeds ½ inch in depth~~ <u>water is drained through the pan's waste pipe</u> and shall produce an audible alert, <u>utilize a phone or wireless notification system, or both</u>.

Commenter's Reason: Alarm and/or notification systems should be installed below the drainline in order to get the earliest notification when a leak is present. Relying on the drainline if iffy at best. Most of the time they are clogged or plugged. Even when it does work, large amounts of water could be lost before most building owners would notice. Early notification can save thousands of dollars in repairs and is a very simple step. Phone and/or wireless is a plus, especially for unattended buildings, where someone would not be present to hear the alarm. I feel any alarm system would benefit the building industry. Early detection would mean money savings, property protection, and energy savings.

Final Action: AS AM AMPC____ D

P158-09/10, Part II
IRC P2801.5.3 (New)

Proposed Change as Submitted

Proponent: Douglas Sabbag, Resource Conservation Technologies, Inc.

PART II – IRC

Revise as follows:

<u>**P2801.5.3 Leak detector required.** Upon water heater installation, an alarm device shall be installed in the drain pan. The alarm shall sense when the water level in the drain pan exceeds ½ inch in depth and shall produce an audible alert.</u>

Reason: Water Heaters are generally considered a maintenance-free appliance, but they are also one of the single most damaging appliances in the home. Because water heaters are continually under pressure, even small pressurized leaks can quickly flood and devastate a home. Whether at home or at work, these flooding events can go undetected for hours or even days.

It is a common occurrence that water heaters leak, especially near the end of their standard or expected life cycle. Leaking water heaters are usually found months or years after their initial installation with their associated damages. One common cause of leaking is when the first two to three courses of galvanized threads begin to deteriorate since water is in contact with the copper and galvanized piping. This corrosion at the connections into the water heater, eventually lead to leaks.

A slow leak can cause a water heater to rust and the surrounding floors and walls to decay. The price tag from such damage can be significant: water heater failures cost an average of more than $4,444 per incident. (http://www.disastersafety.org/text.asp?id=water_heaters)

Besides the frequently extensive damages to the surrounding building materials caused from the leaking water, there is also a very substantial loss of water occurring nationally and internationally from leaking hot water tanks. In just one county in Florida, i.e., Manatee County, it is estimated that there are currently 1,282 leaking water heaters, with a conservative water loss, (at one drop per second), of 2,700 gallons per year, per leaking water heater, or a total of 3,461,400 gallons of wasted water per year. At the ¼ GPM of loss rate, which given the pressurized water condition is frequently the case, the same number of leaking water heaters: (1,282) cause 572,351 gallons of lost water in one day; which extends to 208,908,229 gallons in a year.

On a national level, it is estimated that there are 957,788 leaking hot water heaters. At the ¼ GPM rate of leakage, that equals 156,058,166,261 gallons wasted in a year. One hundred and fifty six BILLION GALLONS of WASTED WATER.

Cost Impact: A simple to install audible alarm costs under $30.

ICCFILENAME: SABBAAG-P1-504.7.3 NEW

Public Hearing Results

PART II- IRC-P
Committee Action: **Disapproved**

Committee Reason: No standard or specification for what this alarm unit is and if it alarms, it will only be useful if someone is present to actually hear it.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dan Fish, representing Fish Construction, requests Approval as Modified by this public comment.

Modify the proposal as follows:

Part II - IRC

P2801.5.3 Leak <u>detection</u> ~~detector required~~. Upon <u>installation of a</u> water heater ~~installation~~, an alarm device shall be installed ~~in the drain pan~~ <u>in the pan's waste pipe.</u> The alarm shall sense when ~~the water level in the drain pan exceeds ½ inch in depth~~ <u>water is drained through the waste pipe</u> and shall produce an audible alert, <u>utilize a phone or wireless notification system, or both</u>.

Commenter's Reason: See P158-09/10, Part I

Final Action: AS AM AMPC____ D

P159-09/10, Part I
904.5

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County Colorado, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

904.5 Location of vent terminal. An open vent terminal from a drainage system shall not be located directly beneath any door, openable window, or other air intake opening of the building or of an adjacent building, and any such vent terminal shall not be within 10 feet (3048 mm) horizontally of such an opening unless it is at least ~~2 feet (610 mm)~~ <u>3 feet (914 mm)</u> above the top of such opening.

Reason: This dimension is inconsistent with many of the other code books such as IMC-401.4 #3; IRC-G2427.6.6 and G2427.8 #1; IFGC-503.6.7; IFGC-618.5 and IFGC-503.8 #1. This 3-foot dimension has been around for years and was also found in the legacy codes. It's very important that the entire family of codes is consistent. It's important that sources of contamination don't make their way into building openings and 3 feet will best accomplish this.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-P1-904.5

Public Hearing Results

PART I- IPC
Committee Action: **Disapproved**

Committee Reason: No need to make this code consistent with IMC or IFGC. If odor is an issue, just make vent pipe taller.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: This is consistent with the approval of RM-10 which recognizes that plumbing vents are a contaminant source, and needs to be 3 feet above air intakes. 8 other code sections say the same thing. It is imperative that there be consistency in the code as it relates to this subject matter.

Final Action: AS AM AMPC____ D

P159-09/10, Part II
IRC P3103.5

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County Colorado, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

P3103.5 Location of vent terminal. An open vent terminal from a drainage system shall not be located less than 4 feet (1219 mm) directly beneath any door, openable window, or other air intake opening of the building or of an adjacent building, nor shall any such vent terminal be within 10 feet (3048 mm) horizontally of such an opening unless it is at least ~~2 feet (610 mm)~~ 3 feet (914 mm) above the top of such opening

> **Reason:** This dimension is inconsistent with many of the other code books such as IMC-401.4 #3; IRC-G2427.6.6 and G2427.8 #1; IFGC-503.6.7; IFGC-618.5 and IFGC-503.8 #1. This 3-foot dimension has been around for years and was also found in the legacy codes. It's very important that the entire family of codes is consistent. It's important that sources of contamination don't make their way into building openings and 3 feet will best accomplish this.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-P1-904.5

Public Hearing Results

PART II- IRC
Committee Action: **Disapproved**

Committee Reason: No technical justification for the change.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: See P159-09/10, Part I

Final Action: AS AM AMPC____ D

RP1-09/10
P2503.5.1

Proposed Change as Submitted

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA) for Plastic Pipe and Fittings Association (PPFA).

Revise as follows:

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or, for piping systems other than plastic, by air with no evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than 10 feet (3048 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

Reason: To carry over the language on air testing of plastic piping systems from the IPC to the IRC. This change would correct an oversight in the IRC section. IPC Section 312.1 "Required tests", contains the specific language: **"**All plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air. After the plumbing fixtures have been set and their traps filled with water, the entire drainage system shall be submitted to final tests." The reason for this language is that under some conditions, air testing poses additional risks for installers. The IRC should reflect the same language as found in the IPC.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: CUDAHY-RP1-P2503.5.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Air testing gives the installer a needed alternate method of testing.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Michael Cudahy, PPFA (Plastic Pipe and Fittings Association), requests Approval as Submitted.

Commenter's Reason: As was stated by many at the initial hearing, the practice of testing piping systems with compressed gas or air carries with it the potential for injury to anyone on the work site. This practice is not permitted for use with plastic pipe in the IPC, the NSPC, the UPC or in the standards for these piping products.

Physics are no different in the IRC than the IPC. If a catastrophic failure occurs during a water test, someone might get wet. If a catastrophic failure occurs during an air test, workers can be, and have been, blinded, injured or killed. That is a significant difference in outcome. This code should be consistent with the others in regards to this safe work practice issue.

PPFA encourages that this item be approved as submitted.

Final Action: AS AM AMPC____ D

RP9-09/10
2904 (New)

Proposed Change as Submitted

Proponent: Guy Tomberlin, Fairfax County, Virginia representing the Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and the Virginia Building and Code Officials Association (VBCOA)

Add new text as follows:

SECTION 2904
HOT WATER SUPPLY SYSTEMS

2904.1 Where required. Hot water shall be supplied to all plumbing fixtures and equipment utilized for bathing, washing or culinary purposes.

P2904.2 Hot water supply temperature maintenance. Where the developed length of hot water piping from the source of hot water supply to the furthest fixture exceeds 40 feet (12192 mm), the hot water supply system shall be provided with a recirculating pump system to maintain hot water temperature to a point that is not further than 40 feet (12 192 mm) in developed pipe length from any fixture.

P2904.2.1 Piping insulation. Circulating hot water system piping shall be insulated in accordance with Section N1103.4.

P2904.2.2 Hot water system controls. Circulating hot water system pump controls shall be in accordance with Section N1103.4.

2904.2.3 Recirculating pump. Where a thermostatic mixing valve is used in a system with a hot water recirculating pump, the hot water or tempered water return line shall be routed to the coldwater inlet pipe of the water heater and the cold water inlet pipe or the hot water return connection of the thermostatic mixing valve.

Reason: Current IRC provides no guidance for the hot water piping installed in a dwelling unit. Several hundred feet of hot water piping can be installed with no regard to energy conservation. Water heaters are being installed in remote locations based on space allotment. Significant water and energy are wasted waiting for the hot water to get to the fixture. These are similar to the provisions that have always been included in the IPC .

Cost Impact: The code change proposal could increase the cost of construction.

ICCFILENAME: TOMBERLIN-RP3-P2904 NEW

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Fifty feet is too short of a distance. Language doesn't account for "home run" type systems. Circulating systems are too expensive. No data to support the need for these systems in a home.

Assembly Action: **Approved as Modified**

P2904.2 Hot water supply temperature maintenance. Where the developed length of hot water piping from the source of hot water supply to the furthest fixture exceeds ~~40~~ 50 feet (~~12192~~ 15240mm), the hot water supply system shall be provided with a recirculating pump system to maintain hot water temperature to a point that is not further than ~~40~~ 50 feet (~~12 192~~ 15240mm) in developed pipe length from any fixture.

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Michael Cudahy, representing self, requests Approved as Modified by this Public Comment.

Modify the proposal as follows:

P2904.2 Hot water supply temperature maintenance. Where the developed length of hot water piping from the source of hot water supply to the furthest fixture exceeds 50 feet (15240 mm), the hot water supply system shall be provided with a ~~recirculating pump~~ hot water priming system to ~~maintain hot water temperature to a point that is~~ cause the source of hot water to be not further than ~~50~~ 20 feet (6096 mm) in developed pipe length from any fixture.

Commenter's Reason: While common recirculation systems do reduce the wait time for hot water at fixtures, they actually waste *more energy via heat loss* in the pipe and a small amount of energy to use the pump. The waste occurs whenever the system is pumping, either 24/7, or even on a timer.

Modern "on demand" *hot water priming systems* exist that use a motion detector or control button to "prime" the hot water loop, and stop as soon as the temperature in the line by the serviced fixture increases slightly when measured by a thermocouple.

These systems are a dramatic improvement over traditional recirculation systems as they save *both* water and energy and are the greener option for homes. Pumps run for only minutes a day, not hours.

Without this modification, this proposal will save *water* but waste *energy*.

If the code is to encourage conservation, hot water priming systems, not recirculation systems, are the greener option.

I suspect others in the area of greenbuilding and water and energy conservation will recommend this type of technology and I urge the FAH support this and similar recommendations.

Also, a fifty foot "run out" fixture branch from a loop seems like an excessive length. Twenty feet seems completely achievable.

Public Comment 2:

Robert Hall, representing Viega LLC, requests Disapproval.

Commenter's Reason: Fifty feet is an arbitrary distance with no technical merit. Such a code change will cause undue expense to the builder and homeowner. Energy evaluation reports substantiate energy savings and efficiency of hot water systems by comparing different piping methods such as, two-pipe and home-run systems. Other factors include the type of piping materials (copper, CPVC, or PEX), sizing pipe to accommodate fixture flow rate, and of coarse the distance from the water heater to the fixture. All of the afore mentioned items should be considered prior to making a decision weather or not a circulation pump is needed. The 50 feet "best guess" approach should be disapproved!

Public Comment 3:

Gary Kozan, representing Ridgeway Plumbing, requests Disapproval.

This code change, appropriately DISAPPROVED 8-3 by the IRC committee, is much too costly and restrictive. It mandates the installation of hot water circulating systems, while disregarding other available techniques of improving hot water delivery time by using "home-run" systems, reduced pipe sizing, and piping overhead rather than below ground.

Practically every new home has at least one plumbing fixture that exceeds 50 feet developed length from the water heater. That's not far at all. Approving this change would mean installing a hot water recirculation system in every new home. Such a system, consisting of an additional hot water return line, an insulated circulation loop, circulating pump, controls, and a power source, would cost at least $500 per house.

A properly designed hot water system takes into account the fixture type, flow rate, frequency of use, and pipe size, as well as the distance from the hot water source. For example, a ¾" pipe holds twice as much water as a ½" pipe, and four times as much as 3/8". Also, underground hot water pipes will cool down quicker than piping run overhead.

Homeowners do not tolerate a long wait for hot water to the kitchen sink and master bath. This can usually be overcome by direct hot water runs, sized appropriately. Seldom-used fixtures such as powder rooms, guest baths, bar sinks, etc. yield negligible energy and water savings. Experienced plumbing contractors already know when a hot water circulating system is called for, and when it is not. I urge disapproval.

Final Action: AS AM AMPC____ D

RP12-09/10
P2904.1

Proposed Change as Submitted

Proponent: Richard J. Prospal, on behalf of The American Society of Sanitary Engineering

1. Revise as follows:

P2904.1 General. Where installed, residential fire sprinkler systems, or portions thereof, shall be in accordance with NFPA 13D or Section P2904, which shall be considered equivalent to NFPA 13D. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose fire sprinkler system shall supply domestic water to both fire sprinklers and plumbing fixtures. Installers of multipurpose fire sprinkler systems shall meet the requirements of ASSE 7010. A stand-alone sprinkler shall system shall be separate and independent from the water distribution system. A backflow preventer shall not be required to separate a stand-alone system from the water distribution system.

2. Add standard to Chapter 44 as follows:

ASSE
7010 - 2008, Professional Qualifications Standard for Plumbing-Based Residential Fire Protection Systems Installers for One and Two-Family Dwellings

Reason: The installers of multipurpose residential fire sprinkler systems must be qualified and pass a certification process assuring the general public of their knowledge of NFPA 13D and Section P2904.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, ASSE 7010-2008, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: PROSPAL-RP-1-P2904.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed standard does not meet ICC criteria and the added requirement may conflict with some state backflow prevention programs.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

James Bickford, CBO, Chief Plumbing Inspector, City of Pompano Beach, Florida, requests Approval as Submitted.

Commenter's Reason: The staff analysis that the ASSE 7010 standard does not comply with ICC criteria is a bit confusing. This standard is an ANSI accredited consensus document. The committee reason for rejection is also incorrect, this document does not have any impact on backflow requirements. The ASSE 7010 is a Professional Qualification Standard for installers of plumbing based residential fire sprinkler systems. The object of the ASSE 7010 standard is to verify minimum knowledge needed to install residential fire sprinkler systems. This standard is an ANSI consensus document which has no impact on backflow requirements. Adoption of this standard would verify that installers of Residential Fire Sprinkler systems have the skills needed to install these important life safety systems.

Final Action: AS AM AMPC____ D

INTERNATIONAL BUILDING CODE – MEANS OF EGRESS

E1-09/10
1001.4 (New) (IFC [B] 1001.4 (New))

Proposed Change as Submitted

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

Add new text as follows:

1001.4 Fire safety and evacuation plans: Fire safety and evacuation plans shall be provided for all occupancies and buildings where required by the *International Fire Code*. Such fire safety and evacuation plans shall comply with the applicable provisions of Sections 401.2 and 404 of the *International Fire Code*.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:

> Review the recommendations issued by NIST in its report entitled "Final Report on the Collapse of the World Trade Center Towers", issued September 2005, for applicability to the building environment as regulated by the I-Codes. To evaluate the necessity of developing code changes in response to the NIST report.

This proposal is similar to E3-07/08 last cycle. However, based on fire service input, it has been expanded to include the reference to Section 401.2 of the IFC, which states:

> 401.2 Approval. Where required by this code, fire safety plans, emergency procedures and employee training programs shall be approved by the fire code official.

This added reference identifies the scope of responsibility of the evaluation of the plans.

The purpose of this code change proposal is to provide consistent requirements for jurisdictions regarding requirements for fire safety and evacuation plans. We feel fire safety and evacuation plans are important issues that impact occupant egress during an emergency and therefore meets the intent of the IBC and needs to be addressed. In addition, many jurisdictions across the country currently have adopted the IBC, however many of these same jurisdictions have not adopted the IFC. This reference will ensure that at least the fire safety and evacuation plans of the IFC are adopted by reference. Enforcement of the provisions is not an issue based on the reference to Section 401.2. The provisions are clearly within the scope of the IFC.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Heilstedt-E2-1001.4

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This proposal would provide uniformity throughout the codes. This will assure that all means of egress issues in the IFC and IBC are addressed before the certificate of occupancies is issued. This will assist the fire department when they perform means of egress maintenance reviews.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

George Kellogg, Rocklin, CA, representing Sacramento Valley Association of Building Officials, requests Disapproval.

Commenter's Reason: Fire Safety and Evacuation plans are documents that require annual maintenance and are required to include a number of provisions not a part of the building codes. Minor changes in building use or changes in business procedures can trigger a modification to the Fire

Safety and Evacuation Plan that would not trigger a building permit. Additionally, building department personnel typically are only trained to apply Chapter 10 means of egress requirements and do not have the training or expertise to evaluate all of the other important aspects of an adequate Fire Safety and Evacuation Plan—putting the review of the plan in the building code would in fact create the false impression that building department approval of plans would indicate that the required Fire Safety and Evacuation Plan is completely adequate and correct. This is clearly within the purview of the Fire official. While there needs to be communication between Building and Fire officials for new construction activity, there is no need for revised fire and evacuation plans required by the Fire Code to be reviewed by the Building official. As stated by the proponent, this proposal is essentially the same as E3-07/08 (that was overturned and soundly defeated by code officials at the Final Action Hearings in Minnesota) excepting the addition of a reference to section 401.2 of the IFC. As also stated by the proponent, this added code reference was intended to clarify the enforcement responsibility for the Fire Safety and evacuation plan. However it appears to add a new level of confusion. IFC section 401.2 states: “Approval. Where required by this code,” [the IFC or IBC?] “fire safety and evacuation plans, emergency procedures, and employee training programs shall be approved by the fire code official.” Clearly, IBC section 1001.4 is the enforcement responsibility of the Building Code official. Will this change now require the Building official to be responsible for the fire official’s actions???

This change adds confusion for enforcement authority and responsibility, and does not improve the IBC or the IFC. Current IFC code contains all of the provisions necessary for requiring and enforcing Fire Safety and Evacuation plans and clearly requires enforcement authority and responsibility with the Fire Code official. No changes to either code are necessary to provide the level of egress safety and planning provided by the Fire Safety and Evacuation Plan.

Public Comment 2:

John E. Rosenquist, representing United Conveyor Corporation, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1001.4 Fire safety and evacuation plans: Fire safety and evacuation plans shall be provided for all occupancies and buildings where required by the *International Fire Code*. Such fire safety and evacuation plans shall comply with the applicable provisions of Sections 401.2 and 404 of the *International Fire Code*. <u>All industrial occupancies shall comply with OSHA 2008, CFR 29, part 1910 Subpart E, and to the requirements of NFPA 101, Chapter 40, Industrial Occupancies.</u>

Add new standard to Chapter 35 as follows:

<u>Occupational Safety and Health Administration</u>
<u>OSHA 2008, CFR 29, part 1910, Occupational Safety and Health Standards, Subpart E, Means of Egress</u>

Commenter’s Reason: Industrial facilities are designed to conform to the safety and egress requirements of OSHA 2008, CFR 29, part 1910 Subpart E, and to the requirements of NFPA 101, Chapter 40, Industrial Occupancies.

The IBC Building Code cannot override the requirements of Federal work place safety and egress rules. It would be better if IBC referenced NFPA 101 for all egress requirements as does OSHA. NFPA 101 encompasses everything covered by IBC with far more clarity and breadth of scope.

Analysis: The standard, OSHA 2008, CFR 29, was not reviewed or considered by the IBC Code Development committee and it was not considered by the hearing attendees at the time of the code development hearings. Section 3.6.3.1 of Council Policy #28, *Code Development,* requires that new standards be introduced in the original code change proposal, therefore, the introduction of a new standard via a public comment is not in accordance with the process required by CP# 28 for adding new standards to the code.

Final Action: AS AM AMPC____ D

E2-09/10
1002.1 (IFC [B] 1002.1)

<u>Proposed Change as Submitted</u>

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

CORRIDOR. An enclosed exit access component that defines and provides a path of egress travel ~~to an exit~~.

Reason: The current definition of “CORRIDOR” is somewhat misleading. Obviously, there are two types of corridors: Fire-resistance rated and non-fire-resistance rated. Section 1018.6 states, “<u>Fire-resistance-rated</u> corridors shall be continuous from the point of entry to an exit…” This provision supports the philosophy that once a given level of protection is achieved, such level of protection shall not be reduced until arrival at the exit discharge. With the non-fire-resistance rated corridor, however, there is no inherent level of protection. It is not uncommon in building design for non-rated corridors to connect open office areas without leading to an exit. The proposed language will correlate with the definition of ‘aisle” in declaring that unprotected exit access components provide a path of egress travel, but not necessarily directly to an exit. This proposal eliminates potential confusion created by the current definition and lets the technical requirements of Section 1018.6 stand on their own merit. Approval of this proposal will resolve a potential conflict in stated intent for commonly used corridor provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Keith-E2-1002.1-Corridor

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The change in the definition could cause confusion for applications for fire-resistance-rated corridors. The entire chapter should be investigated for possible consequences.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Submitted.

Commenter's Reason: Disapproval of Item E2-09/10 by the ICC Means of Egress Code Committee demonstrates the need for clarification of this very subtle provision. A "corridor" is defined in Section 1002.1 as, "An enclosed exit access component that defines and provides a path of egress travel to an exit." Essentially, there are two types of corridors. Based on a number of variables shown at Table 1018.1, a corridor may be of either fire-resistance rated or nonfire-resistance rated construction.

Corridors and aisles are the two most commonly used exit access components. An "aisle" is defined in Section 1002.1 as, "An unenclosed exit access component that defines and provides a path of egress travel." Aisles are obviously a non-rated means of egress component and may or may not lead directly to an exit. Accordingly, that requirement is not stated in the definition of "aisle."

The continuity requirements for corridors are specified in Section 1018.6. That section states, "Fire-resistance-rated corridors shall be continuous from the point of entry to an exit, and shall not be interrupted by intervening rooms." If all corridors were required to be of fire-resistance rated construction, the definition of corridor would be accurate. Section 1018.6 implies, however, that non-fire-resistance rated corridors need not lead to an exit and may be interrupted by intervening rooms. This is consistent with the usage and requirements for aisles. There is no technical or philosophical reason for a non-rated corridor with unprotected openings to be held to the same design standard as a fire-resistance rated corridor. Section 1018.6 properly makes that distinction; however, the definition of corridor at Section 1002.1 does not.

Section 1018 contains no requirement for non-fire-resistance rated corridors to be continuous to an exit. Although definitions are not intended to include technical requirements, the current reference to an "exit" in the definition could be regarded as an implied or de facto requirement. The proposed language will correlate with the definition of "aisle" in declaring that unprotected exit access components shall provide a path of egress travel, but not necessarily directly to an exit. This proposal eliminates potential confusion created by the current definition and lets the technical requirements of Section 1018.6 stand on their own merit. Approval of this proposal will resolve a potential conflict in stated intent for a commonly used means of egress component.

Final Action: AS AM AMPC____ D

E4-09/10
1002.1 (IFC [B] 1002.1)

Proposed Change as Submitted

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT. That portion of a means of egress system ~~which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel~~ between the exit access and the exit discharge or public way. Exit~~s~~ components include exterior exit doors at the level of exit discharge, ~~vertical~~ exit enclosures, exit passageways, horizontal exits, exterior exit stairways~~,~~ and exterior exit ramps ~~and horizontal exits~~.

Reason: The current definition of "EXIT" contains several technical inaccuracies. It contains some absolute information that is not necessarily applicable to all exit components. Obviously, exterior exit stairways and exterior exit ramps are not interior spaces nor are they necessarily constructed of fire-resistance rated construction and opening protectives. Accordingly, this specific language has been removed from the definition. This proposal also acknowledges that some exit components (i.e. an exterior exit door at the level of discharge) may lead directly to the public way. The term exit "component" was added to the definition of exit so as to be consistent with numerous other means of egress provisions. (Please see the definition of "EXIT ENCLOSURE" and "EXIT PASSAGEWAY.") Additionally, the title of Section 1022 was changed from "vertical exit enclosures" to "exit enclosures" in the 2009 Edition of the IBC. The term "vertical" has been removed from the proposed definition so as to be consistent with current terminology. The definition of "EXIT" is fundamental to proper means of egress system design. It is imperative that it be informative and precise. The proposed language will eliminate confusion and misunderstanding as to what the IBC intends.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Keith-E1-1001.1-Exit

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Adding the "or public way" is confusing when the exit is not directly on a street or public sidewalk. It appears to eliminate the 'exit discharge' component of the means of egress system.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

EXIT. That portion of a means of egress system between the exit access and the exit discharge or public way. Exit components include exterior exit doors at the level of exit discharge, ~~exit enclosures~~ interior exit stairways, interior exit ramps, exit passageways, horizontal exits, exterior exit stairways and exterior exit ramps.

Commenter's Reason: The CTC agrees with the intent of E4 that the reference to public way is a correct reference for exits that discharge directly to a public way and that when the exit discharges directly to a public way there does not need to be an exit discharge component in the means of egress system. The modification is to coordinate E4-09/10 with change E5-09/10. Since the intent of the proposed modification to E4-09/10 is to coordinate with E5-09/10, if E5-09/10 is approved we would urge ICC staff to place E-4 after E-5 in the hearing order.

Final Action: AS AM AMPC____ D

403, 408, 410, 414, 415, 705, 707, 708, 709, 712, 715, 716, 803, 804, [F]909, 1002, 1006, 1007, 1009, 1010, 1015, 1016, 1021, 1022, 1023, 1024, 1025, 1026, 1027, 1028, 1110, 2606, 3007, 3008; (IFC 909, 914.3.1.1, [B]1002, [B]1006, [B]1007, [B]1009, [B]1010, [B]1015, [B]1016, [B]1021, [B]1022, [B]1023, [B]1024, [B]1025, [B]1026, [B]1027, [B]1028, 1803.12.1.2, 2705.4.4); (IMC [F] 513.5)

Proposed Change as Submitted

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

PART I – IBC MEANS OF EGRESS

Revise as follows:

SECTION 1002 (IFC [B] 1002)
DEFINITIONS

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.**EXIT.** That portion of a means of egress system ~~which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel~~ between the exit access and the exit discharge. Exit~~s~~ components include exterior exit doors at the level of exit discharge, ~~vertical exit enclosures~~ interior exit stairways, interior exit ramps, exit passageways, horizontal exits, exterior exit stairways~~,~~ and exterior exit ramps ~~and horizontal exits~~.

EXIT ACCESS DOORWAY. A door or access point along the path of egress travel from an occupied room, area or space where the path of egress enters an intervening room, corridor, ~~unenclosed~~ exit access stair or ~~unenclosed~~ exit access ramp.

EXIT ACCESS RAMP. An interior ramp that is not a required interior exit ramp.

EXIT ACCESS STAIRWAY. An interior stairway that is not a required interior exit stairway.

~~**EXIT ENCLOSURE.** An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives, and provides for a protected path of egress travel in a vertical or horizontal direction to the exit discharge or the public way.~~

INTERIOR EXIT RAMP. An exit component that serves to meet one or more means of egress design requirements, such as required number of exits or exit access travel distance, and provides for a protected path of egress travel to the exit discharge or public way.

INTERIOR EXIT STAIRWAY. An exit component that serves to meet one or more means of egress design requirements, such as required number of exits or exit access travel distance, and provides for a protected path of egress travel to the exit discharge or public way.

SECTION 1009 (IFC [B] 1009)
STAIRWAYS

1009.1 (IFC [B] 1009.1)General. Stairways serving occupied portions of a building shall comply with the requirements of this section.

1009.2 (IFC [B] 1009.2) Interior exit stairways. Interior exit stairways shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1.

1009.2.1 (IFC [B] 1009.2.1) Where required. Interior exit stairways shall be included, as necessary, to meet one or more means of egress design requirements, such as required number of exits or exit access travel distance.

1009.2.2 (IFC [B] 1009.2.2) Enclosure. All interior exit stairways shall be enclosed in accordance with the provisions of Section 1022.

1009.3 (IFC [B] 1009.3) Exit access stairways. Floor openings between stories created by exit access stairways shall be enclosed.

Exceptions:

1. In other than Group I-2 and I-3 occupancies, exit access stairways that serve, or atmospherically communicate between, only two stories, are not required to be enclosed.
2. Exit access stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
3. In buildings with only Group B or M occupancies, exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13.
4. In other than Groups B and M occupancies, exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the floor opening does not connect more than four stories, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. 5. Exit access stairways within an atrium complying with the provisions of Section 404 are not required to be enclosed.
6. Exit access stairways and ramps in open parking garages that serve only the parking garage are not required to be enclosed.
7. Stairways serving outdoor facilities where all portions of the means of egress are essentially open to the outside are not required to be enclosed.
8. Exit access stairways serving stages complying with Section 410.5.3.1 and 1015.6 are not required to be enclosed.
9. Stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.
10. In Group I-3 occupancies, exit access stairways constructed in accordance with Section 408.5 are not required to be enclosed.

1009.3.1 (IFC [B] 1009.3.1) Construction. Where required, enclosures for exit access stairways shall be constructed in accordance with this section. Exit access stairway enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.

1009.3.1.1 (IFC [B] 1009.3.1.1) Materials. Exit access stairway enclosures shall be of materials permitted by the building type of construction.

1009.3.1.2 (IFC [B] 1009.3.1.2) Fire-resistance rating. Exit access stairway enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more, and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit access stairway enclosures shall include any basements, but not any mezzanines. Exit access stairway enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

1009.3.1.3 (IFC [B] 1009.3.1.3) Continuity. Exit access stairway enclosures shall have continuity in accordance with Section 707.5 for fire barriers or Section 712.4 for horizontal assemblies as applicable.

1009.3.1.4 (IFC [B] 1009.3.1.4) Openings. Openings in an exit access stairway enclosure shall be protected in accordance with Section 715 as required for fire barriers. Doors shall be self- or automatic-closing by smoke detection in accordance with Section 715.4.8.3.

1009.3.1.4.1 (IFC [B] 1009.3.1.4.1) Prohibited openings. Openings other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.

1009.3.1.5 (IFC [B] 1009.3.1.5) Penetrations. Penetrations in an exit access stairway enclosure shall be protected in accordance with Section 713 as required for fire barriers.

1009.3.1.5.1 (IFC [B] 1009.3.1.5.1) Prohibited penetrations. Penetrations other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.

1009.3.1.6 (IFC [B] 1009.3.1.6) Joints. Joints in an exit access stairway enclosure shall comply with Section 714.

1009.3.1.7 (IFC [B] 1009.3.1.7) Ducts and air transfer openings. Penetrations of an exit access stairway enclosure by ducts and air transfer openings shall comply with Section 716.

1009.3.1.8 (IFC [B] 1009.3.1.8) Exterior walls. Where exterior walls serve as a part of an exit access stairway enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply.

1009.4 ~~1009.1~~ (IFC [B] 1009.4 ~~1009.1~~) Stairway width. *(No change to text)*

(Renumber subsequent sections)

SECTION 1010
RAMPS

1010.2 (IFC [B] 1010.2) Enclosure. All interior exit ramps shall be enclosed in accordance with the applicable provisions of Section 1022. Exit access ramps shall be enclosed in accordance with the provisions of Section 1009.3 for enclosure of stairways.

(Renumber subsequent sections)

~~1010.7~~ 1010.8 (IFC [B] ~~1010.7~~ 1010.8) Ramp construction. All ramps shall be built of materials consistent with the types permitted for the type of construction of the building, except that wood handrails shall be permitted for all types of construction. ~~Ramps used as an exit shall conform to the applicable requirements of Sections 1022.1 through 1022.6 for exit enclosures.~~

SECTION 1016 (IFC [B] 1016)
EXIT ACCESS TRAVEL DISTANCE

1016.1 (IFC [B] 1016.1) General ~~Travel distance limitations.~~ Travel distance within the exit access portion of the means of egress system shall be in accordance with this section. ~~Exits shall be so located on each story such that the maximum length of exit access travel, measured from the most remote point within a story along the natural and unobstructed path of egress travel to an exterior exit door at the level of exit discharge, an entrance to a vertical exit enclosure, an exit passageway, a horizontal exit, an exterior exit stairway or an exterior exit ramp shall not exceed the distances given in Table 1016.1.~~

~~Exceptions:~~

1. ~~Travel distance in open parking garages is permitted to be measured to the closest riser of open exit stairways.~~
2. ~~In outdoor facilities with open exit access components and open exterior exit stairways or exit ramps, travel distance is permitted to be measured to the closest riser of an exit stairway or the closest slope of the exit ramp.~~
3. ~~In other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps when connecting a maximum of two stories. The two connected stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~
4. ~~In other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps in the first and second stories above grade plane in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories above grade plane shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~

5. ~~Where applicable, travel distance on unenclosed exit access stairways or ramps and on connecting stories shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.~~

1016.2 (IFC [B] 1016.2) Limitations. Exit access travel distance shall not exceed the values given in Table 1016.2.

TABLE ~~1016.1~~ 1016.2 (IFC [B] TABLE ~~1016.1~~ 1016.2)
EXIT ACCESS TRAVEL DISTANCE[a]
(Portions of table not shown remain unchanged)

~~1016.2~~ 1016.2.1 (IFC [B] ~~1016.2~~ 1016.2.1) Exterior egress balcony increase. Exit access travel distances specified in ~~Section 1016.1~~ Table 1016.2 shall be increased up to an additional 100 feet (30 480 mm) provided the last portion of the exit access leading to the exit occurs on an exterior egress balcony constructed in accordance with Section 1019. The length of such balcony shall not be less than the amount of the increase taken.

1016.3 (IFC [B] 1016.3) Measurement. Exit access travel distance shall be measured from the most remote point within a story along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit.

Exceptions:

1. In open parking garages, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.
2. In outdoor facilities with open exit access components, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.

1016.3.1 (IFC [B] 1016.3.1) Exit access stairways and ramps. Travel distance on exit access stairways or ramps shall be included in the exit access travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stair and landings. The measurement along ramps shall be made on the walking surface in the center of the ramp and landings.

SECTION 1021(IFC [B] 1021)
NUMBER OF EXITS AND ~~CONTINUITY~~ EXIT CONFIGURATION

1021.1 (IFC [B] 1021.1) General. Each story and occupied roof shall have the minimum number of exits, or access to exits, as specified in this section. The required number of exits, or exit access stairways or ramps providing access to exits, from any story shall be maintained until arrival at grade or a public way. Exits or access to exits from any story shall be configured in accordance with this section. Each story above the second story of a building shall have a minimum of one interior or exterior exit stairway, or interior or exterior exit ramp. At each story above the second story that requires a minimum of three or more exits, or access to exits, a minimum of 50% of the required exits shall be interior or exterior exit stairways, or interior or exterior exit ramps.

Exceptions:

1. Interior exit stairways and interior exit ramps are not required in open parking garages where the means of egress serves only the open parking garage.
2. Interior exit stairways and interior exit ramps are not required in outdoor facilities where all portions of the means of egress are essentially open to the outside.

~~**1021.1 (IFC [B] 1021.1) Exits from stories.** All spaces within each story shall have access to the minimum number of approved independent exits as specified in Table 1021.1 based on the occupant load of the story. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories.~~

~~**Exceptions:**~~

1. ~~As modified by Section 403.15 (Additional exit stairway).~~
2. ~~As modified by Section 1021.2.~~
3. ~~Exit access stairways and ramps that comply with Exception 3 or 4 of Section 1016.1 shall be permitted to provide the minimum number of approved independent exits required by Table 1021 on each story.~~
4. ~~In Groups R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~
5. ~~Within a story, rooms and spaces complying with Section 1015.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit.~~

~~The required number of exits from any story shall be maintained until arrival at grade or the public way.~~

~~TABLE 1021.1 (IFC [B] TABLE 1021.1)~~
~~**MINIMUM NUMBER OF EXITS FOR OCCUPANT LOAD**~~

~~**OCCUPANT LOAD (persons per story)**~~	~~**MINIMUM NUMBER OF EXITS (per story)**~~
~~1-500~~	~~2~~
~~501-1,000~~	~~3~~
~~More than 1,000~~	~~4~~

~~**1021.1.2 (IFC [B] 1021.1.2) Parking structures.** Parking structures shall not have less than two exits from each parking tier, except that only one exit is required where vehicles are mechanically parked. Unenclosed vehicle ramps shall not be considered as required exits unless pedestrian facilities are provided.~~

~~**1021.1.3 (IFC [B] 1021.1.3) Helistops.** The means of egress from helistops shall comply with the provisions of this chapter, provided that landing areas located on buildings or structures shall have two or more exits. For landing platforms or roof areas less than 60 feet (18 288 mm) long, or less than 2,000 square feet (186 m^2) in area, the second means of egress is permitted to be a fire escape, alternating tread device or ladder leading to the floor below.~~

1021.2 (IFC [B] 1021.2) <u>Number of exits</u> ~~Single exits.~~ ~~Only one exit shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single exit in buildings otherwise required to have more than one exit if the areas served by the single exit do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single exit shall not be located more than one story below grade plane.~~ <u>Two exits, or exit access stairways or ramps providing access to exits, from any story or occupied roof shall be provided where one of the following conditions exists:</u>

1. <u>The occupant load exceeds one of the values in Table 1021.2.</u>
2. <u>The exit access travel distance exceeds that specified in Table 1021.2 as determined in accordance with the provisions of Section 1016.1.</u>
3. <u>Helistop landing areas located on buildings or structures shall be provided with two exits, or exit access stairways or ramps providing access to exits.</u>

<u>Exceptions:</u>

1. <u>Rooms, areas and spaces complying with Section 1015.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit.</u>
2. <u>Group R-3 occupancy buildings shall be permitted to have a one exit.</u>
3. <u>Parking garages where vehicles are mechanically parked shall be permitted to have one exit,</u>
4. <u>Air traffic control towers shall be provided with the minimum number of exits specified in Section 412.3.</u>
5. <u>Individual dwelling units with a maximum occupant load of 20 in Group R-2 and R-3 occupancies shall be permitted to one exit.</u>
6. <u>Group R-3 and R-4 congregate residences shall be permitted to have one exit.</u>

<u>Where one exit, or exit access stairway or ramp providing access to exits at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with one exit shall not be located more than one story below grade plane.</u>

TABLE 1021.2 (IFC [B] TABLE 1021.2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT

STORY	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER ~~FLOOR~~ STORY	~~AND~~ MAXIMUM EXIT ACCESS TRAVEL DISTANCE
First story or basement	A, B[b] ~~[d]~~, E[c] ~~[e]~~, F[b] ~~[d]~~, M, U, S[b] ~~[d]~~	49 occupants ~~and~~	75 feet
	H-2, H-3	3 occupants ~~and~~	25 feet
	H-4, H-5, I, R	10 occupants ~~and~~	75 feet
	S	29 occupants ~~and~~	100 feet
Second story	B~~[b]~~, F, M, S~~[a]~~	29 occupants ~~and~~	75 feet
	R-2	4 dwelling units ~~and~~	50 feet
Third story	R-2[a] ~~[c]~~	4 dwelling units ~~and~~	50 feet
Fourth story and above	NP	NA	NA

For SI: 1 foot = 3048.mm
NP – Not Permitted
NA – Not Applicable
~~a. For the required number of exits for parking structures, see Section 1021.1.2.~~
~~b. For the required number of exits for air traffic control towers, see Section 412.3.~~
~~c.~~ a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1026.
~~d.~~ b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
~~e.~~ c. Day care occupancies shall have a maximum occupant load of 10.

1021.2.1 (IFC [B] 1021.2.1) Three or more exits. Three exits, or exit access stairways or ramps providing access to exits at other stories, shall be provided from any story or occupied roof with an occupant load of 501-1,000. Four exits, or exit access stairways or ramps providing access to exits at other stories, shall be provided from any story or occupied roof with an occupant load greater than 1,000.

1021.2.2 (IFC [B] 1021.2.2) Additional exits. In buildings over 420 feet in height, additional exits shall be provided in accordance with Section 403.5.2.

1021.3 (IFC [B] 1021.3) Exit configuration ~~continuity~~. Exits, or exit access stairways or ramps providing access to exits at other stories, shall be arranged in accordance with the provisions of Section 1015.2 through 1015.2.2. Exits shall be continuous from the point of entry into the exit to the exit discharge.

1021.3.1 (IFC [B] 1021.3.1) Access to exits at adjacent levels. Access to exits at other levels shall be by stairways or ramps. Where access to exits occurs from adjacent building levels, the horizontal and vertical exit access travel distance to the closest exit shall not exceed that specified in Section 1016.1. Access to exits at other levels shall be from an adjacent story.

> **Exception:** Landing platforms or roof areas for helistops that are less than 60 feet (18 288 mm) long, or less than 2,000 square feet (186 m^2) in area, shall be permitted to access the second exit by a fire escape, alternating tread device or ladder leading to the story or level below.

1021.4 (IFC [B] 1021.4) Vehicular ramps. Vehicular ramps shall not be considered as an exit access ramp unless pedestrian facilities are provided.

~~**1021.4 (IFC [B] 1021.4) Exit door arrangement.** Exit door arrangement shall meet the requirements of Sections 1015.2 through 1015.2.2.~~

SECTION 1022 (IFC [B] 1022)
~~EXIT ENCLOSURES~~ INTERIOR EXIT STAIRWAYS AND RAMPS

1022.1 (IFC [B] 1022.1) General. Interior exit stairways and interior exit ramps serving as an exit component in a means of egress system shall comply with the requirements of this section. Interior exit stairways and ramps shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An interior exit stairway or ramp shall not be used for any purpose other than as a means of egress.

~~1022.1~~ 1022.2 (IFC [B] ~~1022.1~~ 1022.2) ~~Enclosures required~~ Construction. Enclosures for interior exit stairways and ~~interior exit~~ ramps shall be ~~enclosed with~~ constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Interior exit stairway and ramp ~~Exit~~ enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit stairways or ramps ~~exit enclosure~~ shall include any basements, but not any mezzanines. Interior exit stairways and ramps ~~exit enclosures~~ shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. ~~Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.~~

~~Exceptions~~ Exception: Interior exit stairways and ramps in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.

1. ~~In all occupancies, other than Groups H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.~~
   - ~~1.1 The stairway is open to not more than one story above its level of exit discharge; or~~
   - ~~1.2 The stairway is open to not more than one story below its level of exit discharge.~~
2. ~~Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.~~
3. ~~Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.~~
4. ~~Stairways in open parking structures that serve only the parking structure are not required to be enclosed.~~
5. ~~Stairways in Group I-3 occupancies, as provided for in Section 408.3.8, are not required to be enclosed.~~
6. ~~Means of egress stairways as required by Sections 410.5.3 and 1015.6.1 are not required to be enclosed.~~
7. ~~Means of egress stairways from balconies, galleries and press boxes as provided for in Section 1028.5.1, are not required to be enclosed.~~

~~1022.2~~ 1022.3 (IFC [B] ~~1022.2~~ 1022.3) Termination. ~~Exit enclosures~~ Interior exit stairways and ramps shall terminate at an exit discharge or a public way.

Exception: ~~An exit enclosures~~ Interior exit stairways and ramps shall be permitted to terminate at an exit passageway complying with Section 1023, provided the exit passageway terminates at an exit discharge or a public way.

~~1022.2.1~~ 1022.3.1 (IFC [B] ~~1022.2.1~~ 1022.3.1) Extension. Where ~~an exit enclosures~~ interior exit stairways and ramps are ~~is~~ extended to an exit discharge or a public way by an exit passageway, the ~~exit enclosure~~ interior exit stairway and ramp shall be separated from the exit passageway by a fire barrier constructed in accordance with Section 707 or a horizontal assembly constructed in accordance with Section 712, or both. The fire-resistance rating shall be at least equal to that required for the ~~exit enclosure~~ interior exit stairway and ramp. A fire door assembly complying with Section 715.4 shall be installed in the fire barrier to provide a means of egress from the ~~exit enclosure~~ interior exit stairway and ramp to the exit passageway. Openings in the fire barrier other than the fire door assembly are prohibited. Penetrations of the fire barrier are prohibited.

Exception: Penetrations of the fire barrier in accordance with Section 1022.4 shall be permitted.

~~1022.3~~ 1022.4 (IFC [B] ~~1022.3~~ 1022.4) Openings and penetrations. ~~Exit enclosure~~ Interior exit stairway and ramp opening protectives shall be in accordance with the requirements of Section 715.

Openings ~~in exit enclosures~~ interior exit stairways and ramps other than unprotected exterior openings shall be limited to those necessary for exit access to the enclosure from normally occupied spaces and for egress from the enclosure.

Elevators shall not open into ~~an exit enclosures~~ Interior exit stairways and ramps.

~~1022.4~~ 1022.5 (IFC [B] ~~1022.4~~ 1022.5) Penetrations. Penetrations into and openings through ~~an exit enclosure~~ Interior exit stairways and ramps are prohibited except for required exit doors, equipment and ductwork necessary for independent ventilation or pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication systems and electrical raceway serving the ~~exit enclosure~~ interior exit stairway and ramp and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 713. There shall be no penetrations or communication openings, whether protected or not, between adjacent ~~exit enclosures~~ interior exit stairways and ramps.

~~1022.5~~ 1022.6 (IFC [B] ~~1022.5~~ 1022.6) Ventilation. Equipment and ductwork for ~~exit enclosure~~ interior exit stairway and ramp ventilation as permitted by Section 1022.4 shall comply with one of the following items:

1. Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the ~~exit enclosure~~ interior exit stairway and ramp by ductwork enclosed in construction as required for shafts.
2. Where such equipment and ductwork is located within the ~~exit enclosure~~ interior exit stairway and ramp, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or such air shall be conveyed through ducts enclosed in construction as required for shafts.
3. Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required for shafts.

In each case, openings into the fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by opening protectives in accordance with Section 715 for shaft enclosures.

The ~~Exit enclosure~~ interior exit stairway and ramp ventilation systems shall be independent of other building ventilation systems.

~~1022.6~~ 1022.7 (IFC [B] ~~1022.6~~ 1022.7) ~~Exit enclosure~~ Interior exit stairway and ramp exterior walls. Exterior walls of the ~~an exit enclosure~~ interior exit stairway and ramp shall comply with the requirements of Section 705 for exterior walls. Where nonrated walls or unprotected openings enclose the exterior of the stairway and the walls or openings are exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than ¾ hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the topmost landing of the stairway or to the roof line, whichever is lower.

~~1022.7~~ 1022.8 (IFC [B] ~~1022.7~~ 1022.8) Discharge identification. ~~A stairway in an exit enclosure~~ ~~An~~ interior exit stairway and ramp shall not continue below its level of exit discharge unless an approved barrier is provided at the level of exit discharge to prevent persons from unintentionally continuing into levels below. Directional exit signs shall be provided as specified in Section 1011.

~~1022.8~~ 1022.9 (IFC [B] ~~1022.8~~ 1022.9) Floor identification signs. A sign shall be provided at each floor landing in ~~exit enclosures~~ an interior exit stairway and ramp connecting more than three stories designating the floor level, the terminus of the top and bottom of the ~~exit enclosure~~ interior exit stairway and ramp and the identification of the stair or ramp. The signage shall also state the story of, and the direction to, the exit discharge and the availability of roof access from the ~~enclosure~~ interior exit stairway and ramp for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. Floor level identification signs in tactile characters complying with ICC A117.1 shall be located at each floor level landing adjacent to the door leading from the ~~enclosure~~ interior exit stairway and ramp into the corridor to identify the floor level.

~~1022.8.1~~ 1022.9.1 (IFC [B] ~~1022.8.1~~ 1022.9.1) Signage requirements. Stairway identification signs shall comply with all of the following requirements:

1. The signs shall be a minimum size of 18 inches (457 mm) by 12 inches (305 mm).
2. The letters designating the identification of the ~~stair enclosure~~ interior exit stairway and ramp shall be a minimum of 11/2 inches (38 mm) in height.
3. The number designating the floor level shall be a minimum of 5 inches (127 mm) in height and located in the center of the sign.
4. All other lettering and numbers shall be a minimum of 1 inch (25 mm) in height.
5. Characters and their background shall have a nonglare finish. Characters shall contrast with their background, with either light characters on a dark background or dark characters on a light background.
6. When signs required by Section 1022.8 are installed in ~~interior exit enclosures~~ the interior exit stairways and ramps of buildings subject to Section 1024, the signs shall be made of the same materials as required by Section 1024.4.

~~1022.9~~ 1022.10 (IFC [B] ~~1022.9~~ 1022.10) Smokeproof enclosures and pressurized stairways and ramps. In buildings required to comply with Section 403 or 405, each of the ~~exit enclosures~~ interior exit stairways and ramps serving a story with a floor surface located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access or more than 30 feet (9144 mm) below the finished floor of a level of exit discharge serving such stories shall be a smokeproof enclosure or pressurized stairway or ramp in accordance with Section 909.20.

SECTION 403
HIGH-RISE BUILDINGS

403.2.3 Structural integrity of interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures. For high-rise buildings of occupancy category III or IV in accordance with Section 1604.5, and for all buildings that are more than 420 feet (128 000 mm) in building height, enclosures for interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures shall comply with Sections 403.2.3.1 through 403.2.3.4.

403.2.3.1 Wall assembly. The wall assemblies making up the enclosures for interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures shall meet or exceed Soft Body Impact Classification Level 2 as measured by the test method described in ASTM C 1629/C 1629M.

403.2.3.2 Wall assembly materials. The face of the wall assemblies making up the enclosures for interior exit stairways ~~exit enclosures~~ and elevator hoistway enclosures that are not exposed to the interior of the enclosures for interior exit stairways ~~exit enclosures~~ or elevator hoistway enclosure shall be constructed in accordance with one of the following methods:

1. The wall assembly shall incorporate not less than two layers of impact-resistant construction board each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C 1629/C 1629M.
2. The wall assembly shall incorporate not less than one layer of impact-resistant construction material that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C 1629/C 1629M.
3. The wall assembly incorporates multiple layers of any material, tested in tandem, that meet or exceed Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C 1629/C 1629M.

403.5.1 Remoteness of interior exit stairways ~~enclosures~~. ~~The~~ Required interior exit ~~stairway~~ stairways ~~enclosures~~ shall be separated by a distance not less than 30 feet (9144 mm) or not less than one-fourth of the length of the maximum overall diagonal dimension of the building or area to be served, whichever is less. The distance shall be measured in a straight line between the nearest points of the ~~exit stairway enclosures~~ interior exit stairways. In buildings with three or more interior exit stairway ~~enclosures~~, at least two of the interior exit stairway ~~enclosures~~ shall comply with this section. Interlocking or scissor stairs shall be counted as one interior exit stairway.

403.5.4 Smokeproof ~~exit~~ enclosures. Every required exit stairway serving floors more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access shall comply with Sections 909.20 and 1022.9.

SECTION 408
GROUP I-3

408.3.8 Interior exit stairway and ramp construction ~~enclosures~~. One ~~of the required~~ interior exit stairway or ramp ~~exit enclosures~~ in each building shall be permitted to have glazing installed in doors and interior walls at each landing level providing access to the ~~enclosure~~ interior exit stairway or ramp, provided that the following conditions are met:

1. The interior exit stairway or ramp ~~exit enclosures~~ shall not serve more than four floor levels.
2. Exit doors shall not be less than 3/4-hour fire door assemblies complying with Section 715.4
3. The total area of glazing at each floor level shall not exceed 5,000 square inches ($3m^2$) and individual panels of glazing shall not exceed 1,296 square inches ($0.84\ m^2$).
4. The glazing shall be protected on both sides by an automatic sprinkler system. The sprinkler system shall be designed to wet completely the entire surface of any glazing affected by fire when actuated.
5. The glazing shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler system operates.
6. Obstructions, such as curtain rods, drapery traverse rods, curtains, drapes or similar materials shall not be installed between the automatic sprinklers and the glazing.

SECTION 410
STAGES AND PLATFORMS

410.5.3.1 Stairway and ramp enclosure. Exit access stairways and ramps serving the stage are not required to be enclosed. Exit access stairways serving the lighting and access catwalks, galleries and gridirons are not required to be enclosed.

SECTION 705
EXTERIOR WALLS

705.2 Projections. Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall shall conform to the requirements of this section and Section 1406. Exterior egress balconies and exterior exit stairways and ramps shall also comply with Sections 1019 and 1026, respectively. Projections shall not extend beyond the distance determined by the following three methods, whichever results in the lesser projection:

1. A point one-third the distance from the exterior face of the wall to the lot line where protected openings or a combination of protected and unprotected openings are required in the exterior wall.
2. A point one-half the distance from the exterior face of the wall to the lot line where all openings in the exterior wall are permitted to be unprotected or the building is equipped throughout with an automatic sprinkler system installed under the provisions of Section 705.8.2.
3. More than 12 inches (305 mm) into areas where openings are prohibited.

Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section.

SECTION 707
FIRE BARRIERS

707.3.2 Interior exit stairway and ramp construction ~~enclosures~~. The fire-resistance rating of the fire barrier separating building areas from an interior exit stairway or ramp shall comply with Section 1022.1.

707.3.3 Enclosures for exit access stairways. The fire-resistance rating of the fire barrier separating building areas from an exit access stairway or ramp shall comply with Section 1009.3.1.2.

707.4 Exterior walls. Where exterior walls serve as a part of a required fire-resistance-rated shaft or stairway or ramp ~~exit~~ enclosure, or separation, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure or separation requirements shall not apply.

Exception: Exterior walls required to be fire-resistance rated in accordance with Section 1019 for exterior egress balconies, Section ~~1022.6~~ 1022.7 for interior exit stairways and ramps ~~enclosures~~ and Section 1026.6 for exterior exit stairways and ramps ~~and stairways~~.

707.5.1 Supporting construction. The supporting construction for fire barriers shall be protected to afford the required fire-resistance rating of the fire barrier supported. Hollow vertical spaces within a fire barrier shall be fireblocked in accordance with Section 717.2 at every floor level.

Exceptions:

1. The maximum required fire-resistance rating for assemblies supporting fire barriers separating tank storage as provided in Section 415.6.2.1 shall be 2 hours, but not less than required by Table 601 for the building construction type.
2. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 707.12.
3. Supporting construction for 1-hour fire barriers required by Table 508.2.5 in buildings of Type IIB, IIIB and VB construction is not required to be fire-resistance rated unless required by other sections of this code.
4. Interior exit stairway and ramp enclosures required by Section 1022.2 and exit access stairway and ramp enclosures required by Section 1009.3 shall be permitted to terminate at a top enclosure complying with Section 707.12.

707.6 Openings. Openings in a fire barrier shall be protected in accordance with Section 715. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15 m^2). Openings in enclosures for exit access stairways and ramps, interior exit stairways and ramps ~~exit enclosures~~ and exit passageways shall also comply with Sections 1022.3 and 1023.5, respectively.

Exceptions:

1. Openings shall not be limited to 156 square feet (15 m^2) where adjoining floor areas are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door serving ~~an~~ enclosures for exit access stairways, exit access ramps, interior exit stairways and interior exit ramps ~~exit enclosures~~.
3. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective has been tested in accordance with ASTME 119 orUL263 and has a minimum fire-resistance rating not less than the fire-resistance rating of the wall.
4. Fire window assemblies permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of the length of the wall.
5. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door assembly in a fire barrier separating an enclosures for exit access stairways, exit access ramps, interior exit stairways and interior exit ramps ~~exit enclosures~~ from an exit passageway in accordance with Section 1022.2.1.

707.7.1 Prohibited penetrations. Penetrations into ~~an~~ enclosures for exit access stairways, exit access ramps, interior exit stairways, interior exit ramps ~~exit enclosures~~ or an exit passageway shall be allowed only when permitted by Section 1009.3.1.5, ~~1022.4~~ 1022.5 or 1023.6, respectively.

SECTION 708
SHAFT ENCLOSURES

708.1 General. The provisions of this section shall apply to shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Exit access stairways and exit access ramps shall be protected in accordance with the applicable provisions of Section 1009. Interior exit stairways and interior exit ramps shall be protected in accordance with the requirements of Section 1022. ~~Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.~~

708.2 Shaft enclosure required. Openings through a floor/ceiling assembly shall be protected by a shaft enclosure ~~complying with this section~~.

Exceptions:

1. A shaft enclosure is not required for openings totally within an individual residential dwelling unit and connecting four stories or less.
2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening ~~or stairway that is not a portion of the means of egress~~ protected according to Item 2.1 or 2.2.
   2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator ~~or stairway~~ and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
   2.2. Where the opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.3 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release there from.
3. A shaft enclosure is not required for penetrations by pipe, tube, conduit, wire, cable and vents protected in accordance with Section 713.4.
4. A shaft enclosure is not required for penetrations by ducts protected in accordance with Section 716.6. Grease ducts shall be protected in accordance with the International Mechanical Code.

5. In other than Group H occupancies, a shaft enclosure is not required for floor openings complying with the provisions for atriums in Section 404.
6. A shaft enclosure is not required for approved masonry chimneys where annular space is fireblocked at each floor level in accordance with Section 717.2.5.
7. In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following:
   7.1. Does not connect more than two stories.
   ~~7.2. Is not part of the required means of egress system.~~
   7.3. Is not concealed within the construction of a wall or a floor/ceiling assembly.
   7.4. Is not open to a corridor in Group I and R occupancies.
   7.5. Is not open to a corridor on nonsprinklered floors in any occupancy.
   7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.
   7.7. Is limited to the same smoke compartment.
8. A shaft enclosure is not required for automobile ramps in open and enclosed parking garages constructed in accordance with Sections 406.3 and 406.4, respectively.
9. A shaft enclosure is not required for floor openings between a mezzanine and the floor below.
10. A shaft enclosure is not required for joints protected by a fire-resistant joint system in accordance with Section 714.

~~11. A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 3 or 4 in Section 1016.1.~~

11~~12~~. Floor openings protected by floor fire doors in accordance with Section 712.8.

~~13. In Group I-3 occupancies, a shaft enclosure is not required for floor openings in accordance with Section 408.5.~~

12~~14~~. A shaft enclosure is not required for elevator hoistways in open or enclosed parking garages that serve only the parking garage.

13~~15~~. In open or enclosed parking garages a shaft enclosure is not required to enclose mechanical exhaust or supply duct systems when such duct system is contained within and serves only the parking garage.

14~~16~~. Where permitted by other sections of this code.

708.3 Construction. Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.

~~708.3~~ 708.4 Materials. *(No change to text)*

~~708.4~~ 708.5 Fire-resistance rating. *(No change to text)*

~~708.5~~ 708.6 Continuity. *(No change to text)*

~~708.6~~ 708.7Exterior walls. Where exterior walls serve as a part of a required shaft enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply.

> **Exception:** Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section ~~1022.6~~ 1022.7 for interior exit stairways and ramps ~~exit enclosures~~ and Section 1026.6 for exterior exit stairways and ramps ~~and stairways~~.

(Renumber subsequent sections)

SECTION 709
FIRE PARTITIONS

709.5 Exterior walls. Where exterior walls serve as a part of a required fire-resistance-rated separation, such walls shall comply with the requirements of Section 705 for exterior walls, and the fire-resistance-rated separation requirements shall not apply.

> **Exception:** Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section 1022.6 for interior exit stairways and ramps ~~exit enclosures~~ and Section 1026.6 for exterior exit stairways and ramps ~~and stairways~~.

SECTION 712
HORIZONTAL ASSEMBLIES

712.4 Continuity. Assemblies shall be continuous without openings, penetrations or joints except as permitted by this section and Sections 708.2, 713.4, 714, 1009.3 and 1022.1. Skylights and other penetrations through a fire-resistance-rated roof deck or slab are permitted to be unprotected, provided that the structural integrity of the fire-resistance-rated roof assembly is maintained. Unprotected skylights shall not be permitted in roof assemblies required to be fire-resistance rated in accordance with Section 704.10. The supporting construction shall be protected to afford the required fire-resistance rating of the horizontal assembly supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the horizontal assembly is not required to be fire-resistance-rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by Table 508.2.5, provided the required fire-resistance rating does not exceed 1 hour.
2. Horizontal assemblies at the separations of dwelling units and sleeping units as required by Section 420.3.
3. Horizontal assemblies at smoke barriers constructed in accordance with Section 710.

SECTION 715
OPENING PROTECTIVES

TABLE 715.4
FIRE DOOR AND FIRE SHUTTER FIRE PROTECTION RATINGS

TYPE OF ASSEMBLY	REQUIRED ASSEMBLY RATING (hours)	MINIMUM FIRE DOOR AND FIRE SHUTTER ASSEMBLY RATING (hours)
Fire barriers having a required fire-resistance rating of 1 hour: ~~Shaft, exit~~ Enclosures for shafts, exit access stairways, exit access ramps, interior exit stairways, interior exit ramps and exit passageway walls	1	1
Other fire barriers	1	3/4

(Portions of table not shown remain unchanged)

715.4.4 Doors in ~~exit enclosures~~ interior exit stairways and ramps and exit passageways. Fire door assemblies in interior exit stairways and ramps ~~exit enclosures~~ and exit passageways shall have a maximum transmitted temperature end point of not more than 450ºF (250ºC) above ambient at the end of 30 minutes of standard fire test exposure.

Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

715.4.6.1 Fire door labeling requirements. Fire doors shall be labeled showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or trademark of the third-party inspection agency, the fire protection rating and, where required for fire doors in interior exit stairways and ramps ~~exit enclosures~~ and exit passageways by Section 715.4.4, the maximum transmitted temperature end point. Smoke and draft control doors complying with UL 1784 shall be labeled as such and shall also comply with Section 715.4.6.3. Labels shall be approved and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.

715.4.7.2 ~~Exit and~~ Elevator, stairway and ramp protectives. Approved fire-protection-rated glazing used in fire door assemblies in elevator, stairways and ramps ~~exit~~ enclosures shall be so located as to furnish clear vision of the passageway or approach to the elevator, ~~ramp or~~ stairway or ramp.

SECTION 716
DUCT AND TRANSFER OPENINGS

716.5.2 Fire barriers. Ducts and air transfer openings of fire barriers shall be protected with approved fire dampers installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for stairways ramps ~~exit enclosures~~ and exit passageways except as permitted by Sections 1022.4 and 1023.6, respectively.

Exception: Fire dampers are not required at penetrations of fire barriers where any of the following apply:

1. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an approved smoke control system in accordance with Section 909 and where the use of a fire damper would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, are in areas of other than Group Hand are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

SECTION 803
WALL AND CEILING FINISHES

TABLE 803.9
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY[k]

GROUP	SPRINKLERED[l]			NONSPRINKLERED		
	Interior exit stairways, interior exit ramps ~~exit enclosures~~ and exit passageways[a, b]	Corridors and enclosure for exit access stairways and exit access ramps	Rooms and enclosed spaces[c]	Interior exit stairways, interior exit ramps ~~exit enclosures~~ and exit passageways[a, b]	Corridors and enclosure for exit access stairways and exit access ramps	Rooms and enclosed spaces[c]

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 square foot = $0.0929m^2$.

a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.11.1.

b. In other than Group I-3 occupancies ,~~exit enclosures of~~ in buildings less than three stories above grade plane ~~of other than Group I-3~~, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.

c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.

d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.

e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.

f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.

g. Class B material is required where the building exceeds two stories.

h. Class C interior finish materials shall be permitted in administrative spaces.

i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.

j. Class B materials shall be permitted as wainscotting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.

k. Finish materials as provided for in other sections of this code.

l. Applies when ~~the exit enclosures, exit passageways, corridors or rooms and enclosed spaces are~~ protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

SECTION 804
INTERIOR FLOOR FINISH

804.4 Interior floor finish requirements. In all occupancies, interior floor finish and floor covering materials <u>for interior exit stairways and ramps</u> ~~exit enclosures~~, exit passageways, corridors and rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux as specified in Section 804.4.1.

804.4.1 Minimum critical radiant flux. Interior floor finish and floor covering materials in <u>enclosures for</u> <u>stairways and ramp</u> ~~exit enclosures~~, exit passageways and corridors shall not be less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I-4, M, R-1, R-2 and S. In all areas, floor covering materials shall comply with the DOCFF-1 “pill test” (CPSC 16 CFR, Part 1630).

> **Exception:** Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, Class II materials are permitted in any area where Class I materials are required, and materials complying with the DOC FF-1 “pill test” (CPSC 16 CFR, Part 1630) are permitted in any area where Class II Materials are required.

SECTION 1006 (IFC [B] 1006)
MEANS OF EGRESS ILLUMINATION

1006.3 (IFC [B] 1006.3) Illumination emergency power. The power supply for means of egress illumination shall normally be provided by the premises’ electrical supply.

In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Aisles and unenclosed egress stairways in rooms and spaces that require two or more means of egress.
2. Corridors, <u>interior exit stairways and ramps</u> ~~exit enclosures~~ and exit passageways in buildings required to have two or more exits.
3. Exterior egress components at other than their levels of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.
4. Interior exit discharge elements, as permitted in Section 1027.1, in buildings required to have two or more exits.
5. Exterior landings as required by Section 1008.1.6 for exit discharge doorways in buildings required to have two or more exits.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

SECTION 1007 (IFC [B] 1007)
ACCESSIBLE MEANS OF EGRESS

1007.2 (IFC [B] 1007.2) Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
<u>3.</u> <u>Interior exit access stairways between two stories complying with Sections 1007.3 and 1009.3.</u>
~~3.~~<u>4</u> Exterior exit stairways complying with Sections 1007.3 and 1026.
~~4.~~<u>5</u>. Elevators complying with Section 1007.4.
~~5.~~<u>6</u>. Platform lifts complying with Section 1007.5.
~~6.~~<u>7</u>. Horizontal exits complying with Section 1025.
~~7.~~<u>8</u>. Ramps complying with Section 1010.
~~8.~~<u>9</u>. Areas of refuge complying with Section 1007.6.

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.
2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.

1007.3 (IFC [B] 1007.3) Stairways. In order to be considered part of an accessible means of egress, ~~an exit access stairway as permitted by Section 1016.1~~ ~~or exit~~ a stairway between stories shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit. Exit access stairways that connect levels in the same story are not permitted as part an accessible means of egress.

Exceptions:

~~1. The area of refuge is not required at open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

1.~~2.~~ The clear width of 48 inches (1219 mm) between handrails is not required ~~at exit access stairways as permitted by Section 1016.1or exit stairways~~ in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

2.~~3.~~ Areas of refuge are not required at ~~exit~~ stairways in buildings equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

3.~~4.~~ The clear width of 48 inches (1219 mm) between handrails is not required for ~~exit~~ stairways accessed from a horizontal exit.

4.~~5.~~ Areas of refuge are not required at ~~exit~~ stairways serving open parking garages.

5.~~6.~~ Areas of refuge are not required for smoke protected seating areas complying with Section 1028.6.2.

6.~~7.~~ The areas of refuge are not required in Group R-2 occupancies.

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway ~~within an exit enclosure~~ complying with Sections 1007.3 ~~and 1022~~ or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

~~**Exceptions:**~~

~~1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.~~

~~2. A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.~~

1007.6.2 (IFC [B] 1007.6.2) Separation. Each area of refuge shall be separated from the remainder of the story by a smoke barrier complying with Section 710 or a horizontal exit complying with Section 1025. Each area of refuge shall be designed to minimize the intrusion of smoke.

Exception: Areas of refuge located within an ~~exit~~ enclosure for exit access stairways or interior exit stairways.

1007.7.2 (IFC [B] 1007.7.2) Exterior ~~exit~~ stairway. Exterior ~~exit~~ stairways that are part of the means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) between handrails.

1007.8 (IFC [B] 1007.8) Two-way communication. A two-way communication system shall be provided at the elevator landing on each accessible floor that is one or more stories above or below the story of exit discharge complying with Sections 1007.8.1 and 1007.8.2.

Exceptions:

1. Two-way communication systems are not required at the elevator landing where the two-way communication system is provided within areas of refuge in accordance with Section 1007.6.3.
2. Two-way communication systems are not required on floors provided with ~~exit~~ ramps conforming to the provisions of Section 1010.

SECTION 1015 (IFC [B] 1015)
EXIT AND EXIT ACCESS DOORWAYS

1015.2.1 (IFC [B] 1015.2.1) Two exits or exit access doorways. Where two exits or exit access doorways are required from any portion of the exit access, the exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access doorways. Interlocking or scissor stairs shall be counted as one ~~exit~~ stairway.

Exceptions:

1. Where ~~exit~~ ~~enclosures~~ interior exit stairways are ~~provided as a portion of the required exit and are~~ interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1018, the required exit separation shall be measured along the shortest direct line of travel within the corridor.
2. Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

SECTION 1023 (IFC [B] 1023)
EXIT PASSAGEWAYS

1023.3 (IFC [B] 1023.3) Construction. Exit passageway enclosures shall have walls, floors and ceilings of not less than 1-hour fire-resistance rating, and not less than that required for any connecting ~~exit~~ ~~enclosure~~ interior exit stairway or ramp. Exit passageways shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

1023.5 (IFC [B] 1023.5) Openings and penetrations. Exit passageway opening protectives shall be in accordance with the requirements of Section 715.

Except as permitted in Section 402.4.6, openings in exit passageways other than exterior openings shall be limited to those necessary for exit access to the exit passageway from normally occupied spaces and for egress from the exit passageway.

Where an ~~exit~~ ~~enclosure~~ interior exit stairway or ramp is extended to an exit discharge or a public way by an exit passageway, the exit passageway shall also comply with Section 1022.2.1.

Elevators shall not open into an exit passageway.

SECTION 1024 (IFC [B] 1024)
LUMINOUS EGRESS PATH MARKINGS

1024.2 (IFC [B] 1024.2) Markings within exit components ~~enclosures~~. Egress path markings shall be provided in ~~exit enclosures, including~~ ~~vertical exit~~ ~~enclosures~~ interior exit stairways, interior exit ramps and exit passageways, in accordance with Sections 1024.2.1 through 1024.2.6.

1024.2.4 (IFC [B] 1024.2.4) Perimeter demarcation lines. Stair landings and other floor areas within ~~exit~~ ~~enclosures~~ interior exit stairways, interior exit ramps and exit passageways, with the exception of the sides of steps, shall be provided with solid and continuous demarcation lines on the floor or on the walls or a combination of both. The stripes shall be 1 to 2 inches (25mm to 51 mm) wide with interruptions not exceeding 4 inches (102 mm).

Exception: The minimum width of 1 inch (25 mm) shall not apply to outlining stripes listed in accordance with UL 1994.

1024.2.4.1 (IFC [B] 1024.2.4.1) Floor-mounted demarcation lines. Perimeter demarcation lines shall be placed within 4 inches (102 mm) of the wall and shall extend to within 2 inches (51 mm) of the markings on the leading edge of landings. The demarcation lines shall continue across the floor in front of all doors.

Exception: Demarcation lines shall not extend in front of exit <u>discharge</u> doors that lead out of an exit ~~enclosure~~ and through which occupants must travel to complete the exit path.

1024.2.4.2 (IFC [B] 1024.2.4.2) Wall-mounted demarcation lines. Perimeter demarcation lines shall be placed on the wall with the bottom edge of the stripe no more than 4 inches (102 mm) above the finished floor. At the top or bottom of the stairs, demarcation lines shall drop vertically to the floor within 2 inches (51 mm) of the step or landing edge. Demarcation lines on walls shall transition vertically to the floor and then extend across the floor where a line on the floor is the only practical method of outlining the path. Where the wall line is broken by a door, demarcation lines on walls shall continue across the face of the door or transition to the floor and extend across the floor in front of such door.

Exception: Demarcation lines shall not extend in front of exit <u>discharge</u> doors that lead out of an exit ~~enclosure~~ and through which occupants must travel to complete the exit path.

1024.2.6 (IFC [B] 1024.2.6) Doors <u>within the exit path</u> ~~from exit~~ ~~enclosures~~. Doors through which occupants ~~within an exit~~ ~~enclosure~~ must pass in order to complete the exit path shall be provided with markings complying with Sections 1024.2.6.1 through 1024.2.6.3.

1024.3 (IFC [B] 1024.3) Uniformity. Placement and dimensions of markings shall be consistent and uniform throughout the same ~~exit~~ enclosure.

1024.5 (IFC [B] 1024.5) Illumination. ~~Exit~~ ~~enclosures~~ Where photoluminescent exit path markings are installed shall be provided with the minimum means of egress illumination required by Section 1006 for at least 60 minutes prior to periods when the building is occupied.

SECTION 1025 (IFC [B] 1025)
HORIZONTAL EXIT

1025.4 (IFC [B] 1025.4) Capacity of refuge area. The refuge area of a horizontal exit shall be a space occupied by the same tenant or a public area and each such refuge area shall be adequate to accommodate the original occupant load of the refuge area plus the occupant load anticipated from the adjoining compartment. The anticipated occupant load from the adjoining compartment shall be based on the capacity of the horizontal exit doors entering the refuge area. The capacity of the refuge area shall be computed based on a net floor area allowance of 3 square feet (0.2787 m^2) for each occupant to be accommodated therein.

Exception: The net floor area allowable per occupant shall be as follows for the indicated occupancies:

1. Six square feet (0.6 m^2) per occupant for occupancies in Group I-3.
2. Fifteen square feet (1.4 m^2) per occupant for ambulatory occupancies in Group I-2.
3. Thirty square feet (2.8 m^2) per occupant for nonambulatory occupancies in Group I-2.

The refuge area into which a horizontal exit leads shall be provided with exits adequate to meet the occupant requirements of this chapter, but not including the added occupant load imposed by persons entering it through horizontal exits from other areas. At least one refuge area exit shall lead directly to the exterior or to an <u>interior exit stairway or ramp</u> ~~exit enclosure~~.

Exception: The adjoining compartment shall not be required to have a stairway or door leading directly outside, provided the refuge area into which a horizontal exit leads as stairways or doors leading directly outside and are so arranged that egress shall not require the occupants to return through the compartment from which egress originates.

SECTION 1026 (IFC [B] 1026)
EXTERIOR EXIT ~~RAMPS AND~~ STAIRWAYS <u>AND RAMPS</u>

1026.6 (IFC [B] 1026.6) Exterior ~~ramps and~~ stairway and ramp protection. Exterior exit ~~ramps and~~ stairways and ramps shall be separated from the interior of the building as required in Section 1022.1. Openings shall be limited to those necessary for egress from normally occupied spaces.

Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are no more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.
2. Separation from the interior of the building is not required where the exterior ~~ramp or~~ stairway or ramp is served by an exterior ramp or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior ~~ramp or~~ stairway or ramp located in a building or structure that is permitted to have unenclosed ~~interior~~ exit access stairways in accordance with Section 1009.3 ~~1022.1~~.
4. Separation from the interior of the building is not required for exterior ~~ramps or~~ stairways or ramps connected to open-ended corridors, provided that Items 4.1 through 4.4 are met:
   - 4.1 The building, including corridors, ~~ramps or~~ stairways or ramps, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
   - 4.2 The open-ended corridors comply with Section 1018.
   - 4.3 The open-ended corridors are connected on each end to an exterior exit ~~ramp or~~ stairway or ramp complying with Section 1026.
5. At any location in an open-ended corridor where a change of direction exceeding 45 degrees 0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior ~~ramp or~~ stairway or ramp shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

SECTION 1027 (IFC [B] 1027)
EXIT DISCHARGE

1027.1 (IFC [B] 1027.1) General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 below shall not exceed 50 percent of the number and capacity of the required exits.

Exceptions:

1. A maximum of 50 percent of the number and capacity of ~~the exit enclosures~~ interior exit stairways and ramps is permitted to egress through areas on the level of discharge provided all of the following are met:
   - 1.1 Such ~~exit~~ enclosures egress to a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the ~~exit~~ enclosure.
   - 1.2 The entire area of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the ~~exit~~ enclosure.
   - 1.3 The egress path from the ~~exit enclosure~~ interior exit stairway and ramp on the level of exit discharge is protected throughout by an approved automatic sprinkler system. All portions of the level of exit discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of ~~exits~~ interior exit stairways or ramps.
2. A maximum of 50 percent of the number and capacity of the ~~exit enclosures for~~ interior exit stairways and ramps is permitted to egress through a vestibule provided all of the following are met:
   - 2.1 The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the ~~exit~~ enclosure.
   - 2.2 The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   - 2.3 The area is separated from the remainder of the level of exit discharge by construction providing protection at least the equivalent of approved wired glass in steel frames.
   - 2.4 The area is used only for means of egress and exits directly to the outside.
3. ~~Stairways in open parking garages complying with Section 1022.1, Exception 4, are permitted to egress through the open parking garage at their levels of exit discharge.~~

4. Horizontal exits complying with Section 1025 shall not be required to discharge directly to the exterior of the building.

SECTION 1028 (IFC [B] 1028)
ASSEMBLY

~~**1028.5.1 (IFC [B] 1028.5.1) Enclosure of openings.** Interior stairways and other vertical openings shall be enclosed in an exit enclosure in accordance with Section 1009, as provided in Section 1022.1, except that stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities. At least one accessible means of egress is required from a balcony, gallery or press box level containing accessible seating locations in accordance with Section 1007.3 or 1007.4.~~

SECTION 1110
SIGNAGE

1110.3 Other signs. Signage indicating special accessibility provisions shall be provided as shown:

1. Each assembly area required to comply with Section 1108.2.7 shall provide a sign notifying patrons of the availability of assistive listening systems.

   Exception: Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.

2. At each door to an area of refuge, an exterior area for assisted rescue, an egress stairway, exit passageway and exit discharge, signage shall be provided in accordance with Section 1011.3.
3. At areas of refuge, signage shall be provided in accordance with Section 1007.11.
4. At exterior areas for assisted rescue, signage shall be provided in accordance with Section 1007.11.
5. At two-way communication systems, signage shall be provided in accordance with Section 1007.8.2.
6. Within ~~exit~~ ~~enclosures~~ <u>interior exit stairways and ramps</u>, signage shall be provided in accordance with Section 1022.8.

SECTION 2606
LIGHT-TRANSMITTING PLASTICS

2606.7 Light-diffusing systems. Unless the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, light-diffusing systems shall not be installed in the following occupancies and locations:

1. Group A with an occupant load of 1,000 or more.
2. Theaters with a stage and proscenium opening and an occupant load of 700 or more.
3. Group I-2.
4. Group I-3.
5. ~~Vertical exit~~ ~~enclosures~~ <u>Interior exit stairways and ramps</u> and exit passageways.

SECTION 3007
FIRE SERVICE ACCESS ELEVATOR

3007.4.1 Access. The fire service access elevator lobby shall have direct access to an ~~exit~~ enclosure <u>for an interior exit stairway</u>.

3007.5 Standpipe hose connection. A Class I standpipe hose connection in accordance with Section 905 shall be provided in the the ~~exit~~ ~~enclosure~~ <u>interior exit stairway and ramp</u> having direct access from the fire service access elevator lobby.

SECTION 3008
OCCUPANT EVACUATION ELEVATORS

3008.11.1 Access. The occupant evacuation elevator lobby shall have direct access to an ~~exit~~ ~~enclosure~~ <u>interior exit stairway or ramp</u>.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Unenclosed Interior Stairways". The scope of the activity is noted as:

Scope: The current code allows limited use of unenclosed exit stairs. During the previous code development cycles, numerous code changes have been submitted to clarify the intent and application of the code provisions relative to issues such as: exit versus exit access; travel distance measurements; contribution to the minimum number of required exits; etc. Due to the inter-relationship of code provisions, this requires a comprehensive analysis in order to clarify the code requirements.

Objectives:

A. The Unenclosed Interior Stairway Work Group will answer the following questions based on the current Means of Egress system that is composed of exit, exit access and exit discharge components:
   1. Can an unenclosed interior stairway qualify as an exit?
   2. If an un-enclosed interior stairway can qualify as an exit what is the entrance to the exit (where does the exit begin)?
   3. If an un-enclosed interior stairway can qualify as an exit where does the exit discharge begin (where does the exit end)?
   4. How is travel distance measured when an un-enclosed interior stairway is used as an element in a means of egress?
   5. Does the Minimum Number of Exits Section (1019.1 in the 2006 IBC) require entry to the required exits on each story?

B. The Unenclosed Interior Stairway Work Group will draft recommend code changes, as determined necessary, to effectively communicate the code requirements based on the answers to the above questions.

(Note that all references to stairs in this reason statement are inclusive of ramps)

Preface: Over that last several code development cycles, there have been numerous proposals intended to address the technical relationships between unenclosed interior stairways, travel distance and the required numbers and location of exits. Through these various proposals, it became evident that there was considerable confusion and disagreement as to what the IBC actually requires or implies. Although some minor changes were approved over time, cumulatively, they did little to resolve the underlying technical question being what part of the three part means of egress system is an unenclosed stair between stories. More specifically: Are stairs that are required to meet means of egress design requirements such as number of exits or exit access travel distance but allowed to be unenclosed an exit or an exit access? Are stairs that are not required for means of egress and supplemental but required to be enclosed do to the number of stories connected required to be protected as a shaft or as an exit enclosure? How should travel distance be measured when unenclosed stairs are part of the path of travel? Can required exits per floor be on an adjacent floor and accessed through an open stair?

At the hearings in Palm Springs the ICC Means of Egress Code Development Committee determined that proper attention could not be provided to the issues in that forum and referred the dilemma to the ICC Code Technology Committee. The CTC agreed that the issue should be researched and assigned a study group to investigate the matter and develop a code change proposal to resolve the issues.

This proposal is based on the following concepts:

All stairs within a building are elements of the means of egress system and must comply with chapter 10
Unenclosed stairways are not exits
All Exit Stairways, to qualify as an exit, must be enclosed with a fire rated enclosure consisting of exit stair shafts and passageways based on current exit enclosure provisions
All stairways that are permitted to be open or are not required stairways for egress purposes are Exit Access Stairways
Exit access stairways must be enclosed with fire rated enclosures based on shaft provisions or may be open in accordance exceptions based on the current exceptions;
Exit access travel distance is measured to an entrance to an exit
Exit access travel distance includes the travel distance on Exit access stairways
Entrances to exits on each story are not mandatory and access to exits on other stories is permissible within certain limitations

The code change in general: All of the current exceptions that will allow for an unenclosed opening to accommodate a stairway in chapter 7 and 10 are being relocated to proposed section 1009.3 including current exceptions to sections 708,1016, and 1022. Section 708 for shaft enclosures is being modified to only address floor openings that do not contain a stairway. All enclosure requirements for stairways, exit or exit access, will originate in section 1009. All fire rated enclosure requirements for exit stairs will remain in chapter 10 and exit access stair enclosure requirements will be placed in proposed section 1009.3 based on current section 708 construction requirements. Ramps will be treated the same as stairways. The new formalized concept of Exit Access Stairway is codified in proposed section 1009.3. New definitions are proposed for Exit Access Stairway(ramp) and Interior Exit Stairway(Ramp).

Specific section change explanations:

Modifications to current section 1002- The definition of Exit is proposed to be modified to remove the fire rated construction provisions from the definition because the construction requirements belong in the code text of section 1022. The definition should be focused on what the exit is, which is simply the component that is between the exit access and the exit discharge. The list of components that qualify as exits has been retained. Additionally "Exit Enclosure" is proposed to be replaced with new terms "Interior Exit Stairway" and "Interior Exit Ramp". This concept is that the exit stairway or ramp in its entirety comprises the exit component, not just the enclosure. New definitions are proposed for Exit Access Ramp and Stairway to support the new concept of their use in proposed section 1009.3. The concept is that all interior stairways and ramps that are not formal exits, whether they are required means of egress components or not, are exit access components.

Modifications to current section 1009-In general, the concept with the changes to 1009 and companion changes to other sections is that 1009 is the point source for all requirements relating to interior stair code requirements including opening protection requirements. Figuratively speaking all stairs lead to section 1009. New sections 1009.1 through 1009.4 have been proposed for addition to current section 1009. 1009.1 establishes that all stairways serving occupied portions of a building must comply with section 1009, whether the stairs are required or not. 1009.2 establishes that exit stairs must lead out of the building directly or through an exit passageway or exit discharge component as is currently required. Section 1009.2.1 establishes the general requirement for when an exit stairway is required. Section 1009.2.2 directs the code user to section 1022 for detailed requirements for construction of the exit stairway including the current enclosure requirements. Proposed section 1009.3 is the new section established to regulate enclosure of exit access stairs. The base line is that all exit access stairs must be enclosed with exceptions to follow. All of the current exceptions in sections 708,1016, and 1022 have been moved to this section, as exceptions to the baseline requirement for enclosure because all open stairs are exit access stairs per this proposal. The exceptions either in text or concept are in 1009.3 with every attempt made to keep them as they are currently applied. New section 1009.3.1 and sub-sections are the construction requirements for enclosure of exit access stairs with the exit access stair would not qualify for one of the exceptions that would allow the stairway to be unenclosed. These requirements have been copied from section 708 Shaft enclosures because current code allows stairways that are not used as exits to meet shaft enclosure requirements of current section 708; current exit enclosure requirements of 1022 are only applicable to required exit stairs.

New section 1010.2-This section is proposed as simply a cross reference for ramps so that they are designed for enclosure no differently than stairways.

Modifications to current section 1016.1-The section is proposed for re-organization based on separation general provisions from specific design provisions. Exceptions 1 and 2 to 1016.1 were moved to proposed section 1016.3 due to conversion of existing section 1016.1 into a general section. Exceptions 3 and 4 to 1016.1 were deleted because the intended use of those exceptions is now captured in proposed modifications to current section 1021.1 and 1021.3.1.

Modifications to current section 1016.1- Exit access added for consistency and the table reference was changed to 1016.2 because this proposal includes changing the table number and reference section.

New section 1016.3- New section 1016.3 is proposed to separate the measurement requirements of exit access travel distance into a standalone section for better clarity and order.

Modifications to current section 1021.1-Changed the section to a general section. The first sentence proposed replacement is a mix of language clean and addition of the proposed new terms “exit and exit access stairways or ramps”. The added second underlined text that proposes to require at least one exit stairway serving each story above the section is the relocation of the concept intended by current exceptions 3 and 4 to 1016.1 that have been proposed for deletion. Exceptions for open parking garages and outdoor facilities were relocated to this section. All of the specific provisions regarding required number of exits were moved from the proposed general section 1021.1 to a new section 1021.2.

Modifications to current section 1021.2-The bulk of this sections changes are to improve the format and flow of the section in keeping with moving specific requirements out of the beginning General section and laying out the requirements for number of exits and configuration in a more logical format. Proposed section 1021.3.1 has a provision that limits the access of exits on another floor to an adjacent level.

Modifications to current section 1022-The section title is proposed to be changed to the new term Interior Exit Stairways and Ramps. Some minor editorial changes have been made to the section and the new terms have been inserted into the text. The deleted last two sentences of 1022.1 (proposed 1022.2) were relocated to proposed section 1009.2.

New Section 410.5.3.1- Based on deletion of current exception #6 to 1022.1 the allowance for open stairs serving stages and support areas has been relocated to chapter 4 under the current stage exit provisions in chapter 4. This is cross referenced in proposed 1009.3 Exception #7.

New exception #3 to Section 706-Added cross-reference to top of shaft enclosure allowance in current section 707.12 to allow use for exit and exit access stair termination. This was done in conjunction with adding exit access stair enclosure requirements, modeled after shaft enclosure requirements, into section 1009.

Modifications to current section 708-Added the sentence in general section 708.1 that removes stair openings from regulation by section 708 and directs the code user to section 1009 for all stair opening protection requirements. As a companion to the intent of that change current exceptions numbers 2 (stair part), 7.2, 11 and 13 that address permissible unenclosed floor openings for stairs have been proposed for deletion and to be moved to section 1009.3: current #2 to proposed 1009.3 Exception #3; current #7.2 and #11 to proposed 1009.3 Exception #1; current #13 to proposed 1009.3 Exception #9. See below for a comparison of the suggested revisions between the Open Stairway study group recommendations and the Vertical Openings committee.

Proposed new section 708.3-Shaft enclosure construction provisions were moved out of the general section in 708.1 and into a new section titled Construction.

Modifications to current section 708.3-In current sections 1002 and 1022 the term “Exit Enclosure” is proposed to be replaced with new terms “Interior Exit Stairway” and “Interior Exit Ramp”. This change is companion to that change in term.

Modification to Sections following the main proposal are correlative items to match the proposed revisions to terminology and are not intended to change the scope of the code. Sections that were also reviewed for correlation, but are not proposed to be revised include 403, 408, 410, 414, 415, 705, 707, 708, 709, 712, 715, 716. 803, 804, 909, 1006, 1007, 1015, 1023, 1024, 1025, 1026, 1027, 1028, 1110, 2606, 3007, 3008.

Comparison of CTC proposals for open stairway and vertical openings:
This is a comparison between the overlapping portions of the proposals from the Vertical opening study group and the Open stairway study group. The text in the columns is to compare requirements that may be addressing the same type of provisions. The CTC committee did not feel that there were conflicts in these two proposals, however, in the interest of providing complete information to those participating in the code change process, this matrices should make reviewing for potential conflicts much easier. The first half is the exceptions currently in 708.2 and Section 1022 (exit access stairways). The 2nd half is the construction requirements.

Open Stairway Proposals	Vertical opening Proposals
	~~Section 708~~ Section 712
	~~Shaft Enclosures~~ Vertical Openings
For Stairways – **1009.3 Exit access stairways.** Floor openings between stories created by exit access stairways shall be enclosed. **Exceptions:** (See below) *For Ramps –* **1010.2 Enclosure.** All interior exit ramps shall be enclosed in	**~~708.1~~ 712.1 General.** The provisions of this section shall apply to the vertical opening applications listed in Sections 712.1.1 through 712.1.18. ~~shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.~~

Open Stairway Proposals	Vertical opening Proposals
accordance with the applicable provisions of Section 1022. Exit access ramps shall be enclosed in accordance with the applicable provisions of Section 1009.3. **708.1 General.** The provisions of this section shall apply to shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Exit access stairways and ramps shall be protected in accordance with the applicable provisions of Section 1009. Interior exit stairways and ramps shall be protected in accordance with the requirements of Section 1022. ~~Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.~~	
	~~**708.2 Shaft enclosure required.** Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this Section.~~ ~~**Exceptions:**~~
	712.1.1 Smoke compartments. Vertical openings contained entirely within a shaft enclosure complying with Section 709 shall be permitted.
1009.3 - 2. Exit access stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.	~~**708.2 -1.**~~ **712.1.2 Individual dwelling unit.** ~~A shaft enclosure is not required for~~ Unconcealed vertical openings totally within an individual residential dwelling unit and connecting four stories or less shall be permitted.
708.2 – 2. A shaft enclosure is not required in a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening ~~or stairway that is not a portion of the means of egress~~ protected according to Item 2.1 or 2.2;	~~**708.2 -2.**~~ **712.1.3 Escalator and Stairway Openings.** ~~A shaft enclosure is not required in~~ Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, ~~for~~ an escalator opening or stairway that is not a portion of the means of egress shall be protected according to Item ~~2.1 or 2.2~~ 712.1.3.1 or 712.1.3.2:
708.2 - 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator ~~or stairway~~ and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.	~~**708.2 - 2.1.**~~ **712.1.3.1 Opening size.** Where the area of the ~~floor~~ vertical opening between stories does not exceed twice the horizontal projected area of the escalator or stairway and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
	~~**708.2 - 2.2.**~~ **712.1.3.2 Automatic shutters**. Where the vertical opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.11 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release there from.
	~~**708.2 - 3.**~~ **712.1.4 Penetrations.** ~~A shaft enclosure is not required for p~~Penetrations by pipe, tube, conduit, wire, cable and vents shall be protected in accordance with Section ~~713.4~~ 712.4.
	~~**708.2 - 4.**~~ **712.1.5 Ducts.** ~~A shaft enclosure is not required for~~ Penetrations by ducts shall be protected in accordance with Section 716.6. Grease ducts shall be protected in accordance with the *International Mechanical Code*.
1009.3 - 4. Exit access stairways within an atrium complying with the provisions of Section 404 need not be enclosed.	~~**708.2 - 5.**~~ **712.1.6 Atriums.** In other than Group H occupancies, ~~a shaft enclosure is not required for floor openings complying with the provisions for~~ atriums ~~in~~ complying with Section 404 shall be permitted.
	~~**708.2 - 6.**~~ **712.1.7 Masonry chimney.** ~~A shaft enclosure is not required for a~~Approved masonry chimneys shall be permitted where the annular space is fireblocked at each floor level in accordance with Section 717.2.5.

Open Stairway Proposals	Vertical opening Proposals
1009.3 - 1. In other than Group I-2 and I-3 occupancies, exit access stairways that serve, or atmospherically communicate between, only two stories, need not be enclosed. **708.2 - 7.** In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following: 7.1. Does not connect more than two stories. ~~7.2. Is not part of the required means of egress system.~~ 7.3. Is not concealed within the construction of a wall or a floor/ceiling assembly. 7.4. Is not open to a corridor in Group I and R occupancies. 7.5. Is not open to a corridor on nonsprinklered floors in any occupancy. 7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures. 7.7. Is limited to the same smoke compartment.	**~~708.2 - 7.~~ 712.1.8 Two story openings**. In other than Groups I-2 and I-3~~,~~ ~~a shaft enclosure is not required for~~ a floor opening that is not used as one of the applications listed in this section shall be permitted if it complies with all the items below ~~or an air transfer opening that complies with the following:~~ ~~7.1~~ 1. Does not connect more than two stories. ~~7.2~~ 2. Does not contain a stairway or ramp required by Chapter 10. ~~Is not part of the required means of egress system~~. 3 Does not penetrate a horizontal assembly that separates fire areas or smoke barriers that separate smoke compartments. ~~7.3~~ 4. Is not concealed within the construction of a wall or a floor/ceiling assembly. ~~7.4~~ 5. Is not open to a corridor in Group I and R occupancies. ~~7.5~~ 6. Is not open to a corridor on nonsprinklered floors ~~in any occupancy~~. ~~7.6~~ 7. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures. ~~7.7. Is limited to the same smoke compartment~~.
1009.3 - ~~-~~5. Exit access stairways and ramps in open parking garages that serve only the parking garage are not required to be enclosed.	**~~708.2 - 8.~~ 712.1.9 Parking garages**. ~~A shaft enclosure is not required for~~ Automobile ramps in open and enclosed parking garages shall be permitted where constructed in accordance with Sections 406.3 and 406.4, respectively.
	~~708.2 -~~ ~~9.~~ **712.1.10 Mezzanine.** ~~A shaft enclosure is not required for~~ vertical ~~floor~~ openings between a mezzanine complying with Section 505 and the floor below shall be permitted. ~~and the floor below.~~
	~~708.2 - 10.~~ 712.1.11 Joints. ~~A shaft enclosure is not required for~~ Joints shall be permitted where complying ~~protected by a fire-resistant joint system in accordance~~ with Section ~~714~~ 715.
1009.2 - 3. In buildings with only group B or M occupancies , exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. ~~**708.2 - 11.** A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 3 or 4 in Section 1016.1.~~	**~~708.2 - 11.~~ 712.1.12 Unenclosed stairs and ramps.** A ~~shaft enclosure shall not be required for~~ vertical floor openings created by unenclosed stairs or ramps in accordance with Exception 3 or 4 in Section 1016.1 shall be permitted.
	~~708.2 - 12.~~ 712.1.13 Floor Fire Doors. ~~Floor~~ Vertical openings shall be permitted where protected by floor fire doors in accordance with Section ~~712.8~~ 711.8.
1009.3 - 9. In Group I-3 occupancies, an exit access enclosure is not required for floor openings in accordance with Section 408.5. ~~**708.2 - 13.** In Group I-3 occupancies, a shaft enclosure is not required for floor openings in accordance with Section 408.5.~~	**~~708.2 - 13.~~ 712. 1.14. Group I-3.** In Group I-3 occupancies, ~~a shaft enclosure is not required for floor~~ vertical openings shall be permitted in accordance with Section 408.5.
	~~708.2 - 14.~~ 712.1.15 Elevators in parking garages. ~~A shaft enclosure is not required for e~~ vertical openings for elevator hoistways in open or enclosed parking garages that serve only the parking garage, and complying with 406.3 and 406.4 respectively, shall be permitted..
	~~708.2 - 15.~~ 712.1.16 Duct systems in parking garages. Vertical openings for mechanical exhaust or supply duct systems in open or enclosed parking garages ~~a shaft enclosure is not required to enclose mechanical exhaust or supply duct systems~~ complying with 406.3 and 406.4 respectively, shall be permitted to be unenclosed where ~~when~~ such duct system is contained within and serves only the parking garage.
	712.1.17 Nonfire-resistance-rated joints. Joints in or between floors without a required fire-resistance rating shall be permitted in accordance with section 711.4.1.
	~~708.2 - 16.~~ 712.1.18 Openings otherwise permitted. Vertical openings shall be ~~Where~~ permitted where allowed by other sections of this code
1009.3 - 6. Stairways serving outdoor facilities where all portions of the means of egress are essentially open to the outside.	
1009.3 - 7. Exit access stairways serving stages shall comply with	

Open Stairway Proposals	Vertical opening Proposals
Section 410.5.3.1 and 1015.6.	
1009.3 - 8. Exit access stairways serving balconies, galleries and press boxes shall comply with Section 1028.5.1.	
	SECTION 713
	SHAFT ENCLOSURES
1009.3.1 Construction. Where required, enclosures for exit access stairways shall be constructed in accordance with this section. Exit access stairway enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both.	**713.1 General.** The provisions of this section shall apply to shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Shaft enclosures shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 711, or both.
1009.3.1.1 Materials. Exit access stairway enclosures shall be of materials permitted by the building type of construction.	**~~708.3~~ 713.2 Materials.** The shaft enclosure shall be of materials permitted by the building type of construction.
1009.3.1.2 Fire-resistance rating. Exit access stairway enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more, and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit access stairway enclosures shall include any basements, but not any mezzanines. Exit access stairway enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.	**~~708.4~~ 713.3 Fire-resistance rating.** Shaft enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four *stories* or more, and not less than 1 hour where connecting less than four *stories*. The number of *stories* connected by the shaft enclosure shall include any basements but not any *mezzanines*. Shaft enclosures shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours. Shaft enclosures shall meet the requirements of Section 703.2.1.
1009.3.1.3 Continuity. Exit access stairway enclosures shall have continuity in accordance with Section 707.5 for fire barriers or Section 712.4 for horizontal assemblies as applicable.	**~~708.5~~ 713.4 Continuity.** Shaft enclosures shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both, and shall have continuity in accordance with Section 707.5 for *fire barriers* or Section 712.4 for *horizontal assemblies* as applicable.
1009.3.1.8 Exterior walls. Where exterior walls serve as a part of an exit access stairway enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply. **~~708.6~~ 708.7Exterior walls.** Where exterior walls serve as a part of a required shaft enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply. **Exception:** Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section ~~1022.6~~ 1022.7 for enclosures for interior exit stairways and ramps ~~exit enclosures~~ and Section 1026.6 for exterior exit ramps and stairways.	**~~708.6~~ 713.5 Exterior Walls.** Where exterior walls serve as a part of a required shaft enclosure, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply. **Exception:** Exterior walls required to be fire-resistance rated in accordance with Section 1019.2 for exterior egress balconies, Section 1022.6 for exit enclosures and Section 1026.6 for exterior exit ramps and stairways.
1009.3.1.4 Openings. Openings in an exit access stairway enclosure shall be protected in accordance with Section 715 as required for fire barriers. Doors shall be self- or automatic-closing by smoke detection in accordance with Section 715.4.8.3.	**~~708.7~~ 713.6 Openings.** Openings in a shaft enclosure shall be protected in accordance with Section 715 as required for *fire barriers*. Doors shall be self- or automatic closing by smoke detection in accordance with Section 715.4.8.3.
1009.3.1.4.1 Prohibited openings. Openings other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.	**~~708.7.1~~ 713.6.1 Prohibited openings.** Openings other than those necessary for the purpose of the shaft shall not be permitted in shaft enclosures.
1009.3.1.5 Penetrations. Penetrations in a shaft enclosure shall be protected in accordance with Section 713 as required for fire barriers.	**~~708.8~~ 713.7 Penetrations.** Penetrations in a shaft enclosure shall be protected in accordance with Section 713 as required for *fire barriers*.
1009.3.1.5.1 Prohibited penetrations. Penetrations other than those necessary for the purpose of the exit access stairway enclosure shall not be permitted in exit access stairway enclosures.	**~~708.8.1~~ 713.7.1 Prohibited penetrations.** Penetrations other than those necessary for the purpose of the shaft shall not be permitted in shaft enclosures.
1009.3.1.6 Joints. Joints in an exit access stairway enclosure shall comply with Section 714.	**~~708.9~~ 713.8 Joints.** Joints in a shaft enclosure shall comply with Section 714.
1009.3.1.7 Ducts and air transfer openings. Penetrations of an exit access stairway enclosure by ducts and air transfer openings shall comply with Section 716.	**~~708.10~~ 713.9 Duct and air transfer openings.** Penetrations of a shaft enclosure by ducts and air transfer openings shall comply with Section 716.
	~~708.11~~ 713.10 Enclosure at the bottom. (No change to text)
706.5 Continuity. Fire barriers shall extend from the top of the floor/ceiling assembly below to the underside of the floor or roof slab or	**~~708.12~~ 713.11 Enclosure at top.** A shaft enclosure that does not extend to the underside of the roof sheathing, deck or slab of the building shall be

Open Stairway Proposals	Vertical opening Proposals
deck above and shall be securely attached thereto. Such fire barriers shall be continuous through concealed spaces, such as the space above a suspended ceiling. The supporting construction for fire barriers shall be protected to afford the required fire-resistance rating of the fire barrier supported, except for 1-hour fire-resistance-rated incidental use area separations as required by Table 508.2 in buildings of Type IIB, IIIB and VB construction. Hollow vertical spaces within a fire barrier shall be fireblocked in accordance with Section 717.2 at every floor level. **Exceptions:** 1. The maximum required fire-resistance rating for assemblies supporting fire barriers separating tank storage as provided in section 415.6.2.1 shall be 2 hours, but not less than required by Table 601 for the building construction type. 2. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 707.12. <u>3. Interior exit stairway and ramp enclosures required by Section 1009.2.2 and exit access stairway and ramp enclosures required by Section 1009.3 shall be permitted to terminate at a top enclosure complying with Section 707.12.</u>	enclosed at the top with construction of the same *fire-resistance rating* as the topmost floor penetrated by the shaft, but not less than the *fire-resistance rating* required for the shaft enclosure.
	~~**708.13**~~ <u>**713.12**</u> **Refuse and laundry chutes** (No change to text and subsections)
	~~**708.14**~~ <u>**713.13**</u> **Elevator, dumbwaiter and other hoistways.** (No change to text and subsections)

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME:Heilsted-G8-410.5.3.1

<u>Public Hearing Results</u>

PART I IBC MEANS OF EGRESS
Committee Action: **Approved as Submitted**

Committee Reason: The revisions for stairways will clarify when exit access stairways (i.e., monumental, convenience and mezzanines stairways) are part or the means of egress, including protection, travel distance and enclosure requirements. The proposal coordinates the issue throughout the codes for this important issue. The committee proposal also coordinates with the proposal for vertical openings, FS56-09/10.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

403.5.1 Remoteness of interior exit stairways. Required interior exit stairways shall be separated by a distance not less than 30 feet (9144 mm) or not less than one-fourth of the length of the maximum overall diagonal dimension of the building or area to be served, whichever is less. The distance shall be measured in a straight line between the nearest points of the <u>enclosures surrounding the</u> interior exit stairways. In buildings with three or more interior exit stairway, at least two of the interior exit stairway shall comply with this section. Interlocking or scissor stairs shall be counted as one interior exit stairway.

~~**410.5.3.1 Stairway and ramp enclosure.** Exit access stairways and ramps serving the stage are not required to be enclosed. Exit access stairways serving the lighting and access catwalks, galleries and gridirons are not required to be enclosed.~~

1007.6.2 Separation. Each area of refuge shall be separated from the remainder of the story by a smoke barrier complying with Section 709 or a horizontal exit complying with Section 1025. Each area of refuge shall be designed to minimize the intrusion of smoke.

> **Exception:** Areas of refuge located within an enclosure <u>complying with Sections 1009.3.1</u> for exit access stairways or <u>Section 1022.2</u> for interior exit stairways.

1009.3 Exit access stairways. Floor openings between stories created by exit access stairways shall be enclosed.

Exceptions:

1 – 7. *(No change to current text)*
8. Exit access stairways serving stages, platforms and technical production areas ~~complying with Section 410.5.3.1 and 1015.6~~ in accordance with Section 410.6.2 are not required to be enclosed.
9 – 10 *(No change to current text)*

(Portions of proposal not shown remain unchanged)

Commenter's Reason: 403.5.1: When Section 403.5.1 was put in, the intent was to get separation between the enclosures to prevent a catastrophic event from taking out multiple exit enclosures. This section is specific to the enclosures not the stairs themselves. This modification is intended to make it clear that the measurement for separation is to be taken from the enclosure, not the stair itself or the door into the enclosure.

410.5.1 and 1009.3: G67 revised the provisions for stages in Section 410.5.3 and 1015.6 and deleted section 410.5.3 entirely. G67 was approved as submitted without any opposition and developed with the cooperation of theater designers. In addition, G67 has deleted the definition for fly galleries and gridirons and replace them with a definition for technical production areas. G67 addressed the exit and exit access stairway questions in new Section 410.6 in a manner that works with the new format proposed in E5. G67 addresses un-enclosed stairways serving stages in new section 410.6.2 sot the revision to exception #8 to 1009.3 correlates with the new section and the new term from G67 "technical production area". Since this change was not opposed in any way it is assumed that it will be approved on the consent agenda and proposed section 410.5.1 in E5 will not be necessary. There is concern that the code correlating committee may not meet prior to the final action hearing and may not view removing 410.5.1 from the code if G67 is passed.

1007.6.2: The exception to 1007.6.2 was modified to make it clear that a stair enclosure must be fire rated in compliance with the specific code sections that specify how to fire rate an exit or exit access stair. This is being proposed to make it clear that a non-rated architectural enclosure around a stair, that is permitted to be un-enclosed, is not acceptable to be used in place of a rated enclosure wall to protect an area of refuge.

Public Comment 2:

Mike Ashley C.B.O. representing the Alliance for Fire & Smoke Containment & Control, Inc. requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT. That portion of a means of egress system which is separated from other interior building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel spaces of a between the exit access and the exit discharge. Exits ~~components~~ include exterior exit doors at the level of exit discharge, vertical exit enclosures ~~interior exit stairways, interior exit ramps,~~ exit passageways, horizontal exits, exterior exit stairways, and exterior exit ramps and horizontal exits.

~~**EXIT ACCESS STAIRWAY.** An interior stairway that is not a required interior exit stairway.~~

EXIT ENCLOSURE. An exit component that is separated from other interior spaces of a building or structure by fireresistance-rated construction and opening protectives, and provides for a protected path of egress travel in a vertical or horizontal direction to the exit discharge or the public way.

SECTION 1009 (IFC [B] 1009)
STAIRWAYS

1009.3 (IFC [B] 1009.3) Exit access stairways. Floor openings between stories created by exit access stairways shall be enclosed.

~~**Exceptions:**~~

1. ~~In other than Group I-2 and I-3 occupancies, exit access stairways that serve, or atmospherically communicate between, only two stories, are not required to be enclosed.~~
2. ~~Exit access stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.~~
3. ~~In buildings with only Group B or M occupancies, exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13.~~
4. ~~In other than Groups B and M occupancies, exit access stairway openings are not required to be enclosed provided that the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the floor opening does not connect more than four stories, the area of the floor opening between stories does not exceed twice the horizontal projected area of the exit access stairway, and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13.~~
5. ~~Exit access stairways within an atrium complying with the provisions of Section 404 are not required to be enclosed.~~
6. ~~Exit access stairways and ramps in open parking garages that serve only the parking garage are not required to be enclosed.~~
7. ~~Stairways serving outdoor facilities where all portions of the means of egress are essentially open to the outside are not required to be enclosed.~~
8. ~~Exit access stairways serving stages complying with Section 410.5.3.1 and 1015.6 are not required to be enclosed.~~
9. ~~Stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.~~
10. ~~In Group I-3 occupancies, exit access stairways constructed in accordance with Section 408.5 are not required to be enclosed.~~

SECTION 1016 (IFC [B] 1016)
EXIT ACCESS TRAVEL DISTANCE

1016.1 (IFC [B] 1016.1) General. Travel distance within the exit access portion of the means of egress system shall be in accordance with this section.

Exceptions:

1. Travel distance in open parking garages is permitted to be measured to the closest riser of open exit stairways.
2. In outdoor facilities with open exit access components and open exterior exit stairways or exit ramps, travel distance is permitted to be measured to the closest riser of an exit stairway or the closest slope of the exit ramp.
3. In other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps when connecting a maximum of two stories. The two connected stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.
4. In other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps in the first and second stories above grade plane in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories above grade plane shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.
5. Where applicable, travel distance on unenclosed exit access stairways or ramps and on connecting stories shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.

SECTION 1022 (IFC [B] 1022)
EXIT ENCLOSURES INTERIOR EXIT STAIRWAYS AND RAMPS

1022.2 (IFC [B] 1022.2) Enclosures required Construction. Enclosures for interior exit stairways and interior exit ramps shall be enclosed with constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Interior exit stairway and ramp Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit stairways or ramps exit enclosure shall include any basements, but not any mezzanines. Interior exit stairways and ramps exit enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.

Exception: Interior exit stairways and ramps in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.

SECTION 708
SHAFT ENCLOSURES

708.2 Shaft enclosure required. Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this section.

Exceptions:

1. A shaft enclosure is not required for openings totally within an individual residential dwelling unit and connecting four stories or less.
2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening protected according to Item 2.1 or 2.2.
   - 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
   - 2.2. Where the opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fireresistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.3 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release there from.
3. A shaft enclosure is not required for penetrations by pipe, tube, conduit, wire, cable and vents protected in accordance with Section 713.4.
4. A shaft enclosure is not required for penetrations by ducts protected in accordance with Section 716.6. Grease ducts shall be protected in accordance with the International Mechanical Code.
5. In other than Group H occupancies, a shaft enclosure is not required for floor openings complying with he provisions for atriums in Section 404.
6. A shaft enclosure is not required for approved masonry chimneys where annular space is fireblocked at each floor level in accordance with Section 717.2.5.
7. In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following:
   - 7.1. Does not connect more than two stories.
   - 7.2. Is not concealed within the construction of a wall or a floor/ceiling assembly.
   - 7.3. Is not open to a corridor in Group I and R occupancies.
   - 7.4. Is not open to a corridor on nonsprinklered floors in any occupancy.
   - 7.5. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.
   - 7.6. Is limited to the same smoke compartment.
8. A shaft enclosure is not required for automobile ramps in open and enclosed parking garages constructed in accordance with Sections 406.3 and 406.4, respectively.

9. A shaft enclosure is not required for floor openings between a mezzanine and the floor below.
10. A shaft enclosure is not required for joints protected by a fire-resistant joint system in accordance with Section 714.
11. A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 3 or 4 in Section 1016.1.

~~11~~12. Floor openings protected by floor fire doors in accordance with Section 712.8.
13. In Group I-3 occupancies, a shaft enclosure is not required for floor openings in accordance with Section 408.5.
~~12~~14. A shaft enclosure is not required for elevator hoistways in open or enclosed parking garages that serve only the parking garage.
~~13~~15. In open or enclosed parking garages a shaft enclosure is not required to enclose mechanical exhaust or supply duct systems when such duct system is contained within and serves only the parking garage.
~~14~~16. Where permitted by other sections of this code.

SECTION 1007 (IFC [B] 1007)
ACCESSIBLE MEANS OF EGRESS

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway within an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.
2. A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

SECTION 1028 (IFC [B] 1028)
ASSEMBLY

1028.5.1 (IFC [B] 1028.5.1) Enclosure of openings. Interior stairways and other vertical openings shall be enclosed in an exit enclosure in accordance with Section 1009, as provided in Section 1022.1, except that stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities. At least one accessible means of egress is required from a balcony, gallery or press box level containing accessible seating locations in accordance with Section 1007.3 or 1007.4.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: With over 260 changes to this proposal many of the changes are technical and were not discussed at the hearings. Many of the changes reduce the level of protection for exits and areas of refuge. If changes are to be made to the codes they should only be made to make the buildings safer for the occupants and for protection of property.

Public Comment 3:

David Collins, FAIA, Cincinnati, Ohio representing the American Institute of Architects, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1022.2 (IFC [B] 1022.2) Construction. Enclosures for interior exit stairways and ramps shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Interior exit stairway and ramp enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit stairways or ramps shall include any basements, but not any mezzanines. Interior exit stairways and ramps shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions:

1. Interior exit stairways and ramps in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. Interior exit stairways or ramp located in an atrium that complies with Section 404.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: In the reasons for disapproval of G52-09/10, the committee commented that it wasn't clear how that change would coordinate with E5-09/10. This change establishes that an exit stairway or ramp located in an atrium would be acceptable as an exit.

Public Comment 4:

Jason Thompson, National Concrete Masonry Alliance, representing Masonry Allinaces for Codes and Standards, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT. That portion of a means of egress ~~system~~ which is separated from interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel between the exit access and the exit discharge, or which provides a refuge area, or which discharges directly to the exterior. Exit components include exterior exit doors at the level of exit discharge, interior exit stairways, interior exit ramps, exit passageways, horizontal exits, exterior exit stairway, and exterior exit ramps.

EXIT ENCLOSURE. An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives, and provides for a protected path of egress travel in a vertical or horizontal direction to the exit discharge or the public way.

INTERIOR EXIT RAMP. An exit component that serves to meet one or more means of egress design requirements, such as required number of exits, ~~or~~ exit access travel distance or exit capacity, and provides for a protected path of egress travel to the exit discharge or public way.

INTERIOR EXIT STAIRWAY. An exit component that serves to meet one or more means of egress design requirements, such as required number of exits, ~~or~~ exit access travel distance or exit capacity, and provides for a protected path of egress travel to the exit discharge or public way.

REFUGE AREA. An area within a building or structure that is accessed through a horizontal exit and provides an area adequate to accommodate the occupant load of the area plus the occupant load served by the horizontal exit.

SECTION 1009 (IFC [B] 1009)
STAIRWAYS

1009.2.1 (IFC [B] 1009.2.1) Where required. Interior exit stairways shall be included, as necessary, to meet one or more means of egress design requirements, such as required number of exits, ~~or~~ exit access travel distance or exit capacity.

SECTION 1021 (IFC [B] 1021)
NUMBER OF EXITS AND EXIT CONFIGURATION

1021.1 (IFC [B] 1021.1) General. Each story and occupied roof shall have the minimum number of exits, or access to exits, as specified in this section. The required number of exits, or exit access stairways or ramps providing access to exits, from any story shall be maintained ~~until arrival at grade~~ to the exit discharge or a public way. Exits or access to exits from any story shall be configured in accordance with this section. Each story above the second story of a building shall have a minimum of one interior or exterior exit stairway, or interior or exterior exit ramp. At each story above the second story that requires a minimum of three or more exits, or access to exits, a minimum of 50% of the required exits shall be interior or exterior exit stairways, or interior or exterior exit ramps.

Exceptions:

1. Interior exit stairways and interior exit ramps are not required in open parking garages where the means of egress serves only the open parking garage.
2. Interior exit stairways and interior exit ramps are not required in outdoor facilities where all portions of the means of egress are essentially open to the outside.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: We have submitted this Public Comment requesting approval as modified of this Code Change because of our concerns about the significant changes in the definition for "Exit" and the deletion of the definition for "Exit Enclosure." We have also made some editorial clarifications to the definitions for "Interior Exit Ramp" and "Interior Exit Stairway" and added a new definition for "Refuge Area." And we made an editorial change to Sections 1009.2.1 and 1021.1.

We believe the revisions we have proposed provide significant improvements to this very comprehensive Code Change Proposal. Regarding the definition for "Exit," we strongly believe that the original wording that has been deleted in this Code Change Proposal needs to be reinstated as it relates to the description of the exit being separated from the interior of the building by fire-resistance rated construction in order to provide a protected path of egress travel. We have also added some additional language that addresses the functioning of a horizontal exit as a nontraditional exit in the sense that it does not provide a protected path to the exterior or discharge directly to the exterior. Instead it provides a refuge area for the occupants to evacuate into to escape the fire on the side of the horizontal exit wall from which they are evacuating. Thus, there was a need to provide a definition for "refuge area" based on the provisions contained in Section 1025 Horizontal Exits. This definition will make it clear that the "refuge area" is different than the "area of refuge" used in the accessible means of egress requirements in Section 1007.

We have also made it clear that an exit may simply discharge to the exterior such as is the case for an exterior exit door. We have also reinstated the definition for "Exit Enclosure" since we believe it provides guidance to the users of the code as to what its function is since it is a critical means of egress component. Both the term "exit" and "exit enclosure" have been used successfully in the code for many years and provide important guidance to the users of the code in determining how they fit into the total means of egress system. We see no justification for the drastic changes to the definition for "Exit" and the deletion of the definition of "Exit Enclosure" as helping to further clarify the code requirements for means of egress. In fact, it is our concern that they may, in fact, actually confuse the application of Chapter 10 for means of egress, especially for novice users of the code.

Regarding our proposed revisions to the definitions for "Interior Exit Ramp" and "Interior Exit Stairway," we simply added another means of egress design requirement, namely that of exit capacity, which is just as critical as the other two components mentioned in the definitions for number of exits and exit access travel distance for consideration when designing means of egress systems utilizing these elements. Similarly, we have revised Section 1009.2.1 to add that additional design component for exit capacity for the same reasons. In this case, it is even more important to include it since this is the charging section for requiring interior exit stairways. If we are going to provide a laundry list, then we believe the laundry list should contain the most important elements of the design requirements for means of egress so as not to mislead the user.

In Section 1021.1 we made an editorial revision which we believe greatly clarifies to what extent the required number of exits and exit access stairways and ramps providing access to exits from any story shall be maintained. We deleted the phrase "until arrival at grade" since it seems to be somewhat general and subjective and does not clearly state where the egress system is to terminate. We believe the phrase we have substituted "to the exit discharge" is much more descriptive and concise. Furthermore, the term "exit discharge" is currently defined in Section 1002 as: "That portion of a means of egress system between the termination of an exit and a public way."

In summary, we believe the modifications we have proposed in this Public Comment will help to improve the use, application, interpretation, and enforcement of the means of egress requirements contained in Chapter 10 of the IBC and should be approved by the Class A voting members.

Public Comment 5:

Gerald Anderson, Overland Park, KS, representing self, requests Disapproval.

Commenter's Reason: I have read this code change a number of times and find it very difficult to follow. It would appear that the majority of the code change is simply an introduction of new terms and some reorganization. My principal concern with this code change is that I don't believe it does anything to add clarity to the code. It is almost as if change is being proposes for the sake of change.

My other concern is about Section 1021.2 Number of exits. This section essentially states that two exits, or exit access stairways from any story or occupied roof are required when any of the following conditions exists.

1. The occupant load exceeds one of the values in Table 1021.2.
2. The exit access travel distance exceeds that specified in Table 1021.2 as determined in accordance with the provisions of Section 1016.1.
3. Helistop landing areas located on buildings or structures shall be provided with tow exits, or exit access stairways or ramps providing access to exits.

My concern is with #2. I don't know why we would allow someone to use an exit access stairway once they have exceeded the allotted travel distance in Table 1021/2. I think that the 2009 IBC would require one to enter an Exit when one has reached the maximum travel distance.

#3 also doesn't fit. This language is probably more appropriately placed in the body of the first paragraph.

In the last paragraph, of the same section it states: Where one exit or exit access stairway or ramp providing access to exits at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads form adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with one exit shall not be located more than one story below grad plane.

As written, I think that this paragraph, might allow mixed occupancies (several tenants) on the same floor to have one exit even though the cumulative occupant load would exceed that with is specified in Table 1021.2.

With regard to the reference back to Section 1004.1, I have no idea why the proponent is directing the code use back to this section.

Public Comment 6:

Toni Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council (IFC), requests Disapproval.

Commenter's Reason: Overall, the concept that all interior stairways and ramps that are not formal exits, whether they are required means of egress components or not, are exit access components is an important clarification to the Code. However, while the revisions in this proposal for stairways should clarify when exit access stairways are part or the means of egress, and may clarify travel distance and enclosure requirements, there are some areas where further review and clarification is necessary.

For example, with the changes proposed to the definition of "Exit", the corresponding revisions to Section 708 dealing with the Shaft provisions deletes the requirement in the general article to construct any shaft enclosures as fire barriers in accordance with Section 707 or horizontal assemblies in accordance with Section 712, or both, but not just for exits, for all applications,. While this may suit the objectives of this proposal, it is not appropriate for any other condition where shaft construction is required by the I-Codes. This aspect of the proposal has certainly not been coordinated with the IBC, IFC, IRC, IMC, etc... The new section 708.3 does contain the requirement, but it is not clear from its location if it applies to shaft enclosures in 708.2. At a minimum, the new 708.3 needs to be relocated to 708.2.

In the same vein, proposed section 1009.3 is the new section established to regulate enclosure of exit access stairs. The justification indicates that the base line is that all exit access stairs must be enclosed, with a list of exceptions that follow. All of the current exceptions in sections 708,1016, and 1022 have been located as exceptions to the baseline requirement for enclosure because all open stairs are exit access stairs per this proposal. If that is the case, then the revisions to the definition of "Exit" are not needed. In addition, some of the exceptions in 1009.3 differ slightly from the existing provisions. These need to be explored further to determine whether they are consistent with the intent of the changes.

Lastly, a performance approach to designing exits exists in the ICC process under the Performance Code. These new provisions need to be evaluated against what the Performance Code would currently have required. Certainly, the ICCPC would require far more evaluation of the specific conditions to ensure adequate safe egress from the building. By including these provisions for unenclosed stairs directly into the IBC, it applies to ALL buildings, regardless of size, use, or whether sprinklered or unsprinklered. Chapter 19 of the IPCC addresses means of egress. The general performance requirement is as follows:

> "**1901.3.1 General.** The construction, arrangement and number of means of egress, exits and safe places for buildings shall be appropriate to the travel distance, number of occupants, occupant characteristics, building height, and safety systems and features."

Consequently, the minimum requirements in the ICCPC appear to be more comprehensive than what this proposal would create in the IBC. The proposal needs to be re-evaluated against existing ICCPC requirements before these changes can be made to the IBC.

Public Comment 7:

William E. Koffel, P.E., Koffel Associates, Inc., requests Disapproval.

Commenter's Reason: Without a doubt, the means of egress provisions in the IBC could be cleaned up and reformatted. Unfortunately, E5-09/10 is not the answer and there are too many issues and unintended technical changes to correct by a series of Public Comments. Therefore, I am left with no option other than to request Disapproval for the following reasons. I suspect that some will argue that E5-09/10 should be approved despite the problems identified below because of the improvements contained in the proposal. However, the technical changes and concerns expressed below indicate that publishing the 2012 IBC as proposed in E5-09/10 will only result in a new set of problems and unintended technical changes.

The fact that exits are typically required to be separated from other spaces to provide a protected path of travel is a fundamental concept of the three part means of egress system as defined in the IBC. The fact that the current definition for "exit" says "as required" indicates that the separation is only necessary "as required" by other sections of the Code. In the Committee Reason for Disapproval of E3-09/10 the Committee stated that "The text about separation requirements should not be removed because it makes the user look for separation requirements." The action on E5-09/10 is contradictory to the Committee Action on E3-09/10. It should also be noted that the definitions for interior exit ramp and interior exit stairway include the concept of "protected path of travel" that is proposed to be deleted from the definition of "exit."

The definitions for exit access ramp and exit access stairway limit the phrases to "interior" ramps and stairways. What are the requirements for exterior exit access ramps and exterior exit access stairways? Although exterior ramps and stairs are often either exits or exit discharge components, it is possible that they might also be exit access components.

Why does Section 1009, which is intended to apply to all stairways, address interior exit stairways (with a reference to Section 1022 for interior exit stairways) and interior exit access stairways but there is no reference to exterior exit stairs? A similar question applies to Section 1010 for ramps which also contains no reference to exterior exit ramps (Section 1022).

Section 1021 relaxes the Code by allowing either exits or exit access stairways (or ramps) from each story. In many cases the current Code requires each story to be served by at least two or more exits (existing 1021.1). The proposed Section 1021.2 permits exits or exit access components to be provided. Even in larger occupant load areas, Section 1021.2.1 would permit three or four exit access stairways (or ramps) in lieu of the current Code requirement for three or four exits.

The proposed changes to Section 403 where "exit enclosure" is changed to "interior exit stairways" results in the requirements not being applicable to interior exit ramps and exit passageways. Was this technical change intended?

Although rather circuitous, the requirements for fire barriers separating exit enclosures also applied to exit passageways. The proposed revision to Section 707.3.2 no longer includes exit passageways since there is no direct or circuitous reference to Section 1023 for exit passageways.

It is not clear how Section 707.6 provisions for openings in enclosures for exit access stairways and ramps will truly apply. The intent, most likely, is to only apply to when an enclosure is required for an exit access stairway or ramp. However, the proposed text does not really say that.

The proposed revision to section 1015.2.1 does not include interior exit ramps whereas the current text applies to all exit enclosures.

May the refuge area for a horizontal exit lead to an exit passageway instead of an interior exit stairway or ramp? The proposed revisions to Section 1025.4 would not permit such an arrangement.

Deleting the word "exit" in Item 1.2 of Exception No. 1 to Section 1027.1 and Item 2.1 of Exception No. 2 of Section 1027.1 results in less clarity in the Code. Retaining the word "exit" would clarify what enclosure is being referenced.

Final Action: AS AM AMPC____ D

E5-09/10, Part II

[F]403.3.1.1, [F]414.7.2, [F]415.8.4.6.2, [F]909.5; (IFC 909.5, 914.3.1.1, 1803.12.1.2, 2705.4.4); (IMC [F]513.5)

Proposed Change as Submitted

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

PART II – IFC

Revise as follows:

SECTION 403
HIGH-RISE BUILDINGS

[F] 403.3.1.1 (IFC 914.3.1.1.1) Riser location. Sprinkler risers shall be placed in interior exit stairways and ramps ~~exit enclosures~~ that are remotely located in accordance with Section 1015.2.

SECTION 414
HAZARDOUS MATERIALS

[F] 414.7.2 (IFC 2705.4.4) Dispensing, use and handling. Where hazardous materials having a hazard ranking of 3 or 4 in accordance with NFPA 704 are transported through corridors ~~or exit enclosures~~, interior exit stairways or ramps or exit passageways there shall be an emergency telephone system, a local manual alarm station or an approved alarm-initiating device at not more than 150-foot (45 720 mm) intervals and at each exit and exit access doorway throughout the transport route. The signal shall be relayed to an approved central, proprietary or remote station service or constantly attended on-site location and shall also initiate a local audible alarm.

SECTION 415
GROUPS H-1, H-2, H-3, H-4 AND H-5

[F] 415.8.4.6.2 (IFC 1803.12.1.2) ~~Exit access~~ Corridors and interior exit stairways and ~~exit~~ ramps ~~enclosures~~. Emergency alarms for ~~exit access~~ corridors ~~and exit enclosures~~ interior exit stairways and ramps and exit passageways shall comply with Section 414.7.2.

SECTION 909
SMOKE CONTROL SYSTEMS

[F] 909.5 (IFC 909.5, IMC [F] 513.5) Smoke barrier construction. Smoke barriers shall comply with Section 710, and shall be constructed and sealed to limit leakage areas exclusive of protected openings. The maximum allowable leakage area shall be the aggregate area calculated using the following leakage area ratios:

1. Walls: $A/A_w = 0.00100$
2. Interior exit ~~enclosures~~ stairways and ramps and exit passageways: $A/A_w = 0.00035$
3. Enclosed exit access stairways and ramps and all other shafts: $A/A_w = 0.00150$
4. Floors and roofs: $A/A_F = 0.00050$

where:

A = Total leakage area, square feet (m^2).
A_F = Unit floor or roof area of barrier, square feet (m^2).
A_w = Unit wall area of barrier, square feet (m^2).

The leakage area ratios shown do not include openings due to doors, operable windows or similar gaps. These shall be included in calculating the total leakage area.

Reason: See E5-09/10 Part I.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME:Heilsted-G8-410.5.3.1

Public Hearing Results

PART II- IFC
Committee Action: **Approved as Submitted**

Committee Reason: The changes to sections controlled by the International Fire Code should be revised to be consistent with the terminology and intent in Part I.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC), requests Approval as Submitted.

505.3, 505.4, 1002.1, 1006.3, 1011.1, 1015 (IFC [B] 1002.1, 1006.3, 1011.1, 1015)

Proposed Change as Submitted

Proponent: Anne VonWeller, Murray City, and Ron Clements, Chesterfield County Building Inspection Department, representing the Utah Chapter of the International Code Council

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

EXIT ACCESS ~~DOORWAY~~ POINT. A door or access point along the path of egress travel within the exit access from an occupied room, area or space where the path of egress enters an intervening room, corridor, unenclosed exit access stair or unenclosed exit access ramp.

SECTION 1015 (IFC [B] 1015.1)
EXITS AND EXIT ACCESS ~~DOORWAYS~~ POINTS FOR ROOMS AND SPACES

1015.1 (IFC [B] 1015.1) Number required ~~Exit or exit access doorways from spaces.~~ Two exits or exit access points ~~doorways~~ from any room or space shall be provided where one of the following conditions exists:

Exception: Group I-2 occupancies shall comply with Sections 1014.2.2 through 1014.2.7

1. The occupant load of the room or space exceeds one of the values in Table 1015.1.

   Exception: In Groups R-2 and R-3 occupancies, one exit or exit access point ~~means of egress~~ is permitted within and from individual dwelling units with a maximum occupant load of 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

2. The common path of egress travel exceeds one of the limitations of Section 1014.3.
3. Where required by Section 1015.3, 1015.4, 1015.5, 1015.6 or 1015.6.1.

Where a building contains mixed occupancies, each individual occupancy shall comply with the applicable requirements for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1.

TABLE 1015.1 (IFC [B] 1015.1)
ROOMS & SPACES WITH ONE EXIT OR EXIT ACCESS ~~DOORWAYS~~ POINT
(*Portions of table not shown remain unchanged)*

1015.1.1 (IFC [B] 1015.1.1) Additional ~~Three or more~~ exits or exit access ~~doorways~~ points. Three exits or exit access ~~doorways~~ points shall be provided from any room or space with an occupant load of 501 to 1,000. Four exits or exit access doorways shall be provided from any room or space with an occupant load greater than 1,000.

1015.2 (IFC [B] 1015.2) Availability ~~Exit or exit access doorways arrangement~~. Required exits and exit access points shall be located in a manner that makes their availability obvious. Exits and exit access points shall be unobstructed at all times. Exit and exit access ~~doorways~~ points shall be arranged in accordance with Section~~s~~ 1015.3.~~1015.2.1 and 1015.2.2.~~

~~1015.2.1~~ 1015.3 (IFC [B] ~~1015.2.1~~ 1015.3) Arrangement ~~Two exits or exit access doorways.~~ Where two or more exits or exit access ~~doorways~~ points are required from any portion of the exit access, at least two of the exit doors or exit access ~~doorways~~ points shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access ~~doorways~~ points. For doors and doorways such distance shall be measured from the center of doors and openings. For unenclosed interior stairways and ramps such distance shall be measured from the center of the first stair riser or beginning of ramp slope. Interlocking or scissor stairs shall be counted as one exit or exit access point ~~stairway~~.

Exceptions:

1.~~2.~~ Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance ~~of the exit doors or exit access doorways~~ shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

2.~~1.~~ Where exit enclosures are provided ~~as a portion of the required exit~~ and such exit enclosures are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1018, the required ~~exit~~ separation distance shall be measured along the shortest direct line of egress travel within the corridor.

~~**1015.2.2 (IFC [B] 1015.2.2) Three or more exits or exit access doorways.** Where access to three or more exits is required, at least two exit doors or exit access doorways shall be arranged in accordance with the provisions of Section 1015.2.1.~~

~~1015.3~~ 1015.4 (IFC [B] ~~1015.3~~ 1015.4) Boiler, incinerator and furnace rooms. Two exit access ~~doorways~~ points are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m^2) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422 000 KJ) input capacity. Where two exit access ~~doorways~~ points are required, one is permitted to be a fixed ladder or an alternating tread device. Exit access ~~doorways~~ points shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.

~~1015.4~~ 1015.5 (IFC [B] ~~1015.4~~ 1015.5) Refrigeration machinery rooms. Machinery rooms larger than 1,000 square feet (93 m^2) shall have not less than two exits or exit access ~~doorways~~ points. Where two exit access ~~doorways~~ points are required, one such ~~doorways~~ points is permitted to be served by a fixed ladder or an alternating tread device. Exit access ~~doorways~~ points shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an exit or exit access ~~doorways~~ point. An increase in travel distance is permitted in accordance with Section 1016.1.

Doors shall swing in the direction of egress travel, regardless of the occupant load served. Doors shall be tight fitting and self-closing.

~~1015.5~~ 1015.6 (IFC [B] ~~1015.5~~ 1015.6) Refrigerated rooms or spaces. Rooms or spaces having a floor area larger than 1,000 square feet (93m^2), containing a refrigerant evaporator and maintained at a temperature below 68°F (20°C), shall have access to not less than two exits or exit access ~~doorways~~ points.

Travel distance shall be determined as specified in Section 1016.1, but all portions of a refrigerated room or space shall be within 150 feet (45 720 mm) of an exit or exit access ~~doorways~~ points where such rooms are not protected by an approved automatic sprinkler system in accordance with Section 903.3.1.1. Egress is allowed through adjoining refrigerated rooms or spaces.

Exception: Where using refrigerants in quantities limited to the amounts based on the volume set forth in the International Mechanical Code.

~~1015.6~~ 1015.7 (IFC [B] ~~1015.6~~ 1015.7) Stage means of egress. Where two ~~means of egress~~ exits or exit access points are required, based on the stage size or occupant load, one ~~means of egress~~ exit or exit access point shall be provided on each side of the stage.

~~1015.6.1~~ 1015.7.1 (IFC [B] ~~1015.6.1~~ 1015.7.1) Gallery, gridiron and catwalk means of egress. The means of egress from lighting and access catwalks, galleries and gridirons shall meet the requirements for occupancies in Group F-2.

Exceptions:

1. A minimum width of 22 inches (559 mm) is permitted for lighting and access catwalks.
2. Spiral stairs are permitted in the means of egress.
3. Stairways required by this subsection need not be enclosed.
4. Stairways with a minimum width of 22 inches (559 mm), ladders, or spiral stairs are permitted in the means of egress.
5. A second ~~means of egress~~ exit or exit access point is not required from these areas where a means of escape to a floor or to a roof is provided. Ladders, alternating tread devices or spiral stairs are permitted in the means of escape.
6. Ladders are permitted in the means of egress.

SECTION 505
MEZZANINES

505.3 Egress. Each occupant of a mezzanine shall have access to at least two independent exits ~~means of egress~~ where the common path of egress travel exceeds the limitations of Section 1014.3. Where an unenclosed stairway provides a means of exit access from a mezzanine, the maximum travel distance includes the distance traveled on the stairway measured in the plane of the tread nosing. Accessible means of egress shall be provided in accordance with Section 1007.

Exception: A single exit or exit access point ~~means of egress~~ shall be permitted in accordance with Section 1015.1.

505.4 Openness. A mezzanine shall be open and unobstructed to the room in which such mezzanine is located except for walls not more than 42 inches (1067 mm) high, columns and posts.

Exceptions:

1. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the occupant load of the aggregate area of the enclosed space does not exceed 10.
2. A mezzanine having two or more exits or exit access points ~~means of egress~~ is not required to be open to the room in which the mezzanine is located if at least one exit or exit access point ~~of the means of egress~~ provides direct access to an exit from the mezzanine level.
3. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the aggregate floor area of the enclosed space does not exceed 10 percent of the mezzanine area.
4. In industrial facilities, mezzanines used for control equipment are permitted to be glazed on all sides.
5. In occupancies other than Groups H and I, that are no more than two stories above grade plane and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, a mezzanine having access to two or more exits ~~means of egress~~ shall not be required to be open to the room in which the mezzanine is located.

SECTION 1006
MEANS OF EGRESS ILLUMINATION

1006.3 (IFC [B] 1006.3) Illumination emergency power. The power supply for means of egress illumination shall normally be provided by the premises' electrical supply.

In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Aisles and unenclosed ~~egress~~ exit access stairways and ramps in rooms and spaces that require two or more exits or exit access points. ~~means of egress~~.
2. Corridors, exit enclosures and exit passageways in buildings required to have two or more exits.
3. Exterior egress components at other than their levels of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.
4. Interior exit discharge elements, as permitted in Section 1027.1, in buildings required to have two or more exits.
5. Exterior landings as required by Section 1008.1.6 for exit discharge doorways in buildings required to have two or more exits.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

SECTION 1011
EXIT SIGNS

1011.1 (IFC [B] 1011.1) Where required. Exits and exit access ~~doors~~ points shall be marked by an approved exit sign readily visible from any direction of egress travel. The path of egress travel to exits and within exits shall be marked by readily visible exit signs to clearly indicate the direction of egress travel in cases where the exit or the path of egress travel is not immediately visible to the occupants. Intervening means of egress doors within exits shall be marked by exit signs. Exit sign placement shall be such that no point in an exit access corridor or exit passageway is more than 100 feet (30 480mm) or the listed viewing distance for the sign, whichever is less, from the nearest visible exit sign.

Exception:

1. Exit signs are not required in rooms, spaces or areas which require only one exit or exit access point.
2. Main exterior exit doors or gates that are obviously and clearly identifiable as exits need not have exit signs where approved by the building official.
3. Exit signs are not required in occupancies in Group U and individual sleeping units or dwelling units in Group R-1, R-2 or R-3.
4. Exit signs are not required in dayrooms, sleeping rooms or dormitories in occupancies in Group I-3.
5. In occupancies in Groups A-4 and A-5, exit signs are not required on the seating side of vomitories or openings into seating areas where exit signs are provided in the concourse that are readily apparent from the vomitories. Egress lighting is provided to identify each vomitory or opening within the seating area in an emergency.

Reason:

Background

The 2009 edition added a definition for 'exit access doorway' to clarify that the provisions for exit access doorways applied to components where there is not always a doorway, such as the transition point along the path of egress to unenclosed interior stairways and ramps.

During the discussions of the CTC's Unenclosed Stairway Work Group it was recognized a more clear term was needed to describe the 'point' where requirements such as those for number, availability, and arrangement should be applied. 'Exit Access Point' was very clear and straight forward.

Most of the language in the above proposal was developed in the study group. However, it was determined 'exit access point' was beyond the scope of the specific study. There was a good deal of support for the concept and we were encouraged to bring it forward as a separate change.

The Changes

The one word change in the definition going from 'doorway' to 'point' is the focus of the change. The new term is carried throughout the change. Also, 'within the exit access' was added to make clear an 'exit access point' in only applicable in those portions of the means of egress.

The name of the section was expanded to assist users and avoid confusion with Section 1020.

'Means of egress' was changed to 'exit or exit access point' in several places because means of egress applies to all occupied portions of a building. The change occurs where a term refers to the number of required components which is more appropriate than the general term.

In 1015.3 we have made it clear exactly where to measure the required separation distance between egress components in the exit access. How many debates have been about "Do we measure to the center of the door? The closest edge? The furthest edge? We chose the center. This becomes more important to pin down when now using the concept of 'point'.

Changes to 505, 1006.3, and 1011.1 are for correlation with those in 1015.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Vonweller-E3-1023.6

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The term "transition point" would address travel distance measurements at open stairway; however, it would be confusing for situations where there is a door on a stairway enclosure.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Anne vonWeller, Murray City, Utah, representing Utah Chapter ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1015.1.1 (IFC 1015.1.1) Additional exits or exit access points. Three exits or exit access points shall be provided from any room or space with an occupant load of 501-1,000. Four exits or exit access <u>points</u> ~~doorways~~ shall be provided from any room or space with an occupant load greater than 1,000.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: The reason printed in the report of the hearing does not clearly identify the committee's specific reason for disapproving this item. The proponents maintain their original reasons for this change. This change is especially beneficial if E5-09/10 is approved with the more comprehensive understanding of exit access stairways and the relationship between them and other aspects of egress design.

The purpose for modification is to correct a simple oversight in the original submittal when one of the applicable occurrences was missed.

Final Action: AS AM AMPC____ D

E8-09/10, Part I
1002.1 (IFC [B] 1002.1)

Proposed Change as Submitted

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, Inc.

PART I – IBC MEANS OF EGRESS

Add new text as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

<u>**PROJECTED TREAD DEPTH.** The full depth dimension of a tread with a nosing projection or the sum of the tread depth measured between adjacent nosings and the depth of the nosing projection.</u>

<u>**NOSING PROJECTION.** The additional depth of a tread in excess of the tread depth or the distance between the edges of adjacent treads overlapping horizontally.</u>

<u>**RISER.** The vertical component of a step or stair.</u>

Reason:
Part I -These definitions clarify the intent of the code.

Projected Tread Depth is currently incorrectly characterized as the tread depth in reference to measuring alternating tread devices. This definition will allow for the same terminology to apply to all vertical egress devices as it does to both stairs and ship ladders. Please see our related change to Alternating tread devices.

Nosing projection needs to be better understood by all that use the code. One of the most common misinterpretations akin to the measurement of tread depth is the concept of a nosing projection and how it is measured. This simple definition is long overdue.

Riser is currently listed in the IRC with a definition for a plumbing application. Please see our change to the IRC as well.

Cost Impact: The code change will not increase the cost of construction.

ICCFILENAME:Cooper-G1-202

Public Hearing Results

Committee Action: Disapproved

Committee Reason: The proposed definition for projected tread depth is unclear. The proponent should provide figures so this definition can be fully understood. The definition for 'riser' by inclusion of the word "vertical" could be interpreted to not allow the 30 degree slope on risers currently permitted.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, requests Approval as Modified.

Modify the proposal as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

PROJECTED TREAD DEPTH. ~~The full depth dimension of a tread with a *nosing projection* or the~~ <u>The </u>sum of the tread depth measured between adjacent *nosings* and the depth of the *nosing projection* <u>of the tread or floor above.</u>

NOSING PROJECTION. ~~The additional depth of a tread in excess~~ <u>The portion </u>of the tread depth <u>that extends beyond the tread below.</u>~~ or the distance between the edges of adjacent treads overlapping horizontally~~

RISER. The vertical <u>or sloped</u> component of a step or *stair* <u>connecting a *nosing* with a tread or floor below</u>.

Commenter's Reason: The diagrams below have been provided at the committee's request to provide an easy understanding of the proposed terminology. The language of the definitions has been modified to resolve the IBC committee's concerns for clarity and objections raised in testimony. Specifically:

1. The definition of riser has been clarified to address that risers may be sloped as well as vertical. The sloping has been qualified as connecting a nosing and the tread or floor below. This is sufficient for the definition as the sloping of risers is quantified in **R311.7.4.3 Profile and 1009.4.5 Profile**
2. The concern that the original text implied that the nosing projection was "additional tread depth" has been eliminated by more clearly stating it is a portion of the tread depth. This is clearly illustrated in **Figures 1 – 4 below**.
3. The term projected tread depth has also been simplified and is clearly illustrated by the figures below.
3. The Figures also clearly illustrate that the terminology is common to stairs with vertical and sloped risers, ship ladders, and alternating tread devices. 4. Because of the illustrated relevance and current use of the term *nosing projection* in **R311.7.4.3 Profile**, the proposed change to the IRC has been modified to include *nosing projection*.
5. The term *projected tread depth* is only used in **1009.10 Alternating tread devices** and **1009.11 Ship Ladders** and is only essential to the IBC

In addition to the above referenced sections of the current code dependent on a clear understanding of these terms, please also see the following related approved proposals that include these terms; **E73** – AS, E75 Part I – AS, **RB46** – AM, **E79** – AS, and also the following disapproved proposals; **E75 Part II** – D, **E78** – D.

Illustration of Proposed Defintions

E8-09/10 Part I and Part II by Stairway Manufacturers' Association

The four figures below show that the defined terms and their dimensional relationships are common to stairs, ship ladders and alternating tread devices.

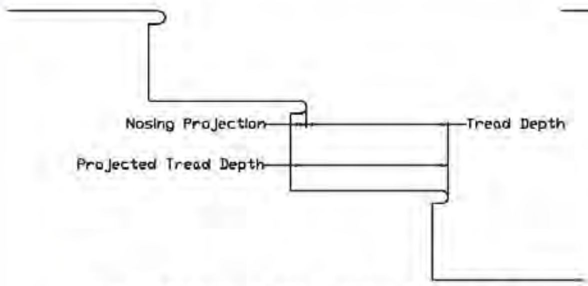

Figure 1: Stairway with traditional nosing projection

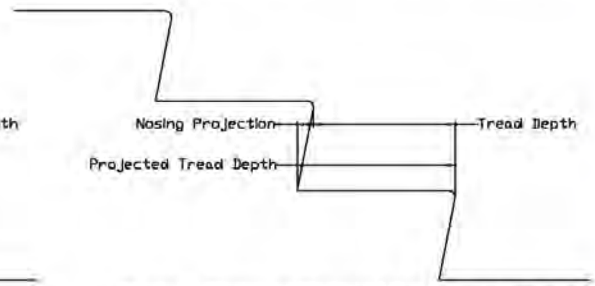

Figure 2: Stairway with sloped riser-nosing projection

Note: Both Stairways are drawn with same riser height and tread depth

Nosing Projection = The portion of the tread depth that extends beyond the tread below.
Projected Tread Depth = Tread Depth + Nosing Projection of tread or floor above .

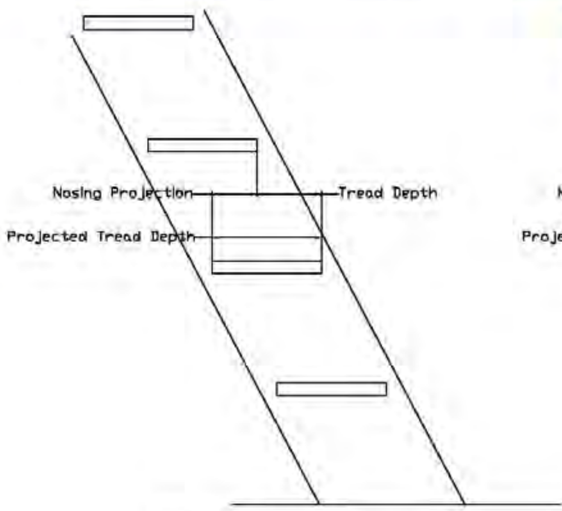

Figure 3: Ship Ladder

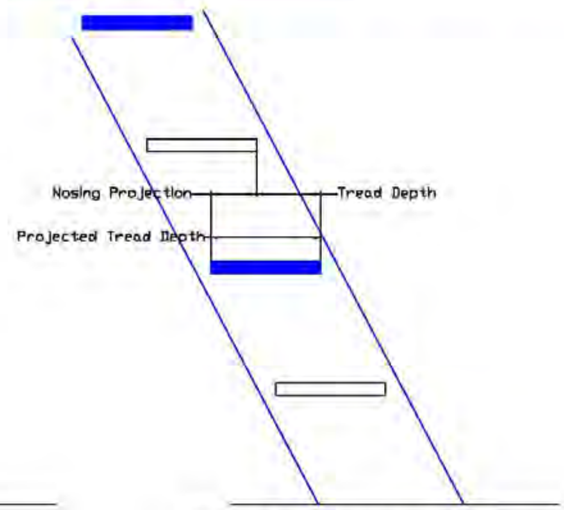

Figure 4: Alternating tread device

Central stringer and treads on opposite side shown in blue

Note: Both Ship ladder & ATD are drawn with same riser height and tread depth

Final Action: AS AM AMPC____ D

E8-09/10, Part II
IRC R202

Proposed Change as Submitted

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, Inc.

PART II – IRC BUILDING/ENERGY

Revise as follows:

SECTION R202
DEFINITIONS

RISER.

1. The vertical component of a *step* or *stair*
2. A water pipe that extends vertically one full story or more to convey water to branches or to a group of fixtures.

Reason:
Part II-These definitions clarify the intent of the code.
Riser – I the 07/09 cycle the IRC committee pointed out that the term riser was confused with riser height and that further confusion was caused by the present definition of a plumbing application. The stair term is more commonly known and is therefore listed first. The existing definition remains unchanged.

Cost Impact: The code change will not increase the cost of construction.

ICCFILENAME:Cooper-G1-202

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This is a good definition and it clarifies the meaning of "riser" as it relates to a step or stair. The definition does not require the riser to be 90° vertical. A slope is permitted in the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

RISER. 1.The vertical or sloped component of a step or *stai*r connecting a *nosing* with a tread or floor below. 2. A water pipe that extends vertically one full story or more to convey water to branches or to a group of fixtures.

NOSING PROJECTION. The portion of the tread depth that extends beyond the tread below.

Commenter's Reason: See E8-09/10 Part I.

Final Action: AS AM AMPC____ D

E13-09/10
Table 1004.1.1 (IFC [B] Table 1004.1.1)

Proposed Change as Submitted

Proponent: Jay Wallace, The Boeing Company

Revise as follows:

TABLE 1004.1.1 (IFC [B] TABLE 1004.1.1)
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	FLOOR AREA IN SQ. FT. PER OCCUPANT
~~Aircraft hangars~~	~~500 gross~~
Aircraft Related Uses	
Airport terminal	
Baggage claim	20 gross
Baggage handling	300 gross
Concourse	100 gross
Waiting areas	15 gross
Manufacturing	
Final assembly	500 gross
Sub-assembly fabrication	300 gross
Hangars	
Maintenance and repair	500 gross
Storage or painting	1,000 gross

(Portions of the table not shown remain unchanged.)

Reason: This proposal intends to provide more representative occupant density factors for aircraft manufacturing and storage facilities. Presently, other than for aircraft hangars, there are no industry specific occupant load factors. The recommended values are typical of industry practices. It should be noted that automation has greatly reduced the number of persons necessary to manufacture aircraft. The typically large area necessary for the manufacturing or storage of aircraft is also a factor in the determination of appropriate values. Assigning one occupant for each 32' x 32' area (1000 sf) in an aircraft storage or paint hanger is actually a conservative approach. This figure was selected to account for common usage in smaller facilities. The proposed fabrication occupant load factors also represent typical production practices. These factors become significant in means of egress design. The Boeing Company has a 4,500,000 square foot manufacturing facility. Using the current industrial area occupant load factor of 100 square feet per occupant, the design occupant load of this building is 45,000. It should be noted that The Boeing Company has only 160,000 employees worldwide. In fact, approximately 20,000 employees divided into three shifts work in this factory. The current calculated occupant load would result in a minimum of four exits having 750 feet of egress width. The proposed occupant load factor of 500 would result in a design occupant load of 9,000. Four exits would still be required, however, total egress width would now be a more realistic 150 total feet (50 x 3'-0" doors). Since the facility also contains sub-assembly fabrication operations, the occupant load would be greater than 9,000 resulting in more total egress width. Approval of this proposal will provide code users with occupant load factors representative of industry practices. Such characteristic values will provide for the safe egress of building occupants while not requiring excessive numbers of means of egress components.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Wallace-E1-T1004.1.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Section 1004 already allows for code officials to approve the actual occupant load in large spaces with minimal occupants. There was no technical justification to support this occupant load across the industry: for example, is this consistent with small airplane manufacturers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jay S. Wallace representing The Boeing Company; Gregory R. Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Submitted

Commenter's Reason: When a use is not included in Table 1004.1.1, Section 1004.1.1 directs the building official to "establish a use based on a listed use that most nearly resembles the intended use". In the case of aircraft manufacturing, the listed use that most nearly resembles our use is "Industrial areas" that assigns 100 square feet per occupant. As pointed out by the ICC Means of Egress Code Committee in its published reason substantiating disapproval of E13-09/10, the exception to Section 1004.1.1 states that the actual occupant load may be used when approved by the building official. This requires some good faith negotiations between the owner and the building official. It is relatively easy to do when the facility is operational, but during design it is harder for the building official to make such an assessment.

The Boeing Company is a global company with manufacturing interests throughout the United States and literally around the world. We participate in the ICC code development process to make the code more relevant and better for users. We are advocates for consistency and clarity so that the application of the code is as uniform as possible in every jurisdiction in which we have facilities. To require global users such as Boeing to negotiate something as fundamental as the occupant load in each and every jurisdiction is problematic.

Also, the committee stated that no technical justification was provided to demonstrate that the proposed occupant load factors are applicable to smaller aircraft manufactures. The Boeing Company manufactures fixed and rotary winged aircraft of all sizes from large commercial and military transport aircraft to single seat fighters. We collected data from the Cessna Aircraft Company and a variety of Boeing aircraft manufacturing environments that includes parts manufacturing and assembly of a full range of part sizes and product deliverables. The following data support our proposed occupant loads:

Modified Values to Table 1004.1.1				
Item No.	**Aircraft Industry Use**	**Floor Area in Sq. Ft. per Occupant Range**	**Floor Area Sq. Ft. per Occupant Average**	**Proposed New Table Value**
1	Manufacturing – Sub Assembly & Parts	140[a] – 976	589[b]	**300**
2	Manufacturing – Final Assembly & Associated Support Activities	373 – 1,053	740	**500**
3	Hangars – Maintenance & Repair	1,075 – 16,095	1,466	**500**
4	Hangars – Storage or Paint	2,508 – 13,086	7,797	**1000**

a) Number based on Cessna estimate in small parts use only, no sub-assembly; current actual figure is 421.
b) If actual number is used instead of Cessna estimate for current small parts use only, then average is 636.

As increased automation impacts industrial areas, the current Table 1004.1.1 occupant load factor of 100 square feet per occupant is due for an update. The Boeing Company conducted contemporary research and determined that the proposed values for aircraft manufacturing facilities are reasonable and on average, very conservative.

Final Action: AS AM AMPC____ D

E17-09/10
1004.3 (IFC [B] 1004.3)

Proposed Change as Submitted

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise as follows:

1004.3 (IFC [B] 1004.3) Posting of occupant load. Every room or space that is an assembly occupancy shall have the maximum occupant load of the room or space posted in a conspicuous place no more than 12 feet (3.66 m) above the floor, near the main exit or exit access doorway from the room or space. Posted signs shall be of ~~an approved legible~~ permanent design with letters and numbers not less than 1 inch (25 mm) high on a contrasting background and shall be maintained by the owner or authorized agent.

Reason: The term "approved legible design" for a maximum occupant load sign is ambiguous and creates unnecessary conflicts in the field, usually around the time when a certificate of occupancy is ready to be issued. The revised language creates a clear standard that will reduce disagreements and potential waste. The proposed language is similar to the text found in Section 1008.1.9.3.

Cost Impact: The code change will not increase the cost of construction.

ICCFILENAME: KRANZ-E1-1004.3.DOC

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The requirement needs stroke width of visible requirements. The proposal does not indicate what should be posted for multi-purpose rooms. The occupant load indicated should be approved by the code official/fire official.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lee J. Kranz Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1004.3 Posting of occupant load. Every room or space that is an assembly occupancy shall have the ~~maximum~~ occupant load of the room or space posted in a conspicuous place no more than ~~12 feet (3.66 m)~~ <u>8 feet (2.44 m)</u> above the floor, near the main exit or exit access doorway from the room or space. Posted signs shall be of <u>an approved</u> permanent design with letters and numbers not less than 1 inch (25 mm) high on a contrasting background and shall be maintained by the owner or authorized agent. <u>The uppercase letter "I" shall be used to determine the allowable stroke width of all characters of a font. The stroke width shall be 10 percent minimum and 30 percent maximum of the height of the uppercase "I" of the font.</u>

Commenter's Reason: As advised by the Egress Committee in Baltimore, the language for this proposal has been modified to: 1) remove the term "maximum" as it relates to the occupant load of the room or space, 2) limit the placement of the sign to no more than 8' above the floor and 3) specify minimum and maximum stroke width. The language specifying the stroke width is consistent with Section 703.2.6 of ICC/ANSI A117.1-2003.

There were also comments made relating to posting of occupant load signs for multi-purpose rooms. The original proposal was not intended to address this issue nor do we intend to address it as part of this public comment. Because multi-purpose rooms can take on many different configurations we consider posting of occupant load signs to be a plan review issue that should be resolved prior to issuance of the permit.

Final Action: AS AM AMPC____ D

E22-09/10

1004.5, 1005.1 (IFC [B] 1004.5, 1005.1)

Proposed Change as Submitted

Proponent: Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International

Revise as follows:

~~**1005.1 (IFC [B] 1005.1) Minimum required egress width.** The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.~~

~~**Exception:** Means of egress complying with Section 1028.~~

1005.1 (IFC [B] 1005.1) General. The means of egress shall be sized in accordance with this section.

Exception: Means of egress complying with Section 1028.

1005.2 (IFC [B] 1005.2) Minimum width based on component. The width of egress components shall not be less than specified elsewhere in this code.

1005.3 (IFC [B] 1005.3) Capacity based on occupant load. The means of egress for any floor, room, or story shall be sized to accommodate the total occupant load, as determined by Section 1004, in accordance with the following:

1005.3.1 (IFC [B] 1005.3.1) Stairways. The capacity of means of egress stairways shall be calculated using a factor of 0.3 inches (7.62 mm) of width per person.

1005.3.2 (IFC [B] 1005.3.2) Other egress components. The capacity of means of egress components other than stairways shall be calculated using a factor of 0.2 inches (5.08 mm) of width per person.

1005.4 (IFC [B] 1005.4) Capacity based on egress path. The capacity of the means of egress required from any story of a building shall be maintained to the termination of the means of egress.

1005.5. (IFC [B] 1005.5) Distribution of egress capacity. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity.

1005.6 (IFC [B] 1005.6) Egress convergence. Where means of egress from floors above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the two floors.

(Renumber subsequent sections.)

Delete without substitution:

~~**1004.5 (IFC [B] 1004.5) Egress convergence.** Where means of egress from floors above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the two floors.~~

(Renumber subsequent sections.)

Reason: This proposal seeks to editorially reorganize and clarify the multiple requirements related to 'egress width' currently contained in a single paragraph in 10051, and to relocate a related provision from 1004.5 to a more logical location with other egress width/capacity provisions. No technical changes are intended by this change.

1005.1 creates a new charging paragraph.
1005.2 replaces the current second sentence of 1005.1, noting that minimum width requirements for means of egress components may be specified in other locations in the code.
1005.3 is consistent with the current egress width factors, but reorganizes the text to clarify that the total occupant load (which is determined in Section 1004) drives the capacity for which the egress width must be provided. The new text also clearly states that egress width/capacity is determined on a floor, room, and story basis.
1005.4 replaces the last sentence of current 1005.1, and notes that once a minimum capacity is required along a means of egress, it must be provided along the entire path of egress travel.
1005.5 is consistent with the current 4th sentence of 1005.1.
1005.6 relocates the provision for 'egress convergence' from 1004.5. This is really an issue of egress capacity/width, and should more appropriately be located here, instead of buried in a section on occupant load.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Perry-E1-1005.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The revisions bring the capacity concept forward in the width determination. Breaking this into parts will add clarity and readability in the code when dealing with means of egress width. This is consistent with the committee approval of E10-09/10.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International; Gregory R. Keith, Professional heuristic Development, representing The Boeing Company; Anne vonWeller, Murray City Corporation, Utah, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 1005
MEANS OF EGRESS SIZING ~~WIDTH~~

1005.1 (IFC [B] 1005.1) General. All portions of the means of egress system shall be sized in accordance with this section.

Exception: Means of egress complying with Section 1028.

1005.2 (IFC [B] 1005.2) Minimum width based on component. The minimum width, in inches, of any means of egress component~~s~~ shall not be less than that specified for such component, elsewhere in this code.

1005.3 (IFC [B] 1005.3) Required capacity based on occupant load. The required capacity, in inches, of the means of egress for any ~~floor,~~ room, area, space or story shall ~~be sized to accommodate the total occupant load, as~~ not be less than that determined ~~by Section 1004,~~ in accordance with the following:

1005.3.1 (IFC [B] 1005.3.1) Stairways. The capacity, in inches, of means of egress stairways shall be calculated by multiplying the occupant load served by such stairway by a means of egress capacity ~~using a~~ factor of 0.3 inches (7.62 mm) ~~of width~~ per occupant ~~person~~. Where stairways serve more than one story, only the occupant load of each story considered individually shall be used in calculating the required capacity of the stairways serving that story.

1005.3.2 (IFC [B] 1005.3.2) Other egress components. The capacity, in inches, of means of egress components other than stairways shall be calculated by multiplying the occupant load served by such component by a means of egress capacity ~~using a~~ factor of 0.2 inches (5.08 mm) ~~of width~~ per occupant ~~person~~.

1005.4 (IFC [B] 1005.4) Continuity ~~Capacity based on egress path~~. The capacity of the means of egress required from any story of a building shall not be reduced along the path of egress travel until arrival at the public way ~~be maintained to the termination of the means of egress~~.

1005.5. (IFC [B] 1005.5) Distribution of egress capacity. Where more than one exit, or access to more than one exit, is required, ~~multiple~~ the means of egress shall be configured ~~sized~~ such that the loss of any one exit, or access to one exit, ~~means of egress~~ shall not reduce the available capacity to less than 50 percent of the required capacity.

1005.6 (IFC [B] 1005.6) Egress convergence. Where the means of egress from stories ~~floors~~ above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the required capacities for the two adjacent stories ~~floors~~.

~~**1004.4 (IFC 1004.4) Exiting from multiple levels.** Where exits serve more than one floor, only the occupant load of each floor considered individually shall be used in computing the required capacity of the exits at that floor, provided that the exit capacity shall not decrease in the direction of egress travel.~~

(Portions of proposal not shown remain unchanged)

Commenter's Reason: In its reason statement for approval of Item E22-09/10 as submitted, the ICC Means of Egress Code Committee stated, "The revisions bring the capacity concept forward in the width determination. Breaking this into parts will add clarity and readability in the code when dealing with means of egress width. This is consistent with the committee approval of E10-09/10." This public comment for approval as modified further clarifies and integrates the capacity concept into the IBC within the format established by Item E22-09/10. The deleted Section 1004.4 provisions correlate with Item E10-09/10 that separates occupant load and egress width/capacity provisions. Former Section 1004.4 provisions have been incorporated, in context, into E22-09/10 Section 1005.3.1. The exception on Section 1005.1 has been revised to be consistent with the language approved in E140-09/10 for assembly. The language and terminology are consistent with related means of egress provisions. Approval of this public comment will result in consistency in the determination of means of egress sizing requirements.

Final Action: AS AM AMPC____ D

E23-09/10
1005.1 (IFC [B] 1005.1)

Proposed Change as Submitted

Proponent: Maureen Traxler representing Washington Association of Building Officials Technical Code Development Committee

Revise as follows:

1005.1 (IFC [B] 1005.1) Minimum required egress width. The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. <u>The width of exit access doorways shall not be less than the width required for doors in Section 1008.</u> Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.

Exception: Means of egress complying with Section 1028.

Reason: The IBC lacks a reasonable provision for minimum width of exit access doorways. The factors in Section 1005.1 only make sense when they are applied to situations where another code section sets forth a minimum width for an egress element, but a high number of occupants would use that element. For example, Section 1018.2 sets forth minimum corridor widths, but also states that the width shall not be less than allowed by Section 1005.1. Section 1018.2 establishes 44 inches as the minimum for most corridors, but if the corridor serves an occupant load of 300, Section 1005.1 would require 60 inches. However, the only section that addresses minimum widths for exit access doorways is 1005.1 which can produce some unacceptable results. For example, if a doorway from a space serves 50 people, Section 1005.1 says the minimum width is 10 inches.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: TRAXLER-E1-1005.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: This is not the correct location for this requirement. A better place for this might be Section 1008. Other provisions of the code already cover the width of doorways, so this item is not needed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler representing Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

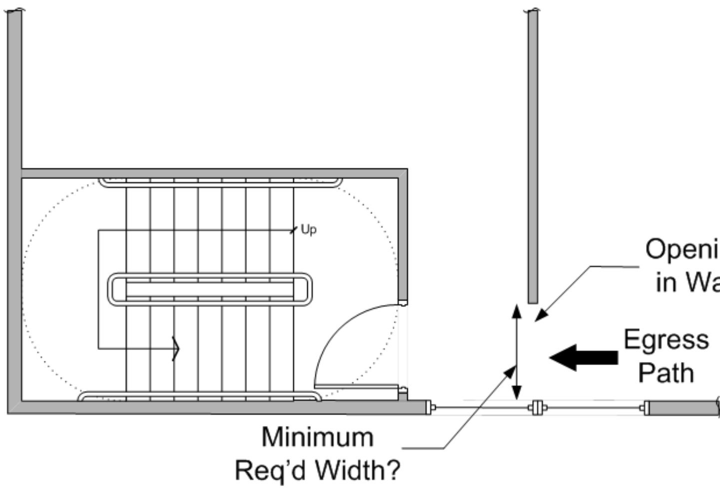
1005.1 (IFC [B] 1005.1) Minimum required egress width. The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. The width ~~of exit access doorways~~ <u>at any point in the path of egress travel</u> shall not be less than the width required for doors in Section 1008. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.

Exceptions: Means of egress width for the following elements shall be permitted to comply with the specified sections:

1. Means of egress for assembly areas in accordance ~~complying~~ with Section 1028.
2. Aisles in accordance with Section 1017.
3. Corridors in accordance with Section 1018.2.
4. Stage stairways and technical production areas in accordance with Section 410.

Commenter's Reason: There is no provision in the IBC that specifies a minimum width where there is no door or doorway. How narrow can an archway or the space between columns be? If the path of egress travel passes through an opening, there should be a required minimum width whether or not the opening is a doorway. The lack of a minimum required egress width can be especially problematic where the egress path is not an accessible path of travel. We believe Section 1005.1 is the appropriate place for this provision since it governs minimum width for means of egress. This proposed language modifies the 0.3 and 0.2 inch factors by imposing a minimum that applies where the factors would result in a width that is less than required for a doorway. For example, where there is an opening in the path of egress travel that serves 50 people, then the 0.2 factor requires a minimum width of only 10 inches. We are proposing to add 2 exceptions that correlate with the lower minimum width provisions for aisles and stage areas. The terminology in Exception 4 is coordinated with the new defined terms in G67-09/10.

The figure below illustrates a real-world example where this was an issue. An interior wall terminated near the exterior wall, creating an opening. The required egress path was not a required accessible path of travel, and passed through the opening. The occupant load was low, so the calculated required egress width was less than 20 inches. There is nothing in the current code text that says the width would have to be greater, but 20 inches is unreasonable.



Final Action: AS AM AMPC____ D

E32-09/10

1007.1.1 (New) [IFC [B] 1007.1.1(New)]

Proposed Change as Submitted

Proponent: Rick Lupton, City of Seattle, representing Seattle Dept of Planning & Development

Revise as follows:

1007.1 (IFC [B] 1007.1) Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress are required by Section 1015.1 or 1021.1 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress are not required in alterations to existing buildings.
2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3, 1007.4 or 1007.5.
3. In assembly areas with sloped or stepped aisles, one accessible means of egress is permitted where the common path of travel is accessible and meets the requirements in Section 1028.8.

1007.1.1 (IFC [B] 1007.1.1) Separation of accessible means of egress. When two accessible means of egress are required, they shall be located as far apart as practical.

Reason: This proposal is intended to address a gap in the code. Currently, there is no specific code language that would prevent two accessible means of egress (AMOE) from being located immediately adjoining. Yet complying with Section 1015.2.1 would place an undue burden on the designer because there are times that an elevator is required as an AMOE and the measure between the elevator and a stair would likely control rather than the measure between stairs as intended for conventional design. According to ICC staff the intent is that two accessible means of egress be separated, but that flexibility is necessary to accommodate types and possible locations of AMOE. While this proposal does not detail exactly how far apart the two AMOE are required to be, it does state the intent yet allows the building official flexibility where necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Lupton-E1F-1007 Exit slip AMOE

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The term 'practical' is not specific enough language for consistent interpretation. If this is an issue a measurement is needed – perhaps using the 30 feet minimum used in the stairway separation.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Modify the proposal as follows:

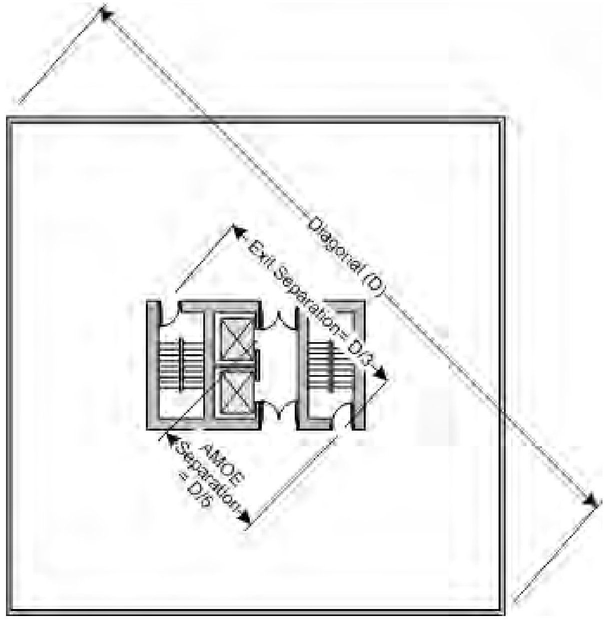
Public Comment:

Rick Lupton, Seattle, WA, representing City of Seattle, Department of Planning & Development, requests Approval as Modified by this Public Comment.

1007.1.1 (IFC [B] 1007.1.1) Separation of accessible means of egress. ~~When two accessible means of egress are required, they shall be located as far apart as practical.~~ Where more than one accessible means of egress is required, at least two accessible means of egress components complying with Section 1007.2, Items 2, 3, 4, 6, or 8 or an accessible exterior exit door shall be located a distance apart equal to not less than one-third of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between the access points of the accessible means of egress components.

> **Exception:** Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance shall not be less than one-fifth of the length of the maximum overall diagonal dimension of the area served.

Commenter's Reason: The committee disapproved the original proposal because the language was not specific enough, suggesting that the minimum 30 foot separation required between high-rise exit stair enclosures (Section 403.5.1) might be appropriate. However, because an elevator is a required accessible means of egress (AMOE) in tall buildings, using 30 feet as a minimum separation would drive an unreasonable expansion of the building core in a small footprint building whether the elevator is located between the stairs or outside the stairs. Instead, this modification proposes a dimension that is approximately 2/3 of the exit separation calculated in accordance with Section 1015.2.1. Such a separation distance provides for an elevator used as an AMOE within a building core without driving the core size larger, using up valuable leasable space. As in Section 1015.2.1, the required separation distance is less in a fully sprinkled building. The modification also clarifies that the separation must be measured to an AMOE component that either provides direct egress or a protected area and not pathway components like an accessible route or ramp or unprotected components like a platform lift. While the basis for the minimum separation proposed is empirical, the modification clearly addresses the committee's concern and accomplishes the original goal of codifying an implied requirement for a separation of AMOEs.



Staff note: Code changes E5-09/10 and E36-09/10 added exit access stairways (complying with current Section 1016.1 Exp. 3 and 4) to the list in Section 1007.1 as a new item 3. Code changes E37-09/10 and E38-09/10 added exterior areas for assisted rescue to the list in Section 1007.1 as a new item 9. If this proposal to E32-09/10 is successful, the new items will be added to the list of acceptable elements.

Final Action: AS AM AMPC____ D

E34-09/10

1007.2.1 (New), 1007.6 (IFC [B] 1007.2.1 (New), 1007.6)

Proposed Change as Submitted

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1007.2 (IFC [B] 1007.2) Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
3. Exterior exit stairways complying with Sections 1007.3 and 1026.
4. Elevators complying with Section 1007.4.
5. Platform lifts complying with Section 1007.5.
6. Horizontal exits complying with Section 1025.
7. Ramps complying with Section 1010.
8. Areas of refuge complying with Section 1007.6.

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.
2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.

1007.2.1 (IFC [B] 1007.2.1) Travel distance limitations. Each required accessible means of egress component shall be so located on each story such that the maximum length of accessible exit access travel, measured from the most remote point of an accessible space to an accessible means of egress exit component, shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1.

(Renumber subsequent sections)

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. ~~The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1.~~ Every required area of refuge shall have direct access to a stairway in an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.
2. A smokeproof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

Reason: Currently, any building that provides accessible means of egress without the use of an area of refuge has no limit to the travel distance required by the accessible means of egress system. Travel distance limits are only found in Section 1007.6. The general means of egress requires a limit to travel distance as part of a holistic approach to the exit system to address the occupant flow rates through exit components and travel speeds along its path. There is limited information on how people with disabilities impact these flow rates and travel speeds, but persons with mobility impairments typically move at a slower rate than able bodied people. The exit system for persons with a disability should be within the same travel distance limits as that provided others within the building. Therefore, this proposal moves the travel distance limitation requirement from that pertaining to only an area of refuge and applies it to the continuity of the overall accessible means of egress where it belongs.

Cost Impact: This code change proposal will increase the cost of construction.

ICCFILENAME:Roether-E5-1007.2.1

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Travel distance should be met for all accessible means of egress, not just to those that contain areas of refuge.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Rick Lupton, Seattle, WA, representing City of Seattle, Department of Planning & Development, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1007.2.1 (IFC [B] 1007.2.1) Travel distance limitations. Each required accessible means of egress component shall be so located on each story such that the maximum length of accessible exit access travel shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1, measured from the most remote point of an accessible space to an accessible exterior exit door, or an accessible means of egress exit component complying with Section 1007.2, Items 2, 3, 4, 6, or 8 ~~shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1~~.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The maximum length of accessible exit travel distance should not be measured to an accessible route, platform lift, or ramp because these components do not necessarily provide direct egress from the building nor a protected location for delayed or assisted rescue. Because the list in Section 1007.2, referred to by the proponent, includes these components, a list of specific appropriate components must be provided. As written, there is no meaningful measure to some components, such as to an accessible route. The modification provides an appropriate list for purposes of travel distance, because it requires a measurement only to those components providing either direct egress or protection. It also clarifies that each must be served by an accessible route and complies with Section 1007.2 to qualify for this measurement. Because proposal E37 was passed in Baltimore and no comments were submitted, exterior areas for assisted rescue are included as item 9 of Section 1007.2, rather than listed independently.

Staff note: Code changes E5-09/10 and E36-09/10 added exit access stairways (complying with current Section 1016.1 Exp. 3 and 4) to the list in Section 1007.1 as a new item 3. Code changes E37-09/10 and E38-09/10 added exterior areas for assisted rescue to the list in Section 1007.1 as a new item 9. If this proposed modification to E34-09/10 is successful, the new items will be added to the list of acceptable elements.

Public Comment 2:

Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International requests Disapproval.

Commenter's Reason: This code change should be disapproved for the following reasons:

• While the proponent validly notes that the current code specifically regulates travel distance for accessible means of egress only where areas of refuge are provided, expanding this concept to all accessible means of egress creates far more questions and problems than it solves.

• The change establishes a new 'starting point' for measuring travel distance (the most remote accessible point vs. the most remote point). For facilities with large spaces that are not accessible (for example, stepped or tiered seating areas in assembly occupancies), there would be significant differences in the effective travel distances permitted.

• The 'end point' of the travel distance measurement is unclear.

• The change requires measuring travel distance to the nearest 'accessible means of egress component', which is not a defined term.

• If one assumes the intent is that the list of components in 1007.2 are the 'accessible means of egress components', the proposal is seriously broken, and there are no 'quick fix' modifications that would resolve the problems.

• As approved, the change allows measurement to an 'accessible route' to determine accessible means of egress travel distance. This makes no sense, and would allow up to a doubling of the code required travel distance for accessible means of egress (maximum travel distance to 'an accessible route', then maximum travel distance to an exit).

• Where elevators are used as an accessible means of egress component, it is unclear where the travel distance would be measured. Would it be to a hoistway door, all hoistway doors, any lobby door, or the nearest lobby door (where lobbies are provided)?

• The issue of using ramps as part of the accessible means of egress needs to be studied and better coordinated. As approved, one can apparently measure to the top of any ramp to determine the accessible means of egress travel distance. Is this appropriate where ramps are part of exit access? At the other extreme, where the code allows unseparated exterior exit ramps (Section 1026), shouldn't the accessible travel distance be measured to the same point as the general travel distance (the top of the ramp)?

• The limited allowance for use of platform lifts as an accessible means of egress needs to be studied and coordinated. As approved, one can measure to the platform lift in any case where a lift is permitted, which may not be appropriate in all cases. At the other extreme, if the change were modified to exclude considering platform lifts when determining accessible travel distance, what is the point in providing standby power to the lift?

• Where the code allows unenclosed stairs (as part of exit access) in lieu of enclosed exit stairs, it makes no sense to have a general rule that would measure maximum travel distance from the upper level, down the stairs to the exit door, and then require a separate calculation using the same maximum travel distance, to assess the accessible means of egress travel distance on the upper level.

• For a very large percentage of new buildings (those that are sprinklered and use stairs in exit enclosures for both general and accessible means of egress), the change adds a new requirement that has no practical effect. In a sprinklered building, the exit stair requirements are identical whether the enclosure is an accessible means of egress or not, and the general code requirements establish the maximum travel distances permitted. Even in buildings greater than 5 stories in height, where an elevator is required as an accessible means of egress, the general travel distance rules would already have ensured that an accessible means of egress (exit stair enclosure) is within travel distance.

• Because the current 'accessible travel distance' requirement is currently a provision within the technical requirements for areas of refuge, there is validly a question as to how the requirement gets applied where the selected accessible means of egress components include those with areas of refuge (e.g., an exit stair in a non-sprinklered building) with those that do not (a horizontal exit). If any simple fix to this 'inconsistency' is needed, it appears that modifying 1007.6 would be the appropriate approach, instead of attempting to take a fundamental code concept (travel distance) and trying to force it into an entirely different application.

Final Action: AS AM AMPC____ D

E38-09/10

1007.2, 1007.7, 1007.7.1 (New), 1007.7.2 (IFC [B] 1007.2, 1007.7, 1007.7.1 (New), 1007.7.2)

Proposed Change as Submitted

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

1007.2 (IFC [B] 1007.2) Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways complying with Sections 1007.3 and 1022.
3. Exterior exit stairways complying with Sections 1007.3 and 1026.

4. Elevators complying with Section 1007.4.
5. Platform lifts complying with Section 1007.5.
6. Horizontal exits complying with Section 1025.
7. Ramps complying with Section 1010.
8. Areas of refuge complying with Section 1007.6.
9. Exterior area for assisted rescue complying with 1007.7

~~Exceptions:~~

~~1. Where the exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.7.~~
~~2. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.7.~~

1007.7 (IFC [B] 1007.7) Exterior area for assisted rescue. Exterior areas for assisted rescue shall be accessed by an accessible route from the area served shall be permitted in accordance with Section 1007.7.1 or 1007.7.2.

1007.7.1 (IFC [B] 1007.7.1) Level of exit discharge. Where the exit discharge does not include an accessible route from an exit located on a level of exit discharge to a public way, an exterior area of assisted rescue shall be provided on the exterior landing in accordance with Sections 1007.7.3 through 1007.7.6.

1007.7.2 (IFC [B] 1007.7.2) Stories above level of exit discharge. Where exit access from the area served is outdoor open air, an exterior area of assisted rescue is permitted as an alternative to an area of refuge. Every required exterior area of assisted recue shall have direct access to an interior exit stairway, exterior stairway, or elevator serving as an accessible means of egress component. The exterior area of assisted rescue shall comply with Section 1007.7.3 through 1007.7.6 and shall be provided with a two-way communication system complying with Sections 1007.8.1 and 1007.8.2.

1007.7.3 (IFC [B] 1007.7.3) Size. Each exterior area for assisted rescue shall be sized to accommodate wheelchair spaces in accordance with Section 1007.6.1. ~~The exterior area for assisted rescue must be open to the outside air and meet the requirements of Section 1007.6.1.~~

1007.7.4 (IFC [B] 1007.7.4) Separation. Separation walls shall comply with the requirements of Section 705 for exterior walls. Where walls or openings are between the area for assisted rescue and the interior of the building, the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower.

~~1007.7.1~~ 1007.7.5 (IFC [B] ~~1007.7.1~~ 1007.7.5) Openness. The exterior area for assisted rescue shall be open to the outside air. The sides other than the separation walls shall be at least 50 percent open, and the open area above ~~the~~ guards shall be ~~so~~ distributed so as to minimize the accumulation of smoke or toxic gases.

~~1007.7.2~~ 1007.7.6 (IFC [B] ~~1007.7.2~~ 1007.7.6) ~~Exterior exit~~ Stairway. ~~Exterior exit~~ Stairways that are part of the means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) between handrails.

> **Exception:** The clear width of 48 inches (1219 mm) between handrails is not required at stairways serving buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: An exterior area of assisted rescue is a component of an accessible means of egress, like other components listed. It is not an exception to a component of an accessible means of egress – it is a viable alternative to an interior area of refuge. This proposal clarifies how an exterior area of assisted rescue can serve as a component and still maintain the provisions relating to other components. With proper separation, communication and signage an exterior area of assisted rescue should not be limited to an exit discharge or an exterior exit stair. A stair complying with Section 1022 allows for an exterior stair, but it also allows for an enclosed exit stair to serve an exterior area of assisted rescue and Section 1107.4 would allow an elevator to also serve it. This option needs clarification on it use and this proposal provides that clarification.

Cost Impact: This code change proposal will increase the cost of construction.

ICCFILENAME:Roether-E6-1007.2

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Allowing for exterior areas of assisted rescue in smoke protected or open air assembly spaces is appropriate. There was a concern about coordination with E37-09/10.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ron Clements, representing Chesterfield County Building Inspection Dept., requests Approval as Modified by this Public Comment.

Replace the proposal with the following:

1007.6.1 Separation. Each *area of refuge* shall be separated from the remainder of the story by a *smoke barrier* complying with section 710 or a *horizontal exit* complying with Section 1025. Each *area of refuge* shall be designed to minimize the intrusion of smoke.

Exceptions:

1. *Areas of refuge* located within *an exit enclosure*.
2. *Areas of refuge* located within group A occupancies where the *exit access* from the area served is outdoor, open air or *smoke protected seating.*

Commenter's Reason: The result of E38-09/10 is to allow what essentially is an area of refuge to be designed with the omission of the fire rated enclosure around the area of refuge when the area of refuge is located in a structure that is open to the outdoor air. This is primarily of use for stadiums and similar open structures. Parking garages are already covered with an exception to 1007.3. Unlike a complete exception to 1007.3 this change did retain the size of the wheel chair space and the two-way communication system that is required for an area of refuge and in the original proposal those two aspects of the change referred the code user back to the area of refuge provisions for design of those elements. Essentially the only two changes that the original E38-09/10 accomplishes is to allow omission of the separation and an exception to the 48" width between handrails in a sprinklered building. The exterior area for assisted rescue is a specialized accessible means of egress component that was created as an element of a grade level exit discharge and it is to awkward to attempt to use the exterior area for assisted rescue section as the method to accomplish the goal of E38-09/10. That is why it took so many modifications throughout section 1007.7 to accomplish. Since the net result of the change is to keep all of the aspects of an area of refuge accept the separation requirement it is cleaner and simpler to accomplish that goal with the single exception to 1007.6.1 Separation, which is proposed with this as-modified public comment. The second part of the original change to add an exception to 1007.7.2 (changed to 1007.7.6), which was adding the exception to the 48" width between handrails in a sprinklered building, is not necessary with this as-modified proposal because by keeping the area in question an area of refuge instead of an exterior area for assisted rescue then the existing exception #2 to 1007.3 will allow for the reduced space between handrails in a sprinklered building.

Final Action: AS AM AMPC____ D

E47-09/10
1007.6 (IFC [B] 1007.6)

Proposed Change as Submitted:

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise as follows:

1007.6 (IFC [B] 1007.6) Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway within an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. ~~Where an elevator lobby is used as an area of refuge, the shaft and lobby~~

~~shall comply with Section 1022.9 for smoke-proof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier~~.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.
2. A smoke-proof enclosure is not required for an elevator lobby used as an area of refuge where the elevator is not required to be enclosed.

Reason: Areas of refuge required to serve an elevator or stair enclosure must be separated from the remainder of the building by a smoke barrier or a horizontal exit per Section 1007.6.2. As written above, this sentence would never apply as all areas of refuge are formed by either a smoke barrier or horizontal exit.

Cost Impact: The code change will not increase the cost of construction.

ICCFILENAME: KRANZ-E4-1007.6.DOC

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Deletion of the last sentence in Section 1007.8 would send the wrong message. Pressurizing the elevator lobby and shaft when the lobby is used as an area of refuge is needed as an option.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lee J. Kranz representing Washington Association of Building Officials Technical Code Development Committee, requesting Approval as Modified by this Public Comment.

Replace the proposal as follows:

1007.6 Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to a stairway within an exit enclosure complying with Sections 1007.3 and 1022 or an elevator complying with Section 1007.4. ~~Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1022.9 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier~~.

1007.6.2 Separation. Each area of refuge shall be separated from the remainder of the story by a smoke barrier complying with Section 710 or a horizontal exit complying with Section 1025. Each area of refuge shall be designed to minimize the intrusion of smoke.

Exceptions:

1. Areas of refuge located within an exit enclosure.
2. An elevator lobby used as an area of refuge and complying with Section 1022.9 for smokeproof enclosures.

Commenter's Reason: The Egress Committee in Baltimore indicated that deleting the text from Section 1007.6 would eliminate pressurization of the elevator lobby as an option for elevator lobbies serving as an area of refuge. The reason for removing this text, as originally proposed, was that it did not make sense as all areas of refuge must be formed by a horizontal exit or smoke barrier so therefore would never be applicable. The smokeproof enclosure option for elevator lobbies used as an area of refuge has now been appropriately relocated to Section 1007.6.2. This exception, allows the area of refuge to comply with Section 1022.9 which refers to Section 909.20 for pressurization and separation of the area of refuge from the remainder of the building.

Final Action: AS AM AMPC____ D

E54-09/10
1008.1.4.3 (IFC [B] 1008.1.4.3)

Proposed Change as Submitted

Proponent: Gregory J. Cahanin, Cahanin Fire & Code Consulting Representing the Smoke Safety Council

Revise as follows:

1008.1.4.3 (IFC [B] 1008.1.4.3) Horizontal <u>or vertical</u> ~~sliding~~ doors. In other than Group H occupancies, horizontal <u>or vertical</u> ~~sliding~~ doors permitted to be a component of a *means of egress* in accordance with Exception 6 to Section 1008.1.2 shall comply with all of the following criteria:

1. The doors shall be power operated and shall be capable of being operated manually in the event of power failure.
2. The doors shall be openable by a simple method from both sides without special knowledge or effort.
3. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door in motion and 15 pounds (67 N) to close the door or open it to the minimum required width.
4. The door shall be openable with a force not to exceed 15 pounds (67 N) when a force of 250 pounds (1100 N) is applied perpendicular to the door adjacent to the operating device.
5. The door assembly shall comply with the applicable *fire protection rating* and, where rated, shall be self-closing or automatic closing by smoke detection in accordance with Section 715.4.8.3, shall be installed in accordance with NFPA 80 and shall comply with Section 715.
6. The door assembly shall have an integrated standby power supply.
7. The door assembly power supply shall be electrically supervised.
8. The door shall open to the minimum required width within 10 seconds after activation of the operating device.

Reason: Doors other than side-swinging doors have had special classifications for some time- turnstiles, revolving doors, and horizontal sliding doors suitable for egress are the most common. Horizontal sliding door classifications for egress were first developed more than 2 decades ago for Won Door's then unique bi-fold door and wall system. Since that time there have been multiple manufacturers whose opening protectives are not side swinging, but meet the same performance and safety requirements for horizontal sliding doors while have a different orientation. This change is recognition of any door system orientation that meets the specific operational requirements that have been successfully in place for horizontal doors is acceptable. Further, it does not matter if the door slides, folds, or rolls up- only that it perform successfully for safe egress. There is no change in the testing or operational requirements- only a clarification of orientation.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Cahanin-E1-1008.1.4.3

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The current text requires full width and assumes that the headroom height will be provided immediately. Since these doors move up, the proposal needs to address when the full height for the means of egress would be provided – this is critical for adequate headroom during egress. It is a concern that these doors, when not yet fully open, may be a hazard for a visually impaired person during egress. There are issues for the change in forces and lifting vs. pushing to open the door in manual operation – information is needed on if this operation is doable by all persons using the means of egress. This new technology should be in a separate section to deal with the specific provisions/concerns for this type of door rather than trying to fit this in with horizontal sliding doors. The section should address requirements to prevent vertical sliding doors from coming down without warning.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory J. Cahanin, Cahanin Fire & Code Consulting, representing Smoke Safety Council, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

<u>**1008.1.4.4 (IFC [B] 1008.1.4.4) Vertical doors.** In other than Group H occupancies, vertical doors permitted to be a component of a *means of egress* in accordance with Exception 10 to Section 1008.1.2 shall comply with all of the following criteria:</u>

1. <u>The doors shall be power operated and shall include standby emergency power capable of operating the doors in the event of power failure.</u>
2. <u>Power-assisted doors shall comply with BHMA A156.19.</u>
3. <u>The doors shall be openable by a simple method from both sides without special knowledge or effort.</u>
4. <u>The force required to operate the door manually shall not exceed 50 pounds (220 N) to set the door in motion and 15 pounds (67 N) to close the door or open it to the minimum required height. The door shall contain a handle or device at its base to assist in manual operation.</u>
5. <u>Vertical doors shall be readily distinguishable from the adjacent walls and finishes such that the doors are easily recognizable as doors. Contrasting marking framing the opening shall be construed as readily distinguishable.</u>
6. <u>Vertical doors shall have an Exit Sign per Section 1011.1. Doors shall contain a label on the egress side with the words, “Exit Do Not Block” meeting the graphics requirements of Section 1011.5.1.</u>
7. <u>The door assembly shall comply with the applicable *fire protection rating* and, where rated, shall be self-closing or automatic closing by smoke detection in accordance with Section 715.4.8.3, shall be installed in accordance with NFPA 80 and shall comply with Section 715.</u>
8. <u>The door assembly shall have an integrated standby power supply per Section 2702.1.</u>
9. <u>The door assembly power supply shall be electrically supervised.</u>
10. <u>The door shall open to the minimum required width and height within 10 seconds after activation of the operating device. An audible alarm while the door is in motion shall sound. The audible alarm shall meet the requirements of Section 907.5.2.1.1.</u>
11. <u>Vertical opening size shall comply with minimum width requirements of Section1008.1.1. The maximum width of vertical doors shall be limited to their listing width.</u>
12. <u>Vertical opening height shall be not less than 80 inches.</u>

(Renumber subsequent sections)

Revise text as follows:

1008.1.2 Door swing. Egress doors shall be of the pivoted or side-hinged swinging type.

Exceptions:

1. Private garages, office areas, factory and storage areas with an *occupant load* of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single dwelling unit in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1008.1.4.1.
6. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.4.3 are permitted in a *means of egress*.
7. Power-operated doors in accordance with Section 1008.1.4.2.
8. Doors serving a bathroom within an individual sleeping unit in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a *means of egress* from spaces with an *occupant load* of 10 or less.
10. <u>In other than Group H occupancies, vertical doors complying with Section 1008.1.4.6 are permitted in a means of egress.</u>

Doors shall swing in the direction of egress travel where serving an *occupant load* of 50 or more persons or a Group H occupancy.

Commenter's Reason: Doors other than side-swinging doors have had special classifications for some time- turnstiles, revolving doors, and horizontal sliding doors suitable for egress are the most common. Horizontal sliding door classifications for egress were first developed more than 2 decades ago for Won Door's then unique bi-fold door and wall system. Since that time there have been multiple manufacturers whose opening protectives are not side swinging, but can meet the same performance and safety requirements for horizontal sliding doors while have a different orientation. This change is recognition of any door system orientation that meets the safety and egress provisions of the Code is acceptable.

The new Section takes the horizontal door requirements and incorporates them into this new section as recommended by the Committee when the original proposal was heard. This new section is also referencing other sections of the Code that has specific requirements to address committee comments during the last two cycles when these doors have been addressed. Those concerns include audibility for the sight impaired when the door is rising, emergency power to operate the door automatically with the same provisions of power operated doors, and visibility requirements that distinguish the door from adjacent walls.

This comment should not be treated as new material since it follows the dictates of the committee over the last two revisions cycles and only references current code sections. In 2 code cycles each of these provisions has been discussed on the floor. This comment has been reformatted into a new section based upon committee comments.

Cost Impact: The code change proposal will not increase the cost of construction.

Final Action: AS AM AMPC____ D

E61-09/10
1008.1.9.3

<u>Proposed Change as Submitted</u>

Proponent: Jim McClintic, Sandy City, representing the Utah Chapter

Revise as follows:

1008.1.9.3 (IFC [B] 1008.1.9.3) Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   - 2.1. The locking device is readily distinguishable as locked;
   - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   - 2.3. The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool <u>and complying with the height requirements outlined in Section 1008.1.9.2.</u>
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.

Reason: This additional language will clarify hardware height requirements in these locations and help eliminate the confusion when this section of the code is being enforced.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Mcclintic-E1-1008.1.9.3

<u>Public Hearing Results</u>

Committee Action: **Approved as Submitted**

Committee Reason: The reference to Section 1008.1.9.2 for height provides direction for the code official for where the “night latch, dead bolt or security chain” in hotel rooms must be installed when these locks are used for purposes other than just security.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jim Budzinski, requests Disapproval.

Commenter’s Reason: The proposal intended modify Section 1008.1.9.3 to establish the minimum and maximum dimensions listed in 1008.9.2 and eliminate the provision permitting “..night latch, dead bolt or security chain…” in individual dwelling or sleeping units to be permitted at any height. The proposed reference to Section 1008.1.9.2 maintains the three conditions for the installation of locks and latches. The conditions include a minimum height, a maximum height, and if “…used only for security purposes and not used for normal operation…” any height; this provides no clarification to condition 4 of 1008.9.3 as intended by the proposal. The devices specified in 1008.9.3 are clearly used for ‘security purposes.’

Final Action: AS AM AMPC____ D

E62-09/10
1008.1.9.3 (IFC [B] 1008.1.9.3)

Proposed Change as Submitted

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise as follows:

1008.1.9.3 (IFC [B] 1008.1.9.3) Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   - 2.1. The locking device is readily distinguishable as locked;
   - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   - 2.3. The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.
6. <u>Doors serving outdoor areas specified in Section 1004.8 having an occupant load of 300 or less are permitted to be equipped with key-operated locking devices from the egress side provided:</u>
   - <u>6.1. The locking device is readily distinguishable as locked;</u>
   - <u>6.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background;</u>
   - <u>6.3. A two-way communication system complying with Sections 1007.8.1 and 1007.8.2 shall be provided on the egress side.</u>
   - <u>6.4 The use of the key-operated locking device is revocable by the building official.</u>

Reason: Egress from confined outdoor areas, as required by Section 1004.8, is necessary. Unfortunately, many building owners are reluctant to leave required egress doors from these areas unlocked for security reasons, which places the public at risk. Fire Code officials, who conduct maintenance inspections, and building owners are at odds on this issue. It makes sense to recognize that this conflict exists and place safeguards in the code to eliminate the conflict. The two-way communication system will allow an occupant to call for help if the egress is accidently locked while the outdoor area is occupied. This new text is similar to exception #2 of Section 1008.1.9.3 as it relates to an allowance to lock egress doors under certain conditions.

Cost Impact: This code change proposal will increase the cost of construction.

ICCFILENAME: KRANZ-E2-1008.1.9.3.DOC

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: It is not clear which side of the door (i.e., inside or outside) the signage should be located on. The reference to Section 1004.8 could include yards and courts where egress may be directly provided without going through the building. There were questions about the two-way communication system: Who would it go to? What is the purpose? This could be problematic with smaller facilities or with multiple balconies.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lee J. Kranz representing Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1008.1.9.3 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship , the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   - 2.1. The locking device is readily distinguishable as locked;
   - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   - 2.3. The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.
6. Required egress doors serving outdoor areas having an occupant load of 300 or less where a required path of egress travel from the outdoor area passes through the building ~~specified in Section 1004.8 having an occupant load of 300 or less~~ are permitted to be equipped with key-operated locking devices ~~from the egress side~~ provided:
   - 6.1 The locking device is readily distinguishable as locked;
   - 6.2 A readily visible durable sign is posted on the ~~egress~~ interior side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE ~~BUILDING~~ OUTDOOR AREA IS OCCUPIED. The sign shall be in letter 1 inch high on a contrasting background;
   - 6.3 A two-way communication system complying with Sections 1007.8.1 and 1007.8.2 shall be provided on the egress side.
   - 6.4 The use of the key-operated locking device is revocable by the building official for due cause.

Commenter's Reason: When occupants from an outdoor area must re-enter the building for egress purposes, Section 1004.8 requires the means of egress serving the outdoor area to comply as though it were any other occupied room in the building. Currently egress doors serving these outdoor areas must remain unlocked to maintain safe egress. Building owners and tenants typically install locks on these egress doors for security purposes, which potentially creates an obstruction for safe egress and places the public at risk.

The language for this proposal has been modified to address comments made by the Means of Egress Committee in Baltimore. Specifically, the committee suggested 1) the signage should be on the interior side of required egress doors, and 2) limit the use of the exception to outdoor areas where occupants must pass through the building. They also asked about the need to install a two-way communication system accessible from the outdoor areas where occupants must pass through the building. A two-way communication system would allow occupants to call for help if the egress door is accidently locked. Two-way communication system requirements are currently found in IBC Section 1007.8.1 & 1007.8.2. Section 1007.8.1 specifies connection to a fire command center or central control point approved by the fire department. If the fire command center is not provided or the central control point is not constantly attended then connections to an approved monitoring location or 911 dispatch are required.

This exception allows locking the required egress doors serving outdoor areas where the egress path is through the building as long as:

1) the locking device is distinguishable as locked,
2) a sign is provided on the interior side of the door requiring the doors to remain unlocked while the outdoor area is occupied,
3) a two-way communication system is provided,
4) the exception is revocable by the building official if all the above conditions are not met.

Final Action: AS AM AMPC____ D

E63-09/10

1008.1.9.3 (IFC [B] 1008.1.9.3)

Proposed Change as Submitted

Proponent: Tom Lariviere, Chairman, representing Joint Fire Service Review Committee

Revise as follows:

1008.1.9.3 (IFC [B] 1008.1.9.3) Locks and latches. Approved locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
   - 2.1 The locking device is readily distinguishable as locked;
   - 2.2 A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background; and
   - 2.3 The use of the key-operated locking device is revocable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.
6. <u>In Group I-2 occupancies housing clients where the means of egress needs to be secured for the safety of the clients provided all the following requirements are met:</u>
   - <u>6.1 The facility is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1,</u>
   - <u>6.2 The doors unlock upon actuation of the automatic sprinkler system,</u>
   - <u>6.3 The doors unlock upon activation of the automatic smoke detection system,</u>
   - <u>6.4 The doors unlock upon loss of power controlling the lock or lock mechanism,</u>
   - <u>6.5 The door locks shall have the capability of being unlocked by a signal from an approved location,</u>
   - <u>6.6 Emergency lighting is provided at the door, and</u>
   - <u>6.7 The facility is constantly staffed.</u>

Reason: The new language addresses the problem faced by providers of patients suffering from Alzheimer's or Dementia wandering out of facilities and endangering their persons. Cognitive impairments caused by these diseases and other forms of dementia, render the residents of this type of facility unable to make the most appropriate decisions for their safety and welfare. This proposal would allow for door locking arrangements without delayed egress locks that are currently approved in health care type occupancies.

These patients can be very quick and mobile. The delayed egress lock poses a very challenging situation for staff when providing care for these patients who seek wandering or "exit seeking" associated with their disease.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A concern would be how this proposal will coordinate with Section 1008.1.9.6 Special locking arrangements in Group I-2.

ICCFILENAME:Lariviere-E1-1008.1.9.3

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposals addresses the unique locking arrangements in Group I-2 where the need is also to protect the clients, however, some of the facilities where this is needed are not necessarily medical facilities.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Joe Pierce, Dallas Fire Department, representing Joint Fire Service Review Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1008.1.9.3 (IFC [B] 1008.1.9.3] Locks and latches. *Approved* locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. through 5. *(No change to current text)*

~~6. In Group I-2 occupancies housing clients where the *means of egress* needs to be secured for the safety of the clients provided all the following requirements are met:~~

- ~~6.1. The facility is protected by an *automatic sprinkler system* in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3,~~
- ~~6.2. The doors unlock upon actuation of the *automatic sprinkler system*,~~
- ~~6.3. The doors unlock upon actuation of the *automatic fire detection system*,~~
- ~~6.4. The doors unlock upon loss of power controlling the lock or lock mechanism,~~
- ~~6.5. The door locks shall have the capability of being unlocked by a signal from an approved location,~~
- ~~6.6. Emergency lighting is provided at the door, and~~
- ~~6.7. The facility is constantly staffed.~~

1008.1.9.6 (IFC [B] 1008.1.9.6) Special locking arrangements in Group I-2. Approved ~~delayed~~ special egress locks shall be permitted in a Group I-2 occupancy where the clinical needs of persons receiving care require such locking. ~~Delayed~~ Special egress locks shall be permitted in such occupancies where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 ~~or~~ and an approved automatic ~~smoke or heat~~ fire detection system installed in accordance with Section 907, provided that the doors ~~unlock~~ are installed and operated in accordance with Items 1 through ~~6~~ 7 below. ~~A building occupant shall not be required to pass through more than one door equipped with a delayed egress lock before entering an exit.~~

1. The doors unlock upon actuation of the automatic sprinkler system or automatic fire detection system.
2. The doors unlock upon loss of power controlling the lock or lock mechanism.
3. The door locks shall have the capability of being unlocked by a signal from the fire command center, a nursing station or other approved location.
4. A building occupant shall not be required to pass through more than one door equipped with a special egress lock before entering an exit.
5. ~~4.~~ The procedures for the operation(s) of the unlocking system shall be described and approved as part of the emergency planning and preparedness required by Chapter 4 of the *International Fire Code*.
6. ~~5.~~ The facility shall be constantly staffed and all clinical staff shall have the keys, codes or other means necessary to operate the locking devices.
7. ~~6.~~ Emergency lighting shall be provided at the door.

Exception: Items 1 through ~~3~~ 4 shall not apply to doors to areas where persons which because of clinical needs require restraint or containment as part of the function of ~~a mental hospital~~ psychiatric treatment areas.

Commenter's Reason: Code Change E63 was Approved as Submitted. However, the language approved in Item 6 of Section 1008.1.9.3 creates an overlap when compared to the language in Section 1008.1.9.6 which was Approved as Modified by G65-09/10. Therefore, the intent of this Public Comment is:

1. Combine the approved language in E36-09/10 with the approved language in IBC 1008.1.9.6 in G65-09/10. Accordingly, these revisions are: modification of the term "unlock" with the phrase "installed and operated"; relocation of the last sentence in the main paragraph to Item 4; and inclusion of Item 4 in the Exception; and revision of the phrase "a mental hospital" to "psychiatric treatment areas" in the Exception.
2. Maintain the requirement for "approved" locks that is specified in 1008.1.9.3.
3. Delete Item 6 from 1008.1.9.3, because it will now be covered in 1008.1.9.6.
4. Add the requirement for constant staffing from 1008.1.9.3 Item 6.6 into 1008.1.9.6 Item 6.
5. The allowance of either fire sprinkler system OR a fire detection system is deleted. Section 4603.4.2 requires fire sprinklers in all existing Group I-2 occupancies and Section 4603.6.3 requires a fire alarm system in all existing Group I-2 occupancies. Therefore, both systems should be present whether the building is new or existing, and requiring both systems to be present is consistent with the requirements in the IBC and IFC.

The revised sections address the problem faced by care providers of patients suffering from Alzheimer's or Dementia wandering out of facilities and endangering their persons. Cognitive impairments caused by these diseases and other forms of dementia, render the residents of this type of facility unable to make the most appropriate decisions for their safety and welfare. This proposal would allow for door locking arrangements which may be delayed egress locks, but more frequently are other types of approved locking arrangements.

Public Comment 2:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC), requests Disapproval.

Commenter's Reason: The proponent correctly notes the need to address special locking arrangements for patients with Alzheimer's or Dementia. However, these provisions are not coordinated and conflict with the provisions in Section 1008.9.16 which were added last cycle via a public comment to E51-07/08 by the CTC to specifically address these conditions. Language of Section 1008.1.9.6 is unique to Group I-2 and the minor issues raised in portions of the proposed new language, such as "constantly staffed", were debated and rejected during the last cycle. We urge the membership to simply deny this change and don't create conflicts in language or loop holes for poor locking arrangements in Group I-2 uses. Approval of E63 will cause an unintended conflict within the code. The CTC supports the modifications to Section 1008.1.9.6 as modified in Code Change G65-09/10.

Final Action: AS AM AMPC____ D

E64-09/10
1008.1.9.4 (IFC [B] 1008.1.9.4)

<u>Proposed Change as Submitted</u>

Proponent: Gene Boecker, AIA, Code Consultants, Inc., representing Code Consultants, Inc.

Revise as follows:

1008.1.9.4 (IFC [B] 1008.1.9.4) Bolt locks. Manually operated flush bolts or surface bolts are not permitted.

Exceptions:

1. On doors not required for egress in individual dwelling units or sleeping units.
2. Where a pair of doors serves a storage or equipment room, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf.
3. Where a pair of doors serves an *occupant load* of less than 50 persons in a Group B, F or S occupancy, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf. The inactive leaf shall contain no doorknobs, panic bars or similar operating hardware.
4. Where a pair of doors serves a Group B, F or S occupancy, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf provided such inactive leaf is not needed to meet egress width requirements and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1. The inactive leaf shall contain no doorknobs, panic bars or similar operating hardware.
5. Where a pair of doors serves patient care rooms in Group I-2 occupancies, self-latching edge or surface-mounted bolts are permitted on the inactive leaf provided that the inactive leaf is not needed to meet egress width requirements and the inactive leaf contains no doorknobs, panic bars or similar operating hardware.
6. <u>Where pairs of doors are installed in accordance with Section 1008.1.9.3, item 2, the inactive leaf shall be permitted to be equipped with manually operated surface or flush bolts provided the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and the inactive leaf is not required for means of egress width.</u>

Reason: This recognizes one of the current practices in the construction industry. Whether we choose to admit it or not, the standard manner in which the doors are installed in compliance with item #2 for Section 1008.1.9.3 is that the active leaf has the readily distinguishable lock and sign while the inactive leaf is simply held in place by flush (edge) bolts. It is the flush bolt that keeps the inactive leaf secure so that the active leaf can be locked when the building is not occupied.

Although it could be easy to simply recognize this condition and include it alone, the exception adds the requirement for sprinkler protection as an added measure of safety. It also differentiates this exception from exception #3 which limits the occupant load to less than 50 and does not address sprinkler protection.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Boecker-E2-1008.1.9.4

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Any door that looks like a means of egress must meet means of egress door requirements. The correct enforcement at doors where they are intended for the movement of equipment and not for a means of egress would be to prohibit hardware on the door so it was obvious that it is not normally operational – the proposal would allow hardware on the inactive leaf.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gene Boecker, Coe Consultants Inc., requests Approval as Submitted.

Commenter's Reason: The original proposal seeks to address a condition that is present in current construction. It broadens the existing exception #4 in that it would apply to more occupancies – M, Assembly with an occupancy of 300 or less and places of worship. However, consistent with the provisions of 1008.1.9.3(2) it also requires the door to be readily distinguishable as locked; labeling of the door with the "THIS DOOR TO REMAIN OPEN. . . " sign and that the key operated locking device provision is revocable by the building official for due cause. Additionally the new exception would allow this only in sprinklered buildings.

The committee stated that any door that looks like a means of egress must meet the means of egress requirements. That is clearly not the case since doors to storage areas are allowed to be locked and the current exceptions allow for doors that are not required for egress capacity to be locked. Also, the application to assembly is limited at best since all assembly occupancies must now have panic devices the ability to use flush or surface bolts would only be where there is a large excess of doors provided such as is provided.

The truth is that the condition exists in many, many buildings today. A storefront system is constructed with a pair of doors and only a single leaf is needed for capacity. The second leaf will be provided with flush bolts as well as door hardware to be used when the door is unlocked. In these situations (and even when exceptions #3 and #4 are used) the inactive leaf will be provided with hardware so the doors have a symmetry.

The fact that these conditions exist is testimony to the fact that there are no major problems with the concept. The opponents did not identify where a single installation exists with the proposed conditions that proved to be problematic to life safety. It is time we recognized this condition and addressed it directly in the code.

Final Action: AS AM AMPC____ D

E65-09/10
1008.1.9.8 (IFC [B] 1008.1.9.8)

Proposed Change as Submitted

Proponent: Edward A. Hite, CML, representing self

Revise as follows:

1008.1.9.8 (IFC [B] 1008.1.9.8) Electromagnetically locked egress doors. Doors in the means of egress ~~that are not otherwise required to have panic hardware~~ in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, M, R-1 or R-2 shall be permitted to be electromagnetically locked if equipped with listed hardware that incorporates a built-in switch and meet the requirements below:

1. The listed hardware that is affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.
2. The listed hardware is capable of being operated with one hand.
3. Operation of the listed hardware releases ~~to~~ the electromagnetic lock and unlocks the door immediately.
4. Loss of power to the listed hardware automatically unlocks the door.

Reason: Bars tested and listed to release electromagnetic locks include both panic bars and fire exit hardware. When power is removed from a listed electromagnetic lock, it will release in less than ½ second. Bars with switches directly release that power. The number of people going through the door has no bearing on this.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: HITE-E2-1008.1.9.8

Public Hearing Results

Committee Action: **Approved as Modified**

Replace the proposal with the following:

1008.1.9.8 (IFC [B] 1008.1.9.8) Electromagnetically locked egress doors. Doors in the means of egress ~~that are not otherwise required to have panic hardware~~ in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, M, R-1 or R-2 shall be permitted to be electromagnetically locked if equipped with listed hardware that incorporates a built-in switch and meet the requirements below:

1. The listed hardware that is affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.
2. The listed hardware is capable of being operated with one hand.
3. Operation of the listed hardware <u>directly</u> releases ~~to~~ the electromagnetic lock and unlocks the door immediately.
4. Loss of power to the listed hardware automatically unlocks the door.
5. <u>Where panic or fire exit hardware is required by Section 1008.1.10, operation of the listed panic or fire exit hardware also releases the electromagnetic lock.</u>

Committee Reason: Panic hardware should be permitted where electromagnetic locks are utilized. The modification to Items 3 and 5 clarifies that the release of the lock must be automatic with the operation of the panic bar.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Edward A. Hite, CML, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1008.1.9.8 (IFC [B] 1008.1.9.8) Electromagnetically locked egress doors. Doors in the means of egress in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, M, R-1 or R-2 shall be permitted to be electromagnetically locked if equipped with listed hardware that incorporates a built-in switch and meet the requirements below:

1. The listed hardware that is affixed to the door has an obvious method of operation that is readily operated under all lighting conditions.
2. The listed hardware is capable of being operated with one hand.
3. Operation of the listed hardware directly ~~releases~~ <u>interrupts</u> <u>the power to</u> the electromagnetic lock and unlocks the door immediately.
4. Loss of power to the listed hardware automatically unlocks the door.
5. Where panic or fire exit hardware is required by Section 1008.1.10, operation of the listed panic or fire exit hardware also releases the electromagnetic lock.

Commenter's Reason: Proponent believes that the wording "interrupts the power to" is clearer than "releases."

Public Comment 2:

Kurt Roeper, Cincinnati, OH, representing Ingersoll Rand, requests Disapproval.

Commenter's Reason: The existing language of Section 1008.1.9.8, as it appears in the 2009 IBC, limits electromagnetic locking of egress doors to those *"that are not otherwise required to have panic hardware…"* The existing language is a clear recognition of the scope of panic and fire exit devices, in that they are <u>not</u> listed to act as switching devices for secondary electromagnetic locks on doors in the means of egress.

In support of this position, please consider the following from Underwriters Laboratories;

"From the proposal, when you push the pad the latches would unlock and a switch would turn off power to the magnet to release the door. Therefore this arrangement could not be covered as panic, FVSR, or fire exit hardware, GXHX. UL 305 would need to be revised to allow a magnet before it could be covered as panic, FVSR, or fire exit hardware, GXHX. "

Edgar Wolff-Klammer Principal Engineer - Exit Devices
Underwriters Laboratories

I respectfully request disapproval of E65 until such time as UL 305 has been revised to permit such applications.

Final Action: AS AM AMPC____ D

E66-09/10
1008.1.9.10 (IFC [B] 1008.1.9.10)

Proposed Change as Submitted

Proponent: Tom Lariviere, Chairman, representing Joint Fire Service Review Committee

Revise as follows:

1008.1.9.10 (IFC [B] 1008.1.9.10) Stairway doors. Interior stairway means of egress doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. Stairway discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.5.3.
3. ~~In stairways serving not more than four stories,~~ Stairway doors are permitted to be locked from the stairway side ~~opposite the egress side, provided they are openable from the egress side and~~ when the stairway serves no more than four stories and the doors are capable of being unlocked simultaneously without unlatching upon a signal from the fire command center, if present, or a signal by emergency personnel from a single location inside the main entrance to the building.
4. Stairway doors are permitted to be locked from the stairway side when the stairways serves no more than two stories and the stairway discharge door leads directly to the exit discharge and a key box is provided in accordance with Section 506 of the International Fire Code.

Reason: Many buildings are concerned with security and reentry into the building from the stairways. As a result, building owners and managers desire to lock the stairwell doors to prohibit entry onto the floor from the stairwell. This practice of locking the stairwell doors increases the building security.

This proposal will provide an additional exception for buildings not more than two stories in height. This new exception will allow for the prohibition of reentry from the stairwell as long as a key box is provided for fire department use. The fire department could access the key box and unlock the stairwell doors for fire use.

The current requirements are allow for the locking of these doors, but only is an electric override is provided within the building for fire department use. The current requirement is overly restrictive for stairways serving only two stories, and this exception will provide another option for building owners and managers.

Item 4 is added to provide the allowance for doors to be locked when the building serves no more than 2 stories. Item 3 is revised without changing the intent. This revision is to simplify the wording and clarify the section. This wording is similar to the current wording in Section 403.5.3.

Cost Impact: This code change proposal will decrease the cost of construction.

ICCFILENAME:Lariviere-E3-1008.1.9.10

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: While there are security issues in low rise buildings, the proposed language would allow the locking of the exit discharge door at the level of exit discharge.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joe Pierce (Chairman), representing Joint Fire Service Review Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

1008.1.9.10 (IFC [B] 1008.1.9.10) Stairway doors. *Interior stairway means of egress* doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. *Stairway* discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.5.3.
3. In stairways serving not more than four stories, *stairway* doors are permitted to be locked from the *stairway* side ~~opposite the egress side,~~ provided: ~~they~~
   3.1. The doors are openable from the egress side; ~~and~~
   3.2. The *stairway* discharge door is always openable from the stairway side; and
   3.3. The doors are capable of being unlocked simultaneously without unlatching upon a signal from the fire command center, if present, or a signal by emergency personnel from a single location inside the main entrance to the building.
4. In stairways serving not more than two stories, *stairway* doors are permitted to be locked from the stairway side provided:
   4.1. The doors are openable from the egress side;
   4.2. The *stairway* discharge door leads directly to the exterior;
   4.3. The *stairway* discharge door is always openable from the stairway side; and
   4.4. A key box is provided in accordance with Section 506 of the *International Fire Code* which contains keys to unlock the *stairway* doors.

Commenter's Reason: This proposal was Disapproved at the Code Development Hearing because the Code Development Committee felt that the revisions would allow for the stairway discharge door to also be locked. This was not the intent of the code change, so the revisions have been reformatted to clarify that the discharge door from the stairway is always to remain unlocked from the stairway side.

This Public Comment reformats Items 3 and 4 to provide a clearer understanding of the conditions for allowing the stairway doors to be locked. Item 3 addresses stairways up to 4 stories in height, and Item 4 is limited to stairways up to 2 stories in height.

Final Action: AS AM AMPC____ D

E74-09/10, Part I
1009.4.2 (IFC [B] 1009.4.2)

Proposed Change as Submitted

Proponent: Jake Pauls, representing self

PART I – IBC MEANS OF EGRESS

Revise as follows:

1009.4.2 (IFC [B] 1009.4.2) Riser height and tread depth. Stair riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between the leading edges of adjacent treads. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's leading edge. Winder treads shall have a minimum tread depth of 11 inches (279 mm) measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair.

Exceptions:

1. Alternating tread devices in accordance with Section 1009.10.
2. Ship ladders in accordance with Section 1009.11.
3. Spiral stairways in accordance with Section 1009.9.
4. Aisle stairs in assembly seating areas where the stair pitch or slope is set, for sightline reasons, by the slope of the adjacent seating area in accordance with Section 1028.11.2.
5. In ~~Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in~~ Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; the maximum riser height shall be 7 ¾ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum winder tread depth at the walkline shall be 10 inches (254 mm); and the minimum winder tread depth shall be 6 inches (152 mm).A nosing not less than ¾ inch (19.1 mm) but not more than 1 ¼ inches (32 mm) shall be provided on stairways with solid risers where the tread depth is less than 11 inches (279 mm).
6. See Section 3404.1 for the replacement of existing stairways.
7. In Group I-3 facilities, stairways providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8

inches (203 mm) and a minimum tread depth of 9 inches (229 mm).

Reason: This is purely a technical change affecting maximum and minimum rise and tread depth dimensions respectively. This is the long overdue mainstreaming of the so-called "7-11" step geometry in terms of maximum rise and minimum tread depth. (The proponent has submitted a separate change proposal which simply formats and restates the current requirements; that proposal and this one should be dealt with separately or independently as their purposes and effects are different.)

Much has been written about this topic, especially around 2003 in relation to the IRC and the NFPA codes (NFPA 101 and NFPA 5000 which adopted this change to the mainstreamed "7-11" step geometry at that time. Since that day nobody has attempted to revert to pre-"7-11" criteria for dwelling unit stairs within NFPA and for non-dwelling unit stairs within ICC. The "7-11" minimum standard is the most widely used step geometry standard internationally and reasons for keeping it at least the minimum standard have grown. This is because all the recent research on use of stairs—*including the matter of falls on stairs, including injurious ones*—confirms that it is a very reasonable minimum standard and that it is a long way—about three inches or more—from an "optimum" standard.

The very extensive 2003 proposal I submitted to both ICC and NFPA is not reproduced within this proposal for reasons of length and, more importantly, its free availability on the Internet, specifically the Downloads area of my website, http://web.me.com/bldguse. Once within the Downloads area (where over a hundred PDF files can be freely downloaded on stairway usability and safety plus means of egress performance), simply open the folder titled, "Home Stairway Safety and Codes," and download the 3.4 MB, 40-page file, "Pauls-R311-2003.pdf." Here follows an outline of what was covered in that proposal which I submitted to ICC with NFPA getting a comparable, earlier one that was approved by NFPA members and withstood technical and procedural challenges from the NAHB.

Summary.

What Has Changed Since 2003?

The changes for the worse appear to be directly attributable to even worse home stair construction and regulation than existed before 2003. This is seen in Figure 1 which shows the growth of home stair-related injuries that are NOT due to the aging of the population—as this was checked out to learn that people under 65 and those 65 or more in age both contributed in more or less the same proportion to the substantial growth in home stair, related injuries. A recent, widely-circulated document described the statistical insights as follows: "For both 1997 and 2007, the percentage of NEISS-reported injuries for the 65-and-older group was 15.3 percent plus/minus 0.4 percent for both home settings and all settings." Thus, both before and after 1997, elderly persons were only slightly—but consistently—over-represented in hospital emergency department-treated injuries associated with stairs as reported in national estimates by the US Consumer Product Safety Commission. (The note, titled "The Home Stairway Safety Problem and Related Code Development, Adoption and Enforcement Problems in the USA," is also posted for free downloading from the website "http://web.me.com/bldguse" Downloads area as file "Pauls2009Letter&InjuryNote" within the folder titled, "Home Stairway Safety and Codes.") A list of the topics addressed therein is provided below Figure 1.

Figure 1 shows an extraordinary growth in the US national estimates from the US CPSC/NEISS for stair-related injuries, particularly in homes. The average annual rate of increase in the last several years exceeds the average annual rate of US population growth by a factor of about five while stair-related injuries in non-home settings decrease slightly, resulting in about a 2 percent reduction annually for non-home stairs over the last several years—since about 1998. During these several years there has been increasing use of the "7-11" minimum step geometry standard for non-home stairs, thanks to the adoption—beginning in the 1980s—of this standard in model building codes. This is further evidence of a partial success story on the stairway safety front and ICC members might rightly claim some of the credit for this partial success. Now building officials who control the adoption of the requirements in model codes need to finish the job where it will count most, in homes.

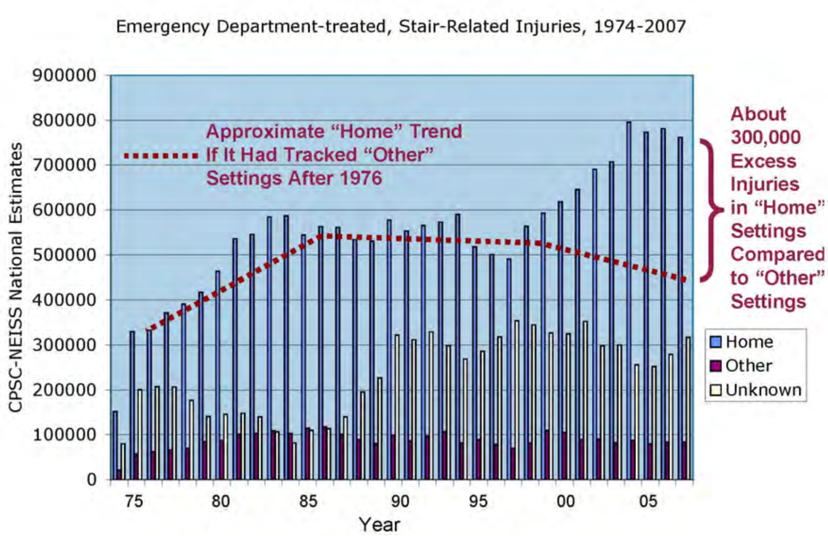

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years.

Updating the 2003 ICC proposal on mainstreaming the "7-11" minimum standard was the note which began circulating in February of 2009. Here are the topics it addressed in its 26 pages (including over two pages of references and additional resources).

References and Guide to Resources.

The 2003 proposal to ICC, "Pauls-R311-2003," included substantial benefit-cost information about stair step geometry in homes which must be updated to take account of recent, dramatic growth in home stair-related injuries (in terms of CPSC-NEISS national estimates) as well as higher-than-general inflation rates for medical treatment costs. The latter are currently running at about $1 million per hour in the USA with total, societal costs running at about $10 million per hour in the USA.

Societal Cost of Stair-related Injuries. Currently, for the USA, the annual societal costs of home stair-related injuries—currently comprising about 89 percent of all stair-related injuries where the location or setting is known—are on the order of $100 billion annually for comprehensive, societal costs. (The basis for the 89-percent figure is the NEISS data described above.) The basis for the societal cost (the sum of medical care costs, direct productivity losses and pain-and-suffering or quality of life costs) is a paper by Lawrence, *et al.* (1999). (Among coauthors for this paper are internationally recognized experts in burden of injury, like Ted Miller.) They estimated a societal cost (in 1997 dollars) of $46.7 billion for stair-related injuries occurring in 1995. For that year the NEISS national estimate for US emergency department-treated, stair-related injuries was 892,610 for all settings and 517,641 for homes. Between 1995 and 2007 these increased, respectively, to 1,161,915 (a 30-percent increase) and 761,881 (a 47-percent increase). (These national estimates for 1995 are the "adjusted" ones obtained via the NEISS website; they correct for a change in NEISS sampling that took effect in January 1, 1997.)

Accounting also for inflation (of about 3 to 4 percent annually—although medical care increases were higher), we can assume that, for 2007, the societal costs for stair-related injuries in the USA were on the order of $100 billion in 2007 dollars (including on the order of $10 billion for medical care, $20 billion for direct productivity losses, and $70 billion for pain and suffering or quality of life costs—with this estimated distribution based on a personal communication with Bruce Lawrence and Ted Miller, among the authors of the above noted paper). This cost was about an order of magnitude greater than the annual construction cost of new stairs (just prior to the recent economic downturn) in the USA. For an analysis of home and stair construction costs see Pauls (2003). The smallest cost component, medical care, is about one million dollars per hour in the US."

Quoting also from the paper by Pauls, 2009 on "Injury Increase Comparisons: The apparent, relatively rapid increase recently in home stair-related injuries has an average annual growth rate of about 4.5%, a few times greater than annual population growth (1%). The overall increase, over a three-decade period, was about 130 percent with the most recent ten-year period showing a 55-percent increase. By contrast, fire-related injuries (the majority of which occur in homes), a major concern traditionally in safety standards and codes, have shown a three-decade pattern of average annual *decrease* of about 2 percent. (If fire-related injuries were plotted on Figure 1A, that plot would be appear very close to the base of the graph, declining from about 50,000 to about 25,000 annual injuries over a three-decade period.) Moreover, the trend for all NEISS injury national estimates for home settings—other than stairs, during the period 1997-2007 has a 39-percent increase over the same last ten-year period when home stair-related injuries increased by 55 percent. For *all* products and settings, the increase in NEISS national estimates over the same 1997-2007 period was only 19 percent, about the same as the 18-percent increase for stairs in other settings (i.e., not homes). From this, and other analyses the author has performed with the CPSC-NEISS data, we can see generally, that homes generally are the major site for injuries, relative to other settings; homes account for about 49 percent of the NEISS national estimates of injuries during the 1997-2007 period.

Aside from fire-related injuries—these NEISS-reported national estimates of all injuries in home settings are increasing faster than in other settings (39 percent versus 19 percent for all NEISS national estimates during the 1997-2007 period).

NEISS national estimates of stair-related injuries in home settings have been increasing over the last ten years at a fast rate relative to NEISS national estimates for all NEISS-coded products (55 percent versus 19 percent) and relative to population growth (55 percent versus 10 percent). Over the 1997-2007 period, NEISS national estimates of home stair-related injuries comprised 89 percent of NEISS national estimates for stair-related injuries in all known settings. For early years of NEISS national estimates, specifically 1975-1977, this was 85 percent. Most of the increase in this proportion occurred since 1990.

Generally, in recent years stairs have accounted for about 9 percent of the NEISS national estimates for all products; home stairs accounted for about 6 percent; other settings' stairs accounted for less than 1 percent; unknown settings' stairs accounted for over 2 percent.
Stairs maintain their position, since the earliest days of CPSC-NEISS, as the leading product, associated with injuries coded by NEISS. Floors are the second leading category. See Lawrence, *et al.* (1999), Table 5, using data for 1995-1996, for an analysis for the top ten NEISS-coded products, ranked by injury cost, for various age groups. As well as ranking first for all ages, stairs rank first for 5 of 12 age groups (preschool children and middle-age adults) and second for another three. Only for the two highest age categories, 70-79 and 80 or more (for which stair use is relatively rare), do floors rank first, reflecting the contribution of gait and balance deterioration. However, stairs are still the second leading product for the 70-79 age group and third (after beds) for the 80-plus age group."

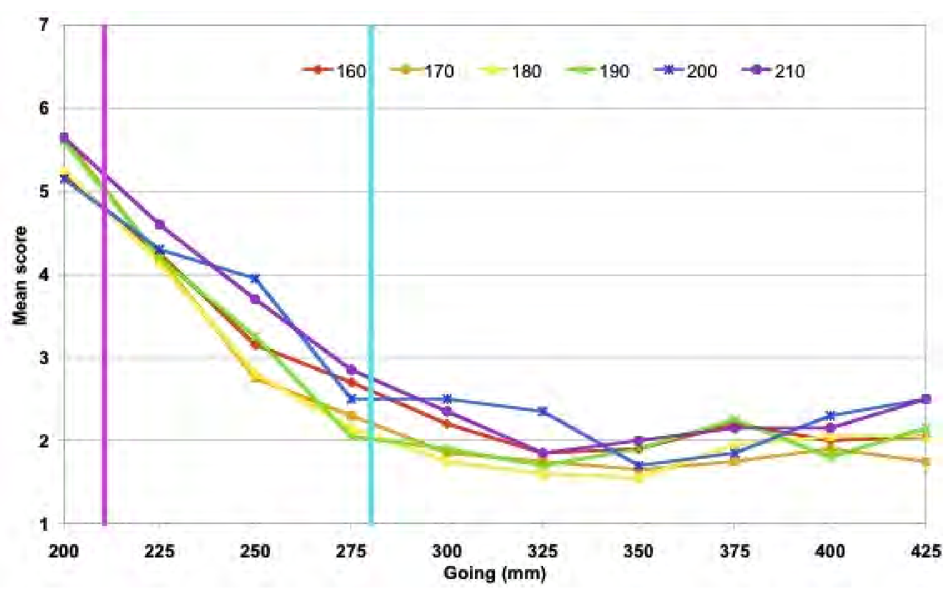
Laboratory and Field Research and Investigations of the Role of Step Geometry on Stairway Safety

The last several years have seen some important work on questions that have long troubled ICC members when addressing this issue of appropriate minimum standards for home step geometry. This work brings no comfort to those arguing that the minimum standards should stay as they are in the IRC and IBC or, even worse, that the NAHB's even lower standard should be the norm. The latter is based on NAHB's long-held national policy position which can be read directly on its website at "www.nahb.org/generic.aspx?sectionID=224&genericContentID=3093" (accessed June 1, 2009): "Support efforts by state and local affiliated Home Builder Associations to oppose the adoption of any new stair geometry that is not consistent with the requirements originally contained in the 1993 BOCA and 1992 CABO Codes by amending those provisions when adopting new editions of model building codes." This is the 8 1/4-inch maximum rise by 9-inch minimum tread depth that, especially with carpeting further degrading the usability and safety of the home stairs, makes them so dangerous and difficult to use. It is indeed beyond belief that, as the stair safety epidemic grows, the homebuilders insist on using a code that was out of date decades ago.

UK Research. Mike Roys and Mike Wright, UK Building Research Establishment have conducted some extraordinarily useful research in recent years, with the last of their papers published in May 2008. Working with a test stairway that offered 10 combinations of tread depth ("going" as it is called in the UK and "run" in some other places), in the range of 200 to 425 mm or 7.9 to 16.7 inches, with 6 combinations of rise height, in the range of 160 to 210 mm or 6.3 to 8.3 inches, they clearly showed the benefits of larger tread depths. Altogether, 60 adult subjects walked up and down each of 20 stair arrangements. Their work, while not completely published yet, is represented centrally in my recent one-day workshops on stairway usability and safety, the PowerPoint slides of which (including a fair selection of the BRE study slides) are available for downloading from my website in the folder titled, "Presentations at MUTN Conference in BC, Canada, April 2009." Papers on this work include Roys, 2001; Wright and Roys, 2005; and Wright and Roys, 2008. (Dr Wright moved to the USA in late 2008 so that now we are fortunate to have, in the USA, one of the top world talents in designing and conducting studies of step geometry and stair use performance.)

Answering a very old question in the code field, they showed that optimum tread depth in terms of many objective and subjective measures was much larger than 11 inches; 14 inches is about where this becomes optimum. The much-used 11-inch criterion is approximately where the graph of some of their findings, reproduced below as Figure 2, shows a change of direction from steep to more gradual slope and finally leveling off at the "optimum" tread depth of about 14 inches or 350 mm. This supports treating 11 inches as the minimum and clearly not the "optimum."

Figure 2. Graph of Findings from the UK Research by Wright and Roys, as Presented (in a PowerPoint) in 2005 at an International Conference on Falls in the UK.

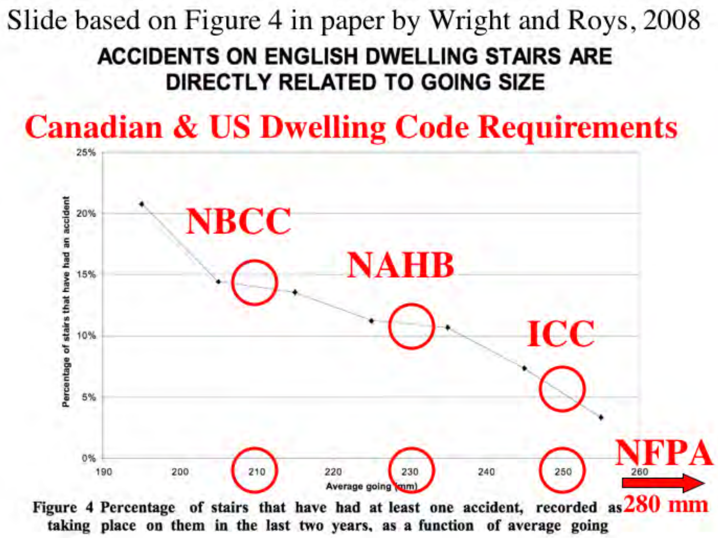


The responses plotted here are to the scaled remark, "I felt safe walking down the stair," with the "most-safe" responses at the bottom of the curves.

The most recent of their papers, Wright and Roys (2008), contains some of the most interesting and valuable work—*in this case conducted in the field and inquiring into actual fall incidents as a function of home stairway rise and tread depth ("going" in the graph).* This is shown in Figure 3, onto which I have superimposed some of the criteria for US and Canadian home stair minimum tread depth, the same range shown in Figure 2 with the vertical bars at the left half of the Figure, specifically at the 210 and 280 mm, 8 1/4 and 11-inch minimum tread depth criteria. Note that any rounding or beveling of the nosing and presence of carpet and pad (in some cases, especially on typical home stairs), the effective tread depth is significantly reduced from these values so that the effective tread depth of some home stairs, built to code, is as small as 180 mm or 7 inches. Incidentally, the testing that led to the results in Figure 2, were with uncarpeted treads with no more than 13 mm or 1/2 inch loss of effective tread depth due to rounding of the nosing. The safety differences among the various tread depths are large and cannot be ignored.

Figure 3. Role of Stair Tread Depth ("Going" in UK) in Stair-related "Accidents" in Homes

(PowerPoint slide based on Wright and Roys, 2008)



Recent US Research on Step Geometry. While there are other studies that could be referenced and described here in relation to the step geometry issue, in the interests of time and space, I will note only one more. This was a paper based on 80 relatively intensively investigated stair-related fall injuries that led to litigation and subsequent investigation by one of the top three or so research and investigation experts in North America with excellent ergonomics credentials. The paper was published in January of 2009 *Professional Safety,* the peer-reviewed journal of the American Society of Safety Engineers and was titled, "Stairway Falls: an ergonomic analysis of 80 cases," by Cohen, LaRue and Cohen (2009). Among their conclusions they note: "In this analysis, excessive dimensional variation appeared to be the most pervasive factor in stairway fall causation, followed by noncompliance with the 7-11 design rule for risers and treads, respectively. As with dimensional variation, this investigation showed a tendency for staircase geometry to fall outside the recommended limits of established building codes. Therefore, stairs that do not follow these requirements are more likely to be involved in falls. It stands to reason that greater adherence to the criteria specified in existing codes (i.e., risers in the range of 7 in. and treads in the range of 11 in.) would decrease the number of actual stairway falls that occur. Therefore, it is essential for both architects and builders to adhere to existing codes regarding stairway dimensions. Furthermore, prevailing codes must be enforced by building code officials, plan checkers and field inspectors, since stair dimensions can often be overlooked in the haste to issue building occupancy permits."

Any ICC chapter wishing to have their members participate in a one-day workshop (also slated for presentation in Eastern Canada on September 14, 2009) should contact Jake Pauls. It is available in a not-for-profit mode. Code authorities should be prepared to deal knowledgeably with consumers who, upon discovering the defects in their home stairs, contact their local building department and ask for a re-inspection of their home stairways. If there has been an injurious fall on such a stairway they should also be prepared to deal with resulting legal actions that might name the local building department as a third party defendant. (ICC itself is also a potential third-party defendant—as are homebuilders and their trade associations—a matter taken up in the so-called "New Orleans Declaration" I issued in the spring of 2009 and posted on my website Downloads area.) Inspectors should at least know about how measurements of the stair step geometry are performed that are of a quality expected in such litigation actions. These measurement techniques, usually requiring use of a spirit level or electronic level, are all described in the workshop materials posted on the above-mentioned website Downloads area and on the DVD of the Spring 2009 workshop noted above. These measurement techniques are consistent with the ICC requirements both as currently stated and as further clarified if the package of proposals I put forward is accepted.

As indicated with all of the epidemiological and etiological work outlined in this proposal, the home stair-related injury issue is many times larger than is the home fire-related injury problem. It should thus be nearly a no-brainer, after adopting home sprinkler requirements, for responsible ICC members to vote for the mainstreaming of the "7-11" step geometry standard. I will be counting on such ICC members and others who can sway opinion to speak out with conviction based on the primacy of their duties to the public, the first item in the code of ethics for certified officials, a code which is available on my website if it cannot be located on ICC's.

Cost Impact: The code change proposal will increase the cost of construction. However, more importantly, the change will lead to much larger benefits in injury reduction and usability, especially for older users.

ICCFILENAME: Pauls-E4-1012.3

Public Hearing Results

Part I-IBC
Committee Action: **Disapproved**

Committee Reason: The injury data is not correlated with the type of stairways in the International Building Code. The data is subjective (i.e., "I felt comfortable on the stairs.").

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jake Pauls, Silver Springs, MD, representing self, requests Approval as Submitted.

Commenter's Reason: This comment adopts, by reference, all of the information in my accompanying comment on E74-09/10 Part 2 on the "7-11" rule for dwellings in the IBC. To that information is added the following pertaining specifically to E74-09/10 Part 1.

The IBC Means of Egress Committee gave the following reason for disapproval of E74-09/10 Part 1. "The injury data is not correlated with the type of stairways in the International Building Code. The data is subjective (i.e., "I felt comfortable on the stairs.")."

The paucity of content in this reason statement is astonishing in view of the wealth of information provided to Committee members and the magnitude of the home stair safety problem, currently running at an hourly societal cost of injury of about 10 million dollars.

Secondly, the injury data were correlated with the type of stairways in the IBC, both in dwellings and elsewhere. Third, it is astonishing that the Committee seized on one finding—out of many more from the UK Building Research Establishment (BRE) studies, indeed only one of 15 questions put to test subjects to buttress the claim that "the data is subjective." There were objective measures as well which correlated well with the subjective measures, all underlining the importance of adequate tread depth for comfort and safety of users as a prime criterion, with riser height being secondary in importance.

Thus, in its reason statement, the Committee was being unreasonable as well as petty.

Even worse, the most astute member on the Committee—at least in terms of formal research responsibilities at the US National Institute of Standards and Technology (NIST)—after voting against the proposal, was asked why by the proponent. He said that he recalled something in Dr. John Templer's book, The Staircase, Vol. 2 (MIT Press, 1992) recommending step geometries considerably different (and less demanding than) the "7-11" rule would dictate. Here he made procedural and technical errors. This belief or recollection on his part should have been put in the form of a question to the proponent who would have disillusioned him on the spot. Rather, in a most unscientific manner, he set aside all of the evidence in favor of a flawed recollection. Templer, in his 1974 dissertation first provided evidence supporting the "7-11" rule although his data were based on 7.2 inches for maximum riser height. (Rounding this to the conventional "7-11" is warranted as there are typically small increases in effective riser height with typically carpeted dwelling unit stairs as well as effective reduction of tread depth when carpeted. Below as Table 1 for this Comment is summary table (2.2) from Dr. Templer's book (again based largely on work he did in 1974 and published in 1992, at least a decade before the more detailed work done by researchers Wright and Roys at the UK Building Research Establishment (BRE).

Table 1. Templer's Recommendations for Maximum Riser Height and Minimum Tread Depth Based on His 1974 Work

TABLE 2.2
Range of Rise and Going Relationships for Comfort and Safety

Rise	*Goings*						
INCHES							
7.2	11						
7	11						
6.5	11	11.5	12	12.5			
6	11	11.5	12	12.5	13	13.5	14
5.5	11	11.5	12	12.5	13		
5	11	11.5	12				
4.6	11						
CENTIMETERS							
18.3	27.9						
17.8	27.9						
16.5	27.9	29.2	30.5	31.8			
15.2	27.9	29.2	30.5	31.8	33.0	34.3	35.6
14.0	27.9	29.2	30.5	31.8	33.0		
12.7	27.9	29.2	30.5				
11.7	27.9						

Note that the 14-inch maximum, as Templer explained in this book, was merely the upper limit of his test apparatus for his 1974 dissertation; he indicated that more research was needed on larger tread depths (and such work was done in the BRE study coming some three decades later). Thus, contrary to the recollection admitted by the one researcher on the IBC Means of Egress Committee, Templer was in favor of the “7-11” rule and he explicitly put this in a written statement when BOCA, one of the three legacy model code groups was considering adopting the “7-11” rule for dwellings.

Thus, not only does the overall committee—with a few exceptions—get a failing grade on their sloppy evaluation of the evidence for the “7-1” rule, the one person who should have championed such research got it wrong. As the old saying goes, “What can you expect of iron when gold rusts?”

Finally, how can the Means of Egress Committee turn its back on the longstanding “7-11” rule that is applied to building contexts where occupants are significantly less vulnerable to unsafe stairs? Their reasoning for disapproval fails the logic test. E74-09/10 should be approved by the ICC membership which, on the comparable proposal (E74-09/10 Part 2) voted 63 percent in favor of approval in Baltimore.

Final Action: AS AM AMPC____ D

E74-09/10, Part II
IRC R311.7.4.1, R311.7.4.2

Proposed Change as Submitted

Proponent: Jake Pauls, representing self

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.7.4.1 Riser height. The maximum riser height shall be 7 inches (178 mm) ~~7 ¾ inches (196 mm)~~. The riser shall be measured vertically between leading edges of the adjacent treads. The greatest riser height within any flight of stairs shall not exceed the smallest by more than $^3/_8$ inch (9.5 mm).

R311.7.4.2 Tread depth. The minimum tread depth shall be 11 inches (279 mm) ~~10 inches (254 mm)~~. The tread depth shall be measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's leading edge. The greatest tread depth within any flight of stairs shall not exceed the smallest by more than $^3/_8$ inch (9.5 mm). Consistently shaped winders at the walkline shall be allowed within the same flight of stairs as rectangular treads and do not have to be within $^3/_8$ inch (9.5 mm) of the rectangular tread depth.

Winder treads shall have a minimum tread depth of 11 inches (279 mm) ~~10 inches (254 mm)~~. measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point within the clear width of the stair. Within any flight of stairs, the largest winder tread depth at the walkline shall not exceed the smallest winder tread by more than $^3/_8$ inch (9.5 mm).

Reason: This is purely a technical change affecting maximum and minimum rise and tread depth dimensions respectively. This is the long overdue mainstreaming of the so-called "7-11" step geometry in terms of maximum rise and minimum tread depth. (The proponent has submitted a separate change proposal which simply formats and restates the current requirements; that proposal and this one should be dealt with separately or independently as their purposes and effects are different.)

Much has been written about this topic, especially around 2003 in relation to the IRC and the NFPA codes (NFPA 101 and NFPA 5000 which adopted this change to the mainstreamed "7-11" step geometry at that time. Since that day nobody has attempted to revert to pre-"7-11" criteria for dwelling unit stairs within NFPA and for non-dwelling unit stairs within ICC. The "7-11" minimum standard is the most widely used step geometry standard internationally and reasons for keeping it at least the minimum standard have grown. This is because all the recent research on use of stairs—*including the matter of falls on stairs, including injurious ones*—confirms that it is a very reasonable minimum standard and that it is a long way—about three inches or more—from an "optimum" standard.

The very extensive 2003 proposal I submitted to both ICC and NFPA is not reproduced within this proposal for reasons of length and, more importantly, its free availability on the Internet, specifically the Downloads area of my website, http://web.me.com/bldguse. Once within the Downloads area (where over a hundred PDF files can be freely downloaded on stairway usability and safety plus means of egress performance), simply open the folder titled, "Home Stairway Safety and Codes," and download the 3.4 MB, 40-page file, "Pauls-R311-2003.pdf." Here follows an outline of what was covered in that proposal which I submitted to ICC with NFPA getting a comparable, earlier one that was approved by NFPA members and withstood technical and procedural challenges from the NAHB.

Summary.

What Has Changed Since 2003?

The changes for the worse appear to be directly attributable to even worse home stair construction and regulation than existed before 2003. This is seen in Figure 1 which shows the growth of home stair-related injuries that are NOT due to the aging of the population—as this was checked out to learn that people under 65 and those 65 or more in age both contributed in more or less the same proportion to the substantial growth in home stair, related injuries. A recent, widely-circulated document described the statistical insights as follows: "For both 1997 and 2007, the percentage of NEISS-reported injuries for the 65-and-older group was 15.3 percent plus/minus 0.4 percent for both home settings and all settings." Thus, both before and after 1997, elderly persons were only slightly—but consistently—over-represented in hospital emergency department-treated injuries associated with stairs as reported in national estimates by the US Consumer Product Safety Commission. (The note, titled "The Home Stairway Safety Problem and Related Code Development, Adoption and Enforcement Problems in the USA," is also posted for free downloading from the website "http://web.me.com/bldguse" Downloads area as file "Pauls2009Letter&InjuryNote" within the folder titled, "Home Stairway Safety and Codes.") A list of the topics addressed therein is provided below Figure 1.

Figure 1 shows an extraordinary growth in the US national estimates from the US CPSC/NEISS for stair-related injuries, particularly in homes. The average annual rate of increase in the last several years exceeds the average annual rate of US population growth by a factor of about five while stair-related injuries in non-home settings decrease slightly, resulting in about a 2 percent reduction annually for non-home stairs over the last several years—since about 1998. During these several years there has been increasing use of the "7-11" minimum step geometry standard for non-home stairs, thanks to the adoption—beginning in the 1980s—of this standard in model building codes. This is further evidence of a partial success story on the stairway safety front and ICC members might rightly claim some of the credit for this partial success. Now building officials who control the adoption of the requirements in model codes need to finish the job where it will count most, in homes.

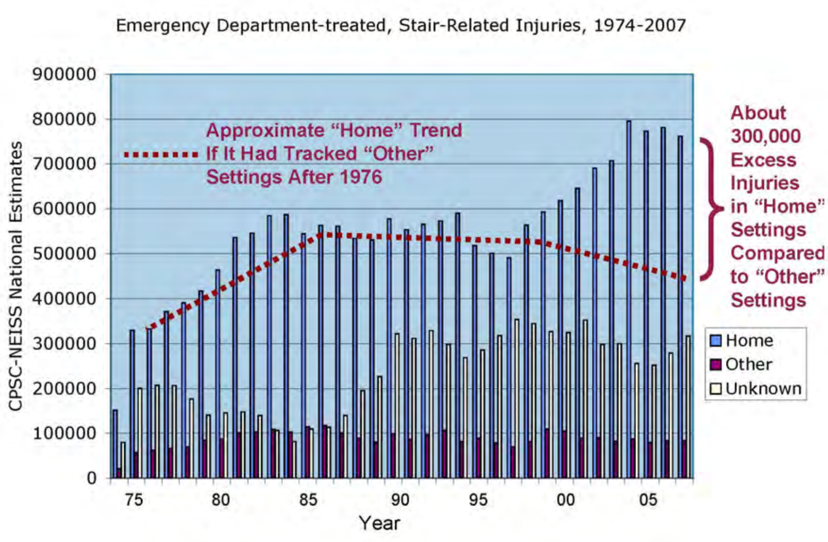

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years.

Updating the 2003 ICC proposal on mainstreaming the "7-11" minimum standard was the note which began circulating in February of 2009. Here are the topics it addressed in its 26 pages (including over two pages of references and additional resources).

Preface

References and Guide to Resources.

The 2003 proposal to ICC, "Pauls-R311-2003," included substantial benefit-cost information about stair step geometry in homes which must be updated to take account of recent, dramatic growth in home stair-related injuries (in terms of CPSC-NEISS national estimates) as well as higher-than-general inflation rates for medical treatment costs. The latter are currently running at about $1 million per hour in the USA with total, societal costs running at about $10 million per hour in the USA.

Societal Cost of Stair-related Injuries. Currently, for the USA, the annual societal costs of home stair-related injuries—currently comprising about 89 percent of all stair-related injuries where the location or setting is known—are on the order of $100 billion annually for comprehensive, societal costs. (The basis for the 89-percent figure is the NEISS data described above.) The basis for the societal cost (the sum of medical care costs, direct productivity losses and pain-and-suffering or quality of life costs) is a paper by Lawrence, *et al.* (1999). (Among coauthors for this paper are internationally recognized experts in burden of injury, like Ted Miller.) They estimated a societal cost (in 1997 dollars) of $46.7 billion for stair-related injuries occurring in 1995. For that year the NEISS national estimate for US emergency department-treated, stair-related injuries was 892,610 for all settings and 517,641 for homes. Between 1995 and 2007 these increased, respectively, to 1,161,915 (a 30-percent increase) and 761,881 (a 47-percent increase). (These national estimates for 1995 are the "adjusted" ones obtained via the NEISS website; they correct for a change in NEISS sampling that took effect in January 1, 1997.)

Accounting also for inflation (of about 3 to 4 percent annually—although medical care increases were higher), we can assume that, for 2007, the societal costs for stair-related injuries in the USA were on the order of $100 billion in 2007 dollars (including on the order of $10 billion for medical care, $20 billion for direct productivity losses, and $70 billion for pain and suffering or quality of life costs—with this estimated distribution based on a personal communication with Bruce Lawrence and Ted Miller, among the authors of the above noted paper). This cost was about an order of magnitude greater than the annual construction cost of new stairs (just prior to the recent economic downturn) in the USA. For an analysis of home and stair construction costs see Pauls (2003). The smallest cost component, medical care, is about one million dollars per hour in the US."

Quoting also from the paper by Pauls, 2009 on "Injury Increase Comparisons: The apparent, relatively rapid increase recently in home stair-related injuries has an average annual growth rate of about 4.5%, a few times greater than annual population growth (1%). The overall increase, over a three-decade period, was about 130 percent with the most recent ten-year period showing a 55-percent increase. By contrast, fire-related injuries (the majority of which occur in homes), a major concern traditionally in safety standards and codes, have shown a three-decade pattern of average annual *decrease* of about 2 percent. (If fire-related injuries were plotted on Figure 1A, that plot would be appear very close to the base of the graph, declining from about 50,000 to about 25,000 annual injuries over a three-decade period.) Moreover, the trend for all NEISS injury national estimates for home settings—other than stairs, during the period 1997-2007 has a 39-percent increase over the same last ten-year period when home stair-related injuries increased by 55 percent. For *all* products and settings, the increase in NEISS national estimates over the same 1997-2007 period was only 19 percent, about the same as the 18-percent increase for stairs in other settings (i.e., not homes). From this, and other analyses the author has performed with the CPSC-NEISS data, we can see generally, that homes generally are the major site for injuries, relative to other settings; homes account for about 49 percent of the NEISS national estimates of injuries during the 1997-2007 period.

Aside from fire-related injuries—these NEISS-reported national estimates of all injuries in home settings are increasing faster than in other settings (39 percent versus 19 percent for all NEISS national estimates during the 1997-2007 period).

NEISS national estimates of stair-related injuries in home settings have been increasing over the last ten years at a fast rate relative to NEISS national estimates for all NEISS-coded products (55 percent versus 19 percent) and relative to population growth (55 percent versus 10 percent). Over the 1997-2007 period, NEISS national estimates of home stair-related injuries comprised 89 percent of NEISS national estimates for stair-related injuries in all known settings. For early years of NEISS national estimates, specifically 1975-1977, this was 85 percent. Most of the increase in this proportion occurred since 1990.

Generally, in recent years stairs have accounted for about 9 percent of the NEISS national estimates for all products; home stairs accounted for about 6 percent; other settings' stairs accounted for less than 1 percent; unknown settings' stairs accounted for over 2 percent.

Stairs maintain their position, since the earliest days of CPSC-NEISS, as the leading product, associated with injuries coded by NEISS. Floors are the second leading category. See Lawrence, *et al.* (1999), Table 5, using data for 1995-1996, for an analysis for the top ten NEISS-coded products, ranked by injury cost, for various age groups. As well as ranking first for all ages, stairs rank first for 5 of 12 age groups (preschool children and middle-age adults) and second for another three. Only for the two highest age categories, 70-79 and 80 or more (for which stair use is relatively rare), do floors rank first, reflecting the contribution of gait and balance deterioration. However, stairs are still the second leading product for the 70-79 age group and third (after beds) for the 80-plus age group."

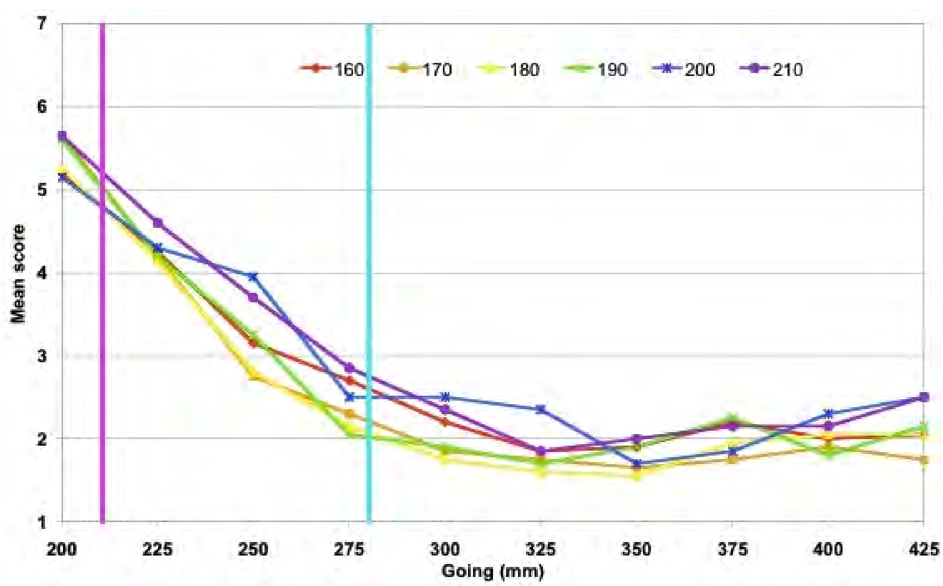
Laboratory and Field Research and Investigations of the Role of Step Geometry on Stairway Safety

The last several years have seen some important work on questions that have long troubled ICC members when addressing this issue of appropriate minimum standards for home step geometry. This work brings no comfort to those arguing that the minimum standards should stay as they are in the IRC and IBC or, even worse, that the NAHB's even lower standard should be the norm. The latter is based on NAHB's long-held national policy position which can be read directly on its website at "www.nahb.org/generic.aspx?sectionID=224&genericContentID=3093" (accessed June 1, 2009): "Support efforts by state and local affiliated Home Builder Associations to oppose the adoption of any new stair geometry that is not consistent with the requirements originally contained in the 1993 BOCA and 1992 CABO Codes by amending those provisions when adopting new editions of model building codes." This is the 8 1/4-inch maximum rise by 9-inch minimum tread depth that, especially with carpeting further degrading the usability and safety of the home stairs, makes them so dangerous and difficult to use. It is indeed beyond belief that, as the stair safety epidemic grows, the homebuilders insist on using a code that was out of date decades ago.

UK Research. Mike Roys and Mike Wright, UK Building Research Establishment have conducted some extraordinarily useful research in recent years, with the last of their papers published in May 2008. Working with a test stairway that offered 10 combinations of tread depth ("going" as it is called in the UK and "run" in some other places), in the range of 200 to 425 mm or 7.9 to 16.7 inches, with 6 combinations of rise height, in the range of 160 to 210 mm or 6.3 to 8.3 inches, they clearly showed the benefits of larger tread depths. Altogether, 60 adult subjects walked up and down each of 20 stair arrangements. Their work, while not completely published yet, is represented centrally in my recent one-day workshops on stairway usability and safety, the PowerPoint slides of which (including a fair selection of the BRE study slides) are available for downloading from my website in the folder titled, "Presentations at MUTN Conference in BC, Canada, April 2009." Papers on this work include Roys, 2001; Wright and Roys, 2005; and Wright and Roys, 2008. (Dr Wright moved to the USA in late 2008 so that now we are fortunate to have, in the USA, one of the top world talents in designing and conducting studies of step geometry and stair use performance.)

Answering a very old question in the code field, they showed that optimum tread depth in terms of many objective and subjective measures was much larger than 11 inches; 14 inches is about where this becomes optimum. The much-used 11-inch criterion is approximately where the graph of some of their findings, reproduced below as Figure 2, shows a change of direction from steep to more gradual slope and finally leveling off at the "optimum" tread depth of about 14 inches or 350 mm. This supports treating 11 inches as the minimum and clearly not the "optimum."

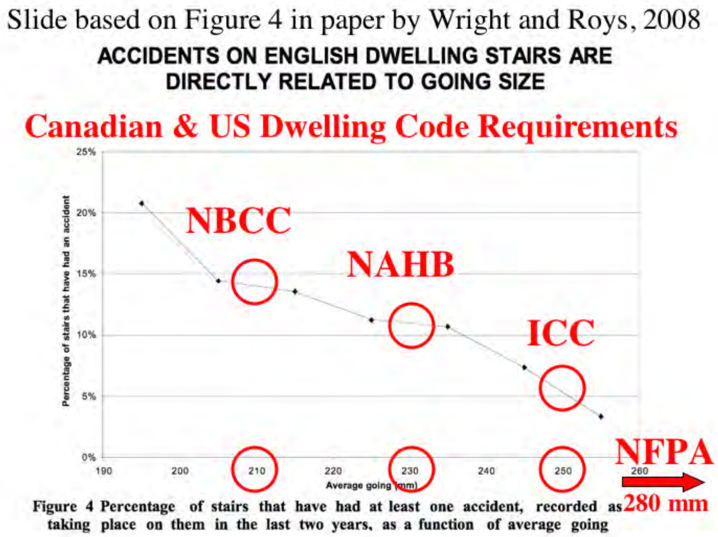
Figure 2. Graph of Findings from the UK Research by Wright and Roys, as Presented (in a PowerPoint) in 2005 at an International Conference on Falls in the UK.



The responses plotted here are to the scaled remark, "I felt safe walking down the stair," with the "most-safe" responses at the bottom of the curves.

The most recent of their papers, Wright and Roys (2008), contains some of the most interesting and valuable work—*in this case conducted in the field and inquiring into actual fall incidents as a function of home stairway rise and tread depth ("going" in the graph).* This is shown in Figure 3, onto which I have superimposed some of the criteria for US and Canadian home stair minimum tread depth, the same range shown in Figure 2 with the vertical bars at the left half of the Figure, specifically at the 210 and 280 mm, 8 1/4 and 11-inch minimum tread depth criteria. Note that any rounding or beveling of the nosing and presence of carpet and pad (in some cases, especially on typical home stairs), the effective tread depth is significantly reduced from these values so that the effective tread depth of some home stairs, built to code, is as small as 180 mm or 7 inches. Incidentally, the testing that led to the results in Figure 2, were with uncarpeted treads with no more than 13 mm or 1/2 inch loss of effective tread depth due to rounding of the nosing. The safety differences among the various tread depths are large and cannot be ignored.

Figure 3. Role of Stair Tread Depth ("Going" in UK) in Stair-related "Accidents" in Homes (PowerPoint slide based on Wright and Roys, 2008)



Recent US Research on Step Geometry. While there are other studies that could be referenced and described here in relation to the step geometry issue, in the interests of time and space, I will note only one more. This was a paper based on 80 relatively intensively investigated stair-related fall injuries that led to litigation and subsequent investigation by one of the top three or so research and investigation experts in North America with excellent ergonomics credentials. The paper was published in January of 2009 *Professional Safety,* the peer-reviewed journal of the American Society of Safety Engineers and was titled, "Stairway Falls: an ergonomic analysis of 80 cases," by Cohen, LaRue and Cohen (2009). Among their conclusions they note: "In this analysis, excessive dimensional variation appeared to be the most pervasive factor in stairway fall causation, followed by noncompliance with the 7-11 design rule for risers and treads, respectively. As with dimensional variation, this investigation showed a tendency for staircase geometry to fall outside the recommended limits of established building codes. Therefore, stairs that do not follow these requirements are more likely to be involved in falls. It stands to reason that greater adherence to the criteria specified in existing codes (i.e., risers in the range of 7 in. and treads in the range of 11 in.) would decrease the number of actual stairway falls that occur. Therefore, it is essential for both architects and builders to adhere to existing codes regarding stairway dimensions. Furthermore, prevailing codes must be enforced by building code officials, plan checkers and field inspectors, since stair dimensions can often be overlooked in the haste to issue building occupancy permits."

Any ICC chapter wishing to have their members participate in a one-day workshop (also slated for presentation in Eastern Canada on September 14, 2009) should contact Jake Pauls. It is available in a not-for-profit mode. Code authorities should be prepared to deal knowledgeably with consumers who, upon discovering the defects in their home stairs, contact their local building department and ask for a re-inspection of their home stairways. If there has been an injurious fall on such a stairway they should also be prepared to deal with resulting legal actions that might name the local building department as a third party defendant. (ICC itself is also a potential third-party defendant—as are homebuilders and their trade associations—a matter taken up in the so-called "New Orleans Declaration" I issued in the spring of 2009 and posted on my website Downloads area.) Inspectors should at least know about how measurements of the stair step geometry are performed that are of a quality expected in such litigation actions. These measurement techniques, usually requiring use of a spirit level or electronic level, are all described in the workshop materials posted on the above-mentioned website Downloads area and on the DVD of the Spring 2009 workshop noted above. These measurement techniques are consistent with the ICC requirements both as currently stated and as further clarified if the package of proposals I put forward is accepted.

As indicated with all of the epidemiological and etiological work outlined in this proposal, the home stair-related injury issue is many times larger than is the home fire-related injury problem. It should thus be nearly a no-brainer, after adopting home sprinkler requirements, for responsible ICC members to vote for the mainstreaming of the "7-11" step geometry standard. I will be counting on such ICC members and others who can sway opinion to speak out with conviction based on the primacy of their duties to the public, the first item in the code of ethics for certified officials, a code which is available on my website if it cannot be located on ICC's.

Cost Impact: The code change proposal will increase the cost of construction. However, more importantly, the change will lead to much larger benefits in injury reduction and usability, especially for older users.

ICCFILENAME: Pauls-E4-1012.3

Public Hearing Results

PART II- IRC B/E
Committee Action: Disapproved

Committee Reason: The committee feels the data submitted seems to be a gray area in what the data is revealing. The solution does not necessarily show that it is related to the problem. The committee feels the "7 3/4-10" standard is a good standard and prefers to keep it.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jake Pauls, Silver Springs, MD, representing self, requests Approval as Submitted.

Commenter's Reason: Several aspects of the IRC RB Committee actions and related, more general policy, process and ethics issues central to this proposal are—as this comment is submitted on the deadline (February 8, 2010)—still subject to an Appeal process filed by the proponent and submitter of this comment. The public hearing on this appeal is scheduled to occur four days after the comment filing deadline. Requests to ICC staff, to extend the comment submission deadline for E74-09/10, were rebuffed as if to say the Appeal process is not important anyway so what does it matter if the comment deadline precedes the Appeal process.

One aspect of the Appeal did occur before the comment submission deadline. That was the IRC RB Committee reconsideration of its action on E74-09/10 Part II. It was not much of a reconsideration—in terms of the central issue of conflict of interest of the four National Association of Home Builders (NAHB) representatives—as a sustaining of the Committee's action at the Baltimore hearings in October. The extent of the hold that the NAHB has on the Committee was exemplified by the fact that the motion to sustain previous action was made and seconded by NAHB representatives. Neither they nor anyone else on the Committee even bothered to try to justify their mostly nonsensical reason for disapproval. That published reason for disapproval was the following.

> Committee Reason: The committee feels the data submitted seems to be a gray area in what the data is revealing. The solution does not necessarily show that it is related to the problem. The committee feels the "7 3/4-10" standard is a good standard and prefers to keep it.

What does this mean? What does the committee mean by "gray area?" The Committee, during its reconsideration, never even bothered to try to explain this or other weaknesses in the reasoning.

Taken as a whole—with year after year of growing injury tolls related to the least regulated of stairs—combined with decades of research specifically on the relationships between step geometry and falls—*all of which was made known to the Committee via the supplied CD of many publications and available more publicly on the referenced websites*, the data are very clear. They are in stark black and white, not gray!

It is now well established by etiological research and by abundant epidemiological data that home stairs are relatively dangerous and the largest set of factors behind the increased dangers are mainly the smaller tread depths, complicated somewhat with higher risers, for dwelling unit stairs.

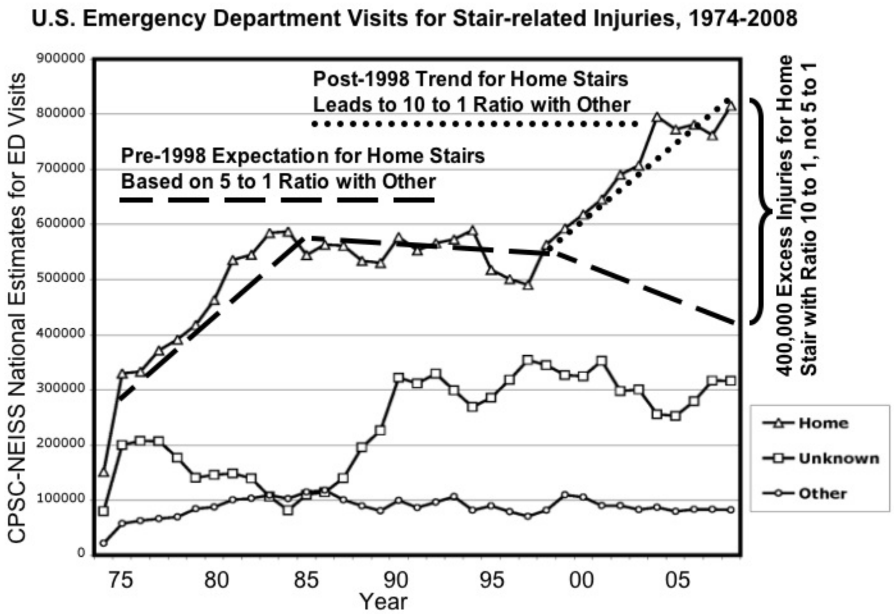
If there is any correct use of the term "gray area," it is in the Committee Reason's use of the phrase, "The committee feels." US residents are currently paying about one million dollars per hour for medical treatment costs *alone* for stair-related injuries—*90 percent of which occur in home settings.* Thus, the most legitimate feelings are indignation over the inaction on the part of ICC, responsible code officials and home builders about the unnecessary perils to which unsuspecting home stair users are exposed.

I do not mean to be critical of only the four NAHB representatives on the IRC BE committee. If they were the only problem here, the vote would have been about seven to four on approval of the proposal rather than nine to two on disapproval. No, the committee appears to have some builder confederates or, at the minimum, some people who want codes based on vague feelings rather than facts or who are not sufficiently aware of the facts. With one or two standout exceptions (including at least one member who appears to have considered the facts with great care), the code officials on the committee appear not to care about facts or due process. This is why the current appeal focuses on ethics issues in the ICC process and these are on the hearing agenda for February 12, 2010.

Notably, the majority of the IRC BE Committee are out of step with the ICC membership as reflected in the assembly vote immediately after the Committee voted 9 to 2 to disapprove E74-09/10 Part II; that assembly vote of nearly 1,000 ICC members was 63 percent in favor of approval of E74-09/10.

The last sentence of the provided reason is especially astonishing. In the face of contrary facts, the committee again "feels" something but does not put any force of action behind the feeling. At least four of the twelve committee members represent the National Association of Home Builders (NAHB) which, for years, has had a policy preventing code professionals from adopting and enforcing even the compromise "7 3/4-10" standard for which there was never a good research basis. The research basis was for the "7-11" standard. (It is another fact that, for all but homes, "7-11" has been the most widely used standard in the world for step geometry in buildings where the stair-related injury toll is showing slight decreases—a few percent per year in the US when population corrected—while US home stairs are showing large increases, especially since ICC and the NAHB made their business agreement that was intended, in part, to keep home stairs at a low standard. If there were a case to be made for the “7 3/4-10” standard, then why haven’t all the codes that adopted the “7-11” standard reverted to the lower, “7 3/4-10” standard? The performance of the “7-11” standard is based on fact, not “feeling.” There are decades of experience with “7-11” in buildings other than homes and as seen in Figure 1, we are now reaping the benefits of that enlightened policy, unfortunately only in the settings where people are least vulnerable. The data in Figure 1 come from the US Consumer Product Safety Commission (CPSC) National Electronic Injury Surveillance System (NEISS for hospital emergency department-treated injuries which comprise about 40 percent of all medically treated injuries—which total about 2 million home stair-related injuries per year in the USA. Thus Figure 1 tends to understate the total medical problem posed by stair-related injuries.

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years
This is an update, including data for 2008, of Figure 1 in proposal E74-09/10



Five reasons have been identified recently for the diverging injury records for home stairways and for stairways in all other settings that are clearly shown in Figure 1. The former are rising rapidly (approaching a growth rate of over 4 percent, about five times US population growth) in a trend begun at about the time the ICC started affecting residential codes in the USA through its production and promotion of the International Residential Code. The latter are now dropping at a notable rate (about 2 percent reduction per year at a time of about 1 percent a year of population growth in the USA). These factors, in no particular order, are:

(A) Significantly lower ICC standard for maximum rise and minimum tread depth for home stairs (the result of the code-development compromise and the code-adoption compromise).
(B) The systemic top-of-flight defect in many homes’ (and some other buildings’) stairs partly due to ICC's failure to provide clearly stated code requirements and to include the rules preventing this in their inspection guides.
(C) ICC's adoption of seriously compromised requirements for handrails for home stairways.
(D) An apparent deterioration in enforcement/inspection quality generally in relation to homes, partly influenced by the widespread perception—possibly nurtured by ICC leaders—that the builders’ work should receive minimal scrutiny in view of their “Strategic Partnership.”
(E) The concurrent deterioration of movement performance of population capability generally with the effects of reduced physical activity, overweight and obesity. (In a public health model, this should lead to increased—*not decreased*—compensation with the design and construction of critical built environment features such as stairways, particularly in the home settings where the most vulnerable populations and use conditions are common and easily predicted.)

Other code change proposals, before ICC this cycle, address at least three of the five reasons. For example, two comments have been submitted in relation to item B (on proposals RB46-09/10 and RB47-09/10). Comments could have been submitted also on item C, especially as there were competing proposals from the Stairway Manufacturers Association (SMA) and from Pauls focused on either expanding or eliminating, respectively, the ability to use Type II handrails. This commenter hopes that the ICC members have the good sense to refuse any expansion of Type II handrail usage and, on a more proactive front, prohibit their further use in all settings, especially dwellings where there is a larger proportion of users disserved by the oversized, ungraspable Type II railings, especially on stairways.

Item D is being addressed in the public hearing on February 12, 2010, just four days after the deadline for submission of comments. (ICC staff refused to provide a later date for comments that would be based on the outcome of the public hearing—as if to imply that the public hearing result was predetermined and would not affect the nature of comments on E74-09/10 one way or another.)

This comment focuses on item A and for the benefit of all who did not see the proponent’s handout at the Baltimore hearings here follow some highlights of that handout. They focused partly on comparisons between home sprinkler requirements and “7-11” stair geometry rule for dwelling unit stairs.

Information on Home Stairways and Sprinklers for Fire Safety Authorities, Building Code Authorities and Others (Re. IRC-BE Proposals E74-09/10 and E97-09/10)

ICC members—including new members wanting to participate in the deliberations on the home fire sprinkler issue, beyond supporting home fire sprinklers (by defeating proposals to pull back from the position taken last year), *should also support proposal E74-09/10 re. home stair step geometry and proposal E97-09/10 re. stair handrails.*

This approach is best for your colleagues, for the public and your mission. For example, fire services—in their EMS work—attend to more non-fire injuries (e.g. from falls) than to fire-related ones. Many of the fall injuries occur because of stairs—*90 percent are in homes.* Currently, the number of medically treated home stair-related injuries in the US total about 2 million per year. About 800,000 of these are treated in hospital emergency departments—*and this toll is increasing at about 5 percent per year*. Meanwhile, *reflecting better codes and enforcement for non-home stairs—e.g. "7-11" stairs*, other settings show a recent 2 percent per year drop in injuries. See Figure 1.

Risk. Fatalities from fire and (under-reported) stair-related fatalities are similar with a risk of about one in 100,000 per year. Annual risk of nonfatal injury is greater for stairs at about one medically treated injury in 150 while for fires the risk is one civilian injury in 17,600.

A civilian has about 100 times greater risk of nonfatal injury due to stairs than from a structural fire with the latter often more serious.

Fire services have to use the same bad stairs in homes during fire response, but they face even more usability and safety challenges, e.g., lack of familiarity, plus stairs with badly undersized treads that are very difficult and dangerous for firefighters to use with large boots, breathing apparatus and other gear affecting vision and movement.

Fire services: Improved home stair step geometry and proper handrails are essential for your members and your mission.

Role of Step Geometry in Stair-related Falls and Injuries. Much has been learned since 2003, the last time there were code-change proposals on the "7-11" rule for homes. Research at the UK Building Research Establishment, based on a survey of "accident" experience by home owners, suggests that the added risk of the short, 9-in tread depths, compared to even a 10-in tread depth (the largest for which sufficient home-based data were available), was a factor of about four (i.e. a risk of 0.12 versus 0.03 of an "accident" occurring in a two-year period). See Table 1; this replaces illegible Fig. 3 of proposal E74-09/10.

Table 1. Risk of Falls Relative to Home Stair Tread Depth
(Risk estimates derived from Wright and Roys (2008) Figure 4)

Tread Depth dimension	Relative risk of falls	Used for home stairs by
255 mm (10.0")	0.03	ICC Codes in USA
245 mm (9.6")	0.07	
235 mm (9.3")	0.11	
225 mm (8.9")	0.12	NAHB in USA
215 mm (8.5")	0.13	
205 mm (8.1")	0.14	NBCC in Canada
195 mm (7.7")	0.21	

NBCC—*National Building Code of Canada*

Based on evidence from actual falls on home stairs, a 10-in tread depth is nearly four times safer than is 9-inches; 11 inches is even more favored and safer. See Figure 2 re. *optimum depth*—14 in.

Figure 2. Findings about the Effectiveness of Ten Tread Depths and Six Step Rise Heights from UK Research by Wright and Roys, as presented in 2005 at an International Conference on Falls

("Going" is the UK and international term for tread depth. Lower is better in the graph.)

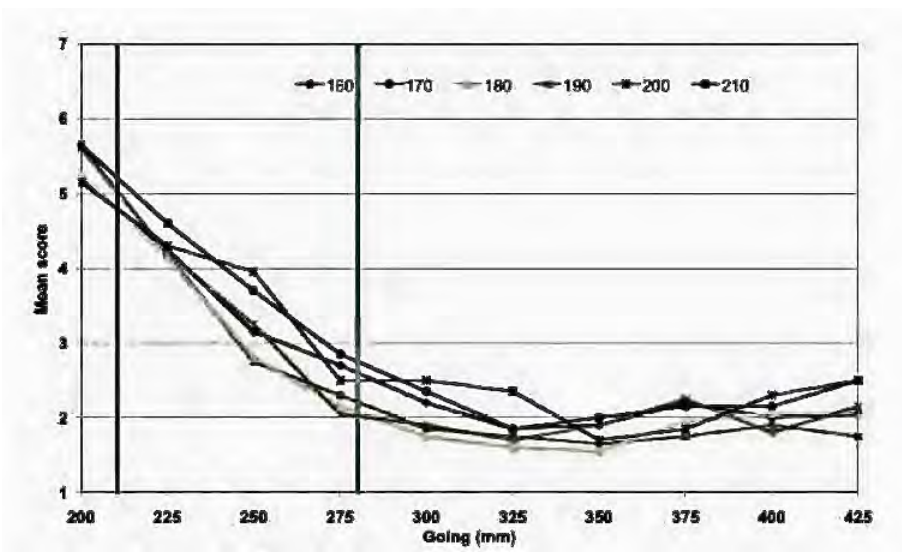


Figure 2 is one of several studies reported after 2003; this counters the claim made by the SMA representative at the Batlimore Hearings that there was nothing new in the research since the prior proposal, in 2003, to have the "7-11" step geometry rule apply to dwelling unit stairs. Among other studies there were some from 2008 (e.g., the study behind Table 1) and 2009. Other incorrect claims made, by the NAHB representative, in the Baltimore hearing and/or the Committee reconsideration relate to the dwelling unit stair rules long used in the UK; he claimed that the UK requirements allowed 220 mm (8.67 inch) dimensions for both rise and tread depth. This is completely wrong as these limits are applied in conjunction with two other rules; you cannot have both a maximum height riser and a minimum tread depth due to the application of the other limits. The SMA representative made a big deal, or so was the initial impression, about the fact that two recommendations came out of the UK Building Research Establishment (BRE) team who did the research. One was for a minimum 300 mm (12-inch) tread depth for all but dwellings and 250 mm (10 inches) for dwellings. What he failed to take into account is that, as in all other countries traditionally—*due to homebuilding industry pressures on both code-development bodies and on technical institutes such as the industry-sponsored BRE*—there was a built in premise that there would be a continuation of the double, lower standard for step geometry in dwellings—even if the research did not support this conclusion.

From Figure 2, it is clear that there are two regions of the graphs, the portion with a fairly steep slope and the region where the slope is relatively gradual. The break between the two regions occurs at approximately 275 mm (about 11 inches). This means that every inch that you add to the depth up to about 11 inches contributes more benefit, in safety performance, than do the inch increments beyond 11 inches (about 275 mm). This is one bit of evidence, among many for the 11-inch minimum.

Also very notable from Figure 2 is that 11 inches (about 275 mm) is not an "optimum" tread depth. That is not achieved until the tread depth is about 14 inches or 350 mm.

Benefits and Costs. Any analysis should address the lifetime benefits and costs, for some period like 50 years. First costs or even mortgage payments are not enough. The long-term costs of not building the house stairs properly—or, conversely, the benefits of building them properly, i.e., to the "7-11" standard—must be taken into account. This was done in 2003, for the ICC-IRC proposal on mainstreaming the "7-11" step geometry rule. Except for the $23,000 item, Table 2 is based on one of the tables from the detailed analysis by Pauls (2003).

Table 2. Values per new home, over a fifty-year period, 2000-2050 (with all costs and benefits expressed in constant year 2000 dollars). Unless noted, the stair step geometry (max. rise by min. tread depth) is 8 1/4 by 9, the step geometry demanded by NAHB.

Cost of new home stairs:	$800
Added cost if "7-11" stair geometry used:	$250-980
Medical care cost for new-stair related injuries:	$3,000
Comprehensive cost of new-stair related injuries:	$30,000
Benefit of injury reduction with "7-11"—at least:	$23,000
Usability benefit for all new-stair users(@$0.002/use):	$2,000
Total usability benefit for certain elderly users of new stairs with "7-11" step geometry:	$7,000

Note: The $800 base cost for home stairways came from data in a house building cost analysis published by NAHB (1999). Injury cost data come from world experts on this: Lawrence, et al. (1999).

Given current data on home stair falls, in relation to step geometry, changing home stair step geometry from what the builders provide to the "7-11"—at a per-home cost of about $1,000—would save at least $23,000 in comprehensive injury costs and provide $7,000 additional in usability benefit, per home, between 2000 and 2050.

Annual US, per capita, comprehensive costs of stair-related injuries are about $300—a grand total of $100 billion annually for all of US.

Concluding Comments. Along with fire sprinklers, improved stair step geometry and functional handrails are cost-effective, especially for our aging and less physically fit population. Each can ultimately save a few thousand lives per year, but better stairways impact a larger number of injuries than can fire sprinklers. Stairs have an ongoing normal use while sprinklers significantly reduce property loss. Fire services and other advocates for home sprinklers: your interests are well served by also advocating for improved home stairways.

Referring back to Figure 1 and Table 2, ICC members (who will be voting on comments such as this one) should ask the following questions. Do they want one of the legacies of the ICC to be the fact that during ICC's time of influence in the model code field in the USA, the number of home stair related injuries grew from five times those in all other settings to ten times those in all other settings. (Note that, according to the latest US injury statistics, homes are—overall—the site of about one-half of all injuries treated in hospital emergency departments. Thus stairs are in a different league in terms of their impact in home settings compared to all others. As indicated in the first four items in the list of five sets of factors affecting home stair-related injuries, the design, construction and regulation of home stairs are major factors in the heightened dangers with stairs in homes. ICC, through its code development process and through its strategic partnership with NAHB—the topic of the public hearing on February 12, 2010—is thus the number one suspect when blame is laid for the huge and growing toll of stair-related injuries, currently costing about 10 million dollars per hour for societal costs in the USA. Also, on the matter of costs and benefits, what other aspects of buildings provide the kind of benefit-cost ratios that we see for properly designed and constructed stairs (Table 2)? Clearly not the vast majority of issues that occupy ICC members in code-development hearings and in their day to day work in building regulation.

Finally, on the frequently made comment by IRC BE Committee members: "the 7 3/4 by 10 standard is a good one; let's stay with it." If it is so good why then has there never been a proposal, let alone a successful proposal to replace the "7-11" rule with the 7 3/4 by 10 rule? Also, for the NAHB members on the IRC BE Committee who claimed the 7 3/4 by 10 is a good standard; why does not the organization they represent then even allow its adoption at state and local level. Hypocrisy does not quite cover the nature of such comments coming from the organization that has done immense harm to home stair users for decades. Soon they will pay. Will ICC, as a Strategic Partner of NAHB pay also in dollars or credibility or both? That, fellow ICC members is something you should think about very carefully.

Final Action: AS AM AMPC____ D

E75-09/10, Part I

1009.4.5, 1009.4.5.1 (New), 1009.4.5.2 (New), 1009.4.5.3 (New) [IFC [B] 1009.4.5, 1009.4.5.1 (New), 1009.4.5.2 (New), 1009.4.5.3 (New)]

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

Proposed Change as Submitted

PART I – IBC MEANS OF EGRESS

Revise as follows:

1009.4.5 (IFC [B] 1009.4.5) Nosing and Riser Profile. The radius of curvature at the leading edge of the tread shall be not greater than $^{9}/_{16}$ inch (14.3 mm). Beveling of nosings shall not exceed $^{9}/_{16}$ inch (14.3 mm). Risers shall be ~~solid~~

~~and~~ vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.52 rad) from the vertical. ~~The leading edge (nosings) of treads shall project not more than 1 ¼ inches (32 mm) beyond the tread below and all projections of the leading edges shall be of uniform size, including the leading edge of the floor at the top of a flight.~~

~~Exceptions:~~

1. ~~Solid risers are not required for stairways that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).~~
2. ~~Solid risers are not required for occupancies in Group I-3 or in F, H and S occupancies other than areas accessible to the public. There are no restrictions on the size of the opening in the riser.~~
3. ~~Solid risers are not required for spiral stairways constructed in accordance with Section 1009.9.~~
4. ~~Solid risers are not required for alternating tread devices constructed in accordance with Section1009.10.~~

1009.4.5.1 (IFC [B] 1009.4.5.1) Nosing Projection Size. The leading edge (nosings) of treads shall project not more than 1 ¼ inches (32 mm) beyond the tread below.

1009.4.5.2 (IFC [B] 1009.4.5.2) Nosing Projection Uniformity. All nosing projections of the leading edges shall be of uniform size, including the projections of the nosings leading edge of the floor at the top of a flight.

1009.4.5.3 (IFC [B] 1009.4.5.3) Solid Risers. Risers shall be solid.

Exceptions:

1. Solid risers are not required for stairways that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).
2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas accessible to the public. There are no restrictions on the size of the opening in the riser.
3. Solid risers are not required for spiral stairways constructed in accordance with Section 1009.9.
4. Solid risers are not required for alternating tread devices constructed in accordance with Section 1009.10.

Reason: There is no technical change to the requirements in this proposal. It is a clarification of intent by separating out and labeling the separate issues of (1) nosing and riser profile or shape, (2) nosing projection size, (3) nosing projection uniformity, and (3) open risers. Based on evidence of poor compliance and inspection, it has been confusing for various topics to be lumped together in one long paragraph.

My special concern here is the apparent widespread failure to build and inspect stairs with regard to uniformity of nosing projection, especially at the top of stair flights. For this reason alone, it is important for this section—with a few topics in one paragraph—to be divided into smaller pieces dealing with a smaller set of issues. It appears that the nosing projection uniformity issue— particularly omitting the nosing projection on the landing nosing—might be mostly responsible for the rapid growth of what I refer to as "Excess Injuries" in Figure 1. Over the several years where these "Excess Injuries" have been seen in the CPSC-NEISS national estimates, there have been a total of about 2 million such "Excess Injuries" which have an associated annual societal cost in the USA of about $200 billion (yes, that is billion with a "b") with the medical care component of these "Excess Injuries" accounting for about $20 billion. (The substantial basis for these cost-of-injury estimates comes from the work of Lawrence, et al., 1999.)

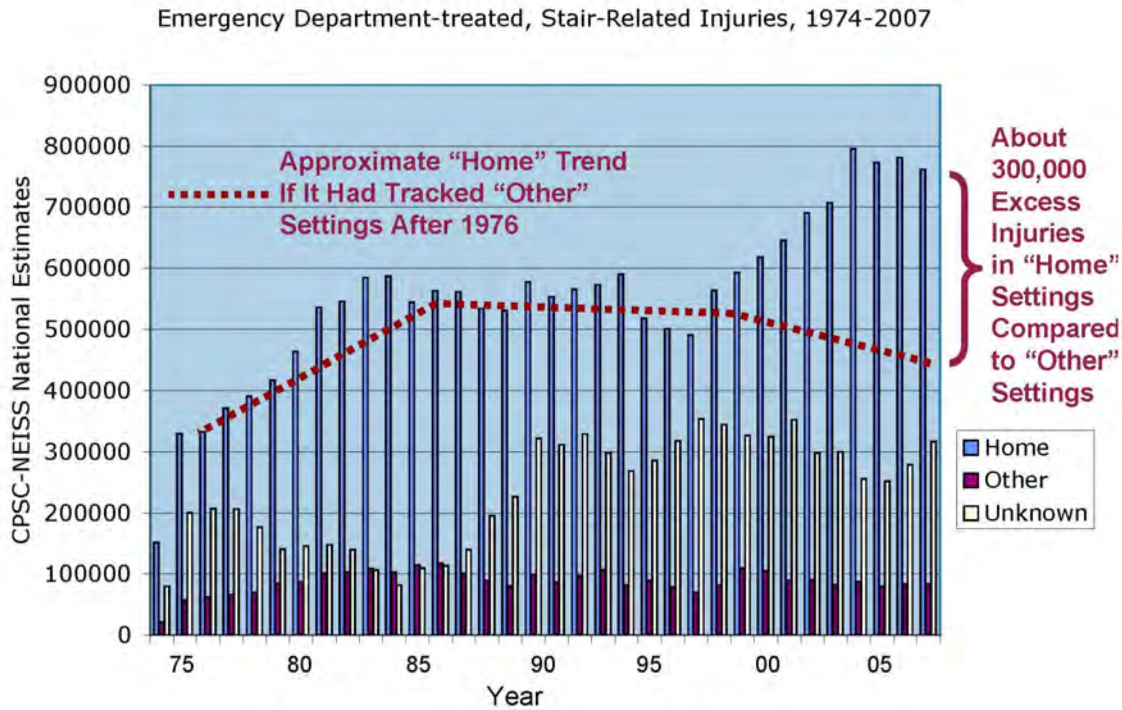

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years.

A far too common error in design and construction of stairways is the lack of attention to keeping all tread depths, especially the top one in a flight, uniform in size, particularly where projecting nosings are provided on a flight of stairs installed as a manufactured unit which does not include the top or landing nosing projection. Thus this is a dual issue of non-uniform tread depths and non-uniform nosing projections. ICC IRC guides for inspection and for the homebuilding industry (published by ICC in conjunction with NAHB) fail to even mention these two important IRC rules. These two ICC publications are listed in the Bibliography. Surely it is fairly strong evidence of a code inadequacy when even ICC experts apparently do not recognize the existence and importance of two rules governing the most potent of factors—step geometry uniformity—for the most dangerous product in homes and other buildings.

The resulting non-uniformities in tread depths, with a larger top tread followed by smaller treads in the flight make the stair flight orders of magnitude more dangerous for descent-direction users. This pervasive systemic defect has also become so concerning to leading stairway safety professionals such as myself that a special website page has been created simply to deal with this issue. See http://web.me.com/bldguse/Site/Stairways.html for information on this including the graph provided below as Figure 1 showing a large increase in the number of home stair-related injuries identified in the CPSC NEISS national estimates for the USA in the last several years. Excerpts of text from the Stairways website page are also quoted below as are excerpts from an American Society of Safety Engineers 2008 Professional Development Conference paper by Pauls and Harbuck. The full ASSE conference paper is freely accessible as a PDF download from the Downloads area of my website, http://web.me.com/bldguse/Site/Downloads.html. Generally, it is suspected that with recent greater use of manufactured stair flights, the incidence of systemic, top-of-flight non-uniformities has grown with resulting significant increases in home stair-related injuries.

On the Stairways website page, referenced above, is the following text and photograph (here identified as Figure 2) of a typical dwelling unit stairway with the systemic top-of-flight defect in nosing projection non-uniformity, the most common reason for the tread depth below the landing to be larger in size than the tread depths below it. Below Figure 2 is an additional photograph, Figure 3, showing what a stair flight looks like it very likely conforms to the uniformity requirements. The crouch-and-sight, visual test is helpful but is neither perfect nor quantitative; therefore, the stair geometry should be properly measured, at least at the top three steps, to confirm that there is not a rare coincidence of both larger tread depth and larger rise dimensions at the top step.

Figure 2. Typical Dwelling Unit Stairway with the Systemic, Top-of-Flight Defect.

Here follows the text from the website (http://web.me.com/bldguse/Site/Stairways.html) which has been publicly available since May 2009.

"While more investigation is required, it appears that a major reason for the recent 'excess' injuries related to home stairs might be a systemic defect on many home stairways (as well as some in other settings) in the USA and Canada. This defect is a non-uniformity of the nosing projection at the top of stair flights; due to the omission of a $10 nosing piece, at the landing level, at the time of stairway construction. This makes the top tread below the landing effectively larger than all the steps below it.

This common defect greatly increases the risk of an 'overstepping misstep' on the second or third step down the flight. Such missteps can lead to a very serious fall down the stair flight, with resulting injuries.

This is why we should now give our stairways 'a second look.' Specifically we should perform the simple 'crouch and sight' test. Do this from the landing above the stair flight you wish to check. Crouch down so you are able to see all the stair nosings (the leading edges) line up. If the top, landing nosing does not line up with all the other step nosings, your stair likely has the systemic defect. Here is a home stairway with the systemic defect."

The "Stairways" page of the website goes on to provide advice specifically for homeowners who perform the "crouch and sight" test and discover that their stairway has the systemic, top-of-flight defect.

"If your home stairway has this defect—which results from the non-uniformities of nosing projections and of what are called 'tread depth' or 'run' dimensions—and your home was recently constructed, call your local building inspection authorities and request that the stairway be re-inspected for building code compliance. Both the non-uniform nosing projection and the non-uniform tread depth or run are building code violations, for example under widely used codes in the USA.

If there has been a fall and significant injury on the non-uniform stair flight, you might also want to confer with an attorney (experienced in dealing with stair-related injury cases), especially if the home was recently constructed.

Much more information on this (and other) safety problems with stairways is found in the downloadable files associated with this website. See especially the latest papers and presentations by Jake Pauls on home stairways in the two most recently posted folders.

- Home Stairway Safety and Codes (Posted February 2009)
- Presentations at MUTN Conference in BC, Canada, April 2009

Also, in early summer 2009, watch this website for an announcement of the availability of an educational DVD package, based on the one-day workshop at the MUTN Conference in BC, Canada, in April 2009. (Contact Jake Pauls for purchase information.)"

Figure 3. Dwelling Unit Stair Very Likely Not Having the Systemic, Top-of-Flight Defect.

Any ICC chapter wishing to have their members participate in a one-day workshop (also slated for presentation in Eastern Canada on September 14, 2009) should contact Jake Pauls. It is available in a not-for-profit form. Code authorities should be prepared to deal knowledgeably with consumers who, upon discovering the systemic defect in their homes (after performing their own "crouch-and-sight" test), contact their local building department and ask for a re-inspection of their home stairways. If there has been an injurious fall on such a stairway they should also be prepared to deal with resulting legal actions that might name the local building department as a third party defendant. They should know how to perform the measurements of the stair step geometry that are of a quality expected in such litigation actions. These measurement techniques, usually requiring use of a spirit level or electronic level, are all described in the workshop materials posted on the above-mentioned website Downloads area and on the DVD of the Spring 2009 workshop noted above. These measurement techniques are consistent with the ICC requirements both as currently stated and as further clarified if this proposal is accepted.

In order to begin stopping all future misinterpretations of the IRC requirements for tread depth uniformity—and thus preventing many predictable and preventable missteps and falls (NOT "accidents" which are defined in the public health field as unpredictable and unpreventable events)—it is hoped that all code enforcement authorities heed very carefully the current and clarified requirements in IBC 109.4.5 (and1009.4.2) as well as R311.7.4.2 (and R311.7.4.3).

(Downloadable as file, "Pauls-Harbuck-ASSE-paper.pdf," from folder, "Home Stairway Safety and Codes," accessible from the Downloads area of http://web.me.com/bldguse/Site/Downloads.html.)

Cost Impact: The code change proposal will not increase the cost of construction as there is no technical change proposed. (The nosing piece required to comply with both the current code and the code as clarified by this proposal costs about $10 per home stair flight in terms of material, in oak, at retail level.)

ICCFILENAME: PAULS-E1-1009.4.5.1

Public Hearing Results

PART I IBC MEANS OF EGRESS
Committee Action: **Approved as Submitted**

Committee Reason: By breaking the current text into smaller sections the proposal clarifies the requirements for stair nosings and risers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consulting, representing Stairway Manufactures' Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1009.4.5 (IFC [B] 1009.4.5) Nosing and Riser ~~Profile~~ Cross Section. The ~~radius of~~ curvature or beveling of the nosing ~~at the leading edge of the tread shall be not greater than 9/16 inch (14.3 mm). Beveling of nosings~~ shall not exceed 9/16 inch (14.3 mm) from the leading edge. Risers shall be solid and vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.52 rad) from the vertical.

Exceptions:

1. Solid risers are not required for stairways that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).
2. Solid risers are not required for occupancies in Group I-3 or in F, H and S occupancies other than areas accessible to the public. There are no restrictions on the size of the opening in the riser.
3. Solid risers are not required for spiral stairways constructed in accordance with Section 1009.9.
4. Solid risers are not required for alternating tread devices constructed in accordance with Section 1009.10.

1009.4.5.1 (IFC [B] 1009.4.5.1) Nosing Projection Size. The leading edge (nosings) of treads shall project not more than 1 ¼ inches (32 mm) beyond the tread below.

1009.4.5.2 (IFC [B] 1009.4.5.2) Nosing Projection Uniformity. All nosing projections of the leading edges shall be of uniform size, including the projections of the nosings leading edge of the floor at the top of a flight.

~~**1009.4.5.3 (IFC [B] 1009.4.5.3) Solid Risers.** Risers shall be solid.~~

~~**Exceptions:**~~

1. ~~Solid risers are not required for stairways that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).~~
2. ~~Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas accessible to the public. There are no restrictions on the size of the opening in the riser.~~
3. ~~Solid risers are not required for spiral stairways constructed in accordance with Section 1009.9.~~
4. ~~Solid risers are not required for alternating tread devices constructed in accordance with Section 1009.10.~~

Commenter's Reason:
1. This modification to Part I changes the section title to use a term more appropriate to the content and technical language used in the code and by those persons and industries using the code.
2. The radius of the curvature has no effect on stair safety provided the point at which the curvature begins on the walking surfaces can be controlled. Please see the illustrated use of larger radii to provide a rounded nosing that is actually less intrusive on the walking surface of the tread. The control for beveling and curvature can in fact be one in the same there by simplifying the text. (See Figures 1 - 3 below)
3. There is no need to establish another section to regulate the properties of risers. An additional section will only cause confusion and misinterpretation. The solidity of the riser is a property of its cross section. Cross section is aptly part of the section title proposed. For this reason all related text and exceptions have been moved back into section 1009.4.5 where they should remain.
4. No comment is offered for E75 Part II because we support the IRC committee's reasons for disapproval of E75 Part II and approval as modified of RB46.

The Figures below show that larger radii can be safely allowed by regulating the extent of the curvature in the same way beveling is regulated.

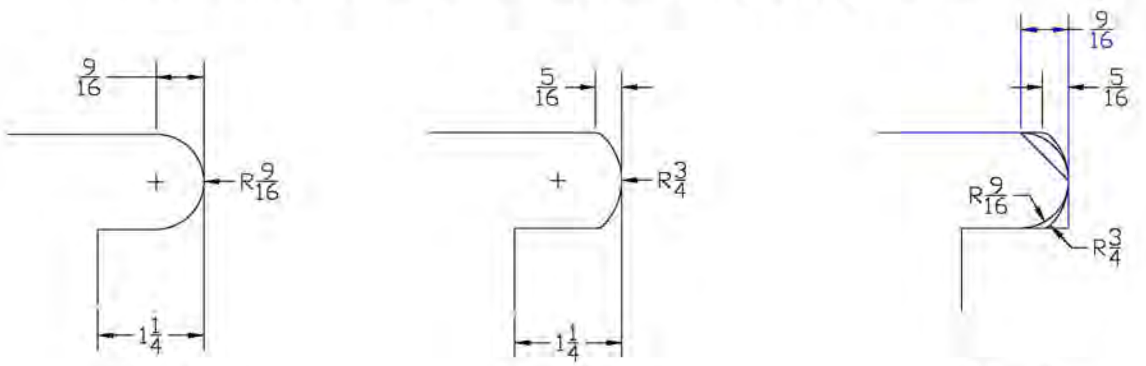

Figure 1 **Figure 2** **Figure 3**

Figure 1 illustrates the maximum radius at the nosing regulated by the current radius dimension

Figure 2 illustrates an alternate curvature or rounding using a radius larger than allowed.

Figure 3 illustrates the maximum beveling in blue in a composite with the nosings of figure 2 and 3.

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY- SEE ABOVE

E75-09/10, PART II – IRC

IRC R311.7.4.3, R311.7.4.3.1 (New), R311.7.4.3.2 (New), R311.7.4.3.3 (New)

PART II – IRC BUILDING/ENERGY

Revise as follows:

R311.7.4.3 Nosing and Riser Profile. The radius of curvature at the nosing shall be no greater than $^{9}/_{16}$ inch (14 mm). ~~A nosing not less than ¾ inch (19 mm) but not more than 1 ¼ inches (32 mm) shall be provided on stairways with solid risers. The greatest nosing projection shall not exceed the smallest nosing projection by more than $^{3}/_{8}$ inch (9.5 mm) between two stories, including the nosing at the level of floors and landings.~~ Beveling of nosings shall not exceed ½ inch (12.7 mm). Risers shall be vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.51 rad) from the vertical. ~~Open risers are permitted, provided that the opening between treads does not permit the passage of a 4-inch diameter (102 mm) sphere.~~

~~**Exceptions:**~~

1. ~~A nosing is not required where the tread depth is a minimum of 11 inches (279 mm).~~
2. ~~The opening between adjacent treads is not limited on stairs with a total rise of 30 inches (762 mm) or less.~~

R311.7.4.3.1 Nosing Projection Size. A nosing projection of not less than ¾ inch (19 mm) but not more than 1 ¼ inches (32 mm) shall be provided on stairways with solid risers.

Exception: A nosing projection is not required where the tread depth is a minimum of 11 inches (279 mm).

R311.7.4.3.2 Nosing Projection Uniformity. The greatest nosing projection shall not exceed the smallest nosing projection by more than $^{3}/_{8}$ inch (9.5 mm) within each flight of stairs, including the nosing at the level of floors and landings.

R311.7.4.3.3 Open Risers. Open risers are permitted, provided that the opening between treads does not permit the passage of a 4-inch

<u>diameter (102 mm) sphere.</u>

<u>Exception:</u> <u>The opening between adjacent treads is not limited on stairs with a total rise of 30 inches (762 mm) or less</u>.

Reason: See Part I-E75-09/10

Cost Impact: See Part I-E75-09/10

PART II- IRC B/E
Committee Action: **Disapproved**

Committee Reason: The committee feels the code already addresses this and it is an enforcement and education issue. There is a concern about correlation of this with the previous action on RB46-09/10. The committee suggests both parties work together and bring this back later.

Assembly Action: **None**

E77-09/10
1009.5 (IFC [B] 1009.5)

Proposed Change as Submitted

Proponent: Lee Kranz representing Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise text as follows:

1009.5 (IFC [B] 1009.5) Stairway Landings. There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall not be less than the width of stairways they serve. Every landing shall have a minimum dimension measured in the direction of travel equal to the width of the stairway. Such dimension need not exceed 48 inches (1219 mm) where the stairway has a straight run <u>or where a curved stairway has a continuous radius</u>. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. When wheelchair spaces are required on the stairway landing in accordance with Section 1007.6.1, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces.

Exception: Aisle stairs complying with Section 1028.

Reason: There are many curved or radius stairways that exceed the minimum required egress width. In those cases, to require the length of the landing in the direction of travel to be equal to the width of the stair is impractical and takes up valuable floor space. Per Section 1005.1, egress width must be maintained to the termination of the means of egress so changes in direction of the stair will not be allowed to be less than the width of the stair.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: KRANZ-E3-1009.5.DOC

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The term “continuous radius” is not clear and will lead to inconsistent interpretations.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consulting, representing Stairway Manufacturers' Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1009.5 (IFC [B] 1009.5) Stairway Landings. There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall not be less than the width of stairways they serve. Every landing shall have a minimum dimension measured in the direction of travel equal to the width of the stairway. Such dimension need not exceed 48 inches (1219 mm) where the stairway has a straight run~~ or where a curved stairway has a continuous radius~~. Where a curved stairway consists of flights connected by a landing of equal or larger radius in a continuous run rotating in the same direction the minimum dimension need not exceed 48 inches (1219 mm). Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. When wheelchair spaces are required on the stairway landing in accordance with Section 1007.6.1, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces.

Exception: Aisle stairs complying with Section 1028.

Commenter's Reason: This modification clarifies the original proponent's intent to provide for intermediate landings of reasonable size in curved stairways where changes in the direction of the user are controlled by the design of a consistent path of travel and thereby also addresses the committees concerns.

Final Action: AS AM AMPC____ D

E85-09/10
1009.13 (IFC [B] 1009.13)

Proposed Change as Submitted

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

1009.13 (IFC [B] 1009.13) Stairway to roof. In buildings four or more stories above grade plane, one stairway shall extend to the roof surface, unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope). In buildings four stories or more above grade plane, without an occupied roof, access to the roof from the top story shall be permitted to be by an alternating tread device or ladder.

Reason: The second sentence in Section 1009.13 isn't clear as to what it applies to; buildings four or more stories above grade plane, buildings of any height, or any building without an occupied roof? The proposed amendment clarifies the criteria to apply to buildings four stories above grade plane and having an unoccupied roof.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Collins-E4-1009.13

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: While ladder access may be a viable alternative for roof access, requirements for what type of ladder would be permitted are needed (i.e., fixed).

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consulting, representing Stairway Manufacturers' Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1009.13 (IFC [B] 1009.13) Stairway to roof. In buildings four or more stories above grade plane, one stairway shall extend to the roof surface, unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope). In buildings four stories or more above grade plane, without an occupied roof, access to the roof from the top story shall be permitted to be by an alternating tread device or ship ladder.

Commenter's Reason: The modification addresses the committee's concern in define what type of ladder. Ship ladders are regulated by Section 1009.11 Ship ladders.

Final Action: AS AM AMPC____ D

E86-09/10
1009.13 (IFC [B] 1009.13)

Proposed Change as Submitted

Proponent: J. Nigel Ellis, Ph.D., PE, Ellis Fall Safety Solutions, LLC

Revise as follows:

1009.13 (IFC [B] 1009.13) Stairway to roof. In buildings four or more stories above grade plane, one stairway shall extend to the roof surface, unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope). In buildings without an occupied roof, access to the roof from the top story shall be permitted to be by an alternating tread device. <u>Hatch openings shall be provided with a means to facilitate access and exit such as ladder grab bars that can be grasped by the climber. Ladder grab bars shall be elevated above the roof and horizontally arranged in a uniform manner.</u>

Reason: The code is presently silent on roof hatch fall hazards.

To avoid necessity for crouching to stabilize balance before entering the roof hatch or to reduce the incidence of tripping on the curb before descending, he externally mounted grab bars can be reached without stooping to permit access or bodily turn around with reduced falling hazard; such fall hazard can be up to 30 ft. in some mental buildings with highly injurious or fatal consequences.

The requirement would also apply to fixed ladder roof hatch access where exemptions to the IBC Code are permitted.

ANSI A14.3 – 2008 Section 5.3.4.3 states the following: "5.3.4.3 Hatch opening shall be provided with a means to facilitate access and exit from a fixed ladder (i.e, grab bars or other such items that can be grasped by the climber."

The University of Michigan Biomechanics Laboratory research report 4/08 financed by NIOSH (awarded by The Center to Protect Worker' Rights) supports the selection of effective horizontal grab bars over ineffective vertical grab bars. NIOSH/CDC is the National Institute of Occupational Safety & Health/Center for Disease Control.

A picture of ladder grab bars for roof hatch access is attached for a commercial building roof hatch. Ladder grab bars have been recognized for decades in industry by OSHA and ANSI known simply as "grab bars". Since 1971, OSHA 1910.27(b)(5) and (d)(4) only has "grab bars" in mind for fixed ladders which are typically 12 inches long, one inch diameter, bolted or welded at each end and 1.5-4" space to grab where a fixed ladder is used. I am proposing that these ladder grab bars only be placed horizontally. Side rails are always vertically arranged which when grasped is a hazard when you fall more than approx. six inches because the hand slides as shown in the University of Michigan ladder report which I submitted electronically to ICC with the file name UM_CPWR_Final1.pdf and can be viewed on the FallSafety.com website under Ladder Improvements. CPWR (Center for Protection of Worker Rights) dispenses NIOSH grants for research. Another reference is the US Corps of Engineers EM385-1-1 (2003) (mandatory) Appendix Fixed Ladder and Stairs J3(h) "Openings shall be provided with elevated horizontal grab bars to facilitate access and exit from upper levels", J4(d) Horizontal grab bars shall be provided to facilitate grip in case of a fall".

I also understand the use of the term "grab bar" since 1990 approx. for bathroom safety rails in the building code and to which no reference is made in this proposal.

ANSI (American National Standards Institute) has used the term "grab bars" for ladder holding stability (when rungs and side rails were not available) since 1956 in the A14.3 fixed ladder standard, as defined in section 2 as follows:
"2.14 Grab Bars are individual handholds placed adjacent to or as an extension above ladders for the purpose of providing access beyond the limits of the ladder"

Fixed ladder grab bars are addressed in <u>proposed</u> OSHA standard 1910.23(c)(21), and alternating tread type stairs are addressed in ANSI A1264.1-2007 section 6 and also <u>proposed</u> OSHA Standard 1910.25(f) and Fig. D3 (4 10 90). OSHA/DOL is the Occupational Safety & Health Administration/Department of Labor.

Horizontal grab bars can be attached by bolting or welding to protective guardrails arranged around roof openings for access to and from alternating tread devices and fixed ladders. More information on www.FallSafety.com Ladder Improvements related to ladder horizontal grab bars.

Cost Impact: Roof Hatch grab bars permanently installed approximately $320 cost and four bolt holes to drill for installation. Where guardrails are added around the roof hatch, the total system costs approximately $1300 before installation.

ICCFILENAME:Ellis-E1-1009.12

Public Hearing Results

Committee Action: Disapproved

Committee Reason: While this safety issue for hatch access on a roof should be addressed, for consistent enforcement additional information is needed for height and attachment of the handholds. Perhaps this would be better located in the International Mechanical Code of International Plumbing Code since this deals with unoccupied roofs.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

J. Nigel Ellis, Ph.D., PE, representing Ellis Fall Safety Solutions, LLC, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

<u>**1009.13.3 Roof hatch grab bars.** Roof hatch openings shall be provided with a means to facilitate access and exit such as grab bars that can be grasped by the climber. Grab bars shall be one inch in diameter and elevated up to 3.5 feet above the roof and horizontally arranged in a uniform manner passed which the access is made.</u>

Commenter's Reason: The code is presently silent on roof hatch fall hazards. Roof maintenance by the owner is anticipated along with periodic contractor visits accompanied by the owner's escort over the life of the building making the IBC the correct location for the wording.

To avoid necessity for crouching to stabilize balance before entering the roof hatch or to reduce the incidence of tripping on the curb before descending, the externally mounted elevated grab bars can be reached and held firmly, without the present curb nipping hazard, to grasp and permit stepping access and/or bodily turn-around with reduced falling hazard; such fall hazard can be up to 30 ft. in some buildings with highly injurious or fatal consequences. Alternatively, grab bars may be part of a hatch opening guard system bolted to the curb.

The requirement would also apply to fixed ladder roof hatch access and where exemptions to the IBC Code are permitted.

ANSI A14.3 – 2008 Section 5.3.4.3 states the following: "5.3.4.3 Hatch opening shall be provided with a means to facilitate access and exit from a fixed ladder i.e. grab bars or other such items that can be grasped by the climber".

Horizontal Grab Bars: A peer-reviewed article in Human Factors & Ergonomics Journal published October 2009 entitled "Hand-Handhold Coupling: Effect of Handle Shape, Orientation and Friction on Breakaway Strength" can be viewed on www.FallSafety.com "Ladder Improvements" showing the ineffective use of vertical grab bars in controlling a fall, and the successful use of horizontal grab bars during a free fall.

Two pictures of alternative horizontal grab bars for roof hatch access are attached for a commercial building roof hatch. Ladder grab bars have been recognized for decades in industry by OSHA and ANSI known simply as "grab bars". Since 1971, OSHA 1910.27(b)(5) and (d)(4) only has "grab bars" in mind for fixed ladders which are typically 12 inches long, ¾" - one inch diameter, bolted or welded at each end and 1.5-4" space to grab where a fixed ladder is used. I am proposing that these ladder grab bars only be placed horizontally above each other spaced one foot apart as is found on a ladder. Side rails are always vertically arranged which when grasped is a hazard when you fall more than approx. six inches because the hand slides as shown in the University of Michigan ladder report UM_CPWR_Final1.pdf. CPWR (Center for Protection of Worker Rights) dispenses NIOSH grants for research. Another reference is the US Corps of Engineers EM385-1-1 (2003) (mandatory) Appendix Fixed Ladder and

Stairs J3(h) “Openings shall be provided with elevated horizontal grab bars to facilitate access and exit from upper levels”, J4(d) Horizontal grab bars shall be provided to facilitate grip in case of a fall”.

I also understand the use of the term “grab bar” since 1990 approx. for bathroom safety rails in the building code and to which no reference is made in this proposal.

ANSI (American National Standards Institute) has used the term “grab bars” for ladder holding stability (when rungs and side rails were not available) since 1956 in the A14.3 fixed ladder standard, as defined in section 2 as follows: "2.14 Grab Bars are individual handholds placed adjacent to or as an extension above ladders for the purpose of providing access beyond the limits of the ladder", and “6.3 shall extend at least 3ft 6 inches above the access/egress level” and “6.4 Grab Bar diameters shall be the equivalent of ladder round-rung diameters”

Fixed ladder grab bars are addressed in proposed OSHA standard 1910.23(c)(21), and alternating tread type stairs are addressed in ANSI A1264.1-2007 section 6 and also proposed OSHA Standard 1910.25(f) and Fig. D3 (4 10 90). OSHA/DOL is the Occupational Safety & Health Administration/Department of Labor.

Horizontal grab bars can be part of protective guardrails arranged around the roof opening for access to and from the alternating tread device or fixed ladder. See examples below.

Final Action: AS AM AMPC____ D

E87-09/10
1010.1 (IFC [B] 1010.1)

Proposed Change as Submitted

Proponent: Jon Siu, City of Seattle, representing Washington Association of Building Officials Technical Code Development Committee

Revise as follows:

1010.1 (IFC [B] 1010.1) Scope. The provisions of this section shall apply to ramps used as a component of a means of egress.

Exceptions:

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2 through 1108.2.4 and 1108.2.6, ramped aisles within assembly rooms or spaces shall conform with the provisions in Section 1028.11.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections 1010.3 through 1010.9 when they are not an accessible route serving accessible parking spaces~~,~~ or other required accessible elements ~~or part of an accessible means of egress~~.
4. In a parking garage where one accessible means of egress serving accessible parking spaces or other accessible elements is provided, a second accessible means of egress serving that area shall be permitted to include a vehicle ramp that does not comply with Sections 1010.4 through 1010.8.

Reason: This proposal solves a practical problem with current code language. In parking garages where parking is provided on the ramps, the accessible parking spaces are usually located on flat areas at the ends of the ramps. One accessible means of egress can usually be easily provided on the flat portion of the garage ramp. However, many times the second required means of egress is provided at the other end or at the center of the garage, and is accessed via the vehicle ramp. While the ramp may be able to provide the correct slope to provide the second accessible means of egress from the accessible parking spaces (1 vertical in 12 horizontal), it is impractical in these types of garages to provide features such as handrails on both sides of the ramp, or to provide a landing for every 30 inches of rise.

The proposed text is modeled on Section 1010.1 exception 3, which allows the deletion of the some provisions for vehicle ramps used as exit access for pedestrians. However, because the ramp still needs to be used as an accessible means of egress, it is necessary to maintain a usable cross-slope (Section 1010.3). In addition, protection at the edges of the ramp should still be provided where the accessible means of egress is along the edge of the vehicle ramp (Section 1010.9). On the other hand, if the accessible means of egress is not near the edge of the vehicle ramp (the most likely scenario), Section 1010.9, Exception 1 can be used to eliminate the edge protection, since the requirement for 1:10 sloped “flares” will easily be met.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: SIU-E1-1010.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: This is a design issue for the accessible level. There are concerns for the cross slope and lack of landings for an accessible means of egress route.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler representing City of Seattle Dept. of Planning & Development, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1010.1 (IFC [B] 1010.1) Scope. The provisions of this section shall apply to ramps used as a component of a means of egress.

Exceptions:

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2 through 1108.2.4 and 1108.2.6, ramped aisles within assembly rooms or spaces shall conform with the provisions in Section 1028.11.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections 1010.3 through 1010.9 when they are not an accessible route serving accessible parking spaces, or other required accessible elements.
4. In a parking garage where one accessible means of egress serving accessible parking spaces or other accessible elements is provided, a second accessible means of egress serving that area shall be permitted to include a vehicle ramp that does not comply with Sections 1010.4, 1010.5, ~~through~~ and 1010.8.

Commenter's Reason: The original proposal was submitted to solve a practical problem with parking garages where parking is provided on the ramps. The accessible parking spaces are usually located on flat areas at the ends of the ramps, so that one accessible means of egress can usually be easily provided on the flat portion of the garage ramp. The problem is that many times the second required means of egress must be accessed via the vehicle ramp. It is often impractical in these types of garages to provide features such as handrails on both sides of the ramp.

The Code Development Committee disapproved the proposal due to concerns for the cross slope and lack of landings for an accessible means of egress route. To address that concern, the proposal is modified to eliminate only the requirements related to vertical rise between landings and handrails. The revised proposal requires landings wherever there is a change in direction on the ramp because Section 1010.6 is not part of the exception.

Final Action: AS AM AMPC____ D

E90-09/10
1011.2 (New) [IFC [B] 1011.2 (New)]

Proposed Change as Submitted

Proponent: Donald LeBrun, CBO, State of Indiana, Fire & Building Safety, representing Indiana Association of Building Officials

Add new text as follows:

1011.2 (IFC [B] 1011.2) Location. When exit signs are mounted on the same vertical plane as the exit or exit-access door served the sign shall be centered above the door with the bottom of the sign no more than 12 inches (305 mm) above the door leaf. Other exit signs used to direct persons to the exit or exit-access door shall be no higher than 10 feet (3.05 m) above the finish floor.

(Renumber subsequent sections)

Reason: Currently we have no direction as to where exit signs should be located. With the higher ceilings being used in more structures we are finding exit signs being mounted well above the exit served, sometimes as much as 25 feet above the door. In an emergency situation people will seek exiting information at their eye level and never see the exit sign 20 feet above their heads. Mounting exit signs at the proposed levels would greatly increase the visibility and effectiveness of the exit signs.

Cost Impact: This proposal will not increase the cost of construction

ICCFILENAME:Lebrun-E1-1011.2

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: This would be a conflict in industrial facilities where high ceilings are needed to move equipment or to signs are located high in order to see them over obstructions. The proponent may choose to narrow this down to certain occupancies where high ceilings are found but clearances are needed (i.e., restaurants).

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

George Kellogg, Rocklin, CA, representing Sacramento Valley Association of Building Officials, requests Approval as Submitted.

Commenter's Reason: This proposal does not appear to conflict with high ceilings in industrial facilities as they can be suspended from the ceiling, mounted on the wall above the door or near the floor. The proposal is needed in large commercial and assembly properties where display walls can cause exiting confusion, making the exits difficult to identify. With clearer exit signage, life/safety can be improved in large and confusing occupancies.

Public Comment 2:

Donald LeBrun, Indianapolis, IN, representing Indiana Association of Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1011.2 (IFC [B] 1011.2) Location in Groups A, B, E, I, M and R. In Groups A, B, E, I, M and R, when exit signs are mounted on the same vertical plane as the exit or exit-access door served the sign shall be centered above the door with the bottom of the sign no more than 12 inches (305 mm) above the door leaf. Other exit signs used to direct persons to the exit or exit-access door shall be no higher than 10 feet (3.05 m) above the finish floor.

Commenter's Reason: This proposal does not appear to conflict with high ceilings in industrial facilities as they can be suspended from the ceiling, mounted on the wall above the door or near the floor. The proposal is needed in large commercial and assembly properties where display walls can cause exiting confusion, making the exits difficult to identify. With clearer exit signage, life/safety can be improved in large and confusing occupancies.

Final Action: AS AM AMPC____ D

E91-09/10
1011.2 (New) [IFC [B] 1011.2 (New)]

Proposed Change as Submitted

Proponent: Donald LeBrun, CBO, State of Indiana, Fire & Building Safety, representing Indiana Association of Building Officials

Add new text as follows:

1011.2 (IFC [B] 1022.1) Floor-level exit signs in Group R-1. Where exit signs are required by Section 1011.1, additional low-level exit signs shall be provided in all corridors serving guest rooms in Group R-1 occupancies.

The bottom of such sign shall be not less than 6 inches (152mm) nor more than 8 inches (203mm) above the floor level. For exit and exit-access doors, the sign shall be on the door or adjacent to the door with the closest edge of the sign within 4 inches (102 mm) of the door frame.

(Renumber subsequent sections)

Reason: This proposal is specifically intended for use group R-1 occupancies where the occupants are transient and not familiar with their surroundings. The current practice of installing exit signs above the heads of most people works well except in a smoke filled space which often accompanies a fire situation. As the space fills with smoke the effectiveness of the high level exit signage diminishes forcing evacuees to crawl on the floor to reach the nearest exit. The installation of these low level will greatly assist these persons in safely exiting the structure.

Cost Impact: This proposal will increase the cost of construction

ICCFILENAME:Lebrun-E2-1011.2

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Technical justification was not provided to indicate how these floor exit signs would assist exiting in Hotels. If there is smoke in the corridor, the proper approach in a hotel room is to close the door and wait for assisted rescue, not to crawl to the exit or try and make it past the fire. The geometry indicating locations may be a conflict with other parts of the codes (i.e., minimum bottom rails on accessible door). There needs to be UL requirements for these signs. If this is an issue for hotels, it should include Group R-2 transient as well as Group R-1.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Donald LeBrun, Indianapolis, IN, representing the Indiana Association of Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1011.2 (IFC [B] 1022.1) Floor-level exit signs in Group R-1. Where exit signs are required in Group R-1 by Section 1011.1, additional low-level exit signs shall be provided in all ~~corridors~~ areas serving guest rooms in Group R-1 occupancies and shall comply with Section 1011.4.

The bottom of the ~~such~~ sign shall be not less than ~~6~~ 10 inches (~~152~~ 254 mm) nor more than ~~8~~ 12 inches (~~203~~ 305 mm) above the floor level. The sign shall be flush mounted to the door or wall. When mounted on the wall, the edge of the sign shall be within 4 inches (102 mm) of the door frame on the latch side. ~~For exit and exit-access doors, the sign shall be on the door or adjacent to the door with the closest edge of the sign within 4 inches (102 mm) of the door frame.~~

Commenter's Reason: The Means of Egress Committee voiced four comments to the original proposal:

1. That the transient uses in Group R-2 should be included in this proposal.
2. That the proposed mounting heights may allow damage to the signs from wheelchairs.
3. That hotel room occupants should stay in their rooms and await rescue.
4. That a standard needed to be brought forward for these signs.

This proposal was specifically intended for Group R-1 occupancies where the occupants are transient and not familiar with their surroundings. As there are no transient uses in Group R-2, we have not added that group to this proposal. While we agree that the Group R-2 should be included, it is not for the committee's reason and feel that staying with the Group R-1 is more appropriate at this time.

The mounting heights prescribed in this proposal have been increased slightly to take into account the heights of kick plates as well as wheelchair foot rests and push bars.

The statement by the committee is that people should stay in their rooms and await rescue is well and good in theory. However, it does not serve to model real life. The first thing people try to do in a fire situation is to get out of the building. Over the years, thousands have died from smoke inhalation while attempting to flee the burning building.

A reference to Underwriters Laboratory Standard UL 924, Standard for Emergency Lighting and Power Equipment, has been added by the reference to Section 1011.4. This standard is already reference in Section 1011.4 and is included in Chapter 35. This is similar to the language for low level exit signs in special amusement buildings in Section 411.7.

The current practice of installing exit signs above the door frames works well except in the smoke filled spaces which occur in a fire situation. The effectiveness of these high level signs is lost when the smoke layer develops at the ceiling. As the space fills with smoke the evacuees are forced to crawl on the floor to reach the nearest exit. They will be confronted with many doors, all looking the same and will not know which is really the exit door. The installation of these low level exit signs will greatly assist these persons in safely exiting the building.

Additionally, these low level exit signs will serve to increase firefighter safety while on the fire scene. In their efforts to evacuate the occupants the firefighters will be in that smoke filled hallway. They may also become dependent upon this low level signage while trying to locate the doors to the stair tower and safely egress the fire floor.

Final Action: AS AM AMPC____ D

E95-09/10
1012.2 (IFC [B] 1012.2)

<u>Proposed Change as Submitted</u>

Proponent: Kenneth F. Traugott, NVR, Inc, representing self

Revise as follows:

1012.2 (IFC [B] 1012.2) Height. Handrail height, measured above stair tread nosings, or finish surface of ramp slope shall be uniform, not less than 34 inches (864 mm) and not more than 38 inches (965 mm). Handrail height of alternating tread devices and ship ladders, measured above tread nosings, shall be uniform, not less than 30 inches (762 mm) and not more than 34 inches (864 mm).

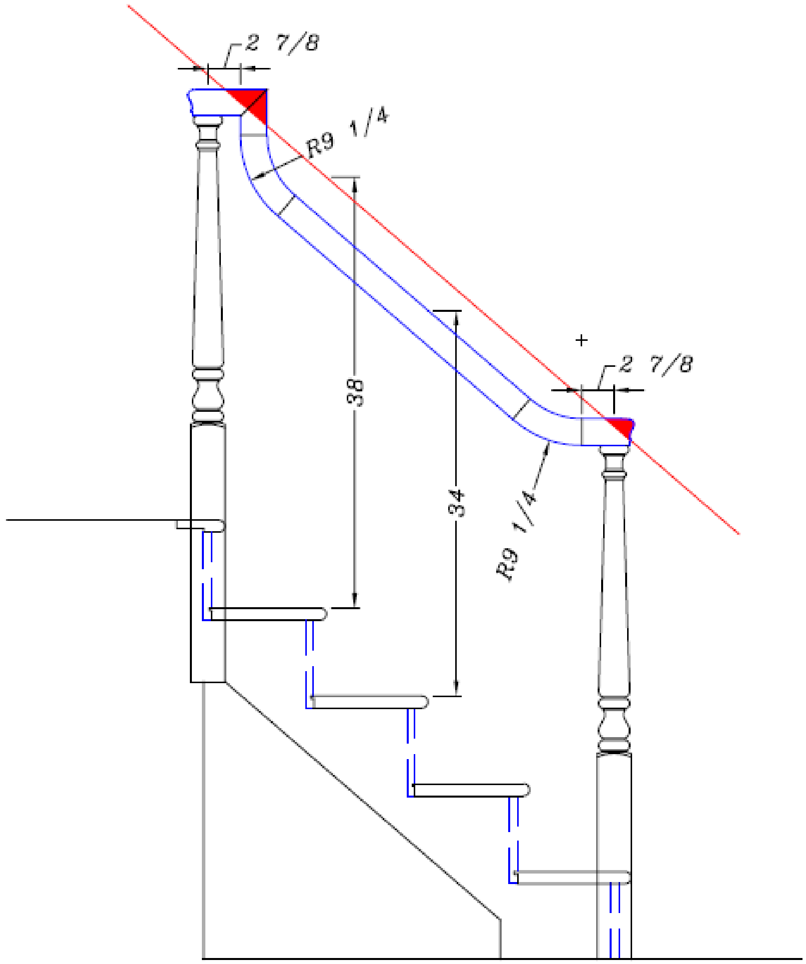
> <u>**Exception:** In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are associated with a Group R-3 occupancy or associated with individual dwelling units in Group R-2 occupancies; when handrail fittings or bendings are used to provide continuous transition between flights, transition at winder treads, transition from handrail to guard, or when used at the start of a flight, the handrail height at the fittings or bendings shall be permitted to exceed the maximum height.</u>

Reason: The above information is being requested to clarify the Code. Fittings such as easings and gooseneck risers are commonly used features intended to provide rail continuity at locations where a straight transition is not possible. Incorporating such features is consistent with the provisions of IBC Section 1012.4 (Continuity) and with standard architectural and construction practice.

The intent of the Code is that the provisions of Section 1012.3 be applied only over the stair run, and not at landings. The handrail height requirements are applicable over the stairway run, not at landings. The height of the handrail, when it doglegs or u-turns over a landing, will vary so that the handrail can remain continuous in accordance with Section 1012.4 and 1012.5. The handrail extensions at the end must also meet the protruding object provisions if they return to a support post (Section 1003.3.2 and 1012.5).

Unfortunately, the current wording of the Code, although it does indicate that height requirements should be "measured above stair tread nosings," does not clearly state that the height requirements do not apply over landings, at winder treads, where handrails meet a guardrail, or when used at the start of a flight. Inspectors, plan reviewers, and other building code officials in many jurisdictions are currently not accepting handrail fittings such as easings or gooseneck risers which are provided to maintain continuity.

This would be consistent with the provisions in the International Residential Code, Section R311.7.7.1, Exp. 2.



Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Lebrun-E2-1011.2

Public Hearing Results

Committee Action: Disapproved

Committee Reason: Goosenecks portions of the handrails (as illustrated in the proponent's reason statement) can result in a vertical handhold on the railing which can be a safety issue for occupants using that portion of the handrail.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consulting, representing Stairway Manufacturers' Association, requests Approval as Submitted.

Commenter's Reason: The fittings and bendings noted in the exception are already permitted in Section 1012.4 Continuity. This new exception only applies to residential applications and is equivalent to the IRC in R311.7.7.1 Handrail height, thus providing for consistent interpretation of the codes. This exception allows the cost effective use of stock fittings as opposed to hand carving custom wreaths and or fabrication of custom bends. What the committee did not understand is this exception only applies when a continuous transition is made and provides an additional margin of safety than the alternative interruption of the rail by a newel at these same locations as specified in Section 1012.4 Continuity.

Final Action: AS AM AMPC____ D

E100-09/10, Part I
1002.1, 1013.2 (IFC [B] 1002.1, 1013.2)

Proposed Change as Submitted

PART I – IBC MEANS OF EGRESS

1. Add new definition as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

FIXED SEATING. Furniture or fixture designed and installed for the use of sitting and secured in place including bench-type seats and seats with or without back or arm rests.

2. Revise as follows:

1013.2 (IFC [B] 1013.2) Height. Required guards shall not be less than 42 inches (1067 mm) high, measured vertically ~~above the~~ as follows:

1. From the adjacent walking surfaces;
2. From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches of a required guard, the guard height shall provide a minimum 42 inches measured diagonally between the top of the guard and the nearest edge of the seat surface; ~~or~~
3. On stairs, from the line connecting the leading edges of the tread ~~treads~~ nosings; and
4. On ramps, from the ramp surface at the guard.

Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the *guard* also serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall not be less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
3. The guard height in front row assembly seating areas complying ~~shall be in accordance~~ with Section 1028.14.
4. Along *alternating tread devices* and ship ladders, *guards* whose top rail also serves as a *handrail*, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread *nosing*.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Climbable Guards". The scope of the activity is noted as:

The study of climbable guards will focus on determining the need for appropriate measures to prevent or inhibit an individual from utilizing the elements of a guard system, including rails, balusters and ornamental patterns, to climb the guard, thereby subjecting that person to the falling hazard which the guard system is intended to prevent.

The purposes of this proposal are to address several items raised last cycle during consideration of code change E85-07/08 which was approved. In particular, this proposal clarifies what constitutes "fixed seating" and proposes a horizontal distance between an object that reduces the "effective" height of a required guard rather than placing total reliance on the term "adjacent".

Definition: The definition of "fixed seating" provides for a common understanding where the term is used. This was a concern that was raised in Public Comment #2 to E85 which was not successful.

Item #2: The concern addressed in this revision is that of fixed seating, with or without arm rests and with or without back rests including bench seating located within 22" of the guard. This seating provides a potential standing surface which as a result reduces the effective height of the guard. For seating within 22" of the guard, the guard height is to be measured diagonally from the nearest edge of the seat to the top of the guard. This measurement method is currently utilized in Section 1028.14.3. The guard would be required to extend past the "last" seat in a row so that the guard top is 42" above the edge of the last seat.

The distance of 22" utilized in this exception has been determined by CTC to be a reasonable distance for the purpose described.

Item #3: The current text is modified to indicate that the line is to be between the tread nosings. In the case of a single riser, hence a single nosing, a minimum tread depth of 11 inches on the lower walking surface establishes the slope.

Item #4: The guard height at the edge of a ramp is to be measured at the guard without consideration for the ramp slope as the dimensional change in the guard height is relatively insignificant. With a ramp slope towards the guard of 1/12, the highest point 22" from the guard is 1.83 inches above the ramp surface at the guard. If the ramp slope is 1/8, at 22" from the guard, the ramp surface is 2.75 inches above the ramp surface at the guard.

IBC Exception **3:** The provisions for guard reduction for front row seating are primarily intended to accommodate the sight line for seated occupants- see section 1028.14.2. The seating within 22 inches of the guards elsewhere would necessitate an increase in the required guard height as indicated in **Item #2.**

ICCFILENAME:Heilstedt-E3-1013.2

Public Hearing Results

PART I IBC MEANS OF EGRESS
Committee Action: Disapproved

Committee Reason: In Section 1013.2, Item 2, there was no substantiation for the 22 inch separation between the fixed seating and the guard. The task force needs to work with experts in assembly seating. The front row concept does not address all the issues for the line of site in venues such as sports stadiums where the event is over the field and not a point.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC); Ed Roether, representing Populous (Formerly HOK Sport Venue Event) requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1013.2 (IFC [B] 1013.2) Height. Required guards shall not be less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces;
2. From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches <u>measured horizontally</u> of a required guard, the guard height shall provide a minimum 42 inches measured diagonally between the top of the guard and the nearest edge of the seat surface;
3. On stairs, from the line connecting the leading edges of the tread nosings; and
4. On ramps, from the ramp surface at the guard.

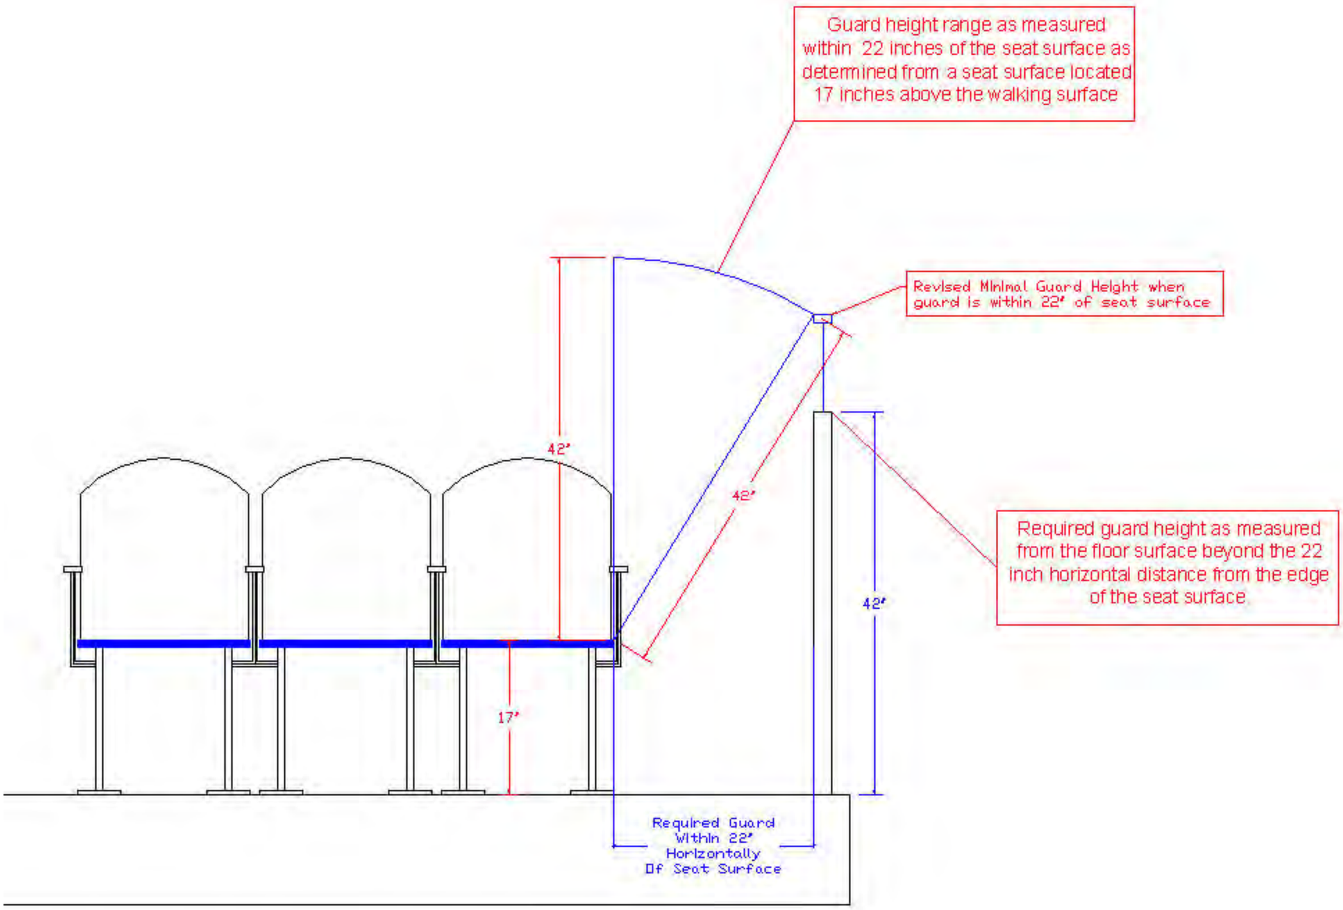
Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the *guard* also serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall not be less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
3. The guard height in ~~front row~~ assembly seating areas ~~complying~~ <u>shall comply</u> with Section 1028.14.
4. Along *alternating tread devices* and ship ladders, *guards* whose top rail also serves as a *handrail*, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread *nosing*.

Commenter's Reason: As noted by the code committee, there was some confusion as to how to make the measurements as well as the need to coordinate these changes with experts in assembly seating. In response, the CTC has partnered with the proponent of code change E147 who is an expert in assembly seating. Further, the CTC provides the following illustrations which show the relationship between the height of the guard and its proximity to the seating surface. This comment should be considered with E147.

If the code change is approved, the illustrations is intended to be added to the IBC Commentaries. The following illustrates the applications of the code requirements:

Elevation view of individual seat configuration, IBC Section 1013.2, Item 2:



Public Comment 2:

Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1013.2 (IFC [B] 1013.2) Height. Required guards shall not be less than 42 inches (1067 mm) high, measured vertically above the as follows:

1. From the adjacent walking surfaces;
~~2.~~ ~~From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches of a required guard, the guard height shall provide a minimum 42 inches measured diagonally between the top of the guard and the nearest edge of the seat surface or~~
~~3.~~ 2. On stairs, from the line connecting the leading edges of the tread nosings; and
~~4.~~ 3. On ramps, from the ramp surface at the guard.

Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the *guard* also serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall not be less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
3. The guard height in ~~front row~~ assembly seating areas complying shall be in accordance with Section 1028.14.
4. Along *alternating tread devices* and ship ladders, *guards* whose top rail also serves as a *handrail*, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread *nosing*.

Commenter's Reason: When jurisdictions start adopting the 2009 edition and see the fixed seating requirement, they cringe at the enforcement issues surrounding the guard that would now be 5 feet tall in areas that the a bench or some type of seating surface is attached to the floor. Just because a seat is "fixed" doesn't mean that it is permanent. What happens when the seating is relocated later? Does the guard at the new location need to be increased to 60 inches above the floor? How will the guard at the old location look without the seating? This requirement is unenforceable.

The committees noted that the proposed language needs additional work for the assembly seating requirements. The current language in Section 1028 adequately covers the requirements for guards in assembly spaces. We do not need to revise those requirements. This comment deletes the restriction to the front row assembly seating and addresses all assembly seating in exception 3.

The addition of the fixed seating guards in the 2009 IBC was over restrictive. Whether a seating surface is fixed or movable, a child can still climb over the guard and fall. In fact, children can climb over guards when there is no seating adjacent to a guard. The code cannot be written to protect everyone. We must draw the line at some point and this requirement crossed that line.

Final Action: AS AM AMPC____ D

E100-09/10, Part II

IRC R202, R312.2

Proposed Change as Submitted

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

SECTION R202
DEFINITIONS

FIXED SEATING. Furniture or fixture designed and installed for the use of sitting and secured in place including bench-type seats and seats with or without back or arm rests.

2. Revise as follows:

R312.2 Height. Required guards at open-sided walking surfaces, including stairs, porches, balconies or landings, shall be not less than 36 inches high measured vertically ~~above the~~ as follows:

1. From the adjacent walking surface;
2. From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches of the required guard, the guard height shall provide a minimum 36 inches measured diagonally between the top of the guard and the nearest edge of the seat surface ~~or~~;
3. On stairs, from the line connecting the leading edges of the tread ~~treads~~ nosings; and
4. On ramps, from the ramp surface at the guard.

Exceptions:

1. Guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. Where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Climbable Guards". The scope of the activity is noted as:

The study of climbable guards will focus on determining the need for appropriate measures to prevent or inhibit an individual from utilizing the elements of a guard system, including rails, balusters and ornamental patterns, to climb the guard, thereby subjecting that person to the falling hazard which the guard system is intended to prevent.

The purposes of this proposal are to address several items raised last cycle during consideration of code change E85-07/08 which was approved. In particular, this proposal clarifies what constitutes "fixed seating" and proposes a horizontal distance between an object that reduces the "effective" height of a required guard rather than placing total reliance on the term "adjacent".

Definition: The definition of "fixed seating" provides for a common understanding where the term is used. This was a concern that was raised in Public Comment #2 to E85 which was not successful.

Item #2: The concern addressed in this revision is that of fixed seating, with or without arm rests and with or without back rests including bench seating located within 22" of the guard. This seating provides a potential standing surface which as a result reduces the effective height of the guard. For seating within 22" of the guard, the guard height is to be measured diagonally from the nearest edge of the seat to the top of the guard. This measurement method is currently utilized in Section 1028.14.3. The guard would be required to extend past the "last" seat in a row so that the guard top is 42" above the edge of the last seat.

The distance of 22” utilized in this exception has been determined by CTC to be a reasonable distance for the purpose described.

Item #3: The current text is modified to indicate that the line is to be between the tread nosings. In the case of a single riser, hence a single nosing, a minimum tread depth of 11 inches on the lower walking surface establishes the slope.

Item #4: The guard height at the edge of a ramp is to be measured at the guard without consideration for the ramp slope as the dimensional change in the guard height is relatively insignificant. With a ramp slope towards the guard of 1/12, the highest point 22” from the guard is 1.83 inches above the ramp surface at the guard. If the ramp slope is 1/8, at 22” from the guard, the ramp surface is 2.75 inches above the ramp surface at the guard.

IBC Exception **3:** The provisions for guard reduction for front row seating are primarily intended to accommodate the sight line for seated occupants- see section 1028.14.2. The seating within 22 inches of the guards elsewhere would necessitate an increase in the required guard height as indicated in **Item #2.**

ICCFILENAME:Heilstedt-E3-1013.2

Public Hearing Results

PART II- IRC B/E

Committee Action: Disapproved

Committee Reason: The committee feels this does address the issue but it does not address it fully. It will create some gray areas that will require interpretation of what the code intends. This needs more work. The committee suggests the addition of figures would improve the clarity on the intent.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC); Ed Roether, representing Populous (Formerly HOK Sport Venue Event) requests Approval as Modified

Modify the proposal as follows:

R312.2 Height. Required guards at open-sided walking surfaces, including stairs, porches, balconies or landings, shall be not less than 36 inches high measured vertically as follows:

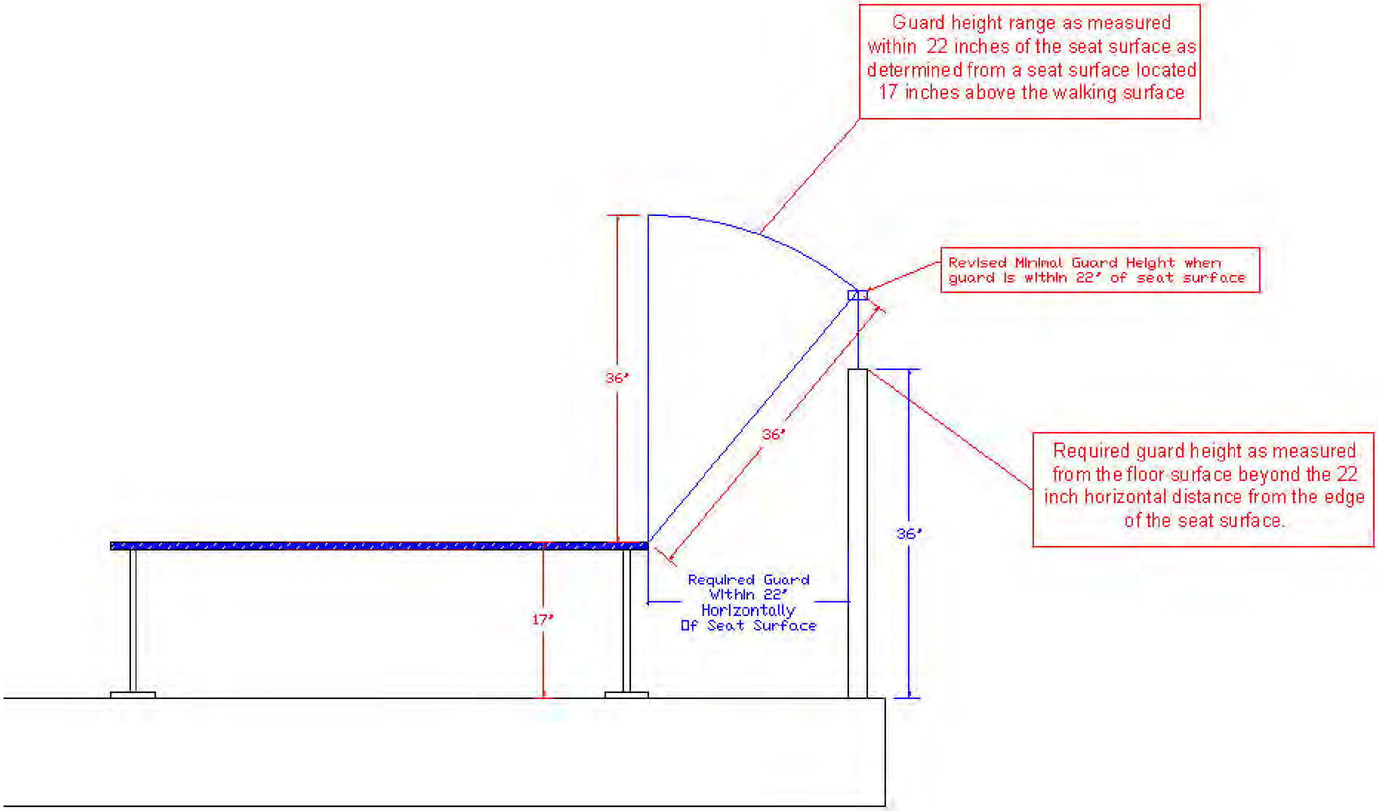
1. From the adjacent walking surface;
2. From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches <u>measured horizontally</u> of the required guard, the guard height shall provide a minimum 36 inches measured diagonally between the top of the guard and the nearest edge of the seat surface;
3. On stairs, from the line connecting the leading edges of the tread nosings; and
4. On ramps, from the ramp surface at the guard.

Exceptions:

1. Guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. Where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.

Commenter’s Reason: As noted by the code committee, there was some confusion as to how to make the measurements as well as the need to coordinate these changes with experts in assembly seating for the IBC requirements. If the code change is approved, the illustrations is intended to be added to the IRC Commentaries. The following illustrates the applications of the code requirements:

Elevation view of bench seat configuration – IRC 312.2, Item 2:



Public Comment 2:

Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R312.2 Height. Required guards at open-sided walking surfaces, including stairs, porches, balconies or landings, shall be not less than 36 inches high measured vertically as follows:

1. From the adjacent walking surface;
~~2. From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches of the required guard, the guard height shall provide a minimum 36 inches measured diagonally between the top of the guard and the nearest edge of the seat surface;~~
2.~~3.~~ On stairs, from the line connecting the leading edges of the tread nosings; and
3.~~4.~~ On ramps, from the ramp surface at the guard.

Exceptions:

1. Guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. Where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.

Commenter's Reason: When jurisdictions start adopting the 2009 edition and see the fixed seating requirement, they cringe at the enforcement issues surrounding the guard that would now be nearly 4-1/2 feet tall (i.e., 18" + 36") in areas that the a bench or some type of seating surface is attached to the floor or deck. Just because a seat is "fixed" doesn't mean that it is permanent. What happens when the seating is relocated later? Does the guard at the new location need to be increased to 54 inches above the floor? How will the guard at the old location look without the seating? What if a homeowner adds fixed seating next to a guard? Will they now need a permit to install the seat? This requirement is unenforceable.

The addition of the fixed seating guards in the 2009 IRC was over restrictive. Whether a seating surface is fixed or movable, a child can still climb over the guard and fall. In fact, children can climb over guards when there is no seating adjacent to a guard. The code cannot be written to protect everyone. We must draw the line at some point and this requirement crossed that line.

Final Action: AS AM AMPC____ D

E105-09/10

1014.3, Table 1014.3 (New) [IFC [B] 1014.3, Table 1014.3 (New)]

Proposed Change as Submitted

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

1. Revise as follows:

1014.3 (IFC [B] 1014.3) Common path of egress travel. The common path of egress travel shall not exceed the travel distances in Table 1014.3. ~~In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Group H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1028.8.~~

~~Exceptions:~~

1. ~~The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.~~
2. ~~Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).~~
3. ~~The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).~~
4. ~~The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~

2. Add new Table as follows:

TABLE 1014.3 (IFC TABLE [B] 1014.3)
COMMON PATH OF EGRESS TRAVEL

OCCUPANCY	**WITHOUT SPRINKLER SYSTEM (feet)**			**WITH SPRINKLER SYSTEM [a] (feet)**
	Any Occupant Load (OL)	**Occupant Load**		
		OL 30	**OL 30**	
B, S	Not Applicable	100	75	100
U	Not Applicable	100	75	75
F	75	Not Applicable	Not Applicable	100
H-1, H-2, H-3	Not Permitted	Not Permitted	Not Permitted	25
R-2	75	Not Applicable	Not Applicable	125 [b]
I-3	100	Not Applicable	Not Applicable	100
All others [c]	75	Not Applicable	Not Applicable	75

a. Approved automatic sprinkler system in accordance with Section 903.3.1.1
b. Approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2
c. For Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1028.8

Reason: This is an editorial change to simplify this code section. The existing paragraphs, with accompanying exceptions, have been replaced with a table which is easier to understand and follow. The content and code requirements are not altered in any form or shape.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Maiel-E2-1014.3

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The table format is easier to read and brings clarity to the requirements for common path of egress travel.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Eirene Oliphant, MCP, City of Leawood, representing the Metropolitan Kansas City Chapter of the ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE 1014.3 (IFC TABLE [B] 1014.3)
COMMON PATH OF EGRESS TRAVEL

OCCUPANCY	WITHOUT SPRINKLER SYSTEM			WITH SPRINKLER SYSTEM[a]
	~~Any Occupant Load (OL)~~	Occupant Load (OL)		
		OL≤30	OL>30	
B, S	~~Not Applicable~~	100	75	100
U	~~Not Applicable~~	100	75	75
F	~~75~~	~~Not Applicable~~ 75	~~Not Applicable~~ 75	100
H-1, H-2, H-3	~~Not Permitted~~	Not Permitted	Not Permitted	25
R-2	~~75~~	~~Not Applicable~~ 75	~~Not Applicable~~ 75	125[b]
I-3	~~100~~	~~Not Applicable~~ 100	~~Not Applicable~~ 100	100
All others[c]	~~75~~	~~Not Applicable~~ 75	~~Not Applicable~~ 75	75

a. Approved automatic sprinkler system in accordance with Section 903.3.1.1
b. Approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2
c. For Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1028.8

(Portions of proposal not shown remain unchanged)

Commenter's Reason: I applaud the original proponent for developing the table as it does simplify the language in the code. However, the column identified as "any occupant load" creates confusion as well. The two factors are whether or not the building is sprinklered and whether the occupant load is not more than 30. The proposed changes address all occupant loads for all occupancy groups identified in the table.

Public Comment 2:

Maureen Traxler, representing the City of Seattle Department of Planning & Development, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1014.3 (IFC [B] 1014.3) Common path of egress travel. The common path of egress travel shall not exceed the common path of egress travel distances in Table 1014.3.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The subject of Section 1014.3 is common path of egress travel, so the reference to "travel distance" is replaced with "common path of egress travel" for consistency and to correlate with Table 1014.3.

Final Action: AS AM AMPC____ D

E106-09/10
1014.3 (IFC [B] 1014.3)

Proposed Change as Submitted

Proponent: Gene Boecker, Code Consultants Inc., representing Code Consultants, Inc.

Revise as follows:

1014.3 (IFC [B] 1014.3) Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Groups H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1028.8

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 <u>or R-3</u> occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason It is only appropriate that the exception should apply to a dwelling unit that is a single or double and not "three or more." Where a dwelling unit is associated with another occupancy and there are multiple apartments it will be an R-2 occupancy. If there is only the owner's apartment or two small apartments, then it would be treated as an R-3 occupancy. This is the case in urban areas. Additionally, R-3 needs the second means of egress where the area of the dwelling unit exceeds 4,000 sf (resulting in an occupant load >20) or where the unit is more than 3 stories in height.

By extending the exception to these dwelling units, it is only clarifying that the same rules apply to these types of uses whether there are one, two or three units in the same building.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Boecker-E4-1014.3

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The occupants of a dwelling unit are familiar with the space; therefore, where two exits are required for Group R-3 occupancy, the common path of travel should be applicable in the same manner as a Group R-2 unit.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Stephan Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1014.3 (IFC [B] 1014.3) Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Groups H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1028.8

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 ~~or R-3~~ occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
5. <u>The length of a common path of egress travel in a Group R-3 occupancy located in a mixed occupancy building shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.</u>

Commenter's Reason: The proponent was trying to clarify that the common path requirements for a Group R-3 occupancy is the same as a Group R-2 occupancy. We agree with that premise. However, Section 1021.2 states Group R-3 buildings are only required to have one exit. Therefore, the common path requirements do not apply to a building that only contains a Group R-3 occupancy. But, when a Group R-3 use is located in a mixed occupancy building, Section 1021.2 would not apply. This public comment attempts to clarify the original intent of the proponent and eliminate the potential conflict between Sections 1014.3 and 1021.1.

Final Action: AS AM AMPC____ D

E107–09/10

1015.2.1 (IFC [B] 1015.2.1)

Proposed Change as Submitted

Proponent: Homer Maiel, PE, CBO, City of San Jose**,** representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

1015.2.1 (IFC [B] 1015.2.1) Two exits or exit access doorways. Where two exits or exit access doorways are required from any portion of the exit access, the exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access doorways. Interlocking or scissor stairs shall be counted as one exit stairway.

Exceptions:

1. Where exit enclosures are provided as a portion of the required exit and are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1018, the required exit separation shall be measured along the shortest direct line of travel within the corridor. <u>The exit or exit access doorway to such enclosures shall not be less than 25 feet (7.62 m), measured in a straight line, from the exit or exit access doorway of another exit enclosure.</u>
2. Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

Reason: The current exception 1 allows the separation of two exits to be measured in a line of travel within a rated corridor. Although this length (traveling within a corridor) may be longer than one-half of the overall diagonal, the exit enclosures can be placed very close to each other. Thus a fire could compromise both exits. Furthermore, the travel distance in the corridor can be reduced to one third (per exception 2) which can further exacerbate this problem.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Maiel-E1-1015.2.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: No technical justification was provided for the 25 feet separation requirement. Highrise provisions are already addressed in Section 403, and this requirement may be too restrictive for very small buildings. The term 'exit access' door is not applicable to exit enclosures.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Homer Maiel, PE, CBO, City of San Jose, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Chapters), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1015.2.1 (IFC [B] 1015.2.1) Two exits or exit access doorways. Where two exits or exit access doorways are required from any portion of the exit access, the exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access doorways. Interlocking or scissor stairs shall be counted as one exit stairway.

Exceptions:

1. Where exit enclosures are provided as a portion the required exit and are interconnected by a 1-hour fire-resistance- rated corridor conforming to the requirements of Section 1018, the required exit separation shall be measured along the shortest direct line of travel within the corridor. ~~The exit or exit access doorway to such enclosures shall not be less than 25 feet (7.62m), measured in a straight line, from the exit or exit access doorway of another exit enclosure.~~ <u>The exit enclosures interconnected by a 1-hour fire-resistance-rated corridor shall be separated by a distance of not less than 30 feet, or not less than one-fourth of the length of the maximum overall diagonal dimension of the building or area served. This distance shall be measured in a straight line between the nearest points of the exit enclosure.</u>
2. Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

Commenter's Reason: The original proposal adding a sentence to Exception 1 is modified in this public comment to delete the original proposed wording and substitute wording identical to that used in 2009 IBC Section 403.5.1, Remoteness of exit stairway enclosures.

This substituted wording addresses the comments received from the ICC Egress Committee by using currently established exit enclosure separation distance criteria from Section 403.5.1, and by removing the term "exit access doorway". The fact that very small footprint buildings normally only need one exit per Table 1021.2, and that this provision only applies once two exits are required, should mitigate the concern raised about the separation being too restrictive when applied to very small footprint buildings.

The 2009 IBC's inclusion of a straight line separation requirement between exit enclosures applicable to High Rise Buildings (having an occupied floor located more than 75 feet above the lowest level of fire department vehicle access) is equally applicable in buildings of fewer stories, because of the code's underlying premise for having a minimum separation of exits is that all occupants should be reasonably assured to have the use of at least <u>one</u> of the two required exits.

Final Action: AS AM AMPC____ D

E108-09/10
1016.1, 1022.1 (IFC [B] 1016.1, 1022.1)

Proposed Change as Submitted

Proponent: Ronald W. Clements, Jr., representing Chesterfield County Virginia Building Inspection Department; Gregory R. Keith, Professional heuristic Development, representing The Boeing Company; and Michael L. Perrino, CBO, representing Code Consultants, Inc.; Sarah Rice, CBO, representing self

Revise as follows:

1016.1 (IFC [B] 1016.1) Travel distance limitations. Exits shall be so located on each story such that the maximum length of exit access travel, measured from the most remote point within a story along the natural and unobstructed path of egress travel to an exterior door at the level of exit discharge, an entrance to a vertical exit enclosure, an exit passageway, a horizontal exit, an exterior exit stairway or an exterior exit ramp shall not exceed the distances given in Table 1016.1.

Exceptions:

1. Travel distance in open parking garages is permitted to be measured to the closest riser of open exit stairways.
2. In outdoor facilities with open exit access components and open exterior exit stairways or exit ramps, travel distance is permitted to be measured to the closest riser of an exit stairway or the closest slope of the exit ramp.
3. ~~In other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps when connecting a maximum of two stories. The two connected stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~
4. ~~In other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps in the first and second stories above grade plane in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories above grade plane shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories.~~

Where applicable, travel distance on unenclosed exit access stairways or ramps and on connecting stories shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.

1022.1 (IFC [B] 1022.1) Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. Exit enclosures shall have a fire-resistance rating not less than the floor assembly penetrated but need not exceed 2 hours. Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. In other than Group H and I occupancies, stairways and ramps that serve only one adjacent story need not be enclosed. Any two such interconnected stories shall not be open to other stories. ~~In all occupancies, other than Groups H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.~~
    - ~~1.1. The stairway is open to not more than one story above its level of exit discharge, or~~
    - ~~1.2. The stairway is open to not more than one story below its level of exit discharge.~~
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
4. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
5. Stairways in Group I-3 occupancies, as provided for in Section 408.3.8, are not required to be enclosed.
6. Means of egress stairways as required by Section 410.5.3 and 1015.6.1are not required to be enclosed.
7. Means of egress stairways from balconies, galleries and press boxes as provided for in Section 1028.5.1, are not required to be enclosed.

Reason: This proposal is intended to correlate and correct fundamental interior exit stairway enclosure provisions. The history and technical inconsistency of current provisions were brought to light during ICC Code Technology Committee (CTC), Unenclosed Exit Stairway Study Group discussions associated with the drafting of a CTC code change proposal for the current (2009/2010) development cycle. One of the main charges of the study group was to validate the relationship between Chapter 10 required exit, access to exit, exit enclosure and exit access travel distance provisions. These provisions lie at the heart of means of egress design philosophy.

Unfortunately, the 2000 Edition of the IBC did not do a particularly good job of consolidating the means of egress provisions contained in the former model (legacy codes). This was owed to several factors, not the least of which was the significantly different systems or approaches to means of egress design used by the various contributing codes. This is probably best illustrated through the 2000 IBC exceptions to interior exit stairway enclosure requirements. In fact, none of the 2000 IBC general design related exceptions appeared in any of the legacy codes. The exceptions were spawned as compromises with former provisions. The BOCA building code fundamentally maintained that required interior exit stairways at all stories be enclosed. The ICBO building code, on the other hand, basically allowed that in other than Group H and I occupancies, exit enclosures were not required for interior stairways serving only one adjacent story. The 2000 IBC resolved the issue by permitting 50% of the required stairways to be unenclosed. That provision supported neither legacy philosophy.

In subsequent editions, the related provisions have been manipulated to a point that current requirements create or support no functional means of egress strategy. Unfortunately, with the inability of the IBC to effectively state its intent, practitioners have largely resorted to their specific legacy indoctrination resulting in varying interpretations. In the 2003 Edition, an additional exception to exit enclosure provisions allowed for all interior exit stairways to be unenclosed at the first and second stories of a sprinklered building of other than Group H and I occupancies. The 2006 Edition formalized the concept of accessing required exits from adjacent levels by way of unenclosed interior stairways and ramps. In the 2009 Edition of the IBC, two fundamental exceptions to exit enclosure requirements were moved to Section 1016.1, travel distance provisions. As has been previously mentioned, various provisions have been manipulated over time in an attempt to contort them to a desired technical end. Virtually all of these attempts have failed to recognize the delicate technical relationships between the fundamental means of egress concepts of numbers of exits, access to required exits and exit access travel distance.

The 2009/2010 CTC interior stairway proposal effectively establishes such a system with supporting terminology and requirements based on current IBC means of egress provisions. The study group intentionally avoided including substantial technical changes in its code change proposal, although a majority of members may have agreed with a certain concept or provision.

This proposal is intended to further cultivate and clarify the <u>IBC system</u> of means of egress design. Essentially, it allows for a general two-story exception to the enclosure of required interior exit stairways in other than Group H and I occupancies. This arguably represents the cumulative impact of numerous current exceptions addressing unenclosed exits or access to exits. It also serves to reinforce access to exits at adjacent building level provisions. The ultimate goal is to require that all interior exit stairways (required exit components) be enclosed without specifying their required location. Effectively, this allows a given means of egress design to dictate which exit components are employed and where. It also acknowledges that exits may be accessed from an adjacent story or level within prescribed exit access travel distance limitations.

This proposal effectively integrates the related legacy requirements with current IBC provisions. The reason that this provision was not included in the 2009/2010 CTC interior stairway proposal is that it represents a relaxation of current IBC exit enclosure requirements. Again, please bear in mind that current IBC enclosure requirements are based on an ICC Means of Egress Drafting Committee technical compromise. What is recommended in this proposal is identical in concept to that of the former Uniform Building Code. Such a means of egress design method has decades of distinguished performance history. It is also consistent with the means of egress philosophy promoted in the 2009/2010 CTC interior stairway proposal. That is, that formal exits, or access to exits, shall be provided in prescribed numbers from each building level. Unenclosed stairways and ramps (certain occupancies notwithstanding) may access exits at an adjacent building level within prescribed exit access travel distance limitations. Accordingly, buildings more than two stories in height will have not less than two enclosed interior exit stairways. It is acknowledged that such exit enclosures may not serve all building stores based on the specific building and means of egress design; however, such enclosed exits are within the exit access travel distance limitations and are not more than one level removed from the exit. It should be noted that when exit enclosures are employed to support a given design, they typically serve all building stories. Occasionally, security or privacy concerns dictate that access to enclosed interior exit stairways at all stories is undesirable. Nevertheless, occupants at those levels have access to exits comparable to that required for any building level. Additionally, the fire service has protected enclosures to serve as staging areas for the attack of a fire at, above or below the story of incident origin.

In summary, this proposal eliminates many of the technical inconsistencies associated with current means of egress provisions. This proposal, in combination with the 2009/2010 CTC interior stairway proposal, effectively repairs the IBC means of egress system design requirements and their technical relationships. Each of the proponents of this proposal was a voting member of the ICC Code Technology Committee, Unenclosed Exit Stairway Study Group and they represent a majority of voting study group members.

Cost Impact: The code change proposal will not increase the cost of construction.

<u>Public Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The revised text loses the allowance for fully sprinklered buildings to have two open exit access stairways. It is not clear if the stairways in Section 1022.1 Exception 1 are interior or exterior stairways, or if they are exit or exit access stairways. Technical justification should be provided to indicate that open stairways should be permitted between floors. It is not clear how this will work with the provisions accepted in E5-09/10. This proposal seems to be taking protection away from stairways.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory R. Keith, Professional heuristic Development, representing the Boeing Company, Ron Clements, representing Chesterfield County Building Inspection Dept., Mike Perrino, representing Code Consultants, Inc., Sarah Rice, CBO, representing self, requests Approved as Modified by this public comment.

Replace the proposal with the following:

SECTION 1021(IFC [B] 1021)
NUMBER OF EXITS AND ~~CONTINUITY~~ <u>EXIT CONFIGURATION</u>

<u>**1021.1 (IFC [B] 1021.1) General.** Each story and occupied roof shall have the minimum number of exits, or access to exits, as specified in this section. The required number of exits, or exit access stairways or ramps providing access to exits, from any story shall be maintained until arrival at grade or a public way. Exits or access to exits from any story shall be configured in accordance with this section.</u>

1021.2 (IFC [B] 1021.2) Number of exits. Each story and occupied roof shall have a minimum of one exit, or one exit access stairway or ramp that provides access to an exit.

Two exits, or exit access stairways or ramps providing access to exits, from any story or occupied roof shall be provided where one of the following conditions exists:

1. The occupant load exceeds one of the values in Table 1021.2.
2. The exit access travel distance exceeds that specified in Table 1021.2 as determined in accordance with the provisions of Section 1016.1.
3. Helistop landing areas located on buildings or structures shall be provided with two exits, or exit access stairways or ramps providing access to exits.

Exceptions:

1. Rooms, areas and spaces complying with Section 1015.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit.
2. Group R-3 occupancy buildings shall be permitted to have a one exit.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one exit.
4. Air traffic control towers shall be provided with the minimum number of exits specified in Section 412.3.
5. Individual dwelling units with a maximum occupant load of 20 in Group R-2 and R-3 occupancies shall be permitted to have one exit.
6. Group R-3 and R-4 congregate residences shall be permitted to have one exit.

Where one exit, or exit access stairway or ramp providing access to exits at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with one exit shall not be located more than one story below grade plane.

~~**1021.1 (IFC [B] 1021.1) Exits from stories.** All spaces within each story shall have access to the minimum number of approved independent exits as specified in Table 1021.1 based on the occupant load of the story. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories.~~

~~**Exceptions:**~~

1. ~~As modified by Section 403.15 (Additional exit stairway).~~
2. ~~As modified by Section 1021.2.~~
3. ~~Exit access stairways and ramps that comply with Exception 3 or 4 of Section 1016.1 shall be permitted to provide the minimum number of approved independent exits required by Table 1021 on each story.~~
4. ~~In Groups R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.~~
5. ~~Within a story, rooms and spaces complying with Section 1015.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit.~~

~~The required number of exits from any story shall be maintained until arrival at grade or the public way.~~

~~**TABLE 1021.1 (IFC [B] TABLE 1021.1)**~~
~~**MINIMUM NUMBER OF EXITS FOR OCCUPANT LOAD**~~

~~**OCCUPANT LOAD (persons per story)**~~	~~**MINIMUM NUMBER OF EXITS (per story)**~~
~~1-500~~	~~2~~
~~501-1,000~~	~~3~~
~~More than 1,000~~	~~4~~

~~**1021.1.2 (IFC [B] 1021.1.2) Parking structures.** Parking structures shall not have less than two exits from each parking tier, except that only one exit is required where vehicles are mechanically parked. Unenclosed vehicle ramps shall not be considered as required exits unless pedestrian facilities are provided.~~

~~**1021.1.3 (IFC [B] 1021.1.3) Helistops.** The means of egress from helistops shall comply with the provisions of this chapter, provided that landing areas located on buildings or structures shall have two or more exits. For landing platforms or roof areas less than 60 feet (18 288 mm) long, or less than 2,000 square feet (186 m^2) in area, the second means of egress is permitted to be a fire escape, alternating tread device or ladder leading to the floor below.~~

~~**1021.2 (IFC [B] 1021.2) Single exits.** Only one exit shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single exit in buildings otherwise required to have more than one exit if the areas served by the single exit do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single exit shall not be located more than one story below grade plane.~~

TABLE 1021.2 (IFC [B] TABLE 1021.2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT

STORY	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER ~~FLOOR~~ STORY	~~AND~~ MAXIMUM EXIT ACCESS TRAVEL DISTANCE
First story or basement	A, B[b] ~~[d]~~, E[c] ~~[e]~~, F[b] ~~[d]~~, M, U, S[b] ~~[d]~~	49 occupants ~~and~~	75 feet
	H-2, H-3	3 occupants ~~and~~	25 feet
	H-4, H-5, I, R	10 occupants ~~and~~	75 feet
	S	29 occupants ~~and~~	100 feet
Second story	B~~[b]~~, F, M, S~~[a]~~	29 occupants ~~and~~	75 feet
	R-2	4 dwelling units ~~and~~	50 feet
Third story	R-2[a] ~~[c]~~	4 dwelling units ~~and~~	50 feet
Fourth story and above	NP	NA	NA

For SI: 1 foot = 3048.mm
NP – Not Permitted
NA – Not Applicable
~~a. For the required number of exits for parking structures, see Section 1021.1.2.~~
~~b. For the required number of exits for air traffic control towers, see Section 412.3.~~
~~c.~~ a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1026.
~~d.~~ b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
~~e.~~ c. Day care occupancies shall have a maximum occupant load of 10.

1021.2.1 (IFC [B] 1021.2.1) Three or more exits. Three exits, or exit access stairways or ramps providing access to exits at other stories, shall be provided from any story or occupied roof with an occupant load of 501-1,000. Four exits, or exit access stairways or ramps providing access to exits at other stories, shall be provided from any story or occupied roof with an occupant load greater than 1,000.

1021.2.2 (IFC [B] 1021.2.2) Additional exits. In buildings over 420 feet in height, additional exits shall be provided in accordance with Section 403.5.2.

Commenter's Reason: (Note: E108-09/10 is a companion code change proposal to E5-09/10. If E5-09/10--which was approved as submitted by the ICC Means of Egress Code Committee in Baltimore--is disapproved during the final action hearing process, this public comment will be withdrawn.) This proposal contains the same language as that included in E5-09/10 with the two following revisions: 1) The deletion of the last two sentences and exceptions in Section 1021.1. 2) The addition of the first sentence in Section 1021.2. Due to ICC public comment formatting protocols, the modification appears much more extensive and complex than it actually is.

The ICC Code Technology Committee (CTC) appointed an Unenclosed Exit Stairway Study Group to validate the relationship between Chapter 10 required exit, access to exit, exit enclosure and exit access travel distance provisions. Based on their research, that study group developed a comprehensive code change proposal E5-09/10 that was approved as submitted by the ICC Means of Egress Code Committee in Baltimore. During their discussions, the study group recognized that 2009 Section 1022 exit enclosure provisions were inconsistent with the exit/access stairway system requirements that had been restructured through E5-09/10. Specifically, it was felt that the IBC should not arbitrarily require enclosed interior exit stairways at each building level above the first story. Rather, it was felt that number of exit, separation of exit, exit access travel distance and vertical opening protection requirements should stand on their own merit based on the specific building design. This allows greater flexibility in building design while maintaining appropriate levels of occupant safety.

The study group, however, felt that this issue exceeded the scope of their reorganization effort and it should not be included in E5-09/10. A majority of the study group members did agree with the technical/philosophical concern and agreed to submit a separate code change that would eliminate the 2009 IBC provision that 50 percent of interior exit stairways be enclosed in other than Group H and I occupancies. This was submitted as proposal E108-09/10. It should be noted that the ICC Code Technology Committee agreed with that technical position. Unfortunately, the proposal was out of context when applied to 2009 means of egress provisions. The concept was intended to overlay E5-09/10 provisions; however, procedurally needed to modify current IBC requirements. This created a great deal of confusion with the code committee and assembly.

There is a very subtle and complicated relationship between various means of egress provisions. Through its organization and terminology, E5-09/10 greatly clarifies Chapter 10 design requirements. In their published committee action reason statement substantiating disapproval, the ICC Means of Egress Code Committee stated, "The revised text loses the allowance for fully sprinklered buildings to have two open exit access stairways." Such is not the case. E5 Section 1009.3, Exception 1 states, "In other than Group I-2 and I-3 occupancies, exit access stairways that serve, or atmospherically communicate between, only two stories, are not required to be enclosed." Another committee comment was that, "It is not clear if the stairways in Section 1022.1 Exception 1 are interior or exterior stairways, or if they are exit or exit access stairways." Section 1022 specifies that it applies to interior, exit stairways. That comment does reinforce the notion that current stairway/exit provisions are misunderstood. An additional comment stated, "Technical justification should be provided to indicate that open stairways should be permitted between floors." The IBC has always allowed for open stairways (and shaft openings) between floors under prescribed conditions. It was also observed that, "It is not clear how this will work with the provisions accepted in E5-09/10." This public comment provides that clarification by adjusting number of exits, access to exits and interior exit stairway provisions in the context of E5-09/10 and each other. The final committee comment was, "This proposal seems to be taking protection away from stairways." One of the primary reasons for assigning a study group to investigate this area of study was the widely varying opinions and applications of stairway enclosure requirements. In fact, E5 Section 1009.2.2 specifically states that all interior exit stairways shall be enclosed, with no exceptions. The only unenclosed or "open" stairways permitted by E5 are delineated in E5 Section 1009.3, exceptions that are based on current IBC stairway and shaft exceptions. In each case, such unenclosed stairways are "exit access stairways" by definition and travel distance is accounted for.

The means of egress design progression clarified by E5-09/10 begins with Section 1021 that requires specific numbers of exits, or access to exits, for each story or occupied roof. It is not intended to specifically require any particular exit component at a given building level. Rather, it is intended that the design of the building and means of egress system will dictate the type and location of various means of egress components. As regards interior exit stairways (formerly exit enclosures), they are required by need similar to other exit components.

Fundamentally, E5 Sections 1021.1 and 1009.3 generally allow access to exits at an adjacent building level in other than Group I-2 and I-3 occupancies. E5 Section 1021.3.1 clarifies that such access be by stairways or ramps and shall be included within the required exit access travel distance limitations. In multi-story buildings more than two stories in height, enclosed interior exit stairways would always be included in the building design. E5 Section 1022.1 requires that, once established, all interior exit stairways lead to, or be extended to, the exterior of the building.

This proposal effectively eliminates the current requirement generally mandating that at least 50 percent of exits from certain building levels be enclosed interior exit stairways. It is felt that exit access travel within two adjacent stories is appropriate and that individual exit components should not be specified by the IBC. Number of exits, separation of exits and exit access travel distance requirements will dictate the incorporation of exit components into the building design.

The approval as modified of E108-09/10 will coordinate with the system of means of egress design established through the approval of E5-09/10 by the ICC Means of Egress Code Committee. In combination, these proposals will greatly enhance the understanding and effectiveness of fundamental means of egress design.

Final Action: AS AM AMPC____ D

E109-09/10

1016.3 (New), Table 1016.3 (New), 1016.3.1 (New); [IFC [B] 1016.3 (New), Table 1016.3 (New), 1016.3.1 (New)]

Proposed Change as Submitted

Proponent: Jay Wallace, The Boeing Company and Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Add new text and table as follows:

1016.3 (IFC [B] 1016.3) Aircraft manufacturing facilities. In buildings used for the manufacturing of aircraft, exit access travel distances indicated in Section 1016.1 shall be increased in accordance with the following:

1. The building shall be of Type I or II construction.
2. Exit access travel distance shall not exceed the distances given in Table 1016.3.

TABLE 1016.3 (IFC [B] TABLE 1016.3)
AIRCRAFT MANUFACTURING EXIT ACCESS TRAVEL DISTANCE

HEIGHT (feet) [b]	MANUFACTURING AREA (sq. ft.) [a]					
	≥150,000	≥200,000	≥250,000	≥500,000	≥750,000	≥1,000,000
≥ 25	400	450	500	500	500	500
≥ 50	400	500	600	700	700	700
≥75	400	500	700	850	1,000	1,000
≥ 100	400	500	750	1,000	1,250	1,500

For SI: 1 foot = 304.8 mm

a. Contiguous floor area of the aircraft manufacturing facility having the indicated height.

b. Minimum height from finished floor to bottom of ceiling or roof slab or deck.

1016.3.1 (IFC [B] 1016.3.1) Associated areas. Egress from rooms, areas and spaces associated with the primary manufacturing area shall be permitted through such area having a minimum height as indicated in Table 1016.3. Exit access travel distance within the associated room, area or space shall not exceed that indicated in Table 1016.1 based on the occupancy classification of that associated area. Total exit access travel distance shall not exceed that indicated in Table 1016.3.

Reason: Many aircraft manufacturing buildings are unusually large due to the size of the commercial or military aircraft being produced. For instance, an assembled Boeing 747 has a tail height of over 63 feet. The rectangular footprint of a Boeing 747-800 is over 56,000 square feet.

Group F-1 occupancies greater than 150,000 square feet can have difficulty complying with 250 foot, sprinklered exit access travel distance limitations without incorporating exit passageways or horizontal exits into the design of the building means of egress system. The use of either exit component is somewhat problematic. Due to the compartmentalized nature of horizontal exits, they do not lend to aircraft production processes or movement of the finally assembled aircraft. For similar reasons, exit passageways are generally installed below the floor of the assembly level. The use of underground exit passageways during an emergency in a very high volume space is generally contrary to human nature. Once aware of an event, employees would instinctively evacuate the building at the level with which they are most familiar. Also, it is relatively easy to move away from the point of origin of a fire due to a person's sensory awareness within the entire open space. Given the fact that occupants sense safety as they move away from the fire, it is counter-intuitive to enter an underground area unless as a last resort.

Regardless of human nature, it must be demonstrated that high volume spaces provide a tenable environment for the evacuation or relocation of building occupants. The Boeing Company conducted smoke and temperature fire modeling using the NIST FDS (National Institute of Standards and Technology - Fire Dynamics Simulator) computer program.

In order to establish a performance baseline, a series of worse case scenarios were combined into the first test. We referenced previous Boeing proprietary laboratory test data on a large, 10 megawatt fire and duplicated and calibrated those data in our fire and smoke model. We placed the 10 megawatt event in an interior corner of a 400 foot x 400 foot building with exterior exit doors at the midpoints of each exterior wall. A corner fire was considered worse case because anticipated radiation off of adjacent 90° walls focuses and accelerates the progression of the fire.

The minimum ceiling height permitted in the means of egress by the International Building Code is 7'-6"--impractically low for an aircraft manufacturing area ceiling height. A similarly impractical ceiling height of 10 feet was selected as a worse case baseline for data determination purposes. Active fire suppression was not included in the model; therefore, the test fire burns until it is consumed. It should be noted that because sprinklers were not utilized in the model, they are not included as a requirement in the proposed provision. That being said, it is recognized that to achieve the qualifying contiguous areas of proposed Table 1016.3, the building would be sprinklered based on the fire area thresholds in Section 903. This proposal lets each issue stand on its own merit without introducing a new sprinkler trade-off. Also, for simplicity, it was also assumed that when smoke is introduced into the space, smoke detection would shut down any HVAC systems. Therefore, no mechanical ventilation is included in the model. The model assumed no fuel contribution by the building itself; therefore, the proposed provisions are limited to buildings of Type I or II construction.

Six modeling runs were conducted. One, for the 400 foot x 400 foot space with a 10 foot ceiling height for data base line purposes. Four additional runs were made for the same building area with ceiling heights of 25, 50, 75 and 100 feet for purposes of data development. One additional run was conducted for a 1,000,000 square foot building with a 100 foot ceiling height for data interpolation purposes. These data points were selected to support the area and height thresholds established in proposed Table 1016.3.

The 160,000 sf, 10' high ceiling baseline model indicates: (Maximum permitted travel distance: 200 feet [Group F-1, unsprinklered; Table 1016.1]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 48 seconds.)

After 4 minutes, the exit nearest the point of origin of the fire is still completely free of smoke and heat from the fire.

Ceiling temperatures near the source immediately reach 165 degrees and the fire sprinkler system would activate.

The 160,000 sf, 25' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends approximately 100 feet from the point of origin of the fire. The smoke level is at approximately 20 feet above the floor. After 360 seconds, the smoke level is at approximately 10 feet above the floor (360 - 96 = 264 ÷ 96 = 2.75 factor of safety).

After 150 seconds, the ceiling temperature has just reached 165 degrees directly above the point of origin of the fire. Sprinkler activation occurs 54 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 127 degrees.

The 160,000 sf, 50' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends approximately 100 feet from the point of origin of the fire. The smoke level is at approximately 42 feet above the floor. After 420 seconds, the smoke level is at approximately 25 feet above the floor (420 - 96 = 324 ÷ 96 = 3.37 factor of safety).

After 150 seconds, the ceiling temperature is 108 degrees directly above the point of origin of the fire. Sprinkler activation occurs 84 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 98.5 degrees.

The 160,000 sf, 75' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends less than 100 feet from the point of origin of the fire. The smoke level is at approximately 60 feet above the floor. After 420 seconds, the smoke level is at approximately 25 feet above the floor at one point (420 - 96 = 324 ÷ 96 = 3.37 factor of safety).

After 150 seconds, the ceiling temperature is 98.5 degrees directly above the point of origin of the fire. Sprinkler activation occurs 144 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 98.5 degrees.

The 160,000 sf, 100' high ceiling model indicates: (Maximum proposed travel distance: 400 feet [≥150,000 sf, ≥ 25'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 96 seconds.)

After 120 seconds, the smoke plume extends less than 100 feet from the point of origin of the fire. The smoke level is at approximately 85 feet above the floor. After 420 seconds, the smoke level is at approximately 30 feet above the floor at one point (420 - 96 = 324 ÷ 96 = 3.37 factor of safety).

After 150 seconds, the ceiling temperature is 89 degrees directly above the point of origin of the fire. Sprinkler activation occurs 144 seconds after building evacuation has occurred. After 300 seconds, no ceiling temperature is greater than 89 degrees.

The 1,000,000 sf, 100' high ceiling model indicates: (Maximum proposed travel distance: 1,500 feet [≥1,000,000 sf, ≥ 100'; Table 1016.3]. Based on an assumed rate of travel of 250 feet per minute, maximum travel time is 360 seconds.)

After 360 seconds, the smoke plume extends less than 500 feet from the point of origin of the fire. The smoke level is at approximately 75 feet above the floor. After 720 seconds, the smoke level is still at approximately 75 feet above the floor (720 - 360 = 360 ÷ 360 = 1.0 factor of safety).

At 300 seconds, the ceiling temperature is 70 degrees directly above the point of origin of the fire. At 300 seconds, ceiling temperatures are dropping and no temperature is greater than 89 degrees.

Data clearly indicate that the proposed exit access travel distances for aircraft manufacturing facilities provide for a high for level of occupant tenability with a minimum factor of safety of 100 percent. It is intuitive that high volume spaces provide sufficient time for an occupant to safely access an exit. Nevertheless, The Boeing Company has reinforced that common sense through fire modeling that validates and quantifies that logic.

Most manufacturing facilities have other supporting occupancies including offices, break rooms, cafeterias, etc. This proposal would permit occupants of such associated spaces to egress through the manufacturing area with the increased exit access travel distance provided that the exit access travel distance within the associated areas does not exceed that specified in Table 1016.1 for the occupancy(s) under consideration.

Please do not be distracted by some of the larger exit access travel distance values contained in the proposed table. The longest allowance of 1,500 feet appears extreme compared to Table 1016.1 values. In reality, it only represents six minutes of travel time based on an assumed rate of travel of 250 feet per minute (*NFPA Life Safety Code Handbook* data), and it is only permitted in a building with a volume of over one hundred million cubic feet. Upon further examination, 71 percent of the cells of the proposed table require less than three minutes of exit access travel time for buildings having a volume of not less than 3.75 million cubic feet. The results of Boeing modeling runs would indicate that ceiling height is a major factor in the maintenance of occupant tenability during egress from a fire event. This proposal is limited to aircraft manufacturing facilities only. This is because of a high degree of occupant familiarity and the relatively low fuel loading compared with many other Group F-1 and S-1 occupancies.

In summary, the unique size of some aircraft manufacturing facilities inherently provides a tenable environment for building occupants as they travel to an exit. It is logical that spaces with higher ceilings provide for a greater level of occupant tenability than those with lower ceilings. Rather than arbitrarily selecting travel distance values based on former provisions or attempting an educated guess, The Boeing Company has conducted computer modeling in order to determine acceptable travel distances. Supporting data is available for review at http://www.boeing.com/nosearch/tds/. Approval of this proposal will acknowledge means of egress design issues associated with large area, high volume aircraft manufacturing spaces while providing a high degree of occupant safety during egress from such buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Fattah-E1-1017.5

Public Hearing Results

Committee Action: Disapproved

Committee Reason: Boeing should be commended for their fire model analysis on this issue, however, there are concerns about the assumptions in the model: for example what is the technical basis for the size of the fire; what are the tenability methods used; why the one location for the fire vs. moving it around; What is the growth of the fire. The American Society for Protection Engineers does have standards for performance based analysis or tenability methods from ISO that could be investigated. The egress analysis did not include people with mobility impairments or consideration of occupant delays upon alarm notification. The study should have a third party peer review. Quantitative information on the size and types of fuel loads and the resulting fire size should be provided – this is important as the industry moves to using more composite materials that may increase fuel loads. The technical data is applicable for large airplanes; however, a concern would be if this was applicable for small aircraft facilities. The anticipated occupant loading and how the occupants are notified were not included in the reason. Did the sprinkler systems activate?

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jay S. Wallace, representing The Boeing Company, Gregory R. Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Submitted.

Commenter's Reason Supporting technical data, to include formal peer review, are available for review at http://www.boeing.com/nosearch/tds/.

The Boeing Company submitted Item E109-09/10 that is intended to allow for increased travel distances in high volume aircraft manufacturing buildings. To support its proposal, Boeing conducted smoke and temperature fire modeling using the NIST FDS (National Institute of Standards and Technology - Fire Dynamics Simulator) computer program. Boeing correlated initial model fire data to an actual burn test conducted at a certified test facility in Washington State.

In their published reason statement for disapproval, the ICC Means of Egress Code Committee stated, "Boeing should be commended for their fire model analysis on this issue, however, there are concerns about the assumptions in the model: for example what is the technical basis for the size of the fire; what are the tenability methods used; why the one location for the fire vs. moving it around; What is the growth of the fire. The American Society for Protection Engineers does have standards for performance based analysis or tenability methods from ISO that could be investigated. The egress analysis did not include people with mobility impairments or consideration of occupant delays upon alarm notification. The study should have a third party peer review. Quantitative information on the size and types of fuel loads and the resulting fire size should be provided – this is important as the industry moves to using more composite materials that may increase fuel loads. The technical data is applicable for large airplanes; however, a concern would be if this was applicable for small aircraft facilities. The anticipated occupant loading and how the occupants are notified were not included in the reason. Did the sprinkler systems activate?"

It was evident that the key to gaining committee confidence in the proposal was the performance of a third party peer review. Virtually all of the specific technical questions would be addressed through the performance of such a review. The Boeing Company has obtained the services of Arup, a widely renowned design and consulting firm to perform this peer review. Arup reviewed the committee comments and provided Boeing with a revised set of parameters for new modeling runs. Speaking specifically to expressed concerns:

What is the technical basis for the size of the fire? Our original model run used data from a certified fire test that generated a peak heat release of about 5 megawatts. The technical basis for the size of the fire was a number of actual fire tests previously conducted by The Boeing Company and FM Global, our insurance underwriter. That sized fire is typical for the materials used in aircraft production, to include flammable liquids, and associated support equipment. Prior to our initial simulation run, FM Global agreed with the assumed fire size. The test article was a support cart laden with plastics, flammable liquid containers and ordinary combustibles that are typically found on an aircraft manufacturing support cart. To dispel any concerns about the fire size, current model runs are based on a 10 megawatt, steady growth rate fire.

What is the growth of the fire? Fire growth of the 5 megawatt fire was based on the data from the actual fire test. The 10 megawatt fire simulation uses a fast growth T^2 (Time/Temperature) fire that goes steady state at 10 megawatts.

Quantitative information on the size and types of fuel loads and the resulting fire size should be provided – this is important as the industry moves to using more composite materials that may increase fuel loads. The issue of composite materials in aircraft production was investigated. It was determined that such materials perform very similarly to traditional aluminum or other lightweight metallic products. This is due to the fact that when used as an element of assembly, such parts have been previously fabricated and cured. The overriding factor remains that the Federal Aviation Administration regulates the combustibility limits of commercial aircraft. The Boeing Company and FM Global have determined that a fire will likely originate at some individual process point as opposed to the entire aircraft itself.

The technical data is applicable for large airplanes; however, a concern would be if this was applicable for small aircraft facilities. The applicability of proposed Table 1016.3 to buildings of not less than 150,000 square feet in area and not less than 25 feet in height, excludes small aircraft facilities. Typically, smaller facilities do not require increased travel distance allowances.

What are the tenability methods used? Smoke obscuration and heat gradients were modeled by the FDS software in volumes having ceiling heights of 10 to 100 feet. Data were collected over time of smoke density at various elevations including 6 feet above the floor. The model showed no smoke extending to within 6 feet above the floor for the 25 to 100 foot tall spaces within proposed travel times (distances) and only minimal smoke extending to within 6 feet of the floor for the 10 foot tall space within the currently permitted travel time (distance). Heat gradients were also similar with much of the heat dissipating through the large volumes. Occupant exiting was determined to be a minimum of 240 seconds (for the 10 foot ceiling) and for the most part unlimited at the 100 foot ceiling level test.

Why the one location for the fire vs. moving it around? A corner fire was chosen as it is recognized that it represents a worst case scenario due to the effect of the walls on the fire dynamics. FM Global concurred with this assumption prior to initial modeling. Since the worst case scenario was selected, we reasoned that moving the fire to other locations would only produce a better result.

The egress analysis did not include people with mobility impairments or consideration of occupant delays upon alarm notification. Due to the nature of the work, people with mobility impairments are typically not involved in assembly operations. Should that not be the case, the employment of a person with a disability would trigger Americans with Disabilities Act, Title I requirements. Practically speaking, in the event of evacuation of work areas, able-bodied employees assist those who are disabled. This practice is demonstrated repeatedly in our evacuation exercises. Regarding the issue of occupant delay due to alarm notification, in a large manufacturing facility of this nature, occupants would either become aware of the incident though their senses (sight, smell and hearing) or be directed by a supervisors, industrial fire brigades or municipal fire department personnel. In very large volume buildings of this nature that do not have combustible interior finishes or continuous fuel packages, there is not a risk of a fire outpacing evacuation.

The anticipated occupant loading and how the occupants are notified were not included in the reason. Occupant loads are considerably less than those determined based on the Table 1004.1.1 factor of one occupant per 100 square feet. Typical occupant densities are in the 300 – 500 square foot per occupant range. Due to the large area of these spaces, initial notification is based on situational and sensory awareness. Those nearest the event trigger an internal notification system.

Did the sprinkler systems activate? Obviously, an automatic sprinkler system is required in a building of this size. Sprinklers, however, were not considered in the model run. It was felt that the test results should be based on a "worse case" scenario. Sprinkler activation is considerably delayed due to the dissipation of the heat from the fire in buildings with large volumes and very high roof lines. Additionally, simulation data revealed that building evacuation normally occurred prior to sprinkler activation. Unlike a paint hangar or a maintenance and repair facility, the fire loading in this use is quite low. The aircraft have never been painted or fueled and are primarily constructed with non-combustible materials. There are no foam-extinguishing or deluge sprinkler systems in these buildings. Even though not included in the model, it is recognized that if sprinkler activation were to occur, it would certainly contribute positively to the emergency egress scenario.

The Boeing Company has addressed all of the concerns expressed by the ICC Means of Egress Code Committee during discussion of E109-09/10. Most importantly, a third party peer review was conducted to validate Boeing research. Approval of this proposal will provide for appropriate travel distance requirements for very specialized, high volume aircraft manufacturing facilities.

Final Action: AS AM AMPC____ D

E111-09/10
1018.1 (IFC [B] 1018.1)

<u>Proposed Change as Submitted</u>

Proponent: Mark Blanke, PE, New York State Div. of Code Enforcement and Administration

Revise as follows:

1018.1 (IFC [B] 1018.1) Construction. Corridors shall be fire-resistance rated in accordance with Table 1018.1. The corridor walls required to be fire-resistance rated shall comply with Section 709 for fire partitions.

Exceptions:

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has at least one door directly to the exterior and rooms for assembly purposes have at least one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A fire-resistance rating is not required for corridors contained within a dwelling or sleeping unit in an occupancy in Group R.
3. A fire-resistance rating is not required for corridors in open parking garages.
4. A fire-resistance rating is not required for corridors in an occupancy in Group B which is a space requiring only a single means of egress complying with Section 1015.1.
5. <u>A fire-resistance rating is not required for corridors where the length of the corridor is less than 2.5 times the least width.</u>

Reason: This proposed amendment provides a uniform application for corridor enclosure requirements and offers a design option to enlarge a corridor width in lieu of providing a fire resistance rating.

The IBC definition of a corridor does not readily establish when a space should be considered a room or a corridor. This is because it does not acknowledge narrowness or length as corridor characteristics commonly found in most dictionaries. The definition of a corridor is "an enclosed exit access component that defines and provides a path of egress travel to an exit." Any room is an enclosed exit access component that provides a path of egress to an exit. The room becomes a corridor when it actually defines a path to an exit. But the question is what room configuration defines a path to an exit where it becomes a corridor that should be subject to fire-resistance rating requirements. This proposed amendment provides a length-to-width ratio that more clearly and uniformly establishes this threshold.

The purpose of fire rating corridor enclosures is to protect occupants traveling in a confined space from the hazards of fire. The more the space is confined the greater the hazard, and by contrast, decreasing the confinement reduces the hazard. If a corridor width is increased, it begins to resemble a room where it becomes reasonable to eliminate the fire-resistance rating of the enclosure. As an example, a corridor measuring 3'x25' serving an occupant load of 40 in an unsprinklered Group B occupancy is required to have 1-hour fire-resistance rated enclosures with fire protection of door openings. Given the confined nature of this space, it is appropriate to require the necessary fire protection. However, if the corridor width were increased to 10 feet while maintaining its original length, the space becomes much less confined, less hazardous, and begins to resemble an adjoining or intervening room otherwise permitted without rated enclosures as part of an exit access. Some would argue that the enlarged space is no longer a corridor and not subject to the provisions of Section 1018.

The proposed amendment establishes a 2.5 length/width ratio as the transition for requiring fire-resistant rated corridor enclosures. This ratio was chosen because it is the same as that used in exception #3 of Section 1018.4 that would allow an unlimited dead end corridor where the length is less than 2.5 times the width. Given that the code has established this ratio as an appropriate exception to allow unlimited dead end corridors, it seems appropriate to use the same standard to corridor fire-resistance requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Blanke-E1-1018.1

Public Hearing Results

Committee Action: Disapproved

Committee Reason: The ratio 2.5:1 is commonly used for elevator lobbies off corridors for dead end provisions. If there is an exception for the construction this could be interpreted as requiring a rating for the corridor but not the elevator lobby. Defining corridors in this manner could affect rooms.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mark Blanke, PE, New York State Div. of Code Enforcement and Administration, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1018.1 (IFC [B] 1018.1 Construction. Corridors shall be fire-resistance rated in accordance with Table 1018.1. The corridor walls required to be fire-resistance rated shall comply with Section 709 for fire partitions.

Exceptions:

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has at least one door directly to the exterior and rooms for assembly purposes have at least one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A fire-resistance rating is not required for corridors contained within a dwelling or sleeping unit in an occupancy in Group R.
3. A fire-resistance rating is not required for corridors in open parking garages.
4. A fire-resistance rating is not required for corridors in an occupancy in Group B which is a space requiring only a single means of egress complying with Section 1015.1.
5. A fire-resistance rating is not required for corridors <u>which are not part of an elevator lobby and</u> where the length of the corridor is less than 2.5 times the least width.

Commenter's Reason: The committee's primary reason for disapproval is because the proposal may be interpreted to exempt fire-resistance rating requirements for fire partitions that enclose elevator lobbies. The modification should address this concern.

Final Action: AS AM AMPC____ D

E113-09/10
Table 1018.1 (IFC [B] Table 1018.1)

Proposed Change as Submitted

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM): Thomas S. Zaremba, Roetzel & Andress, representing self

Revise as follows:

TABLE 1018.1 (IFC [B] TABLE 1018.1)
CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not permitted	1
H-4, H-5	Greater than 30	Not permitted	1
A, B, ~~E~~, F, M, S, U	Greater than 30	1	0
E	Greater than 30	1	1
R	Greater than 10	Not permitted	0.5
I-2[a], I-4	All	Not permitted	0
I-I, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2. see Sections 407.2 and 407.3.
b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.
c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 901.3.1.1 or 903.3.1.2 where allowed.

Reason:
Davidson/Shuman – This code change was proposed by several parties in the last development cycle as E117-07/08. Although half the Committee supported its adoption, the Chair broke a tie vote in favor of a recommendation of disapproval. At the Final Action Hearings, the Committee's recommendation was overturned, but a motion to "approve as submitted" failed to secure the 2/3 majority needed for adoption. The Membership voted 55% in favor of adoption.

There are good reasons that a solid majority of the Membership favors adopting this proposal. First, the E occupancies at issue represent structures built to house a dense population of children ranging from ages 4 through early teens. Group E occupancies typically have paper and other flammables hung from ceilings to floors throughout. Classrooms are filled with desks containing books, papers and other flammables. Science labs use chemicals and accelerants. Lunch rooms have stoves, ovens and trash cans spread throughout loaded with waste paper and other flammables. Theaters house clothing, wooden and cardboard props and paper banners strung from one end of the room to the other. Lockers contain books and hide things that are not easily monitored. Janitorial closets house cleaning solutions and solvents. Many Group E occupancies are multi-story buildings with classrooms on several floors.

Group E occupancies mix a high concentration of children with fuel loads on a daily basis. As budgets shrink, so do the number of adult supervisors. Our children are in schools because they are required to be there. We owe them a duty to ensure they are safe from the risk of fire while in school. We simply cannot wait for a catastrophe to protect children while at school.

Unfortunately the world of elementary, secondary and higher education learning has gone through tremendous changes in security measures undertaken, both operationally and hardware installations, due to the threat of violent acts committed against students and staff. Where we had educational facilities with highly effective fire drill evacuation procedures and actions during system activation, we now have written plans and training in place to ignore the activation of the fire alarm system if a "lockdown" has been declared because the activation of the fire alarm system may be a diversion to bring staff and students out into the open to serve as victims.

This is not a possible situation. This is a very real situation that occurs throughout the country in response to the acts of violence that have occurred at educational facilities. Though the exact procedure may vary site to site, the main premise of a "lockdown" is to gather staff and students into classrooms and offices and to lock the doors, preventing intruders from getting into the room and preventing staff and students from leaving the rooms until an all clear is announced. The staff and students are trained to ignore a fire alarm activation during a lockdown until they are ordered to evacuate after someone in authority, (could be a Principal or could be a Police Commander), makes a determination that the fire threat is real and that they must evacuate to survive the fire.

Because the students and staff will delay their evacuation while a fire is attacking the structure and potentially cutting off escape routes where corridors are not protected, this code change proposal will require all corridors serving an occupant load greater than 30 in group E educational occupancies to have 1 hour fire resistant rating except as allowed by Exception 1 to section 1018.1.

Exception 1 to Section 1018.1 is a legitimate exception for the one hour corridor fire resistant rating requirement, since it requires every classroom to have at least one door directly to the exterior and rooms used for assembly purposes have at least ½ of the required means of egress directly to the exterior as well. Under those conditions, there is no need for the students and other occupants to rely on exiting the building through the corridors since they can go directly to the exterior and move to a safe area of refuge. Once the announcement to evacuate occurs they can exit without being exposed to the fire threat potentially extended into the unprotected corridor.

However, if this is not the case, then the students, teachers, and other occupants of the educational occupancy must rely on the corridor system to exit safely from the building. In that case the paths of travel to get out of the building are restricted and the occupants may be exposed to the room of fire origin while trying to evacuate. Certainly, the basis for 1 hour fire resistive protection for corridors when the occupant load exceeds 30 is to provide for a reasonable level of protection for the occupants as they exit the building without having them unduly be exposed to a fire condition, water, and smoke which may impede their egress because they have delayed their evacuation due to a "lockdown".

It has been reported that there is an annual average of 14,700 fires in educational properties in the United States. The estimated average property loss from these fires is $85 million per year, and caused approximately 100 injuries. The costs of bussing students to alternate facilities, the impact of double sessions in schools to accommodate displaced students, and the mental aspect of the children who fell victim to the fires is less than construction costs of a 1 hour fire resistant corridor.

Nearly half (49.7 %) of these fires were incendiary or suspicious in nature. Structure fires can start in a wide variety of different areas. During 1999-2001, 23% of the fire origins were in bathrooms/locker rooms, 13% started in the kitchen area, 7% in the classrooms, and another 7% started in corridors. Even more disturbing are findings indicating that injuries per school fires are higher than those of ALL non-residential structure fires. Certainly, the fact that more than 70% of fires occur between 0800 and 1600, the hours students are most likely to be in school, and 16% of fires occur between 1700 and 2400; 12% occur between 2400 and 0800 shows that the threat of a fire occurring while children are present is real.

Currently, the International Building Code (IBC) allows the 1-hour fire –resistance rated corridor to be omitted where the building is protected by an automatic sprinkler system. We don't believe that such a "trade-off" is appropriate, especially in an educational occupancy where there are large numbers of children at relatively high density who are placed at risk in a fire situation. We believe that due to the expanding use of "lockdown" procedures a balanced design approach to providing life safety in educational occupancies is prudent so that the 1-hour fire resistance rated corridors can work in conjunction with the automatic sprinkler system to assure the level of life safety for the building's occupants intended by the code.

Note that an I-3 occupancy, (correctional centers, detention centers, jails, prerelease centers, prisons, and reformatories), requires the corridors to have 1 hour fire-resistance ratings when the occupancy is protected by a fire suppression system, regardless of the number of occupants. When a "lockdown" occurs in a school the staff and students are prisoners. They are prohibited from leaving the rooms or areas of protection until given permission (ordered) to do so, or because they are being held hostage. For consistency purposes the staff and students in educational occupancies deserve the same level of protection we provide to inmates. A comparison to the other I groups where evacuation of the occupants may be delayed or prevented because they are incapable of self preservation is also appropriate and substantiates a need to increase the protection level for corridors in the education group occupancies since in the case of "lockdowns" the staff and students are prevented from taking self preservation actions when the fire alarm activates until authorized, (ordered), to evacuate after an undetermined delay in time.

Other points to consider are the construction modifications made due to high-profile events and fuel loads in our schools. Events as the Columbine High School shootings, the need of school security can sometimes conflict with the requirements of fire safety. For example, exits may be restricted for security reasons preventing escape should a fire occur. Today's structures are unquestionably safer, yet the contents of today's classrooms are more combustible. Evidence suggests that fires in schools can spread far more rapidly due to the fuel load in the school buildings.

An additional benefit of the 1-hour fire resistance rated corridor is that it can assist fire fighters and tactical response team members in doing their job by providing a protected means of access to the interior of the building where they can perform their search and rescue missions, as well as fire fighting operations, in relative safety. Fire resistant corridors provide fire fighters and tactical response team members with additional time to conduct their life safety operations more effectively and safely.

From an economic perspective, fires rank as a major national problem, and since no individual safety measure is reliable all of the time, fire protection should and must be redundant. We are concerned that the compounding effect of sprinkler trade-offs could lead to greater risk to the life safety of the building occupants, especially if combined with the reduction in or the elimination of the 1 hour fire resistance rated corridors providing access to the exits or exit stairwells in an occupancy that routinely has staff and students drill and respond in real events to ignore fire alarm system activations. Too much reliance on automatic sprinkler systems may not be wise where life safety is a key consideration. We strongly believe that a balanced approach to fire and life safety in buildings should be provided when a fire occurs.

Zaremba -This code change was proposed by several parties in the last development cycle. Although half the Committee supported its adoption, the Chair broke a tie vote resulting in a Committee recommendation of disapproval. At the Final Action Hearings, however, the Committee recommendation was overturned. Although a motion to "approve as submitted" received a favorable vote of 55% of the Membership, it did not receive the 2/3 majority needed for adoption.

A majority of the Membership had good reason to favor the adoption of this proposal. First, the E occupancies at issue represent structures built to house a dense population of children ranging from ages 4 through early teens. Group E occupancies typically have paper and other flammables hung from ceiling to floor on every wall. Classrooms are filled with desks containing books, papers and other flammables. Science labs use chemicals and accelerants. Lunch rooms have stoves, ovens and trash cans spread throughout, all loaded with waste paper and other flammables. Theaters house clothing, wooden and cardboard props and paper banners strung from one end of to the other. Lockers contain books and hide things that are not easily monitored. Many Group E occupancies are multi-story buildings with relatively long corridors between classrooms and exit discharges.

In short, Group E occupancies represent a daily mix of high occupancy loads, children and significant fuel loads. As budgets shrink, so do the number of adult supervisors. E occupancies should provide children with an environment redundant in fire safety protections.

Especially because large numbers of children would be at risk in the event of a fire, redundant fire protection systems is warranted without waiting for a catastrophic loss of life to provide the motivation for making this change. Sprinklered Group E occupancies with corridors serving occupant loads of more than 30 children should include 1-hour fire resistance rated corridor construction.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME:Zaremba-E2-Table 1018.1

Public Hearing Results

Committee Action: Disapproved

Committee Reason: If you take away the trade off for sprinklers vs. rated corridors the result will be many more schools designed without sprinklers – sprinklered schools are safer during a fire event than schools with rated corridors. The antidotal data vs. the NFPA data does not justify the significant increase in the cost of construction. In addition there will be issues with maintaining the fire resistance rating of the walls especially to automatic closers on the doors being in-place and functional. The fire doors with automatic closers will be a problem for access to classrooms. This would also require rated corridors in day care facilities, which would be excessive. Information was not provided for the justification for the 30 occupant exception for the proposed ratings

The proponents continually brought up the possibility of a fire event during a lockdown situation. Rating of a corridor is a means of egress issue, not a security issue. Rated corridors will not protect students from terrorists during a lockdown situation. If there is, a concern for a fire event during a lock-down that needs to be addressed with the emergency responders in the fire and safety evacuation plans, not through a corridor rating. In addition, there are other safety concerns in schools. Schools commonly have doors with vision panels and sidelights for observation of the classrooms and student/teacher interaction. Requiring rated doors at these locations would either significantly raise the costs for the opening protective and/or result in solid doors without this necessary observation feature.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Mike Ashley, representing Alliance for Fire & Smoke Containment & Control, Inc., requests Approval as Submitted.

Commenter's Reason: All exit corridors in E occupancies should be 1 hour protected construction, this does not include the small corridors that may serve offices such as principle, councilors or other small areas.

With today's security issues school systems do not evacuate the buildings immediately when the fire alarm is sounded. The students and staff are held in place until the administrative staff checks for the problem and then the students and staff exit if necessary.

Without a rated corridor the safety of the students and staff become comprised due to the extra time required to exit the building.

Second with main streaming of students with special needs extra time is required to get special needs students into wheel chairs or other types of transporting devices and exit the building. Actual surveys show that one child with special needs that is in his or her study desk requires up to 12 minutes to assist the child out of the desk and placed into the wheel chair and then pushed to the safe area outside the building. The one hour protected corridor allows this child and staff person the added safety from fumes and gases and smoke that will occur in a fire event.

Public Comment 2:

Thomas S. Zaremba, Roetzel & Andress, representing Glazing Industry Code Committee (GICC), a Committee of the Glass Association of North America (GANA); Robert J. Davidson, Davidson Code Concepts, LLC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE 1018.1
CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not permitted	1
H-4, H-5	Greater than 30	Not permitted	1
A , B , F , M , S , U	Greater than 30	1	0
E	~~Greater than 30~~ <u>All</u>	1	1
R	Greater than 10	Not permitted	0.5
I-2[a],I-4	All	Not permitted	0
I-I, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2. See Sections 407.2 and 407.3.

b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 901.3.1.1 or 903.3.1.2 where allowed.

Commenter's Reason: Adopting this proposal will significantly increase the fire safety of both life and property in new schools. An increased level of fire safety is clearly justified in schools because, every year, there are an average of 5,500 fires in schools throughout the Country. More than 70% of these fires happen while students are in the classrooms. Every year, these fires claim approximately 125 injuries and more than $50 Million in property damage. (See, Topical Fire Research Series, Vol. 8, Issue 1 (August 2007) U.S. Fire Administration, Department of Homeland Security; Report of School Fires prepared by Catastrophic Fire Prevention Task Force of the National Association of State Fire Marshalls 2002).

There is nothing anecdotal about the need for increased levels of fire safety in our schools. It is a fact that fires regularly occur in schools throughout our country. Their frequency, severity and the fact that they regularly occur while occupied by teachers and students, clearly separates E-occupancies from the other occupancies with which they are currently grouped in Table 1018.1.

If adopted, this proposal would require 1-hour fire-resistance rated corridors in E-occupancies with fire areas less than 12,000 square feet. (Only E-occupancies with fire areas greater than 12,000 square feet are required to have automatic sprinkler systems pursuant to section 903.2.3 of the IBC.) It would require both sprinkler systems and rated corridors in E-occupancies with fire areas greater than 12,000 square feet. This would provide the same type of redundancy for sprinklered E-occupancies that is currently required in R-occupancies and many I-occupancies. Since our children, and our tax dollars, are both at stake in the level of fire protection afforded to our schools, the adoption of this change is both warranted and appropriate.

The Committee disapproved this proposal claiming that only "anecdotal" evidence had been submitted in support. As set forth above, that is, simply, not correct. Educational occupancies are the subject of frequent fires that repeatedly result in significant injuries and property losses every year.

The Committee also confused "security" issues and "life safety issues" as they relate to lockdowns. Post-9/11 and post-Columbine, educational occupancies have been forced to retreat from procedures requiring occupants to immediately exit schools as soon as a fire alarm is sounded out of concern that either a fire will be set or fire alarms falsely activated in order to draw students out of their classrooms, into the open where they are vulnerable to violent acts. This has resulted in the initiation of "lockdown" procedures typically requiring students to be locked in their classrooms following fire alarms until authorities can ascertain that the building is free of intruders. These new "security" procedures significantly increase the risks to life in the event of fire by significantly increasing the length of time that students are forced to remain in their classrooms before they are allowed to exit a burning building. These increased risks can and should be mitigated by requiring automatic sprinkler systems and one-hour fire-resistance rated corridors.

Adding rated corridors to sprinklered E-occupancies is not being proposed to somehow protect students from terrorists, as suggested by the Committee. It is being proposed to address the fact that numerous fires occur in our schools each and every year. Those fire risks are significantly increased by the realities of new lockdown procedures. This proposal is about safeguarding life and property in our schools from the risks of fire.

It was originally proposed that this change only apply to corridors serving occupant loads greater than 30. The Committee saw no justification for that exception and, accordingly, the proposal has been modified to remove it.

Final Action Agenda voters are strongly urged to vote against the standing motion to disapprove in order to vote in favor of a motion to approve E113 As Modified by this Public Comment.

Final Action: AS AM AMPC____ D

E114-09/10

1018.1, 1018.1.1 (New) [IFC [B] 1018.1, 1018.1.1 (New)]

Proposed Change as Submitted

Proponent: Robert J Davidson, Code Consultant, Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM); Thomas S. Zaremba, Roetzel & Andress representing self

Add new text as follows:

1018.1 (IFC [B] 1018.1) Construction. Corridors, other than those regulated by Section 1018.1.1, shall be fire-resistance rated in accordance with Table 1018.1. The corridor walls required to be fire-resistance rated shall comply with Section 709 for fire partitions.

Exceptions:

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has at least one door opening directly to the exterior and rooms for assembly purposes have at least one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A fire-resistance rating is not required for corridors contained within a dwelling or sleeping unit in an occupancy in Group R.
3. A fire-resistance rating is not required for corridors in open parking garages.
4. A fire-resistance rating is not required for corridors in an occupancy in Group B which is a space requiring only a single means of egress complying with Section 1015.1.

TABLE 1018.1 (IFC [B] TABLE 1018.1)
CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not Permitted	1
H-4, H-5	Greater than 30	Not Permitted	1
A, B, E, F, M, S, U	Greater than 30	1	0
R	Greater than 10	Not Permitted	0.5
I-2[a], I-4	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3.
b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.
c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

1018.1.1 (IFC [B] 1018.1.1) Category III and IV Buildings in Hurricane-Prone and Seismic Areas. Corridors in all Category III and Category IV buildings as defined in Table 1604.5 shall have a fire resistance rating of 1-hour if located in hurricane-prone regions defined in Section 1609.2 or assigned to seismic design categories C, D, E or F in Section 1613.5.6.

Reason:
Davidson, Shuman - Category III buildings are defined in Table 1604.5 as those “that represent a substantial hazard to human life in the event of failure.” They include, but are not limited to:

- Public assembly occupancies with occupant loads greater than 300,
- Elementary or secondary schools or day care facilities with occupant loads greater than 250,
- Adult education facilities with occupant loads greater than 500,
- Group I-2 occupancies with occupant loads greater than 50, and
- Group I-3 occupancies.

Category IV buildings are those which are designated as essential facilities. “Essential Facilities” are defined in section 1602.1 as “buildings and other structures that are intended to remain operational in the event of extreme environmental loading from flood, wind, snow or earthquakes. These include, but are not limited to:

- Designated earthquake, hurricane or other emergency shelters,
- Designated emergency preparedness, communications and operations centers and other facilities required for emergency response, and
- Fire, rescue, ambulance and police stations and emergency vehicle garages.

In the face of impending natural disasters, residents regularly seek refuge in, or are evacuated from their homes to, Category III or IV buildings. At the same time, hurricanes and earthquakes regularly render roads impassable, often times cutting these evacuation shelters off from municipal and emergency medical, police and fire services. Even if these sites remain accessible by road, first responders may be unable to promptly respond when confronted with the wide spread devastations of a hurricane or earthquake.

Adopting this code change would ensure that redundant safety features, in the form of sprinklers and fire resistance rated corridors, are in place to ensure a safe evacuation of high occupancy buildings used as emergency shelters in hurricane and seismic areas.

Zaremba - Buildings and infrastructures can be severely damaged in hurricanes and earthquakes.

Category III buildings are those that represent a “substantial hazard to human life in the event of failure” and include buildings with high occupancy loads, for example, public assembly buildings with occupant loads greater than 300; elementary or secondary schools or day care facilities with occupant loads greater than 250; adult education facilities with occupant loads greater than 500; Group I-2 occupancies with occupant loads greater than 50; and Group I-3 occupancies.

Category IV buildings are specifically intended to provide shelter in natural catastrophes. These are “essential facilities,” defined in section 1602.1 as those intended to remain operational throughout a natural disaster. They include designated earthquake, hurricane or other emergency shelters; designated emergency preparedness, communications and operations and emergency response centers; and fire, rescue, ambulance and police stations and emergency vehicle garages.

Hurricanes and earthquakes can quickly interrupt utilities, including power, communications and water supplies, while slowing or prohibiting travel to and from these facilities. A fire in a Category III or IV building during or after a hurricane or seismic event could result in a significant loss of life when large concentrations of people, including first responders, or those suffering from disabilities, are forced to evacuate under circumstances where communications and sprinkler systems are inoperable and emergency fire and rescue services are inaccessible or unavailable. To ensure safe evacuations in the event of fire, this proposal would require Cat. III and IV buildings in hurricane prone and seismic areas to include 1-hour fire-resistance rated corridors.

Cost impact: The code change proposal will increase the cost of construction.

ICCFILENAME:Davidson-Shuman-E2-1018.1.1

Public Hearing Results

Committee Action: Disapproved

Committee Reason: Buildings in earthquake and hurricane areas are already designed to a higher standard, therefore this rated corridor requirement is not needed. Structural robustness is not related to fire-resistance-rated corridors. Technical justification was not providing indicating that the fire incidences are higher for the specified buildings in earthquake and hurricane areas. This would require rated corridors in schools, police stations, fire stations, all emergency shelters (i.e., churches, schools, community centers, football stadiums). This would be a serious operational issue for Group I-2 functions where this would require rated corridors.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Thomas S. Zaremba, Roetzel & Andress, representing Glazing Industry Code Committee (GICC), a Committee of the Glass Association of North America (GANA); Robert J. Davidson, Davidson Code Concepts, LLC, representing self, requests Approval as Submitted.

Commenter’s Reason: This proposal will increase the fire safety of high hazard Category III and IV Buildings found in hurricane and seismic zones. In that regard, it proposes that occupants and property in these types of Buildings be protected from the risks of fire by 1-hour fire resistance rated exit corridors since hurricanes and earthquakes often cause a loss of water supply to sprinkler systems.

Category III and IV buildings are well defined in Chapter 16 of the IBC. Category III buildings are those that represent “a substantial hazard to human life in the event of failure” and Category IV buildings are those designated as “essential facilities.” See, Table 1604.5

In recommending disapproval, the Committee mistakenly believed that this proposal was somehow attempting to use the fire resistance ratings of exit corridors to address the “structural robustness” of Category III and IV buildings. While it may be understandable for the Committee to make such a mistake since this proposal did not come before the Committee until after 10:00 o'clock at night, it is clear that this proposal has nothing to do with "structural robustness." It proposes 1-hour fire resistance rated corridors to address and enhance the **fire** safety of Category III and IV buildings found in areas that suffer from a high risk that water supplies to their sprinkler systems will be lost during or after seismic and hurricane events.

Simply put, water supplies upon which sprinkler systems depend are often interrupted as a result of hurricanes and earthquakes. This means that occupants and property in Category III and IV buildings will be subjected to a higher risk of loss from fire if those buildings are only protected by sprinkler systems. That risk is magnified by the fact that during natural disasters, fire service and other emergency service response times are frequently delayed by overwhelming numbers of emergency calls; losses of power and communications; impassable roads; and many other dangers incident to the delivery of emergency services during natural disasters. The fire safety of these high hazard Category III and IV buildings can be significantly increased by requiring exit corridors with 1-hour fire resistance ratings.

Category III and IV buildings are very likely to be occupied during or after natural disasters. A failure of Category III or IV buildings to protect occupants from the risk of fire after a loss of water supply would represent "a substantial hazard to human life" and a substantial risk to the ability to provide essential services to those affected by natural disasters.

Final Action Agenda voters are strongly urged to vote against the standing motion to disapprove in order to vote in favor of a motion to approve E114 "As Submitted."

Final Action: AS AM AMPC____ D

E115-09/10

1018.2, Table 1018.2 (New) [IFC [B] 1018.2, Table 1018.2 (New)]

Proposed Change as Submitted

Proponent: John England, MCO, England Enterprises Inc., representing self

1. Revise as follows:

1018.2 (IFC [B] 1018.2) Corridor width. The minimum corridor width shall be as determined in Section 1005.1, but not less than specified in Table 1018.2 ~~but not less than 44 inches (1118 mm).~~

~~Exceptions:~~

1. ~~Twenty-four inches (610 mm)—For access to and utilization of electrical, mechanical or plumbing systems or equipment.~~
2. ~~Thirty-six inches (914 mm)—With a required occupant capacity of less than 50.~~
3. ~~Thirty-six inches (914 mm)—Within a dwelling unit.~~
4. ~~Seventy-two inches (1829 mm)—In Group E with a corridor having a required capacity of 100 or more.~~
5. ~~Seventy-two inches (1829 mm)—In corridors and areas serving gurney traffic in occupancies where patients receive outpatient medical care, which causes the patient to be not capable of self-preservation.~~
6. ~~Ninety-six inches (2438 mm)—In Group I-2 in areas where required for bed movement~~

2. Add new Table as follows:

Table 1018.2 (IFC [B] Table 1018.2)
MINIMUM CORRIDOR WIDTH

Occupancy	Width (inches)
Any facilities not listed below	44 inches
Access to and utilization of mechanical, plumbing or electrical systems or equipment	24 inches
Occupant load less than 50	36 inches
Within a dwelling unit	36 inches
Group E with occupant load of 100 or more	72 inches
Group B or I-2 outpatient medical facilities where patients are moved on gurneys	72 inches
Group I-2 in areas where care recipients are moved on beds	96 inches

For SI: 1 inch=25.4 mm

Reason: A table will make it easier to understand.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The terminology used in the text of the exceptions is different than the terminology used in the proposed table. A concern would be if this change in terminology change the original interpretation of these exceptions.

ICCFILENAME:England-E1-1018.2

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Placing the base requirement and exceptions in a table makes the requirements easier to understand.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Table 1018.2 (IFC [B] Table 1018.2)
MINIMUM CORRIDOR WIDTH

Occupancy	**Width (inches)**
Any facilities not listed below	44 inches
Access to and utilization of mechanical, plumbing or electrical systems or equipment	24 inches
~~Occupant load~~ With a required occupancy capacity less than 50	36 inches
Within a dwelling unit	36 inches
In Group E with a corridor having a required capacity ~~occupant load~~ of 100 or more	72 inches
In corridors and areas serving gurney traffic in occupancies where patients receive outpatient medical care, which causes the patient to be not capable of self-preservation ~~Group B or I-2 outpatient medical facilities where patients are moved on gurneys~~	72 inches
Group I-2 in areas where required for bed movement ~~care recipients are moved on beds~~	96 inches

For SI: 1 inch=25.4 mm

Commenter's Reason: The proposed modification is intended to address a valid question raised by the staff comment. While the intent of the code change is purely editorial, the slight differences in the current and revised text raises enough questions so that it won't consistently be interpreted the same as current code. One example: current code says that in Group E, corridors with a required capacity of 100 occupants have a minimum 72" width. In the original proposal, this is instead stated as a minimum 72" corridor width for ' Group E with an occupant load of 100 or more'. This bases the corridor width on the overall occupant load of the occupancy, rather than the required capacity of the specific corridor. The modification simply places wording identical to the current text into the newly proposed table.

Final Action: AS AM AMPC____ D

E122-09/10, Part I
1021.2 (IFC [B] 1021.2)

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

Proposed Change as Submitted

Proponent: Christine Reed and Stuart Tom, P.E., CBO, representing the California Fire Chiefs Association and the Los Angeles Basin Chapter, ICC; Jonathan C. Siu, representing City of Seattle, Department of Planning and Development

PART I – IBC MEANS OF EGRESS

Revise as follows:

1021.2 (IFC [B] 1021.2) Single exits. ~~Only one exit shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2.~~ Occupancies shall be permitted to have a single exit in buildings otherwise required to have more than one exit if the areas served by the single exit do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single exit shall not be located more than one story below grade plane.

Reason:
PART I –Section 1015.1 and Section 1021.1 both contain identical, very specific, exception language that allows Group R-3 occupancies to be permitted with one means of egress provided the occupant load is limited to a maximum of 20 and the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. As currently written, Section 1021.2 creates two (2) potential conflicts.

In one case, a potential conflict arises if the stricken sentence remains because of the reference "… as indicated in Table 1021.2". Table 1021.2 limits the number of occupants on the first story or basement of Group R occupancies to a maximum of 10 and a maximum travel distance of 75 feet. This conflict would result in the severe limitation of the size of 1-story Group R-3 occupancies with one means of egress to only 2,000 square feet, which is contrary to Sections 1015.1 and 1021.1 which allow up to 4,000 square feet in buildings equipped throughout with an automatic sprinkler system.

In the second case, a potential conflict arises if the stricken sentence remains because some readers might ignore the reference " … as indicated in Table 1021.2" and provide only one means of egress for Group R-3 occupancy buildings regardless of size. This would be in conflict with Sections 1015.1 and 1021.1 which impose a size limitation of 4,000 square feet based upon the maximum occupant load limit of 20, considering the occupant load factor of 200 square feet per occupant as indicated in Table 1004.1.1.

This proposal eliminates a confusing sentence within Section 1021.2, that is currently in conflict with Sections 1015.1 and 1021.1, thereby making all three sections consistent.

Cost Impact: The code change proposal will not increase the cost of construction

ICCFILENAME:tom-reed-siu-E1-1021.2

Public Hearing Results

PART I IBC MEANS OF EGRESS
Committee Action: **Approved as Submitted**

Committee Reason: The first sentence in Section 1021.2 is redundant with the text in Section 1021.1 and 1015.1. This should be correlated with the committee actions on E119 and E121.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Steve Orlowski, representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1021.2 (IFC [B] 1021.2) Single exits. <u>Only one exit shall be required from</u> <u>one- and two-family dwellings and townhouses. All other</u> occupancies shall be permitted to have a single exit in buildings otherwise required to have more than one exit if the areas served by the single exit do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single exit shall not be located more than one story below grade plane.

Commenter's Reason: Based on the supporting arguments made by the original proponent, NAHB considers this suggested modification to be in keeping with the proper style of code language and appropriately deals with the two concerns of the original proponent. This modification correctly address the concerns that there are times when a group R-3 occupancies need to require an additional exit based on its use, while still exempting one- and two- family dwellings and townhouses from the requirements of Table 1021.2 and allowing for a single exit.

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

E122-09/10, PART II – IRC BUILDING/ENERGY
R311.4

Proponent: Christine Reed and Stuart Tom, P.E., CBO, representing the California Fire Chiefs Association and the Los Angeles Basin Chapter, ICC; Jonathan C. Siu, representing City of Seattle, Department of Planning and Development

Revise as follows:

R311.4 Vertical egress. Egress from habitable levels including habitable attics and basements not provided with an egress door in accordance with Section R311.2 shall be by ~~a~~ <u>one or more</u> ramp<u>s</u> in accordance with Section R311.8 or ~~a~~ <u>one or more</u> stairway<u>s</u> in accordance with Section R311.7 <u>or both</u>. <u>Habitable levels larger than 1,000 square feet (92.9 m^2) located more than one story above or below an egress door shall be provided with not less than two means of egress.</u>

Reason:
PART II –The IRC fails to address the fact that a single exit may not be sufficient for every R-3 occupancy One- or Two- Family Dwelling. While a single exit may be suitable for most dwellings, the same cannot be said of all dwellings. The IRC establishes the standards that will also apply to very large dwellings and dwellings constructed on steep lots, where egress design becomes more critical.

In comparison, the IBC addresses the need for a second means of egress through Sections IBC 1015.1 and IBC 1021.1. Both of these provisions will require a second means of egress from a Group R-3 occupancy if the occupant load exceeds 20 persons. Furthermore, since the IBC utilizes the 3-part means of egress design concept, Group R-3 occupancies regulated by the IBC would be required to have both means of egress comply with all applicable provisions of IBC Chapter 10.

Since the IRC does not utilize the 3-part means of egress concept nor the occupant load concept, it is not practical to use the same approach as the IBC in establishing whether a second means of egress is required in R-3 occupancies up to 3-stories in height. Furthermore, the need for a second means of egress is most critical on floors that are located more than one story above or below an egress door. This proposal does not require a second means of egress from 1- or 2- story Group R-3 occupancies because the length of vertical egress travel is inherently limited to a maximum of one story in such buildings. This proposal will only require a second means of egress from habitable levels that are located more than one level above or below the egress door, and only if such levels exceed 1,000 square feet in area. Egress from such occupied floor levels becomes more critical because of the combination of increased vertical egress travel combined with the increased travel distance within a large floor area exceeding 1,000 square feet.

The IRC also fails to adequately address egress from Group R-3 occupancy dwellings constructed on steep hillside lots, especially lots located on the down-slope side of a street. Many jurisdictions throughout the country have steep hillside residential areas, where it is common to construct homes on the down-slope side of a street with the topmost floor located at street level and two additional floors located below street level. Often such down-slope lots are so steep that there is no usable rear yard. Consequently, homes constructed on such steep terrain typically do not have a rear door (that could serve as a second means of egress), because a door that leads to a steep and unusable rear yard is not likely to be installed. This proposal would require such occupied levels that are greater than 1,000 square feet in area to be provided with a second means of egress.

This code change proposal will not affect the majority of Group R-3 occupancy One- and Two- Family Dwellings regulated by the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II- IRC B/E
Committee Action: **Disapproved**

Committee Reason: The committee recognizes there is a need for this in large mansions. However, this proposal is unclear and confusing on how to apply. The 1000 square foot threshold is an arbitrary number. The remoteness of the two means of egress is not addressed. There is no data for deaths or injuries associated with this situation.

Assembly Action: **None**

E124-09/10
1022.3, 1022.4 (IFC [B] 1022.3, 1022.4)

<u>Proposed Change as Submitted</u>

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1022.3 (IFC [B] 1022.3) Openings ~~and penetrations~~. Exit enclosure opening protectives shall be in accordance with the requirements of Section 715.

Openings in exit enclosures other than unprotected exterior openings shall be limited to those necessary for exit access to the enclosure from normally occupied spaces and for egress from the enclosure. <u>There shall be no communicating openings, whether protected or not, between adjacent exit enclosures.</u>

Elevators shall not open into an exit enclosure.

1022.4 (IFC [B] 1022.4) Penetrations. Penetrations into and ~~openings~~ through an exit enclosure are prohibited except for ~~required exit doors,~~ equipment and duct work necessary for independent pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication and electrical raceway serving the exit enclosure and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 713.

There shall be no penetrations ~~or communicating openings~~, whether protected or not, between adjacent exit enclosures.

Reason: The current title of Section 1022.3 is somewhat misleading in that it references "penetrations." No provisions in Section 1022.3 apply to penetrations and there are no cross-references to Section 713. Section 1022.4, however, does address the penetration provisions applicable to exit enclosures. Technical references to openings in Section 1022.4 have either been removed or relocated to Section 1022.3. For instance, the reference to "required exit doors" in the first sentence has been eliminated because that concern is addressed in the second paragraph of Section 1022.3 that limits openings into an exit enclosure to those necessary for egress. Approval of this proposal will reduce confusion and assist users in the correct identification of applicable exit enclosure opening and penetration requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Keith-E8-1022.3

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The current text for openings and penetrations is clear. It is not clear what the proponent was trying to address in the revisions.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory R. Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Submitted.

Commenter's Reason: It appears that the ICC Means of Egress Code Committee may not have understood the intent of Item E124-09/10. In their published reason statement for disapproval, it was stated, "The current text for openings and penetrations is clear. It is not clear what the proponent was trying to address in the revisions.

The proposal was intended to be purely editorial in nature. It contained no technical changes. The intent of the proposal was to organize applicable technical provisions in the proper section. Currently, Section 1022.3 is titled, "Openings and penetrations"; however, it contains no requirements pertinent to penetrations and there are no cross references to Section 713. Therefore, "penetrations" was removed from the section heading. Section 1022.4 is titled, "Penetrations"; however, it contains some technical provisions applicable to openings. Those provisions have been properly relocated in Section 1022.3, Openings.

E124-09/10 simply creates proper section headings and correctly places applicable technical requirements within those sections. Approval of this proposal will reduce confusion and assist users in the correct identification of applicable exit enclosure opening and penetration requirements.

Final Action: AS AM AMPC____ D

E126-09/10

1022.4, 1023.6 (IFC [B] 1022.4, 1023.6)

Proposed Change as Submitted

Proponent: Matthew Davy, PE, Schirmer Engineering Corporation, representing self

Revise as follows:

1022.4 (IFC [B] 1022.4) Penetrations. Penetrations into and openings through an exit enclosure are prohibited except for required exit doors, equipment and ductwork necessary for independent ventilation or pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication systems and electrical raceway serving the exit enclosure and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 713. There shall be no penetrations or communication openings, whether protected or not, between adjacent exit enclosures.

Exception: Membrane penetrations shall be permitted on the outside of the exit enclosure. Such penetrations shall be protected in accordance with Section 713.3.2.

1023.6 (IFC [B] 1023.6) Penetrations. Penetrations into and openings through an exit passageway are prohibited except for required exit doors, equipment and ductwork necessary for independent pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication and electrical raceway serving the exit passageway and terminating at a steel box not exceeding 16 square inches (0.010m^2). Such penetrations shall be protected in accordance with Section 713. There shall be no penetrations or communicating openings, whether protected or not, between adjacent exit passageways.

Exception: Membrane penetrations shall be permitted on the outside of the exit passageway. Such penetrations shall be protected in accordance with Section 713.3.2.

Reason: The purpose of Sections 1022.4 and 1023.6 is to limit through penetrations into an exit enclosure or exit passageway; however, membrane penetrations should be permitted on the outside of the exit enclosure or exit passageway. As currently written, a pull station next to a door into the stair, fire hose cabinets, fire extinguisher cabinets, request-to-exit devices related to access control locks, notification appliances, etc., are not permitted on the outside of the exit enclosure. This exceptions needs to clarify the intent of Sections 1022.4 and 1023.6.

Cost Impact: The code change proposal will not increase the cost of construction

ICCFILENAME:Davy-E1-1023.5

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Membrane penetration in the walls of exit enclosures is a common practice. The allowance maintains a reasonable level of safety.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, P.E., City of San Diego, Development Services Department, representing San Diego Area Chapter of ICC requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1022.4 (IFC [B] 1022.4) Penetrations. Penetrations into and openings through an exit enclosure are prohibited except for required exit doors, equipment and ductwork necessary for independent ventilation or pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication systems and electrical raceway serving the exit enclosure and terminating at a steel box not exceeding 16 square inches (0.010 m2). Such penetrations shall be protected in accordance with Section 713. There shall be no penetrations or communication openings, whether protected or not, between adjacent exit enclosures.

E**xception:** Membrane penetrations for manual fire alarm boxes, access or egress control devices, emergency communication devices and fire alarm notification appliances shall be permitted on the outside of the exit enclosure. Such penetrations shall be protected in accordance with Section 713.3.2.

1023.6 (IFC [B] 1023.6) Penetrations. Penetrations into and openings through an exit passageway are prohibited except for required exit doors, equipment and ductwork necessary for independent pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication and electrical raceway serving the exit passageway and terminating at a steel box not exceeding 16 square inches (0.010m2). Such penetrations shall be protected in accordance with Section 713. There shall be no penetrations or communicating openings, whether protected or not, between adjacent exit passageways.

Exception: Membrane penetrations for manual fire alarm boxes, access or egress control devices, emergency communication devices and fire alarm notification appliances shall be permitted on the outside of the exit passageway. Such penetrations shall be protected in accordance with Section 713.3.2.

Commenter's Reason: This Code change as proposed and approved by the Means of Egress Committee is too broad and allows any membrane penetration into exit enclosures and exit passageways that are designed to allow occupants to egress through fire floors or through areas under fire. These exit elements are highly protected, have unlimited travel distance and send occupants through areas of the building that may be under fire conditions. Other egress components protect exit ways from smoke. The proponent testified and that it would be difficult to place a recessed manual fire alarm boxes immediately adjacent to exit doors into exit enclosures as is required in chapter 9. This section as approved will not prevent medicine cabinets, electrical panels, or a whole host of other large items from breaching the outer membrane of the exit passageway. Fire extinguishers and fire hose cabinets do not have to be installed on the walls of the exit enclosure.

Final Action: AS AM AMPC____ D

E129-09/10
1023.3 (IFC [B] 1023.3)

Proposed Change as Submitted

Proponent: Michael DiMascio, Arup, representing self

Revise as follows:

1023.3 (IFC [B] 1023.3) Construction. Exit passageway enclosures shall have walls, floors and ceilings of not less than 1-hour fire-resistance rating~~, and not less than that required for any connecting exit enclosure~~. When acting as a horizontal continuation of an exit enclosure on the level of exit discharge, the fire-resistance rating of the exit passageway shall not be less than the rating required for the exit enclosure. Exit passageways shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

Reason: This amendment is primarily intended as clarification. The present wording uses the term "any connecting exit enclosure". This has been interpreted to require a 2-hr exit passageway on a floor, other than the level of exit discharge, even when the exit passageway; (1) only provides access to a 2-hr vertical exit enclosure, which in turn continues to exit discharge, (2) only serves the floor on which it is located and (3) is separated from the vertical exit enclosure by 2-hr rated construction and the required opening protectives. This exit passageway is not a "continuation" of the vertical exit enclosure. It provides access to the vertical exit enclosure and is properly separated from the vertical exit enclosure. The level of protection provided is commensurate with the hazard, since the exit passageway is only protecting occupants from the hazards on the floor they are exiting. Whereas the vertical exit enclosure provides protection from the hazards on all floors it connects. In fact the code only requires a 1 hour rated vertical exit enclosure when the enclosure connects three floors or less.

This amendment provides needed clarification to the level of protection intended.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Dimascio-E1-1023.3

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Exit passageways when connected to an exit stairway at the level of exit discharge or at upper levels should have a consistent level of protection throughout. The reduction of the fire resistance rating is not justified.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Raymond A. Grill, Arup, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1023.3 (IFC [B] 1023.3) Construction. Exit passageway enclosures shall have walls, floors and ceilings of not less than 1-hour fire-resistance rating. When acting as a horizontal continuation of an exit enclosure required to have a fire-resistance rating of not less than 2 hours ~~on the level of exit discharge, the fire-resistance rating of~~ the exit passageway enclosure shall ~~not be less than the rating required for the exit enclosure~~ shall have a fire-resistance rating of not less than 2 hours. Exit passageways shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

Commenter's Reason: The original proposal never intended that the fire resistance rating be reduced for a passageway that connects two 2-hour rated stair enclosures (i.e., stair transfer). This was the committee's perception of the intent behind the original proposal as noted during the discussion of the committee action.

The modification makes it clear that if the passageway provides a continuation of a 2 hour fire rated enclosure, the passageway must be 2 hour.

A passageway that is provided solely to address travel distance such as in a mall and that may provide access to stairs,

Final Action: AS AM AMPC____ D

E130-09/10

1002.1, 1023.4 (IFC [B] 1002.1, 1023.4)

Proposed Change as Submitted

Proponent: Michael DiMascio, Arup; representing self

Revise as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT PASSAGEWAY. An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives, and provides for a protected path of egress travel in a horizontal direction to an exit or an exit discharge ~~or the public way~~.

1023.4 (IFC [B] 1023.4) Termination. Exit passageways on the level of exit discharge shall terminate at an exit discharge ~~or a public way~~. Exit passageways on other levels shall terminate at an exit.

Reason: This amendments are primarily intended as clarification. The present wording does not define the use of exit passageways on levels other than the level of exit discharge. This means it does not address the use of exit passageways in malls and on upper and lower floors in buildings with large floor plates. In malls, exit passageways are frequently used between the mall itself and the vertical exit enclosure. (See Section 402.4.5 and 402.4.6) Using exit passageways on levels other than the level of exit discharge is a common practice where the travel distance to the vertical exit enclosure exceeds the allowable travel distance. The removal of the term, "or a public way" is for consistency. Based on the definition of means-of-egress, you must pass through an exit discharge before you reach a public way. Since the exit passageway is an extension of the exit enclosure, it must end at an exit discharge when located on the level of exit discharge.

This amendment provides needed clarification as to when the exit passageway must terminate at an exit discharge and clarifies it would not end at a public way.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Dimascio-E2-1023.4

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This proposal clarifies that transfer passageways at upper floors between exit enclosures are permitted and that the rating must be consistent for the entire enclosure.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Ali M. Fattah, P.E., City of San Diego, Development Services Department, representing San Diego Area Chapter of ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT PASSAGEWAY. An exit component that is separated from other interior spaces of a building or structure by fire resistance rated construction and opening protectives, and provides for a protected path of egress travel in a horizontal direction to an exit or an exit discharge <u>or the public way</u>.

1023.4 (IFC [B] 1023.4) Termination. Exit passageways on the level of exit discharge shall terminate at an exit discharge <u>or a public way</u>. Exit passageways on other levels shall terminate at an exit<u> enclosure.</u>

Commenter's Reason: The proposed code change to Section 1023.4 as initially submitted will allow an exit passageway to terminate at a horizontal exit. It will also allow an exit enclosure that transfers horizontally via a passageway to terminate at a horizontal exit. Both are code violations and have never been permitted in any of the legacy codes. This code change will lead to conflicts with Section 1022 that states in part that "…Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1". Section 1023.4 as published in the 2009 IBC is not broken and does need to be changed and this public comment respects the wish of the committee and attempts to correct an inadvertent omission.

Public Comment 2:

Lawrence G. Perry, AIA, representing the Building Owners and Managers Association (BOMA) International, request Approval as Modified by this Public Comment.

Modify the proposal as follows:

1023.4 (IFC [B] 1023.4) Termination. Exit passageways on the level of exit discharge shall terminate at an exit discharge. Exit passageways on other levels shall terminate at <u>or connect to</u> an exit.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The concern with the language as approved is that it can be read to require a physical separation (exit doors and walls) between a vertical exit enclosure and an exit passageway. Where an exit passageway is used on an upper floor to serve as a transfer corridor where the vertical enclosure offsets, there is no reason to be required to 'terminate' the exit passageway at each end. The proposed modification appears to retain the overall intent of the change, but eliminate the potential misapplication of separation requirements between exits and exit passageways.

Final Action: AS AM AMPC____ D

E131-09/10

1024.4 (IFC [B] 1024.4)

Proposed Change as Submitted

Proponent: Lee C. DeVito, PE, FIREPRO Incorporated, representing self

Revise as follows:

1024.4 (IFC [B] 1024.4) ~~Self-luminous and photoluminescent~~ <u>Luminescent materials</u>. Luminous egress path markings shall be permitted to be made of any material, including paint, ~~provided that an electrical charge is not required to maintain the required luminance~~. Such materials shall include, but are not limited to, self-luminous materials ~~and~~ photoluminescent materials <u>and electroluminescent materials</u>. Materials shall comply with either:

1. UL 1994; or
2. ASTM E 2072, except that the charging source shall be 1 foot-candle (11 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 30 millicandelas per square meter at 10 minutes and 5 millicandelas per square meter after 90 minutes.

Reason: Electrical systems provide the building management with more flexibility with the operation of the exit path marking systems.

Electrical systems do not need backup lighting which will allow building managers to control lighting. Furthermore, energy savings and Green/LEEDS requirements (for example thru the use of motion sensor lighting) may be further achieved with electroluminescent materials, as separate, continuously operational light sources are not required for charging purposes. A later section of this code, 1024.5 Illumination, requires means of egress illumination for photoluminscent exit path markings is required for at least 60 minutes prior to periods when the building is occupied. Electroluminescent exit path markings would not require this.

Electrical systems can be operated at any time as they have available power and they are protected with battery standby support. Therefore, the building management can utilize the electrical systems whenever there is an alarm activity or other situation in the building, whether the building power is available or not. Self luminous and photoluminescent materials only provide lighting when the background lighting is limited.

Electrical systems are supervised so the building management will know that there is a problem. Self-luminous materials and photoluminescent materials are not supervised, so they can be damaged or removed and no one is notified until a manual check is performed on the system. Whereas the systems are required in some high-rise buildings manual inspection will be time consuming and possibly burdensome, which may mean that self luminous or photoluminescent systems may not be inspected.

The building management can utilize the flexibility of electrical systems to provide further information on the availability or disruption of an egress path.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Devito-E1-1024.4

Public Hearing Results

Committee Action: Disapproved

Committee Reason: While this new technology will allow greater flexibility, this proposal is not clear on electrical backup and supervision requirements. There is still the issue of maintenance of the battery system. Would 'loss of power' be loss of power to the building or loss of emergency power?

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lee C. DeVito, PE, FIREPRO Incorporated, representing self, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

1024.4 (IFC [B] 1024.4) Luminescent materials. Luminescent exit path markings shall be permitted to be made of any material, including paint;. Such materials shall include, but not limit to, self-luminous ~~materials,~~ and photoluminescent materials ~~and electroluminescent materials~~ or electrical devices such as electroluminescent or LED strips. Materials shall comply with either:

Self-luminous and photoluminescent materials –

1. UL 1994, or
2. ASTM E 2072, except that the charging source shall be 1fc (10 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 5 milicandelas per square meter after 90 minutes.

Electrical devices –

1. UL 1994, and
2. The system shall have a backup emergency power supply that consists of a dedicated battery source that provides backup power for a minimum of 90 minutes and it is listed to UL 924.
3. The electrical devices shall illuminate within ten seconds in the event of a power failure in the area where the devices are located. The devices shall remain illuminated for 90 minutes following the loss of power.
4. The electrical system shall be supervised and provide a supervisory signal to the building fire alarm panel.

Commenter's Reason: The original proposal was rejected, but with the request that additional information be provided. The individual that provided a public objection also indicated an item of concern. I have addressed each of those concerns, which primarily addressed the battery backup requirements for the electrical systems.

Final Action: AS AM AMPC____ D

E132-09/10

707.3.10 (New), 1026 (IFC [B] 1026)

Proposed Change as Submitted

Proponent: Ron Clements, Chesterfield County Virginia Building Inspection Department, representing self

1. Revise as follows:

SECTION 1026 (IFC [B] 1026)
EXTERIOR EXIT STAIRWAYS ~~RAMPS~~ AND RAMPS ~~STAIRWAYS~~

1026.1 (IFC [B] 1026.1) General ~~Exterior exit ramps and stairways.~~ Exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ serving as an exit component in the ~~element of a~~ ~~required~~ means of egress shall comply with this section.

> **~~Exception~~ Exceptions:** ~~Exterior exit ramps and stairways for outdoor stadiums complying with Section 1022.1, Exception 2.~~
>
> 1. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside are not required be comply with this section.
> 2. Stairways in open parking structures that serve only the parking structure are not required to comply with this section.

1026.2 (IFC [B] 1026.2) Occupancy and height limitations ~~Use in a means of egress.~~ ~~Exterior exit stairways shall not be used as an element of a required means of egress for occupancies in Group I-2. For occupancies in other than Group I-2,~~ In other than Group I-2 occupancies, exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ shall be permitted as ~~an element of~~ a required ~~means of egress~~ exit ~~for~~ in buildings not ~~exceeding~~ more than six stories above grade plane in height or having occupied floors more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

1026.3 (IFC [B] 1026.3) Open side. Exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ ~~serving as an~~ ~~element of a required means of egress~~ shall be open to a yard, court or public way on at least one side. ~~An~~ The open side shall have a minimum ~~of~~ 35 square feet (3.3 m^2) of aggregate open area adjacent to each floor level and the level of each intermediate landing. The required open area shall be located not less than 42 inches (1067 mm) above the adjacent floor or landing level.

~~**1026.4 (IFC [B] 1026.4) Side yards.** The open areas adjoining exterior exit ramps or stairways shall be either yards, courts or public ways; the remaining sides are permitted to be enclosed by the exterior walls of the building.~~

~~1026.5~~ 1026.4 (IFC [B] ~~1026.5~~ 1026.4) Fire separation distance ~~Location~~. Exterior exit stairways and ramps ~~and stairways~~ shall ~~be located in accordance with Section 1027.3.~~ have a fire separation distance of not less than 10 feet. The outermost vertical plane of the exterior stair assembly shall be considered the building face for the fire separation distance measurement.

~~1026.6~~ 1026.5 (IFC [B] ~~1026.6~~ 1026.5) Exterior ramps and stairway protection. Exterior exit stairways and ramps ~~and stairways~~ shall be separated from the interior of the building with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both. Such separation shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories ~~as required in Section 1022.1~~. Openings in such fire barriers shall be limited to those necessary for egress from normally occupied spaces.

Where the sides of the exterior stairway or ramp are exposed to other parts of the building at an angle of less than 180 degrees (3.14 rad), the exterior walls of the building within 10 feet (3048 mm) horizontally of the exterior stairway or ramp exposed sides shall have a fire-resistance rating of not less than 1 hour or the exposed side of the exterior stairway must be a wall constructed as a fire barrier having a fire-resistance rating of not less than 1 hour. Openings within the 1 hour fire-resistive rated exposure protection shall be protected by opening protectives having a fire protection rating of not less than 3/4-hour. The fire rated construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the topmost landing of the stairway or to the roof line, whichever is lower.

Exceptions:

1. In other than Group R-1 or R-2 occupancies, separation from the interior of the building is not required ~~for occupancies, other than those in Group R-1 or R-2,~~ in buildings that are no more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.
2. Separation from the interior of the building is not required where the exterior exit stairway ~~ramp~~ and ramp ~~stairway~~ is served by an exterior ramp ~~and/~~or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior exit stairway ~~ramp~~ and ramp ~~stairway~~ serving ~~located in~~ a building ~~or structure~~ that is permitted to have unenclosed ~~interior~~ stairways in accordance with Section 1022.1.
4. Separation from the interior of the building is not required for exterior exit stairways ~~ramps~~ and ramps ~~stairways~~ connected to open-ended corridors provided that Items 4.1 through 4.4 are met:
   - 4.1. The building, including corridors, exit stairways ~~ramps and~~ or ramps ~~stairs~~, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
   - 4.2. The open-ended corridors comply with Section 1018.
   - 4.3. The open-ended corridors are connected on each end to an exterior exit ramp or stairway complying with Section 1026.
   - 4.4. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior exit stairway ~~ramp~~ and ramp ~~stairway~~ shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

2. Add new text as follows:

707.3.10 Exterior Exit Stairways and ramps. The fire-resistance rating of the fire barrier separating building areas from an exterior exit stairway and ramp shall comply with Section 1026.5.

Reason: This is an attempt to clean up the exterior exit stair provisions. First the majority of exterior exit elements that are designed in accordance with this section are stairs, not ramps therefore Stairway has been placed before Ramp.

Section 1026.1 has been re-titled as General so the title is not a restatement of the overall section title and follows the common code format. The exception for open exterior stairways have been revised to allow exterior exit stairways that are attached to open buildings to not have to meet the provisions in this section since the danger of smoke accumulation in the stairway is not there.

Section 1026.2 changes are all editorial.

Section 1026.4 was deleted and the requirement for the stair to be open to a yard was added to Section 1026.3.

Section 1026.5 Location was renamed separation distance and the 10 fire separation distance based on Section 1027.2 was included in section 1026.5 and the reference to Section 1027.3 was removed. Exterior exit stairs are not part of the exit discharge therefore it is incorrect and confusing to reference the separation requirements on exit discharge requirements. Furthermore a cross reference was added for Section 705.2.

Section 1026.6 was modified to include the fire rated protection requirements for an exterior stair in the exterior stair section and remove the reference to interior exit stairs. These are not interior exit stairs and the protection requirements should be available in the exterior exit stair section specific to exterior exit stairs.

Section 707.3.10 was added in keeping with the organization of Section 707.3 listing as a cross reference all of the locations fire barriers are used.

Cost Impact: This proposal will not increase the cost of construction.

ICCFILENAME:Clements-E5-1026

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Several of the proponents and opponent brought up possible revisions to clarify the text that need to be brought forward at the public comment phase. The proposal needs to clarify if the term “assembly” includes the supporting construction or not. “Essentially open”, while it is currently in code text, leaves too much open for interpretation.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ron Clements, representing Chesterfield County Building Inspection Dept., requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 1026
EXTERIOR EXIT STAIRWAYS AND RAMPS

1026.1 (IFC [B] 1026.1) General. Exterior exit stairways and ramps serving as an exit component in the means of egress shall comply with this section.

Exceptions:

1. Exterior exit stairways and ramps in buildings of Group A-5 where all portions of the means of egress are open to the outside air. ~~Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside are not required be comply with this section.~~
2. Stairways in open parking structures that serve only the parking structure are not required to comply with this section.

1026.2 (IFC [B] 1026.2) Occupancy and height limitations. In other than Group I-2 occupancies, exterior exit stairways and ramps shall be permitted as a required exit in buildings not more than six stories in height above grade plane ~~in height~~ or having occupied floors more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

1026.4 (IFC [B] 1026.4) Fire separation distance. Exterior exit stairways and ramps shall be located in accordance with Section 1027.3 ~~have a fire separation distance of not less than 10 feet. The outermost vertical plane of the exterior stair assembly shall be considered the building face for the fire separation distance measurement~~.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: Section 1026.1, Exception #1 was modified to change "essentially open to the outside" to "where all portions of the means of egress are open to the outside air." Based on floor and committee testimony. Open to the outside air was a term introduced and approved in E38.

In 1026.2 was changed per floor testimony from "more than six stories above grade plane in height" to "more than six stories in height above grade plane"

In 1026.4 the original text was returned based on committee comments that were in opposition to the original proposed language that measured the fire separation distance to the outermost vertical plane of the exterior stair assembly.

Final Action: AS AM AMPC____ D

E133-09/10
1026.6 (IFC [B] 1026.6)

Proposed Change as Submitted

Proponent: Anne VonWeller, Murray City, representing the Utah Chapter of the International Code Council

Revise as follows:

1026.6 (IFC [B] 1026.6) Exterior ramps and stairway protection. Exterior exit ramps and stairways shall be separated from the interior of the building as required in Section 1022.1. Openings shall be limited to those necessary for egress from normally occupied spaces.

Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are no more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.
2. Separation from the interior of the building is not required where the exterior ramp or stairway is served by an exterior ramp or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum

of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.

3. Separation from the interior of the building is not required for an exterior ramp or stairway located in a building or structure that is permitted to have unenclosed interior stairways in accordance with Section 1022.1 <u>or Exceptions 3 and 4 of Section 1016.1.</u>
4. Separation from the interior of the building is not required for exterior ramps or stairways connected to open-ended corridors, provided that Items 4.1 through 4.4 are met:
   - 4.1. The building, including corridors and ramps and stairs, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
   - 4.2. The open-ended corridors comply with Section 1018.
   - 4.3. The open-ended corridors are connected on each end to an exterior exit ramp or stairway complying with Section 1026.
   - 4.4. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior ramp or stairway shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

Reason: In the 2009 Edition a distinction has been made between 'exit' stairways and ramps and 'exit access' stairways and ramps. In the past all of the exceptions for unenclosed stairways and ramps occurred in Section 1022.1. Now some of those exceptions are located in Section 1022.1 and some in Section 1016. This change is to lead user to the new location for the two exceptions relocated to Section 1016.1.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Vonweller-E1-1023.6

<u>Public Hearing Results</u>

Committee Action: **Approved as Submitted**

Committee Reason: The proposal will keep the exterior exit stairway provisions together in a place that is easier to find. This proposal may need correlation with E5 revisions.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Anne VonWeller, Murray City, representing the Utah Chapter of the International Code Council, requests Disapproval.

Commenter's Reason: The Code Development Committee approved the change with a note that it should be coordinated with E5-09/10. The concern is already addressed by E5-09/10. This comment is submitted by the original proponent to ensure the item is on the final action agenda. If E5-09/10 is approved during the final action this change is not necessary and should be disapproved. However, if E5-09/10 is not approved this public comment will be withdrawn and the approved code change will be included in the 2012 edition.

Final Action: AS AM AMPC____ D

E136-09/10
1027.1 (IFC [B] 1027.1)

Proposed Change as Submitted

Proponent: Sarah A. Rice, CBO, representing self

Revise as follows:

1027.1 (IFC [B] 1027.1) General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 below shall not exceed 50 percent of the number and capacity of the required exits.

Exceptions:

1. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through areas on the level of discharge provided all of the following are met:
   1.1. Such exit enclosures egress to a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the exit enclosure.
   1.2. The entire area of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
   1.3. The egress path from the exit enclosure on the level of exit discharge is protected throughout by an approved automatic sprinkler system. All portions of the level of exit discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of exits.
2. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through a vestibule provided all of the following are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the level of exit discharge by construction providing protection at least the equivalent of approved wired glass in steel frames.
   2.4. The area is used only for means of egress and exits directly to the outside.
3. Stairways in open parking garages complying with Section 1022.1, Exception 4, are permitted to egress through the open parking garage at their levels of exit discharge.
4. Horizontal exits complying with Section 1025 shall not be required to discharge directly to the exterior of the building.
5. <u>The exit discharge for an exit enclosure which terminate in a court without direct access to a public way is permitted to reenter the building provided one of the following are met:</u>
   <u>5.1. An exit passageway which has the same fire-resistance rating as the exit enclosure served, is provided through the building from the court to an exterior wall of the building fronting on a public way; or</u>
   <u>5.2. A covered walkway which is open to the atmosphere at opposite ends is provided through the building to an exterior wall fronting on a public way and which has walls and ceiling of not less than 1 hour fire-resistance-rated-construction and opening protected with opening protectives have not less than a ¾ hour rating.</u>

Reason: Prior to 1997 at least one of the legacy codes allowed exit enclosures to terminate into an open central court surround on all sides by a building. To provide exit discharge from such court, the code permitted an exit passageway. The IBC is silent on this type of design, and a strict reading of Section 1027.1 would prohibit it. The exception proposes two options. The first is the exit passageway. The second is an open 'breezeway' or 'tunnel' which goes from the court to the public way. It has been interpreted that the code allows the approach in 5.2 because it doesn't 're-enter' the building, but simply goes 'under' the building. This proposal codifies that interpretation. Essentially the 5.2 option is a passageway without enclosures at either end. To be consistent with other exit passageways, the passageway allowed here should have the same rating as the vertical exit enclosure served. Only one hour is proposed for the open breezeways as this is consistent with the egress court provisions in Section 1027 and because this is an atmospherically open tunnel, 1 hour should be sufficient to protect the users.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Rice-E2-1027.1

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: This is a limited application, which should already be covered by the code text. The base requirement under Exception 5 is a conflict with the definition of exit discharge by saying it can terminate in a court and not a public way. A concern would be if the passageway did not provided a clear line of site to the outside that some type of exit signage would be required. The wording in 5.2 is not clear that the passage goes through the wall to the outside rather than just up to the wall.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, P.E., City of San Diego, Development Services Department, representing Sand Diego Area of Chapter of ICC, requests Approved as Modified by this public comment.

Modify the proposal as follows:

1027.1 (IFC [B] 1027.1) General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 below shall not exceed 50 percent of the number and capacity of the required exits.

Exceptions:

1. A maximum of 50 percent of the number and capacity of exit enclosures is permitted to egress through areas on the level of discharge provided all of the following are met.
   1.1 Such exit enclosures egress to a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the exit enclosure.
   1.2. The entire area of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
   1.3. The egress path from the exit enclosure on the level of exit discharge is protected throughout by an approved automatic sprinkler system. All portions of the level of exit discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 03.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of exits exit enclosure.
2. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through a vestibule provided all of the following are met:
   2.1 The area is used only for means of egress and exits directly to the outside.
   2.2 The vestibule depth from the exterior of the building is not greater than 10 feet (3048 mm) and the vestibule length is not greater than 30 feet (9144 mm).
   2.3 The area is separated from the remainder of the level of exit discharge by a fire barrier having a one hour fire-resistance rating. construction providing protection at least the equivalent of approved wire glass in steel frames Doors and windows in the separation walls shall be rated ¾ hour and shall not exceed the size limits specified in Section 707.6. Duct penetrations shall comply with Section 713.1.1, and other penetrations shall comply with Section 713.3.
   2.4 The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
3. Stairways in open parking garages complying with Section 1022.1, Exception 4, are permitted to egress through the open parking garage at their levels of exit discharge.
4. Horizontal exits complying with Section 1025 shall not be required to discharge directly to the exterior of the building.

~~5. The exit discharge for an exit enclosure which terminate in a court without direct access to a public way is permitted to reenter the building provided one of the following are met:~~
~~5.1. An exit passageway which has the same fire-resistance rating as the exit enclosure served, is provided through the building from the court to an exterior wall of the building fronting on a public way; or~~
~~5.2. A covered walkway which is open to the atmosphere at opposite ends is provided through the building to an exterior wall fronting on a public way and which has walls and ceiling of not less than 1 hour fire-resistance-rated-construction and opening protected with opening protectives have not less than a ¾ hour rating.~~

<u>5. The exit discharge from an interior occupied court shall be permitted to reenter the building through an exit passageway constructed in accordance with Section 1023.3 and enclosed with a fire-resistance-rating of not less than 1 hour.</u>
<u>6. The exit discharge for an exit enclosure, or exterior exit stairway, which terminates in an interior court without direct access to a public way shall be permitted to reenter the building provided the path of egress travel reenters the building through an exit passageway constructed in accordance with Section 1023 and is enclosed with the same fire-resistance rating as the exit served.</u>

Commenter's Reason: This public comment is submitted to support an omission from the code a provision that exited in more than one legacy code to address interior courts whose occupants need to renter a building to reach the public way. This code is necessary to address egress from interior courts that are occupied or courts through which exit enclosures or exterior exit stairways must pass through the court and renter the building to reach the public way. The public comment deletes the proposed exception 5.2 since: it is not clear does and not address maximum length, will allow communicating openings into it and will thus result in lower protection than that provided by an exit passageway. The exit passageway shall have the same level of protection as the exit enclosure or exterior exit stairway or one-hour when serving occupied courts.

Final Action: AS AM AMPC____ D

E138-09/10
1027.3 (IFC [B] 1027.3)

Proposed Change as Submitted

Proponent: Lawrence Brown, CBO, National Association of Home Builders (NAHB); Eirene Oliphant, MCP, Building Official, representing City of Leawood, KS

Revise as follows:

1027.3 (IFC [B] 1027.3) Exit discharge location. Exterior balconies, stairways and ramps shall be located at least 10 feet (3048 mm) from adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.

> **Exception:** Where serving Group R-3 occupancies, exterior balconies, stairways and ramps shall be permitted to be located 5 feet (1524 mm) minimum from adjacent lot lines and from other buildings on the same lot.

Reason: The added exception will help to coordinate this section with the provisions found in Table 705.8. Footnote "f" of Table 705.8 allows an unlimited amount of unprotected openings with a fire separation distance of 5 feet or greater. It would seem reasonable to allow the exterior stairways, ramps and balconies for a Group R-3 to be located in the 5 to 10 foot range if it is permissible to have an unlimited amount of unprotected openings.

While the 10 foot provision of this section does coordinate with the exterior wall rating required in Table 602 for most Group R-3 construction, permitting an unlimited amount of unprotected openings in that wall effectively eliminates the required protection beyond the 5 foot distance. Changing this section will help to coordinate with many local zoning laws that impose a 5 foot side yard requirement in residential areas. In addition Table R302.1 of the IRC permits walls to be non-rated if over 5 feet.

If the committee and members would consider another possible exception, it may be reasonable to add a second exception that would coordinate with footnote "d" of Table 705.8. This second exception would allow exterior stairs, ramps and balconies to have a minimum of 3 feet of separation provided that the wall had no more than 25 percent of unprotected or protected openings. Possible wording would be:

Exceptions:

2. In Group R-3 occupancies where the exterior wall of the exterior stairway, ramp and balcony comply with footnote "d" of Table705.8, a separation of 3 feet (915 mm) minimum shall be provided from adjacent lot lines and from other buildings on the same lot.

This second exception would not only coordinate with the provisions of Table 705.8 but would seem to correct an inconsistency that occurs within the code. As currently written, the code would allow an "interior" stairway to be located within the 3 to 5 foot range and allow 25 percent of the wall to be an unprotected opening. However, if that opening or an opening on an adjacent side exceeded 35 square feet (Section 1026.3) and the stair then was considered as an "exterior" stair it would need to be located "at least 10 feet (3048 mm) from adjacent lot lines." If the level of protection provided for the wall facing the property line is consistent then the code should not impose a 10 foot requirement on "exterior" stairs while allowing "interior" stairs to be 3 feet from the line.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Brown-E1-1027.3

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: It would be preferable to close the identified loophole in Section 705.8 rather than allow exit discharge so close to the lot line.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Eirene Oliphant, MCP, City of Leawood, representing Metropolitan Kansas City Chapter of the ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as:

1027.3 Exit discharge location. Exterior balconies, stairways and ramps shall be located at least 10 feet (3048 mm) from adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 704 based on fire separation distance.

> **Exception:** Where serving R-3 occupancies, exterior balconies, stairways and ramps shall be permitted to be located at least 5 feet (1524 mm) ~~minimum~~ from adjacent lot lines and from other buildings on the same lot.

Commenter's Reason: The request to approve as modified is intended to match the format of the provisions found in Section 1027.3.

When this was presented to the committee for consideration, there was little to no discussion. The committee simply disapproved the code change, stating they wanted the loophole in Table 705.8 to be addressed rather than accept this code change.

Table 705.8 is not where the loophole exists. This proposed added section provides clarity to allow for decks and other exterior means of exit discharge from an R-3 occupancy to be included in the area of allowed unprotected and protected openings. The appropriate place for this to be provided for is in the exit discharge section of the code, as presented in this proposed code change.

Final Action: AS AM AMPC____ D

E142-09/10

1028.1.1.1 (New) [IFC [B] 1028.1.1.1 (New)]

Proposed Change as Submitted

Proponent: Gerard A. Hathaway, RA, New York State Department of State Building Codes Division, representing self.

Add new text as follows:

1028.1.1.1 (IFC [B] 1028.1.1.1) Spaces under grandstands and bleachers. When spaces under grandstands or bleachers are used for purposes other than toilet rooms and ticket booths less than 100 sq.ft. (9.29 m^2), such spaces shall be separated by fire barriers complying with Section 707 and horizontal assemblies complying with Section 712 with not less than 1-hour fire-resistance-rated construction.

Reason: The intent is to provide requirements for buildings under bleachers and grandstands that include spaces such as concessions, storage and ticket booths. The provisions are consistent with what permitted in the legacy codes. The location of this section is chosen for its proximity to the reference to the ICC 300. That way it will not be missed.

The legacy codes included provisions for spaces under seats to be kept free of combustible and flammable materials. Rooms under the bleachers were enclosed in a 1 hour fire-resistant rated construction. None of this information was passed forward into any edition of the IBC.

ICC 300, Section 305 sends you to the building and fire codes for requirements. The IBC does not include any specific provisions for this area except space over 1,000 sq.ft. must be sprinklered in accordance with Section 903.2.1.5.

From an intent point of view, the general stairway provisions (which may be viewed as similar to part of the bleacher system) require that any space under a stairway be enclosed with a 1 hour fire-resistance-rated construction (Section 1009.6.3).

Southern had –
403.6.2.2 When spaces under grandstands or bleachers are used for purposes other than toilet rooms, ticket booths less than 100 sq.ft. (9.29 m^2) in area and open ramps or level exiting facilities, such spaces shall be separated by not less than 1-hour fire resistant construction.

BOCA had –
1013.8 Spaces underneath seats: Spaces underneath grandstand seats shall be kept free of all combustible and flammable materials and shall not be occupied or used for other than exits; except that where enclosed in not less than 1-hour fire resistance rated construction, the code official shall approve the use of such spaces for other purposed, provided that the safety of the public is not endangered.

ICBO had the following provisions (see the 4th paragraph for separation requirements)–
Division 4. Stadiums, reviewing stands and amusement park structures not included within other Group A Occupancies. Specific and general requirements for grandstands, bleachers and reviewing stands are to be found in Chapter 10.

303.2 Construction, Height and Allowable Area.

303.2.2 Special provisions.

303.2.2.3 Division 4 provisions. Grandstands, bleachers or reviewing stands of Type III One-hour, Type IV or Type V One-hour construction shall not exceed 40 feet (12 192 mm) to the highest level of seat boards; 20 feet (6096 mm) in cases where construction is Type III-N or Type V-N; and 12 feet (3658 mm) in cases where construction is with combustible members in the structural frame and located indoors.

Division 4 structures other than Type III-N and Type V-N grandstands, bleachers, reviewing stands and folding and telescoping seating of open skeleton-frame type without roof, cover or enclosed usable space are not limited in area or height.

Erection and structural maintenance shall conform to these special requirements as well as with other applicable provisions of this code.

When the space under a Division 4 Occupancy is used for any purpose, including means of egress, it shall be separated from all parts of such Division 4 Occupancy, including means of egress, by walls, floor and ceiling of not less than one-hour-fire-resistive construction.

EXCEPTIONS:

1. A means of egress under temporary grandstands need not be separated.
2. The underside of continuous steel deck grandstands when erected outdoors need not be fire protected when occupied for public toilets.

The building official may cause Division 4 structures to be reinspected at least once every six months.

Grandstands, bleachers or folding and telescoping seating may have seat boards, toeboards, bearing or base pads and footboards of combustible materials regardless of construction type.

Seating and exiting requirements for reviewing stands, grandstands, bleachers, and folding and telescoping seating are provided under Section 1008.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME:Hathaway-E1-1028.1.1.1

Public Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as following:

1028.1.1.1 (IFC [B] 1028.1.1.1) Spaces under grandstands and bleachers. When spaces under grandstands or bleachers are used for purposes other than ~~toilet rooms and~~ ticket booths less than 100 sq.ft. (9.29 m^2) <u>and toilet rooms</u>, such spaces shall be separated by fire barriers complying with Section 707 and horizontal assemblies complying with Section 712 with not less than 1-hour fire-resistance-rated construction.

Committee Reason: The modification clarifies that the exemption is for toilet rooms of any size and the 100 sq.ft. limit is only applicable to the ticket booths. The proposal identifies information that is missing in the current text to address hazards under bleachers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David S. Collins, FAIA, The Preview Group, representing the American Institute of Architects requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1028.1.1.1 (IFC [B] 1028.1.1.1) Spaces under grandstands and bleachers. When spaces under grandstands or bleachers are used for purposes other than ticket booths less than 100 sq.ft. (9.29 m^2) and ~~toilet rooms~~ <u>unenclosed means of egress</u>, such spaces shall be separated by fire barriers complying with Section 707 and horizontal assemblies complying with Section 712 with not less than 1-hour fire-resistance-rated construction.

Commenter's Reason: This is a great fix and improvement to the safety of these facilities and the persons using them. However, being a user of a legacy code that did not exempt toilet rooms from this separation I propose to require the same level of protection for them. I am sure that everyone has witnessed the illegal use of tobacco products and other irrational use of ignited materials in public restrooms. Trash cans with towels even the toilet paper itself is often a target for vandalism. The same level of protection afforded other uses beneath an assembly seating area should also be afforded these toilet rooms.

All three legacy codes did allow the space under the grandstands and bleachers to be used for means of egress, such as vomitory exits, as long as they were unenclosed. See the original reason statement for additional information

Final Action: AS AM AMPC____ D

E147-09/10
1028.14.2 (IFC [B] 1028.14.2)

<u>Proposed Change as Submitted</u>

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

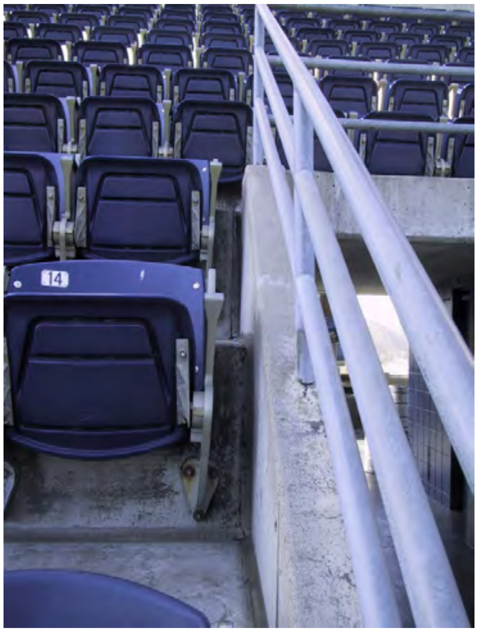
Revise as follows:

1028.14.2 (IFC [B] 1028.14.2) Sightline-constrained guard heights. Unless subject to the requirements of Section 1028.14.3, a fascia or railing system in accordance with the *guard* requirements of Section 1013 and having a minimum height of 26 inches (660 mm) <u>measured vertically above the adjacent walking surfaces, adjacent bench seat or the line connecting the leading edges of the treads</u> shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. At *bleachers*, a *guard* must be provided where required by ICC 300.

> <u>**Exception:** The height of the guard shall not be required to be measured vertically above an adjacent automatic or self-rising chair.</u>

Reason: This proposal addresses several things, first it brings clarity to confusion that was created by a change that occurred in the 2009 IBC. The term "seatboard" was replaced with the term "fixed seating" in the 2009 IBC Section 1013.2 on how the height of guards are measured with the stated reason "to clarify the measurement, using common terminology". With respect to assembly seating, the term "fixed seating" does not offer greater clarity, instead it offers significantly more confusion. For example, how do you measure the height of the guard adjacent fixed seats when they are self-rising chairs? (Refer to photographs below.) In assembly seating, fixed seats refers to chairs that are secured to the structure, not that they provide a walking surface. The aisle access way provisions of Section 1028.10 specifically address the clear width between rows of seats where there is automatic or self-rising chairs and chairs with seats that do not move. Therefore, the clarity provided other occupancies unfortunately increased confusion pertaining to assembly seating. Section 1028.14 needs to include how to measure the height of guards so that clarity can be provided assembly seating and still offer other occupancies the clarity needed for them in Section 1013.2. Please note that this proposal does not include any change to Section 1013.2, only to Section 1028.14.

Following are two photographs of self-rising chairs and one of bench seats. The fixed bench seating could serve as a walking surface, however the self-rising chairs are not easily used as a walking surface. 2007 ICC 300 measures vertically above the leading edge of the tread, adjacent walking surface or adjacent bench seat. This proposal maintains how the height of the guard is measured by 1013.2 with the exception of replacing the term "fixed seat" with the term "bench seat" to coordinate with ICC 300 and to enhance clarity that guard height needs to be measured vertically above such seats. Also, the term "bench seat" rather than "seatboard" is commonly used for this type of seating in assembly seating project specifications. An exception was added for self-rising chairs since these seats are not easily used as a walking surface and there is no well defined way to measure these chairs.



Cost Impact: This code change proposal will not increase the cost of construction.

ICCFILENAME:Roether-E9-1028.14.2

Public Hearing Results

Committee Action: Disapproved

Committee Reason: Using a walking surface measurement is appropriate to get the level of safety we are looking for when using self rising chairs. The proponents and CTC committee should work together to address this issue of guards heights adjacent to different types of seats in assembly venues.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC) requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1028.14.2 (IFC [B] 1028.14.2) Sightline-constrained guard heights. Unless subject to the requirements of Section 1028.14.3, a fascia or railing system in accordance with the *guard* requirements of Section 1013 and having a minimum height of 26 inches (660 mm) ~~measured vertically above the adjacent walking surfaces, adjacent bench seat or the line connecting the leading edges of the treads~~ shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. At *bleachers*, a *guard* must be provided where required by ICC 300.

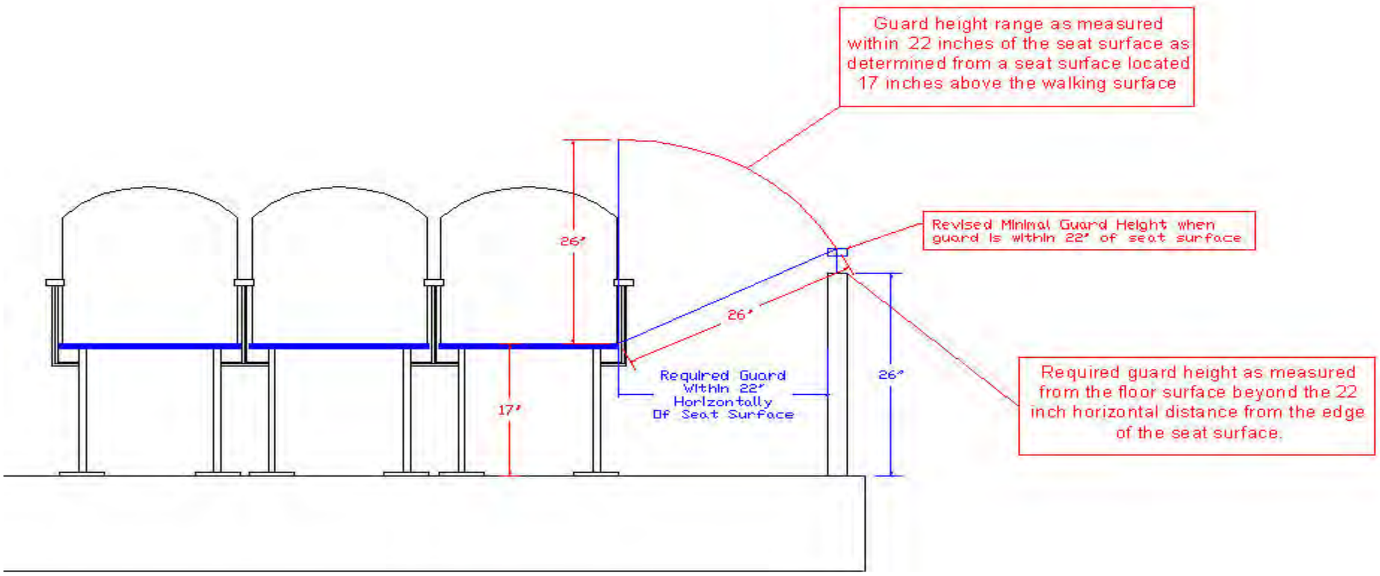
> **Exception:** ~~The height of the guard shall not be required to be measured vertically above an adjacent automatic or self-rising chair.~~ The height of the guard in front of seating shall be measured from the adjacent walking surface.

Commenter's Reason: As noted by the code committee, there was a need to coordinate CTC's proposed E100 and Ed Roether's E147 who is an expert in assembly seating design. This comment is in recognition of that need.,

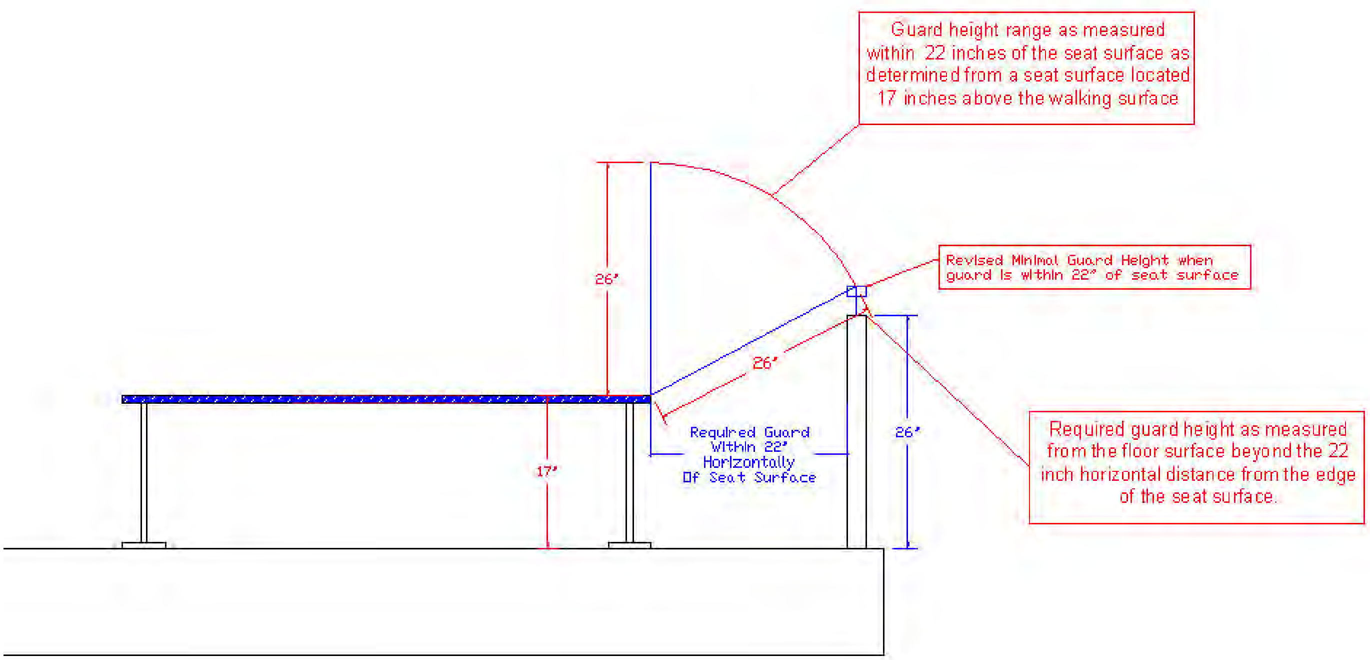
The public comment to this code change, along with the comment to E100, will bring clarity to the required height of guards in assembly seating. Confusion resulted when the term “seatboard” was replaced with “fixed seating” in Section 1013.2. It is recognized that E100 provides the needed clarity to how the height of guards is measured where the line of sight is not a consideration, but line of sight in assembly seating is critical. The revised exception to Section 1028.14.2 addresses line of sight issues. This exception does not alter the height of guards immediately beside or behind seating or other conditions as established in Section 1013.2. The minimum height of 26 inches would be measured in accordance with 1013.2 where the guard would otherwise interfere with the line of sight and the minimum height of 42 inches would be measured in accordance with 1013.2 where there is not interference with line of sight. This comment and that of E100 should be heard together. Please see the illustrations published with the public comment to E100-09/10.

The following illustrate how guards would be measured in assembly seating.

Elevation view of individual seat configuration – guard measurement from Section 1013.2, Item 2 with the 26 inch height from Section 1013.2, Exp. 3 and Section 1028.14.2:



Elevation view of bench seat configuration – guard measurement from Section 1013.2, Item 2 with the 26 inch height from Section 1013.2, Exp. 3 and Section 1028.14.2:



Public Comment 2:

Ed Roether, representing Populous (Formerly HOK Sport Venue Event), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1028.14.2 (IFC [B] 1028.14.2) Sightline-constrained guard heights. Unless subject to the requirements of Section 1028.14.3, a fascia or railing system in accordance with the *guard* requirements of Section 1013 ~~and having a minimum height of 26 inches (660 mm)~~ ~~measured vertically above the adjacent walking surfaces, adjacent bench seat or the line connecting the leading edges of the treads~~ shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below. <u>At *bleachers*, a *guard* must be provided where required by ICC 300. Where</u> ~~and~~ the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating <u>guards shall not be less than 26 inches (660 mm) high and be measured vertically as follows</u>:

1. <u>From the adjacent walking surfaces,</u>
2. <u>From a seat surface of adjacent fixed seating, with or without arm or back rests, within 22 inches measured horizontally of a required guard, the guard height shall provide a minimum 26 inches measured diagonally between the top of the guard and the nearest edge of the seat surface</u>
3. <u>On stairs, from the line connecting the leading edges of the tread nosings, and</u>
4. <u>On ramps, from the ramp surface at the guard.</u>

~~At *bleachers*, a *guard* must be provided where required by ICC 300.~~

Exception: ~~The height of the guard shall not be required to be measured vertically above an adjacent automatic or self-rising chair.~~ <u>The height of the guard in front of seating shall be measured from the adjacent walking surface.</u>

Commenter's Reason: This proposal provides an alternative to the text proposed by CTC for E147-09/10 and matches their proposed text for how to measure guard height in G100-09/10. Assuming the general reference back to the guard requirements in Section 1013 will let designers/code official understand that you use Section 1013.2 for how to measure the guard height, with Section 1013.2, Exp. 3 sending you to Section 1028.14.2 for the actual height, could be considered vague and circuitous. Sections 1028.14.1 and 1028.14.3 specifically state how the guard is to be measured and its height without bouncing you around in a circle. Putting the text here will be more specific for assembly seating. The sentence about bleachers is existing text and is simply relocated for clarity.

Final Action: AS AM AMPC____ D

E150-09/10, PART II
IRC R310.1

NOTE: PART I DID NOT RECEIVE A PUBLIC COMMENT AND ARE ON THE CONSENT AGENDA. PART I IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.

<u>*Proposed Change as Submitted*</u>

Proponent: Steven Orlowski, representing National Association of Home Builders

PART II – IRC BUILDING/ENERGY

R310.1 Emergency escape and rescue required. Basements, habitable attics and every sleeping room shall have at least one operable emergency escape and rescue opening. Where basements contain one or more sleeping rooms, emergency egress and rescue openings shall be required in each sleeping room. Where emergency escape and rescue openings are provided they shall have a sill height of not more than 44 inches (1118 mm) above the floor. Where a door opening having a threshold below the adjacent ground elevation serves as an emergency escape and rescue opening and is provided with a bulkhead enclosure, the bulkhead enclosure shall comply with Section R310.3. The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. Emergency escape and rescue openings with a finished sill height below the adjacent ground elevation shall be provided with a window well in accordance with Section R310.2. Emergency escape and rescue openings shall open directly into a public way, or to a yard or court that opens to a public way.

~~Exception~~ <u>Exceptions</u>:

1. Basements used only to house mechanical equipment and not exceeding total floor area of 200 square feet (18.58 m^2).

2. <u>Emergency escape and rescue openings shall not be required in one- and two family dwellings and townhouses that are equipped with an approved automatic sprinkler system in accordance with Section R313 or Section P2904.</u>

Reason: Based on extensive research on the performance of residential smoke alarms, the NFPA 72 technical committee on residential alarms has determined that both ionization and photoelectric smoke alarms provide adequate escape time along the normal path of egress in both fast flaming and slow smoldering fires. In tests conducted by NIST, the results show that when smoke alarms are present and functioning properly, these devices will detect and notify the occupant with enough time to vacate the structure prior to untenable conditions being reached within the dwelling. The purpose for the emergency egress is to provide a secondary means of escape and rescue, in the event that the normal path of egress becomes blocked or conditions are unsustainable.

During the last code development cycle, the sprinkler proponents testified that residential fire sprinklers are effective in 96% of the fires that grow large enough to activate the system. With the recent addition of residential sprinklers, the time for evacuating the structure before conditions become untenable and incapacitate the occupant have been extended. When sprinklers are used in tandem with smoke alarms, the available escape time in a fast flaming fire is increased and occupants are given more time for escape. Proponents also testified that when sprinklers are present it will provide additional time for firefighters to conduct search and rescue, since the fire will be either extinguished or contained.

If homes are required to be equipped with both an active suppression system and alarm system, it is time to start reevaluating the need for some of the passive life safety features in the home that have previously been justified to protect occupants in the event of a fire. While this proposal may raise the eyebrows of many skeptics, the concept of not requiring emergency egress and rescue openings in one- and two- family dwellings equipped with an automatic suppression system is not new since this exception has been permitted in NFPA 101 The Life Safety Code for several years. In addition, the International Building Code has exempted R-1, R-2 and I-1 occupancies from requiring emergency escape and rescue openings when an approved automatic suppressions system is installed.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Orlowski-E1-1029.1

<u>Public Hearing Results</u>

PART II- IRC B/E
Committee Action: **Approved as Submitted**

Committee Reason: This change adds a reasonable exception based on an approved automatic sprinkler system in the dwelling. This creates an incentive to provide a sprinkler system. Also, this may get some retrofits for additions.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jeff Inks, Washington, DC representing Window and Door Manufacturer's Association, requests Disapproval.

Commenter's Reason: WDMA is strongly opposed to the approval of this proposal which was soundly defeated when considered by the Means of Egress Committee for inclusion in the IBC.

Removal of the requirement for EER openings is an unjustified and significant compromise in occupant safety. Characterizing EER openings as redundant, unneeded safety features in homes, if they are equipped with a residential fire sprinkler system is simply irresponsible.

What the proponents are saying is that if you install a sprinkler, there is no need for a back-up emergency escape and rescue which completely disregards the fact that sprinklers are not 100% effective or reliable, ignores the other limitations with the installation and operation of sprinklers in single family homes, such as maintenance, homeowner deactivation or disruption of the system, etc., and it completely disregards every other emergency that may require emergency escape or rescue.

While there is no disputing sprinklers provide an added measure of safety, there are many concerns with trading off EER opening requirements if residential sprinklers are installed making such a trade-off an unjustified compromise in occupant safety.

As noted, among the many concerns are the limits to the reliability of residential fire sprinkler systems which is directly dependent upon proper care and maintenance by the homeowner. While 13-D does require the installer to provide instructions on inspecting, testing, and maintaining the system -- clearly because it is critical to maintaining the operability of the system -- there is no requirement that any maintenance is to be performed and proper maintenance is therefore not likely to happen. NFPA 13-D also requires that damaged or painted sprinkler heads be replaced, but how will that be enforced throughout the life of the home, and what if the sprinkler head is damaged in some way that is not apparent? In addition, removing the EER opening requirements also ignores situations where the system is shut-off or otherwise disabled.

With respect to existing exceptions for other residential type occupancies, it also unreasonable to base this proposal on them. One- and two-family homes are completely different occupancy types operated and maintained very differently from other residential occupancy types where those exceptions are allowed. Removing the EER opening requirement completely ignores that fact.

There are many other concerning questions as well such as, what if the system does fail to operate? What if the occupants are not fully cognizant or physically able to safely egress? The sprinkler system is only intended as an "aid" as stated in NFPA 13-D to give occupants a few additional minutes to escape, but what if that is not enough time? What if the only path for egress is through or close to the fire hazard, or if the path is blocked, or if they are afraid, or are disabled or otherwise incapacitated? What about other non-fire emergencies? And equally important, what if they need to be rescued and rescued quickly? Rescue is another critical function these openings provide and that is also being completely ignored.

Furthermore, the IRC B&E Committee's approval of this proposal is counter to their action to reject RB-186 which does the exact same thing and was heard immediately before E-150. After extensive testimony, the Committee rejected RB-186 stating that "*The committee feels this change sacrifices safety without an appropriate return*." However, the Committee then approved E-150 in a contradictory action to RB-186 without any further testimony (because of the extensive testimony that had already been provided on RB-186) stating "*This change adds a reasonable exception based on an approved automatic sprinkler system in a dwelling*," yet there was no further testimony provided or any discussion by them of their concerns expressed in their decision to disapprove RB-186.

While installing sprinkler systems is an improvement in fire safety, removing the EER opening requirements as a trade off is a huge leap backwards in overall safety. It is an unjustified compromise and we urge disapproval of this proposal.

Public Comment 2:

Gary Lewis, Construction Official, City of Summit, NJ representing self, requests Disapproval.

Commenter's Reason: Code proposals RB186-09/10 and E150-09/10 were heard consecutively by the IRC Building and Energy Committee in Baltimore. Both proposals sought to achieve the same overall result……to eliminate the long-standing requirement to provide emergency escape and rescue windows in dwelling units equipped with automatic fire sprinklers. Testimony provided at the hearing resulted in an overwhelming committee disapproval of RB186 and no assembly action. The opponents mistakenly sat down, far from the testimony microphones, assuming E150 would similarly be disapproved to be consistent with the immediately previous action on RB186. Unfortunately, the committee reversed themselves without any additional testimony and recommended E150-09/10 for approval, resulting in this public comment.

One need only read the IBC Means of Egress Committee's reason for disapproving Part I of this change (similar language in the IBC) to find ample rationale for overturning the committee. To the point, R-5 and R-3 occupancies only require a single means of egress in an occupancy where people sleep. Not discounting the value of early warning or active suppression, the MOE Committee felt a lack of required system maintenance necessitates keeping the redundancy of these windows. Understand that these are escape **and rescue** windows.

The membership needs to understand that without the minimum provisions of R310.1, the *only* minimum size and height threshold for the second-or-third story windows in a dwelling is the 4% (of floor area) natural ventilation provisions, which have never contemplated and value to emergency escape or access. Complicate matters further by adding the sprinkler system cited as the basis for the exception need only provide a water supply for 10 minutes, beyond the time actually required by many fire departments to commence interior attack on upper floors.

Consider a spec dwelling with 11' by 11' non-master bedrooms. 4% of the floor area is 4.84 square feet. In a corner room, if the minimum openable area is divided over 2 windows, I can achieve my minimum required ventilation through the use of a WDH 24210 by Anderson or similar, which provides a healthy 25"+ of width but a mere 14" in clear height, not to mention I can locate it 5 feet or more above the floor. 14" just will not allow an emergency responder in gear to pass through. Not to mention the difficulty in clearing the glass if the dwelling happens to be in a windborne debris region with required impact-resistant glazing.

If the fire service were able to say that they could never foresee having to enter a dwelling unit from other than the ground-level entry to effect search and rescue or fire operations, I would be less concerned. I do not believe, however, that is the case.

Responding to the argument that this exception is allowed in the IBC, that exception is only in place for occupancies equipped with NFPA 13 or 13R sprinkler systems, not 13D or P2904.

In conclusion, there is no correlation between the additional protection afforded by limited dwelling system sprinklers and the need for a second path in (or out) of a dwelling unit.

Public Comment 3:

Tim Pate with the Colorado Chapter of ICC; Brad Emerick, representing Fire Marshal's Association of Colorado, requests Disapproval.

Commenter's Reason: This public comment will ask the membership to overturn the Committee and ultimately disapprove E150 Part II which will match the action that the Means of Egress Committee did to E150 Part I.

It's acknowledged that an NFPA 13D sprinkler system "…aids in the detection and control of residential fires and thus provides improved protection against injury, life loss, and property damage", but is primarily "…expected to prevent flashover (total involvement) in the room of fire origin, where sprinklered, and to improve the chance for occupants to escape or be evacuated." But to escape or be evacuated, means of egress/access have to be provided. Until enough data is compiled on the effectiveness of 13D systems installed on a broad scale, by various trades, and maintained by homeowners, it's premature to allow escape routes to be compromised – especially from basements. Enough data is starting to be accumulated on smoke alarms, which have been required for some time, to now identify the weaknesses of the associated code provisions, the devices themselves, and the importance of maintenance (e.g., children sleeping through notification, ionization technology in smoldering fires, device expiration, etc.). Had egress systems been compromised in anticipation of the benefits of smoke alarms, many of the people for whom the system worked would have been put at risk. The same cautionary approach should be taken with respect to 13D sprinkler systems.

In addition to occupant egress, rescue/escape windows often provide the only means for a fire department to put a hose stream directly on a basement fire.

And finally, from the discussion on E150, Part 1:

"…There is no alert element on an NFPA13D system, and while smoke detectors are good at detection, they are not always the best at alerting. In a person's home the occupants may be sleeping, intoxicated or unable to evacuate without assistance – this can cause delayed evacuation, thus the real need for the emergency escape windows…"

Public Comment 4:

Julie Ruth, New Lenox, IL representing American Architectural Manufacturers Association, requests Disapproval.

Commenter's Reason: E150, Part II adds an exception to the Emergency Escape and Rescue Opening requirements of the IRC for one and two family homes that are equipped with an automatic sprinkler system. Upon first glance this appears to simply be an extension of the long standing exception to Emergency Escape and Rescue Openings in sprinklered buildings that has existed in the IBC since its first edition, and which existed in some of the ICC legacy codes.

The proposed exception to the IRC, however, is not exactly the same as the exception to Section 1029.1 that exists in the 2009 IBC. The exception in the 2009 IBC is only for Group R and I-1 occupancies that are equipped with an NFPA 13 or NFPA 13R fire suppression system. The proposed exception to Section R310.1 relies upon a NFPA 13D sprinkler system, or a system that complies with Section P2904 of the IRC.

The provisions of NFPA 13D, including its requirements for water supply and discharge, type of sprinkler heads and maximum number of operating ones, connection to the fire department, alarms, pumps, pressure valves, listing of components, installation and ongoing maintenance of the system, are not equivalent to those of NFPA 13 or NFPA 13R. An NFPA 13D system does not provide the same level of coverage as a 13 or 13R system does and it is not subject to the same level of maintenance inspections. Also, the NFPA 13D system relies upon a water reservoir and pump that is to be provided within the home and which is only required to have a 10 minute water supply, as opposed to the 30 minute water supply required for a NFPA 13 or 13R system. Single family homes are not required to be provided with the same level of emergency back-up systems as are required for other occupancies, municipalities or other agencies responsible for fire protection. In situations such as natural disasters where power or water systems are disrupted the fire suppression system may not deploy. Most R3 buildings for example are not equipped with back-up power or water storage tanks as required for other occupancies. Therefore, it would be inappropriate to expand the existing IBC exception, which relies upon a NFPA 13 or a3R system, into the IRC with reliance upon a NFPA 13D system.

It should also be noted that escaping fire is only one reason people have for egressing from their home through a window. There may be other causes that are just as significant from a life safety standpoint, such as the need to escape from an intruder into the home. Elderly or incapacitated individuals experiencing a health-related emergency may need to leave the home by the closest route possible, and therefore require an alternate egress path provided by a window. This is also true if the home becomes full of other toxic fumes or gases, such as carbon monoxide. Providing a fire suppression system does not address these other concerns. In some cases burglary assault prevention advocates have advised home occupants to use the EERO as a means of escaping danger in their own home. They should be able to continue to rely on this passive exit path or rescue opening. Adding an exception for buildings equipped with an NFPA 13D system could create a scenario where a passive exit path or rescue opening is not provided, or any exterior windows in a sleeping room may even be covered with security bars or grills that would specifically prevent escape or egress through that opening.

The inappropriateness of expanding the existing IBC exception to buildings equipped with other sprinkler systems was demonstrated by the IBC Means of Egress Committee's Disapproval of Part I of E150, which would have added a 13D system to the current exception. Disapproval of E150, Part II would be consistent with the IBC MOE committee's action on Part I.

Final Action: AS AM AMPC____ D

NOTE: PART I REPRODUCED FOR INFORMATIONAL PURPOSES ONLY- SEE ABOVE.

E150-09/10, PART I – IBC MEANS OF EGRESS
1029.1 (IFC [B] 1029.1)

Proponent: Steven Orlowski, representing National Association of Home Builders

PART I – IBC MEANS OF EGRESS

Revise as follows:

1029.1 (IFC [B] 1029.1) General. In addition to the means of egress required by this chapter, provisions shall be made for emergency escape and rescue in Group R and I-1 occupancies. Basements and sleeping rooms below the fourth story above grade plane shall have at least one exterior emergency escape and rescue opening in accordance with this section. Where basements contain one or more sleeping rooms, emergency escape and rescue openings shall be required in each sleeping room, but shall not be required in adjoining areas of the basement. Such openings shall open directly into a public way or to a yard or court that opens to a public way.

Exceptions:

1. In ~~other than Group R-3 occupancies,~~ <u>Group R</u> buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1<u>,</u> ~~or~~ 903.3.1.2 <u>or 903.3.1.3</u>.
2. In other than Group R-3 occupancies, sleeping rooms provided with a door to a fire-resistance-rated corridor having access to two remote exits in opposite directions.
3. The emergency escape and rescue opening is permitted to open onto a balcony within an atrium in accordance with the requirements of Section 404, provided the balcony provides access to an exit and the dwelling unit or sleeping unit has a means of egress that is not open to the atrium.
4. Basements with a ceiling height of less than 80 inches (2032 mm) shall not be required to have emergency escape and rescue windows.
5. High-rise buildings in accordance with Section 403.
6. Emergency escape and rescue openings are not required from basements or sleeping rooms that have an exit door or exit access door that opens directly into a public way or to a yard, court or exterior exit balcony that opens to a public way.
7. Basements without habitable spaces and having no more than 200 square feet (18.6m^2) in floor area shall not be required to have emergency escape windows.

Reason: Based on extensive research on the performance of residential smoke alarms, the NFPA 72 technical committee on residential alarms has determined that both ionization and photoelectric smoke alarms provide adequate escape time along the normal path of egress in both fast flaming and slow smoldering fires. In tests conducted by NIST, the results show that when smoke alarms are present and functioning properly, these devices will detect and notify the occupant with enough time to vacate the structure prior to untenable conditions being reached within the dwelling. The purpose for the emergency egress is to provide a secondary means of escape and rescue, in the event that the normal path of egress becomes blocked or conditions are unsustainable.

During the last code development cycle, the sprinkler proponents testified that residential fire sprinklers are effective in 96% of the fires that grow large enough to activate the system. With the recent addition of residential sprinklers, the time for evacuating the structure before conditions become untenable and incapacitate the occupant have been extended. When sprinklers are used in tandem with smoke alarms, the available escape time in a fast flaming fire is increased and occupants are given more time for escape. Proponents also testified that when sprinklers are present it will provide additional time for firefighters to conduct search and rescue, since the fire will be either extinguished or contained.

If homes are required to be equipped with both an active suppression system and alarm system, it is time to start reevaluating the need for some of the passive life safety features in the home that have previously been justified to protect occupants in the event of a fire. While this proposal may raise the eyebrows of many skeptics, the concept of not requiring emergency egress and rescue openings in one- and two-family dwellings equipped with an automatic suppression system is not new since this exception has been permitted in NFPA 101 The Life Safety Code for several years. In addition, the International Building Code has exempted R-1, R-2 and I-1 occupancies from requiring emergency escape and rescue openings when an approved automatic suppressions system is installed.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I IBC MEANS OF EGRESS
Committee Action: **Disapproved**

Committee Reason: Group R-3 is unique in that it is only required to have one means of egress, therefore the redundancy of the emergency escape window is needed. Early suppression and early detection saves lives, but there are no maintenance requirements for a NFPA13D system, therefore, there is a concern that the chance of these systems to be out of service is high enough that removal of the requirement for a secondary exit through the emergency escape window is not warranted. There is no alert element on an NFPA13D system, and while smoke detectors are good at detection, they are not always the best at alerting. In a person's home the may be sleeping, intoxicated or unable to evacuate without assistance – this can cause delayed evacuation, thus the real need for the emergency escape windows. One of the opponent indicated that not having emergency escape windows in group homes may be a violation of federal law – that needs to be investigated. There needs to be more information on the entry rescue issues brought up by the fire service, including their use in non-fire emergencies.

Assembly Action: **None**

E151-09/10, PART III
IBC [P] 2902.4, IPC 403.4

NOTE: PARTS I, II AND IV DID NOT RECEIVE A PUBLIC COMMENT AND ARE ON THE CONSENT AGENDA. PART I, II AND IV ARE REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART III.

Proposed Change as Submitted

PART III – IPC

Revise 2902.4 to match IPC 403.4 as follows:

SECTION [P] 2902 (IPC 403.4)
MINIMUM PLUMBING FACILITIES

[P] 2902.4 Signage. ~~A legible sign designating the sex shall be provided in a readily visible location near the entrance to each toilet facility~~. Required public facilities shall be designated by a legible sign for each sex. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1110 ~~ICC A117.1~~.

IPC 403.4 Signage. Required *public* facilities shall be designated by a legible sign for each sex. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1110 of the *International Building Code.*

Reason:
Part III – IPC – 2902.4 (IPC 403.4) – The reference to the signage requirements in Chapter 11 will help a user locate all the provisions for accessible signage associated with toilet rooms and in addition will pick up the ICC A117.1 references. The signage requirements in Chapter 29 should match the Plumbing Code requirements.

ICCFILENAME:Wiehle-E8-1101.2

Public Hearing Results

PART III- IPC
Committee Action: **Approved as Submitted**

Committee Reason: The revisions clarify the applicable technical requirements in ICC A117.1 for signage at toilet rooms.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lawrence Brown, CBO, representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

[P] 2902.4 Signage. Required public facilities shall be ~~designated by~~ provided with a ~~legible~~ sign ~~for each~~ designating the sex. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1110.

IPC 403.4 Signage. Required *public* facilities shall be ~~designated by~~ provided with a ~~legible~~ sign ~~for each~~ designating the sex. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1110 of the *International Building Code*.

Commenter's Reason: This modification is proposed as the IPC and IBC do not always require a separate toilet facility for each sex, as shown below in the Exceptions to Section 2902.2. As Section 2902.4 (above) only addresses the signs themselves, is it more appropriate that sign itself have the correct designation for the sex, or for a facility that can be used by either sex. This modification achieves this intent.

[P] 2902.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for *dwelling units* and *sleeping units*.
2. Separate facilities shall not be required in structures or tenant spaces with a total *occupant load*, including both employees and customers of 15 or less.
3. Separate facilities shall not be required in mercantile occupancies in which the maximum *occupant load* is 50 or less.

Final Action: AS AM AMPC____ D

NOTE: PART I, II, AND III REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE.

E151-09/10, PART I-IBC MEANS OF EGRESS
406.2.2, 1007.9 (IFC [B] 1007.9), 1011.3 (IFC [B] 1011.3), 1022.8 (IFC [B] 1022.8), 1104.4, 1106.7, 1108.2.2, 1108.2.3, 1108.4.1.1, 1108.4.1.2, 1108.4.1.4, 1108.4.1.5, 1109.1, 1109.2.1.1, 1109.2.2, 1109.2.3, 1109.3, 1109.4, 1109.6, 1109.8, 1109.13, [P] 2902.4, 3001.3, 3411.6, E104.3, E105.1, E105.2.1, E105.2.2, E105.3, E105.4, E105.6, E106.2, E106.3, E106.4, E106.4.9, E106.5, E107.2, E109.2.1, E109.2.2.1, E109.2.6, E109.2.8, E110.4

PART I – IBC MEANS OF EGRESS

Revise as follows:

1101.2 Design. Buildings and facilities shall be designed and constructed to be accessible in accordance with this code and ICC A117.1.

SECTION 1102
DEFINITIONS

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

ACCESSIBLE UNIT. A dwelling unit or sleeping unit that complies with this code and the provisions for Accessible units in ICC A117.1.

TYPE A UNIT. A dwelling unit or sleeping unit designed and constructed for accessibility in accordance with this code and the provisions for Type A units in ICC A117.1.

TYPE B UNIT. A dwelling unit or sleeping unit designed and constructed for accessibility in accordance with this code and the provisions for Type B units in ICC A117.1, consistent with the design and construction requirements of the federal Fair Housing Act.

1104.4 Multilevel buildings and facilities. At least one accessible route shall connect each accessible level, including mezzanines, in multilevel buildings and facilities.

Exceptions:

1. An accessible route is not required to stories and mezzanines that have an aggregate area of not more than 3,000 square feet (278.7 m^2) and are located above and below accessible levels. This exception shall not apply to:
   1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces;
   1.2. Levels containing offices of health care providers (Group B or I); or
   1.3. Passenger transportation facilities and airports (Group A-3 or B).

2. Levels that do not contain accessible elements or other spaces as determined by Section 1107 or 1108 are not required to be served by an accessible route from an accessible level.
3. In air traffic control towers, an accessible route is not required to serve the cab and the floor immediately below the cab.
4. Where a two-story building or facility has one story with an occupant load of five or fewer persons that does not contain public use space, that story shall not be required to be connected by an accessible route to the story above or below.
5. Vertical access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator ~~complying with ICC A117.1~~ can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

1106.7 Passenger loading zones. Passenger loading zones shall be <u>accessible</u> ~~designed and constructed in accordance with ICC A117.1~~.

1107.2 Design. Dwelling units and sleeping units that are required to be Accessible units, Type A units and Type B units shall comply with the applicable portions of Chapter 10 of ICC A117.1. Units required to be Type A units are permitted to be designed and constructed as Accessible units. Units required to be Type B units are permitted to be designed and constructed as Accessible units or as Type A units.

1108.2.2 Wheelchair spaces. In theaters, bleachers, grandstands, stadiums, arenas and other fixed seating assembly areas, accessible wheelchair spaces ~~complying with ICC A117.1~~ shall be provided in accordance with Sections 1108.2.2.1 through 1108.2.2.4.

1108.2.3 Companion seats. At least one companion seat ~~complying with ICC A117.1~~ shall be provided for each wheelchair space required by Sections 1108.2.2.1 through 1108.2.2.3.

1108.4.1.1 Jury box. A wheelchair space ~~complying with ICC A117.1~~ shall be provided within the jury box.

Exception: Adjacent companion seating is not required.

1108.4.1.2 Gallery seating. Wheelchair spaces ~~complying with ICC A117.1~~ shall be provided in accordance with Table 1108.2.2.1. Designated aisle seats shall be provided in accordance with Section 1108.2.5.

1108.4.1.4 Employee work stations. The judge's bench, clerk's station, bailiff's station, deputy clerk's station and court reporter's station shall be located on an accessible route. The vertical access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator ~~complying with ICC A117.1~~ can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

1108.4.1.5 Other work stations. The litigant's and counsel stations, including the lectern, shall be accessible ~~in accordance with ICC A117.1~~.

1109.1 General. Accessible building features and facilities shall be provided in accordance with Sections 1109.2 through 1109.14.

Exception: <u>Accessible units,</u> Type A units and Type B units shall comply <u>with Chapter 10 of</u> ICC A117.1.

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be *accessible*. Where a floor level is not required to be connected by an *accessible route*, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. At least one of each type of fixture, element, control or dispenser in each *accessible* toilet room and bathing room shall be *accessible*.

Exceptions:

1. In toilet rooms or bathing rooms accessed only through a private office, not for *common* or *public use* and intended for use by a single occupant, any of the following alternatives are allowed:
   1.1. Doors are permitted to swing into the clear floor space, provided the door swing can be reversed to meet the requirements in ICC A117.1;
   1.2. The height requirements for the water closet in ICC A117.1 are not applicable;
   1.3. Grab bars are not required to be installed in a toilet room, provided that reinforcement has been installed in the walls and located so as to permit the installation of such grab bars; and
   1.4. The requirement for height, knee and toe clearance shall not apply to a lavatory.
2. This section is not applicable to toilet and bathing rooms that serve *dwelling units* or *sleeping unit*s that are not required to be *accessible* by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be *accessible*.
4. Where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be *accessible*.
5. Toilet rooms that are part of critical care or intensive care patient sleeping rooms are not required to be *accessible*.

1109.2.1.1 Standard. Family or assisted-use toilet and bathing rooms shall comply with Sections 1109.2.1.2 through 1109.2.1.7 ~~and ICC A117.1~~.

1109.2.2 Water closet compartment. Where water closet compartments are provided in a toilet room or bathing facility, at least one wheelchair-accessible compartment shall be provided. Where the combined total water closet compartments and urinals provided in a toilet room or bathing facility is six or more, at least one ambulatory-accessible water closet compartment shall be provided in addition to the wheelchair-accessible compartment. ~~Wheelchair-accessible and ambulatory-accessible compartments shall comply with ICC A117.1.~~

1109.2.3 Lavatories. Where lavatories are provided, at least 5 percent, but not less than one, shall be *accessible*. Where the total lavatories provided in a toilet room or bathing facility is six or more, at least one lavatory with enhanced reach ranges ~~in accordance with ICC A117.1~~, shall be provided.

1109.3 Sinks. Where sinks are provided, at least 5 percent but not less than one provided in accessible spaces shall <u>be accessible</u> ~~comply with ICC A117.1~~.
Exception: Mop or service sinks are not required to be accessible.

1109.4 Kitchens and kitchenettes. Where kitchens and kitchenettes are provided in accessible spaces or rooms, they shall be accessible ~~in accordance with ICC A117.1~~.

1109.6 Elevators. Passenger elevators on an accessible route shall be accessible and comply with ~~Section 3001.3~~ Chapter 30.

1109.8 Storage. Where fixed or built-in storage elements such as cabinets, shelves, medicine cabinets, closets and drawers are provided in required accessible spaces, at least one of each type shall contain accessible storage space ~~complying with ICC A117.1~~.

1109.13 Fuel-dispensing systems. Fuel-dispensing systems shall be accessible ~~comply with ICC A117.1~~.

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

406.2.2 Clear height. The clear height of each floor level in vehicle and pedestrian traffic areas shall not be less than 7 feet (2134 mm). Vehicle and pedestrian areas accommodating van-accessible parking shall comply with ~~required by~~ Section 1106.5 ~~shall conform to ICC A117.1.~~

SECTION 1007 (IFC [B] 1007)
ACCESSIBLE MEANS OF EGRESS

1007.9 (IFC [B] 1007.9) Signage. Signage indicating special accessibility provisions shall be provided as shown:

1. Each door providing access to an *area of refuge* from an adjacent floor area shall be identified by a sign stating: AREA OF REFUGE.
2. Each door providing access to an exterior area for assisted rescue shall be identified by a sign stating: EXTERIOR AREA FOR ASSISTED RESCUE.

Signage shall comply with the ICC A117.1 requirements for visual characters and include the International Symbol of Accessibility. Where exit sign illumination is required by Section 1011.2, the signs shall be illuminated. Additionally, raised character and braille ~~tactile~~ signage complying with ICC A117.1 shall be located at each door to an *area of refuge* and exterior area for assisted rescue in accordance with Section 1011.3.

SECTION 1010 (IFC [B] 1010)
RAMPS

1010.1 (IFC [B] 1010.1) Scope. The provisions of this section shall apply to ramps used as a component of a means of egress.

Exceptions:

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2 through 1108.2.4 and 1108.2.6, ramped aisles within assembly rooms or spaces shall conform with the provisions in Section 1028.11.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections 1010.3 through 1010.9 when they are not an accessible route serving accessible parking spaces, other required accessible elements or part of an accessible means of egress.

1010.6.5 (IFC [B] 1010.6.5) Doorways. Where doorways are located adjacent to a ramp landing, maneuvering clearances required by ICC A117.1 are permitted to overlap the required landing area.

1010.9 (IFC [B] 1010.9) Edge protection. Edge protection complying with Section 1010.9.1 or 1010.9.2 shall be provided on each side of ramp runs and at each side of ramp landings.

Exceptions:

1. Edge protection is not required on ramps that are not required to have handrails, provided they have flared sides that comply with the ICC A117.1 curb ramp provisions.
2. Edge protection is not required on the sides of ramp landings serving an adjoining ramp run or stairway.
3. Edge protection is not required on the sides of ramp landings having a vertical drop off of not more than ½ inch (12.7 mm) within 10 inches (254 mm) horizontally of the required landing area.
4. In assembly spaces with fixed seating, edge protection is not required on the sides of ramps where the ramps provide access to the adjacent seating and aisle accessways.

SECTION 1011(IFC [B] 1011)
EXIT SIGNS

1011.3 (IFC [B] 1011.3) ~~Tactile~~ Raised character and Braille exit signs. A ~~tactile~~ sign stating EXIT in raised characters and Braille and complying with ICC A117.1 shall be provided adjacent to each door to an area of refuge, an exterior area for assisted rescue, an exit stairway, an exit ramp, an exit passageway and the exit discharge.

SECTION 1022 (IFC [B] 1022)
EXIT ENCLOSURES

1022.8 (IFC [B] 1022.8) Floor identification signs. A sign shall be provided at each floor landing in exit enclosures connecting more than three stories designating the floor level, the terminus of the top and bottom of the exit enclosure and the identification of the stair or ramp. The signage shall also state the story of, and the direction to, the exit discharge and the availability of roof access from the enclosure for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. In addition, floor level identification signs in ~~tactile~~ raised characters and Braille complying with ICC A117.1 shall be located at each floor level landing adjacent to the door leading from the enclosure into the corridor to identify the floor level.

CHAPTER 30
ELEVATORS AND CONVEYING SYSTEMS

3001.3 Accessibility. Passenger elevators required to be accessible ~~by Chapter 11 shall conform to ICC A117.1~~ or serve as part of an accessible means of egress shall comply with Section 1107 and 1109.6.

3008.13.1 Design and installation. The two-way communication system shall include audible and visible signals and shall be designed and installed in accordance with the requirements in ICC A117.1.

3008.13.2 Instructions. Instructions for the use of the two-way communication system along with the location of the station shall be permanently located adjacent to each station. Signage shall comply with the ICC A117.1 requirements for visual characters.

SECTION 3411 (IEBC 310)
ACCESSIBILITY FOR EXISTING BUILDINGS

3411.6 (IEBC 310.6) Alterations. A building, facility or element that is altered shall comply with the applicable provisions in Chapter 11 of this code ~~and ICC A117.1~~, unless technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 3411.7.
2. Accessible means of egress required by Chapter 10 are not required to be provided in existing buildings and facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit ~~and shall comply with the applicable provisions in Chapter 11 and ICC A117.1~~.

3411.8.2 (IEBC 310.8.2) Elevators. Altered elements of existing elevators shall comply with ASME A17.1 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

3411.8.3 (IEBC 310.8.3) Platform lifts. Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

APPENDIX E
SUPPLEMENTARY ACCESSIBILITY REQUIREMENTS

E101.2 Design. Technical requirements for items herein shall comply with this code and ICC A117.1.

SECTION E104
SPECIAL OCCUPANCIES

E104.2 Accessible beds. In rooms or spaces having more than 25 beds, 5 percent of the beds shall have a clear floor space complying with ICC A117.1.

E104.2.1 Sleeping areas. A clear floor space complying with ICC A117.1 shall be provided on both sides of the accessible bed. The clear floor space shall be positioned for parallel approach to the side of the bed.

Exception: This requirement shall not apply where a single clear floor space complying with ICC A117.1 positioned for parallel approach is provided between two beds.

E104.3 Communication features. Accessible communication features ~~complying with ICC A117.1~~ shall be provided in accordance with Sections E104.3.1 through E104.3.4.

E104.3.4 Notification devices. Visual notification devices shall be provided to alert room occupants of incoming telephone calls and a door knock or bell. Notification devices shall not be connected to visual alarm signal appliances. Permanently installed telephones shall have volume controls and an electrical outlet complying with ICC A117.1 located within 48 inches (1219 mm) of the telephone to facilitate the use of a TTY.

SECTION E105
OTHER FEATURES AND FACILITIES

E105.1 Portable toilets and bathing rooms. Where multiple single-user portable toilet or bathing units are clustered at a single location, at least 5 percent, but not less than one toilet unit or bathing unit at each cluster, shall be accessible ~~comply with ICC A117.1~~. Signs containing the International Symbol of Accessibility ~~and complying with ICC A117.1~~ shall identify accessible portable toilets and bathing units.

Exception: Portable toilet units provided for use exclusively by construction personnel on a construction site.

E105.2.1Washing machines. Where three or fewer washing machines are provided, at least one shall be accessible ~~comply with ICC A117.1~~. Where more than three washing machines are provided, at least two shall be accessible ~~comply with ICC A117.1~~.

E105.2.2 Clothes dryers. Where three or fewer clothes dryers are provided, at least one shall be accessible ~~comply with ICC A117.1~~. Where more than three clothes dryers are provided, at least two shall be accessible ~~comply with ICC A117.1~~.

E105.3 Depositories, vending machines, change machines and similar equipment. Where provided, at least one of each type of depository, vending machine, change machine and similar equipment shall be accessible ~~comply with ICC A117.1~~.

Exception: Drive-up-only depositories are not required to comply with this section.

E105.4 Mailboxes. Where mailboxes are provided in an interior location, at least 5 percent, but not less than one, of each type shall be accessible ~~comply with ICC A117.1~~. In residential and institutional facilities, where mailboxes are provided for each dwelling unit or sleeping unit, mailboxes be accessible ~~complying with ICC A117.1~~ shall be provided for each unit required to be an Accessible unit.

E105.6 Two-way communication systems. Where two-way communication systems are provided to gain admittance to a building or facility or to restricted areas within a building or facility, the system shall be accessible ~~comply with ICC A117.1~~.

SECTION E106
TELEPHONES

E106.2 Wheelchair-accessible telephones. Where public telephones are provided, wheelchair-accessible telephones ~~complying with ICC A117.1~~ shall be provided in accordance with Table E106.2.

Exception: Drive-up-only public telephones are not required to be accessible.

E106.3 Volume controls. All public telephones provided shall have accessible volume control ~~complying with ICC A117.1~~.

E106.4 TTYs. TTYs ~~complying with ICC A117.1~~ shall be provided in accordance with Sections E106.4.1 through E106.4.9.

E106.4.9 Signs. Public TTYs shall be identified by the International Symbol of TTY ~~complying with ICC A117.1~~. Directional signs indicating the location of the nearest public TTY shall be provided at banks of public pay telephones not containing a public TTY. Additionally, where signs provide direction to public pay telephones, they shall also provide direction to public TTYs. Such signs shall comply with visual signage requirements in ICC A117.1 and shall include the International Symbol of TTY.

E106.5 Shelves for portable TTYs. Where a bank of telephones in the interior of a building consists of three or more public pay telephones, at least one public pay telephone at the bank shall be provided with a shelf and an electrical outlet ~~in accordance with ICC A117.1~~.

Exceptions:

1. In secured areas of detention and correctional facilities, if shelves and outlets are prohibited for purposes of security or safety shelves and outlets for TTYs are not required to be provided.
2. The shelf and electrical outlet shall not be required at a bank of telephones with a TTY.

SECTION E107
SIGNAGE

E107.1 Signs. Required accessible portable toilets and bathing facilities shall be identified by the International Symbol of Accessibility.

E107.2 Designations. Interior and exterior signs identifying permanent rooms and spaces shall be ~~tactile~~ raised characters and braille. Where pictograms are provided as designations of interior rooms and spaces, the pictograms shall have ~~tactile~~ raised character and braille text descriptors. ~~Signs required to provide tactile characters and pictograms shall comply with ICC A117.1~~.

Exceptions:

1. Exterior signs that are not located at the door to the space they serve are not required to comply.
2. Building directories, menus, seat and row designations in assembly areas, occupant names, building addresses and company names and logos are not required to comply.
3. Signs in parking facilities are not required to comply.
4. Temporary (seven days or less) signs are not required to comply.
5. In detention and correctional facilities, signs not located in public areas are not required to comply.

E107.3 Directional and informational signs. Signs that provide direction to, or information about, permanent interior spaces of the site and facilities shall contain visual characters complying with ICC A117.1.

Exception: Building directories, personnel names, company or occupant names and logos, menus and temporary (seven days or less) signs are not required to comply with ICC A117.1.

SECTION E108
BUS STOPS

E108.3 Bus shelters. Where provided, new or replaced bus shelters shall provide a minimum clear floor or ground space complying with ICC A117.1, Section 305, entirely within the shelter. Such shelters shall be connected by an accessible route to the boarding area required by Section E108.2.

E108.4 Signs. New bus route identification signs shall have finish and contrast complying with ICC A117.1. Additionally, to the maximum extent practicable, new bus route identification signs shall provide visual characters complying with ICC A117.1.

Exception: Bus schedules, timetables and maps that are posted at the bus stop or bus bay are not required to meet this requirement.

SECTION E109
TRANSPORTATION FACILITIES AND STATIONS

E109.2.1 Station entrances. Where different entrances to a station serve different transportation fixed routes or groups of fixed routes, at least one entrance serving each group or route shall comply with Section 1104 ~~and ICC A117.1~~.

E109.2.2.1 ~~Tactile~~ Raised character and braille signs. Where signs are provided at entrances to stations identifying the station or the entrance, or both, at least one sign at each entrance shall be ~~tactile~~ raised characters and braille. A minimum of one ~~tactile~~ raised character and braille sign identifying the specific station shall be provided on each platform or boarding area. Such signs shall be placed in uniform locations at entrances and on platforms or boarding areas within the transit system to the maximum extent practicable. ~~Tactile signs shall comply with ICC A117.1~~.

Exceptions:

1. Where the station has no defined entrance but signs are provided, the ~~tactile~~ raised character and braille signs shall be placed in a central location.
2. Signs are not required to be ~~tactile~~ raised character and braille where audible signs are remotely transmitted to hand-held receivers, or are user or proximity actuated.

E109.2.2.2 Identification signs. Stations covered by this section shall have identification signs containing visual characters complying with ICC A117.1. Signs shall be clearly visible and within the sightlines of a standing or sitting passenger from within the train on both sides when not obstructed by another train.

E109.2.2.3 Informational signs. Lists of stations, routes and destinations served by the station which are located on boarding areas, platforms or mezzanines shall provide visual characters complying with ICC A117.1 Signs covered by this provision shall, to the maximum extent practicable, be placed in uniform locations within the transit system.

E109.2.3 Fare machines. Self-service fare vending, collection and adjustment machines shall comply with ICC A117.1, Section 707. Where self-service fare vending, collection or adjustment machines are provided for the use of the general public, at least one accessible machine of each type provided shall be provided at each accessible point of entry and exit.

E109.2.5 TTYs. Where a public pay telephone is provided in a transit facility (as defined by the Department of Transportation) at least one public TTY complying with ICC A117.1, Section 704.4, shall be provided in the station. In addition, where one or more public pay telephones serve a particular entrance to a transportation facility, at least one TTY telephone complying with ICC A117.1, Section 704.4, shall be provided to serve that entrance.

E109.2.6 Track crossings. Where a circulation path serving boarding platforms crosses tracks, an accessible route ~~complying with ICC A117.1~~ shall be provided.

Exception: Openings for wheel flanges shall be permitted to be 21/2 inches (64 mm) maximum.

E109.2.8 Clocks. Where clocks are provided for use by the general public, the clock face shall be uncluttered so that its elements are clearly visible. Hands, numerals and digits shall contrast with the background either light-on-dark or dark-on-light. Where clocks are mounted overhead, numerals and digits shall comply with visual character requirements ~~ICC A117.1, Section 703.2~~.

SECTION E110
AIRPORTS

E110.2 TTYs. Where public pay telephones are provided, at least one TTY shall be provided in compliance with ICC A117.1, Section 704.4. Additionally, if four or more public pay telephones are located in a main terminal outside the security areas, a concourse within the security areas or a baggage claim area in a terminal, at least one public TTY complying with ICC A117.1, Section 704.4, shall also be provided in each such location.

E110.4 Clocks. Where clocks are provided for use by the general public, the clock face shall be uncluttered so that its elements are clearly visible. Hands, numerals and digits shall contrast with their background either light-on-dark or dark-on-light. Where clocks are mounted overhead, numerals and digits shall comply with visual character requirements ~~ICC A117.1, Section 703.2~~.

Reason:
PART I-IBC
Section 1101.2 establishes ICC A117.1 as the standard for accessible design for Chapter 11. Section E101.2 establishes ICC A117.1 as the standard for accessible design for Appendix E. It is unnecessary to repeat this throughout Chapter 11 or Appendix E unless the specific text is an exception to the standard (Ex: Section 1109.2 Ex. 1) or a specific item within the standard (Ex: Section 1002.1, Definitions for Accessible Unit, Type A unit and Type B unit) . Providing the reference in a haphazard manner within the chapter only serves to create confusion. This is an editorial issue and the editorial committee should verify that there are not other occurrences of this in the chapter. The text provided shows all of the location where ICC A117.1 is currently referenced.

1109.1 – The revisions is correlative with the 2003 A117.1 including Accessible Units in Chapter 10 which only included Type A and Type B units in the 1998 edition. The definition for Accessible units was correlated and approved with the new edition, but this exception was missed.

1109.6 – the reference to Section 3001.3 is only a reference to ICC A117.1, which is not needed since it is already called out in Section 1101.2. All elevators have to comply with Chapter 30 for safety.

406.2.2 – the reference to Section 1106.5 for accessible parking automatically gets ICC A117.1.

1007.9 – ICC A117.1 has changed 'tactile' requirements for signage to 'raised characters and braille'. This revision would correlate with the standard.

1011.3 – ICC A117.1 has changed 'tactile' requirements for signage to 'raised characters and braille'. This revision would correlate with the standard.

3411.6 (IEBC 310.6) - The reference to IBC Chapter 11 already gets the ICC A117.1.

Changes for 'tactile characters' to 'raised characters and braille' is consistent with revisions to the 2009 edition in A117.1.

PART I - IBC MEANS OF EGRESS
Committee Action: **Approved as Submitted**

Modify the proposal as follows (editorial correction):

3001.3 Accessibility. Passenger elevators required to be accessible or serve as part of an accessible means of egress shall comply with ~~Section 1107~~ Sections 1007 and 1109.6.

E105.4 Mailboxes. Where mailboxes are provided in an interior location, at least 5 percent, but not less than one, of each type shall be accessible. In residential and institutional facilities, where mailboxes are provided for each dwelling unit or sleeping unit, accessible mailboxes ~~be accessible~~ shall be provided for each unit required to be an Accessible unit.

(Portions of proposal not shown remain unchanged.)

Committee Reason: The selective deletions of the reference to ICC A117.1 remove redundant text. Revisions in terminology for tactile signage coordinate with revisions in the 2009 edition of ICC A117.1.

Assembly Action: **None**

E151-09/10, PART II-IFC
IFC 907.5.2.3.4 (IBC [F] 907.5.2.3.4)

PART II – IFC

Revise as follows:

SECTION [F] 907 (IFC 907)
FIRE ALARM AND DETECTION SYSTEMS

[F] 907.5.2.3.4 (IFC 907.5.2.3.4) Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, all dwelling units and sleeping units shall be provided with the capability to support visible alarm notification appliances in accordance with Chapter 10 of ICC A117.1.

Reason: Part II – IFC - 907.5.2.3.4 – in this situation, the more specific reference would clarify to users where the alarm requirements for dwelling units are found. This would be consistent with the definitions of Accessible units, Type A units and Type B units.

PART II- IFC
Committee Action: **Approved as Submitted**

Committee Reason: The revisions clarify the applicable technical requirements in ICC A117.1 for visible alarms in dwelling units.

Assembly Action: **None**

E151-09/10, PART IV-IEBC
IEBC 605.1

PART IV – IEBC

SECTION 605
ACCESSIBILITY

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the International Building Code ~~and ICC A117.1~~ unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible. A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provisions for Type B dwelling units ~~and shall comply with the applicable provisions in Chapter 11 of the International Building Code and ICC A117.1~~.

605.1.2 Elevators. Altered elements of existing elevators shall comply with ASME A17.1 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

605.1.3 Platform lifts. Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

Reason: Part IV – IEBC – 605.1 – The reference to IBC Chapter 11 already gets the ICC A117.1.

PART IV- IEBC
Committee Action: **Approved as Submitted**

Committee Reason: The selective deletions of the reference to ICC A117.1 remove redundant text.

Assembly Action: **None**

1102.1, 1104.2, 1104.3, 1109.7, 1109.14, 1110 (New), 3411.8, 3411.8.15 (New), 3411.8.16 (New) [IEBC [B] 310.8, 310.8.15 (New), 310.8.16 (New)

Proposed Change as Submitted

Proponent: Marsha K. Mazz, U.S. Architectural and Transportation Barriers Compliance Board (Access Board)

PART I – IBC MEANS OF EGRESS

1. Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

AMUSEMENT RIDE. A system that moves persons through a fixed course within a defined area for the purpose of amusement.

AMUSEMENT RIDE SEAT. A seat that is built-in or mechanically fastened to an amusement ride intended to be occupied by one or more passengers.

AREA OF SPORT ACTIVITY. That portion of a room or space where the play or practice of a sport occurs.

BOARDING PIER. A portion of a pier where a boat is temporarily secured for the purpose of embarking or disembarking.

BOAT LAUNCH RAMP. A sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.

BOAT SLIP. That portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.

GANGWAY. A variable-sloped pedestrian walkway that links a fixed structure or land with a floating structure. Gangways which connect to vessels are not included.

GOLF CAR PASSAGE. A continuous passage on which a motorized golf car can operate.

PLAY AREA. A portion of a site containing play components designed and constructed for children.

PLAY COMPONENT. An element intended to generate specific opportunities for play, socialization, or learning. Play components may be manufactured or natural, and may be stand alone or part of a composite play structure.

TEEING GROUND. In golf, the starting place for the hole to be played.

TRANSFER DEVICE. Equipment designed to facilitate the transfer of a person from a wheelchair or other mobility device to and from an amusement ride seat.

2. Revise as follows:

1104.2 Within a site. At least one accessible route shall connect accessible buildings, accessible facilities, accessible elements and accessible spaces that are on the same site.

Exceptions:

1. An accessible route is not required between accessible buildings, accessible facilities, accessible elements and accessible spaces that have, as the only means of access between them, a vehicular way not providing for pedestrian access.
2. An accessible route to recreational facilities is not required when exempted under Sections 1110.4 or 1110.6

1104.3 Connected spaces. When a building or portion of a building is required to be accessible, an accessible route shall be provided to each portion of the building, to accessible building entrances connecting accessible pedestrian walkways and the public way.

Exceptions:

1. In assembly areas with fixed seating, an accessible route shall not be required to serve levels where wheelchair spaces are not provided.
2. In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.
3. <u>An accessible route to recreational facilities is not required when exempted under Sections 1110.4 or 1110.6</u>

1109.7 Lifts. Platform (wheelchair) lifts are permitted to be a part of a required accessible route in new construction where indicated in Items 1 through ~~10~~ <u>11</u>. Platform (wheelchair) lifts shall be installed in accordance with ASME A18.1.

1. An accessible route to a performing area and speaker platforms in Group A occupancies.
2. An accessible route to wheelchair spaces required to comply with the wheelchair space dispersion requirements of Sections 1108.2.2 through 1108.2.6.
3. An accessible route to spaces that are not open to the general public with an occupant load of not more than five.
4. An accessible route within a dwelling or sleeping unit.
5. An accessible route to wheelchair seating spaces located in outdoor dining terraces in Group A-5 occupancies where the means of egress from the dining terraces to a public way are open to the outdoors.
6. An accessible route to jury boxes and witness stands; raised courtroom stations including judges' benches, clerks' stations, bailiffs' stations, deputy clerks' stations and court reporters' stations; and to depressed areas such as the well of the court.
7. An accessible route to load and unload areas serving amusement rides.
8. An accessible route to play components or soft contained play structures.
9. An accessible route to team or player seating areas serving areas of sport activity.
10. An accessible route where existing exterior site constraints make use of a ramp or elevator infeasible.
11. <u>Platform lifts shall be permitted to be used instead of gangways that are part of accessible routes serving recreational boating facilities and fishing piers and platforms.</u>

<u>SECTION 1110</u>
<u>RECREATIONAL FACILITIES</u>

<u>1110.1</u> ~~1109.14~~ Recreational and sports facilities. Recreational and sports facilities shall be provided with accessible features in accordance with Sections <u>1110.2</u> ~~1109.14.1~~ through <u>1110.6</u> ~~1109.14.4~~.

<u>1110.2</u> ~~1109.14.1~~ Facilities serving <u>Type B units in</u> a single building. In Group R-2 and R-3 occupancies where recreational facilities are provided serving a single building containing ~~Type A units or~~ Type B units, 25 percent, but not less than one, of each type of recreational facility shall be accessible. Every recreational facility of each type on a site shall be considered to determine the total number of each type that is required to be accessible.

<u>1110.3</u> ~~1109.14.2~~ Facilities serving <u>Type B units in</u> multiple buildings. In Group R-2 and R-3 occupancies on a single site where multiple buildings containing ~~Type A units or~~ Type B units are served by recreational facilities, 25 percent, but not less than one, of each type of recreational facility serving each building shall be accessible. The total number of each type of recreational facility that is required to be accessible shall be determined by considering every recreational facility of each type serving each building on the site.

<u>**1110.4 Facilities serving Accessible and Type A units.** In Group R-2 and R-3 occupancies where recreational facilities are provided serving Accessible or Type A units, every recreational facility of each type serving Accessible or Type A units shall be accessible.</u>

<u>1110.5</u> ~~1109.14.3~~ Other occupancies. All recreational facilities not falling within the purview of Section <u>1110.2 through 1110.4</u> ~~1109.14.1~~ ~~or 1109.14.2~~ shall <u>comply with ICC A117.1 and be located on an accessible route</u> ~~be accessible~~. <u>Each area of sports activity shall be served by an accessible route. Accessible route shall also comply with Section 1110.5.1 through 1110.5.3.</u>

Exception: Areas of sport activity shall not be required to comply with ICC A117.1.

1110.5.1 Protruding objects. Protruding objects shall comply with the requirements of Sections 1003.3.

Exception: Within play areas, protruding objects on circulation paths shall not be required to comply with 1003.3 provided that ground level accessible routes provide vertical clearance in compliance with 1003.3.1.

1110.5.2 Floor surface. Walking surfaces of the accessible route shall comply with ICC ANSI A117.1.

Exception: Within animal containment areas, floor and ground surfaces shall not be required to be stable, firm, and slip resistant.

1110.5.3 Changes in Level. Where changes in level are permitted in floor or ground surfaces, they shall comply with ICC A117.1 for changes in level.

Exception: Animal containment areas shall not be required to comply with ICC A117.1.

1110.6 **~~1109.14.4~~ Recreational and sports facilities exceptions.** Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

1110.6.1 **~~1108.2.2.4~~ Team or player seating.** At least one wheelchair space shall be provided in team or player seating areas serving areas of sport activity.

Exception: Wheelchair spaces shall not be required in team or player seating areas serving bowling lanes that are not required to be located on an accessible route in accordance with Section ~~1109.14.4.1~~ 1110.6.2.

1110.6.2 **~~1109.14.4.1~~ Bowling lanes.** An accessible route shall be provided to at least 5 percent, but no less than one, of each type of bowling lane.

1110.6.3 **~~1109.14.4.2~~ Court sports.** In court sports, at least one accessible route shall directly connect both sides of the court.

1110.6.4 **~~1109.14.4.3~~ Raised boxing or wrestling rings.** Raised boxing or wrestling rings are not required to be accessible or to be on an accessible route.

1110.6.5 **~~1109.14.4.4~~ Raised refereeing, judging and scoring areas.** Raised structures used solely for refereeing, judging or scoring a sport are not required to be accessible or to be on an accessible route.

1110.6.6 Swimming pools, wading pools and spas. Swimming pools, wading pools, and spas shall comply with ICC A117.1.

1110.6.6.1 **~~1109.14.4.5~~ Raised diving boards and diving platforms.** Raised diving boards and diving platforms are not required to be accessible or to be on an accessible route.

1110.6.6.2 Water Slides. Water slides are not be required to be accessible or to be on an accessible route.

1110.6.7 Amusement Rides. Amusement rides shall comply with Section 1110.6.7.1 through 1110.6.7.3.

Exception: Mobile or portable amusement rides shall not be required to be accessible.

1110.6.7.1 Load and Unload Areas. Load and unload areas serving amusement rides shall comply with ICC A117.1.

1110.6.7.2 Minimum Number. Amusement rides shall provide at least one wheelchair space, or at least one amusement ride seat designed for transfer, or at least one transfer device.

Exceptions:

1. Amusement rides that are controlled or operated by the rider shall not be required to comply with this section.

2. Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult, shall not be required to comply with this section.
3. Amusement rides that do not provide amusement ride seats shall not be required to comply with this section.

1110.6.7.3 Amusement Rides. Accessible amusement rides shall be on an accessible routes in accordance with Section 1110.6.7.3.1 and 1110.6.7.3.2.

1110.6.7.3.1 Load and Unload Areas. Load and unload areas shall be on an accessible route. Where load and unload areas have more than one loading or unloading position, at least one loading and unloading position shall be on an accessible route.

1110.6.7.3.2 Wheelchair Spaces, Ride Seats Designed for Transfer, and Transfer Devices. When amusement rides are in the load and unload position, wheelchair spaces, amusement ride seats designed for transfer and transfer devices shall be on an accessible route.

1110.6.8 Recreational Boating Facilities. Boat slips required to be accessible by Section 1110.6.8.1 and 1110.6.8.2 and boarding piers at boat launch ramps required to be accessible by Section 1110.6.8.3 shall be on an accessible route.

1110.6.8.1 Boat Slips. Boat slips complying with ICC A117.1 shall be provided in accordance with Table 1110.6.8.1. Where the number of boat slips is not identified, each 40 feet (12 m) of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for the purpose of this section.

TABLE 1110.6.8.1
BOAT SLIPS

Total Number of Boating Slips Provided in Facility	Minimum Number of Required Accessible Boating Slips
1 to 25	1
26 to 50	2
51 to 100	3
101 to 150	4
151 to 300	5
301 to 400	6
401 to 500	7
501 to 600	8
601 to 700	9
701 to 800	10
801 to 900	11
901 to 1000	12
1001 and over	12, plus 1 for every 100, or fraction thereof, over 1000

1110.6.8.2 Dispersion. Accessible boat slips shall be dispersed throughout the various types of boat slips provided. Where the minimum number of accessible boat slips 1 has been met, no further dispersion shall be required.

1110.6.8.3 Boarding Piers at Boat Launch Ramps. Where boarding piers are provided at boat launch ramps, at least 5 percent, but no fewer than one, of the boarding piers shall comply with ICC A117.1.

1110.6.9 Exercise Machines and Equipment. At least one of each type of exercise machines and equipment shall comply with ICC A117.1 and shall be on an accessible route.

1110.6.10 Fishing Piers and Platforms. Fishing piers and platforms shall comply with ICC A117.1 and be on an accessible route.

1110.6.11 Golf Facilities. Golf facilities shall comply with 1110.6.11.1 through 1110.6.11.3.

1110.6.11.1 Golf Courses. Golf courses shall comply with 1110.6.11.1.1 through 1110.6.11.1.3.

1110.6.11.1.1 Teeing Grounds. Where one teeing ground is provided for a hole, the teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where two teeing grounds are provided for a hole, the forward teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where three or more teeing grounds are provided for a hole, at least two teeing grounds, including the forward teeing ground, shall be designed and constructed so that a golf car can enter and exit each teeing ground.

1110.6.11.1.2 Putting Greens. Putting greens shall be designed and constructed so that a golf car can enter and exit the putting green.

1110.6.11.1.3 Weather Shelters. Where provided, weather shelters shall be designed and constructed so that a golf car can enter and exit the weather shelter and shall comply with ICC A117.1.

1110.6.11.2 Practice Putting Greens, Practice Teeing Grounds, and Teeing Stations at Driving Ranges. At least 5 percent, but no fewer than one, of practice putting greens, practice teeing grounds, and teeing stations at driving ranges shall be designed and constructed so that a golf car can enter and exit the practice putting greens, practice teeing grounds, and teeing stations at driving ranges.

1110.6.11.3 Golf Facilities. At least one accessible route shall connect accessible elements and spaces within the boundary of the golf course. In addition, accessible routes serving golf car rental areas; bag drop areas; course weather shelters; course toilet rooms; and practice putting greens, practice teeing grounds, and teeing stations at driving ranges complying with Section 1110.6.11.2 shall comply with ICC A117.1.

> **Exception:** Golf car passages complying with ICC A117.1 shall be permitted to be used for all or part of accessible routes required by this section.

1110.6.12 Miniature golf facilities. Miniature golf facilities shall comply with 1110.6.12.1 through 1110.6.12.3.

1110.6.12.1 Minimum Number. At least 50 percent of holes on miniature golf courses shall comply with ICC A117.1.

1110.6.12.2 Miniature Golf Course Configuration. Miniature golf courses shall be configured so that the holes complying with ICC A117.1 are consecutive. Miniature golf courses shall provide an accessible route from the last hole complying with ICC A117.1 to the course entrance or exit without requiring travel through any other holes on the course.

> **Exception:** One break in the sequence of consecutive holes shall be permitted provided that the last hole on the miniature golf course is the last hole in the sequence.

1110.6.12.3 Miniature Golf Facilities. Holes required to comply with 1110.6.12.1, including the start of play, shall be on an accessible route.

1110.6.13 Play Areas. Play areas shall comply with ICC A117.1.

1110.6.14 Shooting Facilities with Firing Positions. Where shooting facilities with firing positions are designed and constructed at a site, at least 5 percent, but no fewer than one, of each type of firing position shall comply with ICC A117.1.

1110.6.15 Animal Containment Areas. Animal containment areas that are not for public use are not required to be accessible or to be on an accessible route.

3411.8 (IEBC 310.8) Scoping for alterations. The provisions of Sections 3411.8.1 through ~~3411.8.14~~ 3411.8.16 shall apply to *alterations* to existing buildings and facilities.

3411.8.15 (IEBC 310.8.15) Existing Amusement Rides. Where existing amusement rides are altered, the alteration shall comply with Section 3411.8.15.1 and 3411.8.15.2.

3411.8.15.1 (IEBC 310.8.15.1) Load and Unload Areas. Where load and unload areas serving existing amusement rides are newly designed and constructed, the load and unload areas shall comply with ICC A117.1.

3411.8.15.2 (IEBC 310.8.15.2) Minimum Number. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.6.7.

3411.8.16 (IEBC 310.8) Teeing Grounds. When golf courses are being altered, teeing grounds shall comply with Section 1110.6.11.1.1**.**

> **Exception:** In existing golf courses, the forward teeing ground shall not be required to be one of the teeing grounds on a hole designed and constructed so that a golf car can enter and exit the teeing ground where compliance is not feasible due to terrain.

Reason: ICC A117.1-2009 will include a new Chapter 11 which contains accessibility requirements for recreational facilities including: amusement rides, recreational boating and fishing facilities, exercise machines and equipment, golf and miniature golf facilities, play areas, swimming and wading pools and shooting facilities. The new requirements in ICC A117.1 and in this proposal are drawn directly from the U.S. Access Board's Americans with Disabilities Act (ADA) Accessibility Guidelines for Recreation Facilities originally published in the *Federal Register* on September 3, 2002. These guidelines and the previously issued guidelines for Play Areas (October 2000) were both later incorporated into the Access Board's 2004 ADA and Architectural Barriers Act (ABA) Accessibility Guidelines. Together with new Chapter 11 of the ICC A117.1, the proposal is consistent with the aforementioned Federal guidelines and will afford adults and children with disabilities a reasonable level of access to recreation and play.

Amusement Rides: This proposal addresses access to amusement rides for persons with disabilities, including those who use wheelchairs. Specifications require provision of either a wheelchair space on the ride or a ride seat or device designed for transfer to the ride. Access at loading and unloading areas is also addressed. Specific criteria for wheelchair spaces, ride seats designed for transfer, and transfer devices is included in ICC ANSI A117.1. Certain exceptions are provided in proposed IBC Sections 1110.6.7 for rides that are: set up temporarily, such as at a traveling carnival, designed primarily for children, controlled or operated by the rider, or not equipped with seats.

Boating Facilities: Boating facilities, such as piers and docks provided at marinas to serve recreational vessels, are covered by this proposal which addresses the minimum number of accessible boat slips required to be accessible. This number is based on a table according to the total amount of boat slips provided at a facility. The dynamic interface between land and water presents unique and significant challenges in providing access to floating facilities. Therefore, new Chapter 11 in ICC ANSI A117.1 – 2009 for gangways connecting floating facilities take these constraints into account by modifying requirements for accessible routes and ramps with exceptions to criteria for maximum rise and slope, handrail extensions, and level landings.

Fishing Piers and Platforms: ICC ANSI A117.1 contains new provisions addressing railings and edge protection located on fishing piers and platforms. Railings, guardrails, and handrails are not required by this accessibility standard. However, where they are provided, a portion (at least 25%) cannot be more than 34 inches high so that the railings do not obstruct fishing for people using wheelchairs. An exception permits the use of a guard complying with the International Building Code where required or voluntarily provided. Edge protection at least 2 inches high is also addressed to prevent the wheels of mobility aids from slipping over the edge.

Golf : Access to golf courses is typically achieved through the use of golf cars. An exception to proposed 1110.6.11.3 permits golf car passages in lieu of accessible routes throughout golf courses. To comply, courses must be designed so that golf cars can access teeing grounds and putting greens. Modified accessible routes are required to serve practice putting greens and driving ranges since they often are not located within the boundary of a course. Technical specifications are provided for golf car passages, accessible routes, teeing grounds, putting greens, and weather shelters in ICC ANSI A117.1.

Miniature Golf: At least half of the holes on a miniature golf course must be served by an accessible route. Specifications for accessible routes take into account design conventions for miniature golf courses, such as carpeted surfaces and curbs. All level areas of an accessible hole where a ball may come to rest must be within the reach of golf clubs (36 inches) from accessible routes.

Play Areas: Requirements in ICC A117.1 comprise a subsection of the new chapter on recreation facilities. They cover the number of play components required to be accessible, accessible surfacing in play areas, ramp access and transfer system access to elevated structures, and access to soft contained play structures. The guidelines address play areas typically provided at schools, parks, child care facilities (except those based in the operator's home, which are exempted by ICC ANSI A117.1 Section 1108), and other facilities.

Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities: Provisions for exercise equipment, bowling lanes, and shooting facilities are addressed in this proposal. The accessibility standards do not affect the design of exercise equipment and machines, but instead require one of each type to be on an accessible route and to provide transfer space for persons using wheelchairs. Access is also required to a portion (at least 5%) of bowling lanes and shooting facilities.

Swimming Pools and Wading Pools: Specifications are provided for various means of providing pool access, including pool lifts, sloped entries, transfer walls, transfer systems, and stairs. Access to swimming pools can be achieved by sloped entries or pool lifts. For larger pools (those with 300 or more linear feet of pool wall), a secondary means of access is proposed. Stairs, transfer systems, or transfer walls can be used instead of lifts or sloped entries for this secondary means of access. This is a reasonable provision in light of the fact that nationally recognized safety standards require two means of exit from such larger swimming pools. Specific provisions are also provided for wading pools, wave action pools and other types of pools where user access is limited to one area.

Cost Impact: This code change will increase the cost of construction. However, because these changes are harmonized with the U.S. Access Board's ADA and ABA Accessibility Guidelines, costs associated with compliance cannot be avoided once the U.S. Department of Justice adopts the guidelines as enforceable standards under the Americans with Disabilities Act. The guidelines have already been adopted as enforceable standards under the Architectural Barriers Act applicable to federally funded facilities.

ICCFILENAME:Mazz-E2-1102.1

Public Hearing Results

PART I - IBC MEANS OF EGRESS
Committee Action: **Disapproved**

Committee Reason: The technical provisions in the 2009 edition of ICC A117.1 need to be published before these scoping provisions are included in the IBC. Some of the items in these provisions are outside the scope of the code official's typical purview and should be located in Appendix E (i.e., golf courses, boating piers, amusement rides).

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

AREA OF SPORT ACTIVITY. That portion of a room or space where the play or practice of a sport occurs.

1104.2 Within a site. At least one accessible route shall connect accessible buildings, accessible facilities, accessible elements and accessible spaces that are on the same site.

Exceptions:

1. An accessible route is not required between accessible buildings, accessible facilities, accessible elements and accessible spaces that have, as the only means of access between them, a vehicular way not providing for pedestrian access.
2. An accessible route to recreational facilities is not required when exempted under Sections 1110.4 or 1110.6

1104.3 Connected spaces. When a building or portion of a building is required to be accessible, an accessible route shall be provided to each portion of the building, to accessible building entrances connecting accessible pedestrian walkways and the public way.

Exceptions:

1. In assembly areas with fixed seating, an accessible route shall not be required to serve levels where wheelchair spaces are not provided.
2. In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.
3. An accessible route to recreational facilities is not required when exempted under Sections 1110.4 or 1110.6

SECTION 1110
RECREATIONAL FACILITIES

1110.1 ~~1109.14~~ Recreational and sports facilities. Recreational and sports facilities shall be provided with accessible features in accordance with Sections 1110.2 ~~1109.14.1~~ through 1110.6 ~~1109.14.4~~.

1110.2 ~~1109.14.1~~ Facilities serving Type B units in a single building. In Group R-2 and R-3 occupancies where recreational facilities are provided serving a single building containing ~~Type A units or~~ Type B units, 25 percent, but not less than one, of each type of recreational facility shall be accessible. Every recreational facility of each type on a site shall be considered to determine the total number of each type that is required to be accessible.

1110.3 ~~1109.14.2~~ Facilities serving Type B units in multiple buildings. In Group R-2 and R-3 occupancies on a single site where multiple buildings containing ~~Type A units or~~ Type B units are served by recreational facilities, 25 percent, but not less than one, of each type of recreational facility serving each building shall be accessible. The total number of each type of recreational facility that is required to be accessible shall be determined by considering every recreational facility of each type serving each building on the site.

1110.4 Facilities serving Accessible and Type A units. In Group R-2 and R-3 occupancies where recreational facilities are provided serving Accessible or Type A units, every recreational facility of each type serving Accessible or Type A units shall be accessible.

1110.5 ~~1109.14.3~~ Other occupancies. All recreational facilities not falling within the purview of Section 1110.2 through 1110.4 ~~1109.14.1 or 1109.14.2~~ shall comply with ICC A117.1 and be located on an accessible route ~~be accessible~~. Each area of sports activity shall be served by an accessible route. Accessible routes also shall comply with Section 1110.5.1 through 1110.5.3.

Exception: Areas of sport activity shall not be required to comply with ICC A117.1.

1110.5.1 Protruding objects. Protruding objects shall comply with the requirements of Sections 1003.3.

1110.5.2 Floor surface. Walking surfaces of the accessible route shall comply with ICC ANSI A117.1.

Exception: Within animal containment areas, floor and ground surfaces shall not be required to be stable, firm, and slip resistant.

1110.5.3 Changes in Level. Where changes in level are permitted in floor or ground surfaces, they shall comply with ICC A117.1 for changes in level.

Exception: Animal containment areas shall not be required to comply with ICC A117.1.

1110.6 ~~**1109.14.4**~~ **Recreational and sports facilities exceptions.** Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

1110.6.1 ~~**1108.2.2.4**~~ **Team or player seating.** At least one wheelchair space shall be provided in team or player seating areas serving areas of sport activity.

> **Exception:** Wheelchair spaces shall not be required in team or player seating areas serving bowling lanes that are not required to be located on an accessible route in accordance with Section ~~1109.14.4.1~~ 1110.6.2.

1110.6.2 ~~**1109.14.4.1**~~ **Bowling lanes.** An accessible route shall be provided to at least 5 percent, but no less than one, of each type of bowling lane.

1110.6.3 ~~**1109.14.4.2**~~ **Court sports.** In court sports, at least one accessible route shall directly connect both sides of the court.

1110.6.4 ~~**1109.14.4.3**~~ **Raised boxing or wrestling rings.** Raised boxing or wrestling rings are not required to be accessible or to be on an accessible route.

1110.6.5 ~~**1109.14.4.4**~~ **Raised refereeing, judging and scoring areas.** Raised structures used solely for refereeing, judging or scoring a sport are not required to be accessible or to be on an accessible route.

1110.6.6 ~~**1109.14.4.5**~~ **Raised diving boards and diving platforms.** Raised diving boards and diving platforms are not required to be accessible or to be on an accessible route.

1110.6.7 Animal Containment Areas. Animal containment areas that are not for public use are not required to be accessible or to be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. The intent of this public comment is to move existing recreational facilities to a separate section, Section 1110, *Recreational Facilities* instead of being a part of Section 1109, *Other Features and Facilities*. This proposal will relocate current Section 1109.14 to a new Section 1110 and will harmonize exceptions with those found in the U.S. Access Board's *ADA and ABA Accessibility Guidelines*. This public comment is not dependent on the new technical provisions for recreational facilities found in the 2010 edition of ICC A117.1.

Public Comment 2:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

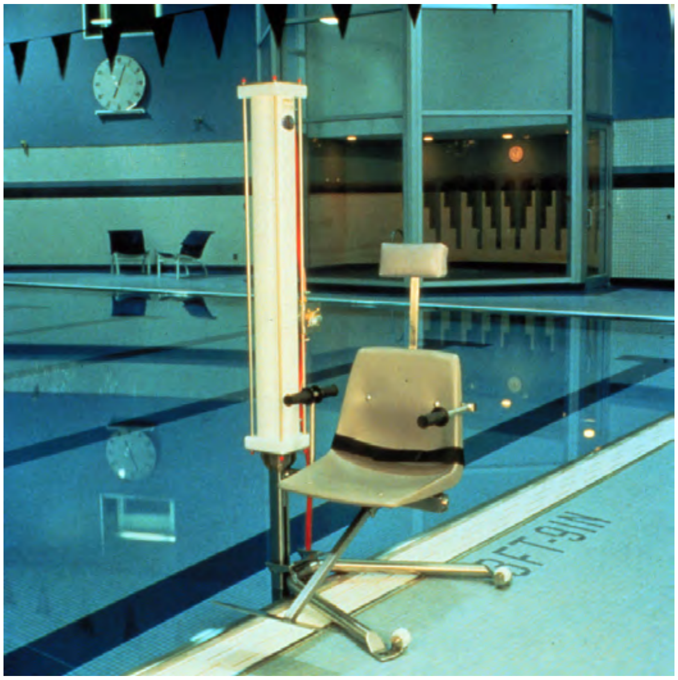
SECTION 1110
RECREATIONAL FACILITIES

1110.6.6 Swimming pools, wading pools and spas. Swimming pools, wading pools, and spas shall comply with ICC A117.1.

1110.6.6.1 ~~**1109.14.4.5**~~ **Raised diving boards and diving platforms.** Raised diving boards and diving platforms are not required to be accessible or to be on an accessible route.

1110.6.6.2 Water Slides. Water slides are not be required to be accessible or to be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This proposal contains scoping provisions for swimming pools that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*. The ICC standards commonly reference the IBC Chapter 11 for accessibility requirements. It is important to have provisions for the accessibility for pools in IBC as the ICC develops their new safety standards for pool construction.



Public Comment 3:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

1. Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

<u>**PLAY AREA.** A portion of a site containing play components designed and constructed for children.</u>

2. Revise as follows:

<u>**SECTION 1110**</u>
<u>**RECREATIONAL FACILITIES**</u>

<u>**1110.6.13 Play Areas.** Play areas shall comply with ICC A117.1.</u>

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This proposal contains scoping provisions for play areas that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*. In disapproving this proposal, the committee questioned whether playgrounds are subject to the building code. Section 402.12 addresses "structures intended as children's playgrounds" and Section 105.2 exempts "swings and other playground equipment accessory to detached one- and two-family dwellings" from permits. To the extent that children's play facilities are covered by the IBC, they should be accessible to children with disabilities. These scoping requirements are reasonable and are the result of recommendations from a regulatory negotiation committee the Access Board established for this purpose that included ASTM Public Playground, Soft Contained Play, and Playground Surfacing Systems Committees manufacturers of play equipment, landscape architects, government associations, elementary school associations, and organizations representing people with disabilities. Since the Access Board's guidelines were published in late 2000, manufacturers offer play equipment complying with these scoping and technical criteria.

Public Comment 4:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

1. Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

AMUSEMENT RIDE. A system that moves persons through a fixed course within a defined area for the purpose of amusement.

AMUSEMENT RIDE SEAT. A seat that is built-in or mechanically fastened to an amusement ride intended to be occupied by one or more passengers.

TRANSFER DEVICE. Equipment designed to facilitate the transfer of a person from a wheelchair or other mobility device to and from an amusement ride seat.

2. Revise as follows:

SECTION 1110
RECREATIONAL FACILITIES

1110.6 ~~1109.14.4~~ Recreational and sports facilities exceptions. Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

1110.6.7 Amusement Rides. Amusement rides shall comply with Section 1110.6.7.1 through 1110.6.7.3.

Exception: Mobile or portable amusement rides shall not be required to be accessible.

1110.6.7.1 Load and Unload Areas. Load and unload areas serving amusement rides shall comply with ICC A117.1.

1110.6.7.2 Minimum Number. Amusement rides shall provide at least one wheelchair space, or at least one amusement ride seat designed for transfer, or at least one transfer device.

Exceptions:

1. Amusement rides that are controlled or operated by the rider shall not be required to comply with this section.
2. Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult, shall not be required to comply with this section.
3. Amusement rides that do not provide amusement ride seats shall not be required to comply with this section.

1110.6.7.3 Amusement Rides. Accessible amusement rides shall be on an accessible routes in accordance with Section 1110.6.7.3.1 and 1110.6.7.3.2.

1110.6.7.3.1 Load and Unload Areas. Load and unload areas shall be on an accessible route. Where load and unload areas have more than one loading or unloading position, at least one loading and unloading position shall be on an accessible route.

1110.6.7.3.2 Wheelchair Spaces, Ride Seats Designed for Transfer, and Transfer Devices. When amusement rides are in the load and unload position, wheelchair spaces, amusement ride seats designed for transfer and transfer devices shall be on an accessible route.

3411.8 (IEBC 310.8) Scoping for alterations. The provisions of Sections 3411.8.1 through ~~3411.8.14~~ 3411.8.15 shall apply to *alterations* to existing buildings and facilities.

3411.8.15 (IEBC 310.8.15) Existing Amusement Rides. Where existing amusement rides are altered, the alteration shall comply with Section 3411.8.15.1 and 3411.8.15.2.

3411.8.15.1 (IEBC 310.8.15.1) Load and Unload Areas. Where load and unload areas serving existing amusement rides are newly designed and constructed, the load and unload areas shall comply with ICC A117.1.

3411.8.15.2 (IEBC 310.8.15.2) Minimum Number. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.6.7.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This public comment contains scoping provisions for amusement rides that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*. To the extent that amusement rides are subject to the code, they should be accessible and usable by individuals with disabilities. These scoping provisions are flexible permitting latitude in terms of the method of access e.g. transfer seat, roll-on seat or transfer device to lift the rider. Mobile and portable rides are exempted in Section 1106.7. Rides without seats, those designed for children who are assisted onto the ride and those rides controlled by the user are also exempt.

Staff Note: E152-09/10, Part 2, Public Comment #1 was submitted with as part of this public comment. Information in E152-09/10, Part 2 is consistent with the provisions for IBC Chapter 34 and IEBC Chapter 3 proposed in this public comments. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Public Comment 5:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

BOARDING PIER. A portion of a pier where a boat is temporarily secured for the purpose of embarking or disembarking.

BOAT LAUNCH RAMP. A sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.

BOAT SLIP. That portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.

GANGWAY. A variable-sloped pedestrian walkway that links a fixed structure or land with a floating structure. Gangways which connect to vessels are not included.

2. Revise as follows:

1109.7 Lifts. Platform (wheelchair) lifts are permitted to be a part of a required accessible route in new construction where indicated in Items 1 through ~~10~~ 11. Platform (wheelchair) lifts shall be installed in accordance with ASME A18.1.

1. An accessible route to a performing area and speaker platforms in Group A occupancies.
2. An accessible route to wheelchair spaces required to comply with the wheelchair space dispersion requirements of Sections 1108.2.2 through 1108.2.6.
3. An accessible route to spaces that are not open to the general public with an occupant load of not more than five.
4. An accessible route within a dwelling or sleeping unit.
5. An accessible route to wheelchair seating spaces located in outdoor dining terraces in Group A-5 occupancies where the means of egress from the dining terraces to a public way are open to the outdoors.
6. An accessible route to jury boxes and witness stands; raised courtroom stations including judges' benches, clerks' stations, bailiffs' stations, deputy clerks' stations and court reporters' stations; and to depressed areas such as the well of the court.
7. An accessible route to load and unload areas serving amusement rides.
8. An accessible route to play components or soft contained play structures.
9. An accessible route to team or player seating areas serving areas of sport activity.
10. An accessible route where existing exterior site constraints make use of a ramp or elevator infeasible.
11. To substitute for gangways that are required to be accessible routes serving recreational boating facilities and fishing piers and platforms.

SECTION 1110
RECREATIONAL FACILITIES

1110.6 ~~**1109.14.4**~~ **Recreational and sports facilities exceptions.** Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

1110.6.8 Recreational Boating Facilities. Boat slips required to be accessible by Section 1110.6.8.1 and 1110.6.8.2 and boarding piers at boat launch ramps required to be accessible by Section 1110.6.8.3 shall be on an accessible route.

1110.6.8.1 Boat Slips. Boat slips complying with ICC A117.1 shall be provided in accordance with Table 1110.6.8.1. Where the number of boat slips is not identified, each 40 feet (12 m) of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for the purpose of this section.

TABLE 1110.6.8.1
BOAT SLIPS

Total Number of Boating Slips Provided in Facility	Minimum Number of Required Accessible Boating Slips
1 to 25	1
26 to 50	2
51 to 100	3
101 to 150	4
151 to 300	5
301 to 400	6
401 to 500	7
501 to 600	8
601 to 700	9
701 to 800	10
801 to 900	11
901 to 1000	12
1001 and over	12, plus 1 for every 100, or fraction thereof, over 1000

1110.6.8.2 Dispersion. Accessible boat slips shall be dispersed throughout the various types of boat slips provided. Where the minimum number of accessible boat slips 1 has been met, no further dispersion shall be required.

1110.6.8.3 Boarding Piers at Boat Launch Ramps. Where boarding piers are provided at boat launch ramps, at least 5 percent, but no fewer than one, of the boarding piers shall comply with ICC A117.1.

1110.6.9 Fishing Piers and Platforms. Fishing piers and platforms shall comply with ICC A117.1 and be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This public comment contains scoping provisions for boating and fishing piers that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*. It is common for boating and fishing piers to be constructed as part of waterfront development that is subject to the building code. Where such development is not subject to a permit, the provisions will not apply. However, it is reasonable for individuals with disabilities to be provided access where code requirements are applicable. If a guard is provided or required, it is not required to be lowered for fishermen with disabilities.

Public Comment 6:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

1. Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

GOLF CAR PASSAGE. A continuous passage on which a motorized golf car can operate.

TEEING GROUND. In golf, the starting place for the hole to be played.

2. Revise as follows:

SECTION 1110
RECREATIONAL FACILITIES

1110.6 ~~1109.14.4~~ **Recreational and sports facilities exceptions.** Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

1110.6.11 Golf Facilities. Golf facilities shall comply with 1110.6.11.1 through 1110.6.11.3.

1110.6.11.1 Golf Courses. Golf courses shall comply with 1110.6.11.1.1 through 1110.6.11.1.3.

1110.6.11.1.1 Teeing Grounds. Where one teeing ground is provided for a hole, the teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where two teeing grounds are provided for a hole, the forward teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where three or more teeing grounds are provided for a hole, at least two teeing grounds, including the forward teeing ground, shall be designed and constructed so that a golf car can enter and exit each teeing ground.

1110.6.11.1.2 Putting Greens. Putting greens shall be designed and constructed so that a golf car can enter and exit the putting green.

1110.6.11.1.3 Weather Shelters. Where provided, weather shelters shall be designed and constructed so that a golf car can enter and exit the weather shelter and shall comply with ICC A117.1.

1110.6.11.2 Practice Putting Greens, Practice Teeing Grounds, and Teeing Stations at Driving Ranges. At least 5 percent, but no fewer than one, of practice putting greens, practice teeing grounds, and teeing stations at driving ranges shall be designed and constructed so that a golf car can enter and exit the practice putting greens, practice teeing grounds, and teeing stations at driving ranges.

1110.6.11.3 Golf Facilities. At least one accessible route shall connect accessible elements and spaces within the boundary of the golf course. In addition, accessible routes serving golf car rental areas; bag drop areas; course weather shelters; course toilet rooms; and practice putting greens, practice teeing grounds, and teeing stations at driving ranges complying with Section 1110.6.11.2 shall comply with ICC A117.1.

> **Exception:** Golf car passages complying with ICC A117.1 shall be permitted to be used for all or part of accessible routes required by this section.

3411.8 (IEBC 310.8) Scoping for alterations. The provisions of Sections 3411.8.1 through ~~3411.8.14~~ 3411.8.16 shall apply to *alterations* to existing buildings and facilities.

3411.8.16 (IEBC 310.8) Teeing Grounds. When golf courses are being altered, teeing grounds shall comply with Section 1110.6.11.1.1**.**

> **Exception:** In existing golf courses, the forward teeing ground shall not be required to be one of the teeing grounds on a hole designed and constructed so that a golf car can enter and exit the teeing ground where compliance is not feasible due to terrain.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This proposal contains scoping provisions for golf facilities that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*. Where a golf course is subject to the building code, this will ensure that people with disabilities are not excluded from the recreational and business opportunities on the course. Please note that a passage sufficiently wide for a golf car substitutes for an accessible route. Today, golfers with disabilities use accessible golf cars, also known as single-rider carts, that are designed to have little impact on the greens and are operated with one-handed controls. Golfers sit in the swivel seats and position to hit the ball from a seated position.

Staff Note: E152-09/10, Part 2, Public Comment #2 was submitted as part of this public comment. Information in E152-09/10, Part 2 is consistent with the provisions for IBC Chapter 34 and IEBC Chapter 3 proposed in this public comments. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Public Comment 7:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

SECTION 1110
RECREATIONAL FACILITIES

1110.6.12 Miniature golf facilities. Miniature golf facilities shall comply with 1110.6.12.1 through 1110.6.12.3.

1110.6.12.1 Minimum Number. At least 50 percent of holes on miniature golf courses shall comply with ICC A117.1.

1110.6.12.2 Miniature Golf Course Configuration. Miniature golf courses shall be configured so that the holes complying with ICC A117.1 are consecutive. Miniature golf courses shall provide an accessible route from the last hole complying with ICC A117.1 to the course entrance or exit without requiring travel through any other holes on the course.

> **Exception:** One break in the sequence of consecutive holes shall be permitted provided that the last hole on the miniature golf course is the last hole in the sequence.

1110.6.12.3 Miniature Golf Facilities. Holes required to comply with 1110.6.12.1, including the start of play, shall be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This proposal contains scoping provisions for miniature golf facilities that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*. Today, miniature golf facilities are likely to be structures comprised of components and materials that are subject to the IBC. To the extent that such facilities are subject to the IBC, they should be accessible to individuals with disabilities.

Public Comment 8:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

SECTION 1110
RECREATIONAL FACILITIES

1110.6.9 Exercise Machines and Equipment. At least one of each type of exercise machines and equipment shall comply with ICC A117.1 and shall be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This proposal contains scoping provisions for exercise machines and equipment that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*. The technical criteria do not require the equipment and machines to be accessible; they merely require clearances around the machines so that individuals with disabilities can use them.

CURT BEAMER

CURT BEAMER

Public Comment 9:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

SECTION 1110
RECREATIONAL FACILITIES

1110.6.14 Shooting Facilities with Firing Positions. Where shooting facilities with firing positions are designed and constructed at a site, at least 5 percent, but no fewer than one, of each type of firing position shall comply with ICC A117.1.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This proposal contains scoping provisions for shooting facilities with firing positions that will harmonize the building code with the Access Board's *ADA and ABA Accessibility Guidelines*.

PARALYZED VETERANS OF AMERICA

Public Comment 10:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

E102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

AMUSEMENT RIDE. A system that moves persons through a fixed course within a defined area for the purpose of amusement.

AMUSEMENT RIDE SEAT. A seat that is built-in or mechanically fastened to an amusement ride intended to be occupied by one or more passengers.

TRANSFER DEVICE. Equipment designed to facilitate the transfer of a person from a wheelchair or other mobility device to and from an amusement ride seat.

2. Revise as follows:

SECTION E111
RECREATIONAL FACILITIES

E111.1 Recreational and sports facilities exceptions. Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

E111.2 Amusement Rides. Amusement rides shall comply with Section E111.2.1 through E111.2.3.

Exception: Mobile or portable amusement rides shall not be required to be accessible.

E111.2.1 Load and Unload Areas. Load and unload areas serving amusement rides shall comply with ICC A117.1.

E111.2.2 Minimum Number. Amusement rides shall provide at least one wheelchair space, or at least one amusement ride seat designed for transfer, or at least one transfer device.

Exceptions:

1. Amusement rides that are controlled or operated by the rider shall not be required to comply with this section.
2. Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult, shall not be required to comply with this section.
3. Amusement rides that do not provide amusement ride seats shall not be required to comply with this section.

E111.2.3 Amusement Rides. Accessible amusement rides shall be on an accessible routes in accordance with Section E111.2.3.1 and E111.2.3.2.

E111.2.3.1 Load and Unload Areas. Load and unload areas shall be on an accessible route. Where load and unload areas have more than one loading or unloading position, at least one loading and unloading position shall be on an accessible route.

E111.2.3.2 Wheelchair Spaces, Ride Seats Designed for Transfer, and Transfer Devices. When amusement rides are in the load and unload position, wheelchair spaces, amusement ride seats designed for transfer and transfer devices shall be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This portion deals with Amusement Rides. If the committee does not wish to have the text in the body of the code, this public comments places amusement rides in *Appendix E, Supplementary Accessibility Requirements*. The appendix can be adopted by states that wish to match the *2004 ADA/ABA Accessibility Guidelines*.

Staff Note: E152-09/10, Part 2, Public Comment #3 was submitted as part of this public comment. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Public Comment 11:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

E102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

BOARDING PIER. A portion of a pier where a boat is temporarily secured for the purpose of embarking or disembarking.

BOAT LAUNCH RAMP. A sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.

BOAT SLIP. That portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.

GANGWAY. A variable-sloped pedestrian walkway that links a fixed structure or land with a floating structure. Gangways which connect to vessels are not included.

2. Add as follows:

E104.2 Lifts. Platform lifts shall be permitted to be used instead of gangways that are part of accessible routes serving recreational boating facilities and fishing piers and platforms. Platform (wheelchair) lifts shall be installed in accordance with ASME A18.1.

SECTION E111
RECREATIONAL FACILITIES

E111.1 Recreational and sports facilities exceptions. Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

E111.2 Recreational Boating Facilities. Boat slips required to be accessible by Section E111.2.1 and E111.2.2 and boarding piers at boat launch ramps required to be accessible by Section E111.2.3 shall be on an accessible route.

E111.2.1 Boat Slips. Boat slips complying with ICC A117.1 shall be provided in accordance with Table E111.2.1. Where the number of boat slips is not identified, each 40 feet (12 m) of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for the purpose of this section.

TABLE E111.2.1
BOAT SLIPS

Total Number of Boating Slips Provided in Facility	Minimum Number of Required Accessible Boating Slips
1 to 25	1
26 to 50	2
51 to 100	3
101 to 150	4
151 to 300	5
301 to 400	6
401 to 500	7
501 to 600	8
601 to 700	9
701 to 800	10
801 to 900	11
901 to 1000	12
1001 and over	12, plus 1 for every 100, or fraction thereof, over 1000

E111.2.2 Dispersion. Accessible boat slips shall be dispersed throughout the various types of boat slips provided. Where the minimum number of accessible boat slips 1 has been met, no further dispersion shall be required.

E111.2.3 Boarding Piers at Boat Launch Ramps. Where boarding piers are provided at boat launch ramps, at least 5 percent, but no fewer than one, of the boarding piers shall comply with ICC A117.1.

E111.2.4 Fishing Piers and Platforms. Fishing piers and platforms shall comply with ICC A117.1 and be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This portion deals with boat and fishing pier facilities. If the members do not wish to have the text in the body of the code, this public comments places boat and fishing pier facilities in *Appendix E, Supplementary Accessibility Requirements*. The appendix can be adopted by states that wish to match the *2004 ADA/ABA Accessibility Guidelines*.

Public Comment 12:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

1. Add new definitions as follows:

E102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

GOLF CAR PASSAGE. A continuous passage on which a motorized golf car can operate.

TEEING GROUND. In golf, the starting place for the hole to be played.

2. Revise as follows:

SECTION E111
RECREATIONAL FACILITIES

E111.1 Recreational and sports facilities exceptions. Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

E111.2 Golf Facilities. Golf facilities shall comply with E111.2.1 through E111.2.3.

E111.2.1 Golf Courses. Golf courses shall comply with E111.2.1.1 through E111.2.1.3.

E111.2.1.1 Teeing Grounds. Where one teeing ground is provided for a hole, the teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where two teeing grounds are provided for a hole, the forward teeing ground shall be designed and constructed so that a golf car can enter and exit the teeing ground. Where three or more teeing grounds are provided for a hole, at least two teeing grounds, including the forward teeing ground, shall be designed and constructed so that a golf car can enter and exit each teeing ground.

E111.2.1.2 Putting Greens. Putting greens shall be designed and constructed so that a golf car can enter and exit the putting green.

E111.2.1.3 Weather Shelters. Where provided, weather shelters shall be designed and constructed so that a golf car can enter and exit the weather shelter and shall comply with ICC A117.1.

E111.2.2 Practice Putting Greens, Practice Teeing Grounds, and Teeing Stations at Driving Ranges. At least 5 percent, but no fewer than one, of practice putting greens, practice teeing grounds, and teeing stations at driving ranges shall be designed and constructed so that a golf car can enter and exit the practice putting greens, practice teeing grounds, and teeing stations at driving ranges.

E111.2.3 Golf Facilities. At least one accessible route shall connect accessible elements and spaces within the boundary of the golf course. In addition, accessible routes serving golf car rental areas; bag drop areas; course weather shelters; course toilet rooms; and practice putting greens, practice teeing grounds, and teeing stations at driving ranges complying with Section E111.2.2 shall comply with ICC A117.1.

> **Exception:** Golf car passages complying with ICC A117.1 shall be permitted to be used for all or part of accessible routes required by this section.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This portion deals with constructed portion of golf facilities. If the members do not wish to have the text in the body of the code, this public comments places golf facilities in *Appendix E, Supplementary Accessibility Requirements*. The appendix can be adopted by states that wish to match the *2004 ADA/ABA Accessibility Guidelines*.

Staff Note: E152-09/10, Part 2, Public Comment #4 was submitted as part of this public comment. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Public Comment 13:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

SECTION E111
RECREATIONAL FACILITIES

E111.1 Recreational and sports facilities exceptions. Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

E111.2 Miniature golf facilities. Miniature golf facilities shall comply with E111.2.1 through E111.2.3.

E111.2.1 Minimum Number. At least 50 percent of holes on miniature golf courses shall comply with ICC A117.1.

E111.2.2 Miniature Golf Course Configuration. Miniature golf courses shall be configured so that the holes complying with ICC A117.1 are consecutive. Miniature golf courses shall provide an accessible route from the last hole complying with ICC A117.1 to the course entrance or exit without requiring travel through any other holes on the course.

> **Exception:** One break in the sequence of consecutive holes shall be permitted provided that the last hole on the miniature golf course is the last hole in the sequence.

E111.2.3 Miniature Golf Facilities. Holes required to comply with E111.2.1, including the start of play, shall be on an accessible route.

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This portion deals with constructed portion of miniature golf facilities. If the members do not wish to have the text in the body of the code, this public comments places miniature golf facilities in *Appendix E, Supplementary Accessibility Requirements*. The appendix can be adopted by states that wish to match the *2004 ADA/ABA Accessibility Guidelines*.

Public Comment 14:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

<u>SECTION E111</u>
<u>RECREATIONAL FACILITIES</u>

<u>**E111.1 Recreational and sports facilities exceptions.** Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.</u>

<u>**E111.2 Exercise Machines and Equipment.** At least one of each type of exercise machines and equipment shall comply with ICC A117.1 and shall be on an accessible route.</u>

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This portion deals with routes to exercise machines and equipment. If the members do not wish to have the text in the body of the code, this public comments places exercise machines and equipment in *Appendix E, Supplementary Accessibility Requirements*. The appendix can be adopted by states that wish to match the *2004 ADA/ABA Accessibility Guidelines*.

Public Comment 15:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved as Modified by this public comment.

Replace the proposal with the following:

<u>SECTION E111</u>
<u>RECREATIONAL FACILITIES</u>

<u>**E111.1 Recreational and sports facilities exceptions.** Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.</u>

<u>**E111.2 Shooting Facilities with Firing Positions.** Where shooting facilities with firing positions are designed and constructed at a site, at least 5 percent, but no fewer than one, of each type of firing position shall comply with ICC A117.1.</u>

Commenter's Reason: This code change has been divided into parts so that the membership can look at each type of recreational facilities on it's own merit. This portion deals with shooting facilities. If the members do not wish to have the text in the body of the code, this public comments places shooting facilities in *Appendix E, Supplementary Accessibility Requirements*. The appendix can be adopted by states that wish to match the *2004 ADA/ABA Accessibility Guidelines*.

Public Comment 16:

Lawrence Brown, representing National Association of Home Builders (NAHB) requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

1110.3 Facilities serving Type B units in multiple buildings. In Group R-2 and R-3 occupancies on a single site where multiple buildings containing <u>primarily</u> Type B units are served by recreational facilities, 25 percent, but not less than one, of each type of recreational facility serving each building shall be accessible. The total number of each type of recreational facility that is required to be accessible shall be determined by considering every recreational facility of each type serving each building on the site.

1110.4 Facilities serving Accessible and Type A units. In Group R-2 and R-3 occupancies where <u>buildings containing</u> <u>primarily</u> ~~recreational facilities are provided serving~~ Accessible or Type A units <u>are served by recreational facilities</u>, every recreational facility of each type serving Accessible or Type A units shall be accessible.

Commenter's Reason: This modification correlates the terminology for the application of recreational facilities for the different types of units required to be accessible. It also levels the playing field for when federally mandated Fair Housing units are provided. The original proposed scoping for recreational facilities far exceeds the requirements already contained in IBC Section 1109.14 and the requirements of the Federal Fair Housing Act (both shown below). The proposed change seems to be intended to nullify the 25 percent rule for Type B units (Fair Housing Units) as these multifamily buildings will also be required to contain Accessible and Type A units in addition to the Type B units. In other words, one could never use the 25 percent rule – it would be nullified by proposed Section 1110.4. In addition, there is no Federal mandate under the Americans with Disabilities Act (ADA) to provide any type of accessible housing to the public. This seems to be an attempt by the federal government to mandate accessibility requirements without going through the federal rule making process. If it is intended that the Access Board will be adding this type of provision to the requirements of the Americans with Disabilities Act, then this type of requirements should not be included in the I-Codes until such time as they are enacted into Federal law.

<u>FAIR HOUSING ACT DESIGN MANUAL – Chapter 1</u>

Accessible Site Facilities on Accessible Routes
Where multiple recreational facilities of the same type are provided at the same location on the site (e.g., tennis courts), not all but a "sufficient" number of the facilities must be accessible to ensure an equitable opportunity for use by people with disabilities. Whenever only one of a type of recreational facility is provided at a particular location on the site, it must be accessible and connected by an accessible route to the covered dwelling units.

2009 IBC
1109.14 Recreational and sports facilities. Recreational and sports facilities shall be provided with *accessible* features in accordance with Sections 1109.14.1 through 1109.14.4.

1109.14.1 Facilities serving a single building. In Group R-2 and R-3 occupancies where recreational facilities are provided serving a single building containing *Type A units* or *Type B units*, 25 percent, but not less than one, of each type of recreational facility shall be *accessible*. Every recreational facility of each type on a site shall be considered to determine the total number of each type that is required to be *accessible*.

1109.14.2 Facilities serving multiple buildings. In Group R-2 and R-3 occupancies on a single *site* where multiple buildings containing *Type A units* or *Type B units* are served by recreational facilities, 25 percent, but not less than one, of each type of recreational facility serving each building shall be *accessible*. The total number of each type of recreational facility that is required to be *accessible* shall be determined by considering every recreational facility of each type serving each building on the site.

Final Action: AS AM AMPC____ D

E152-09/10, Part II
IEBC 605.1, 605.1.15 (New), 605.1.16 (New)

Proposed Change as Submitted

Proponent: Marsha K. Mazz, U.S. Architectural and Transportation Barriers Compliance Board (Access Board)

PART II – IEBC

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through ~~605.1.14~~ 605.2.16, Chapter 11 of the *International Building Code* and ICC A117.1 unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent that is technically feasible.

A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities.
4. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the *International Building Code* and ICC A117.1.

605.1.15 Existing Amusement Rides. Where existing amusement rides are altered, the alteration shall comply with Section 605.1.15.1 and 605.1.15.2.

605.1.15.1 Load and Unload Areas. Where load and unload areas serving existing amusement rides are newly designed and constructed, the load and unload areas shall comply with ICC A117.1.

605.1.15.2 Minimum Number. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.6.7.

605.1.16 Teeing Grounds. When golf courses are being altered, teeing grounds shall comply with Section 1110.6.11.1.1.

Exception: <u>In existing golf courses, the forward teeing ground shall not be required to be one of the teeing grounds on a hole designed and constructed so that a golf car can enter and exit the teeing ground where compliance is not feasible due to terrain.</u>

Reason: ICC A117.1-2009 will include a new Chapter 11 which contains accessibility requirements for recreational facilities including: amusement rides, recreational boating and fishing facilities, exercise machines and equipment, golf and miniature golf facilities, play areas, swimming and wading pools and shooting facilities. The new requirements in ICC A117.1 and in this proposal are drawn directly from the U.S. Access Board's Americans with Disabilities Act (ADA) Accessibility Guidelines for Recreation Facilities originally published in the *Federal Register* on September 3, 2002. These guidelines and the previously issued guidelines for Play Areas (October 2000) were both later incorporated into the Access Board's 2004 ADA and Architectural Barriers Act (ABA) Accessibility Guidelines. Together with new Chapter 11 of the ICC A117.1, the proposal is consistent with the aforementioned Federal guidelines and will afford adults and children with disabilities a reasonable level of access to recreation and play.

Amusement Rides: This proposal addresses access to amusement rides for persons with disabilities, including those who use wheelchairs. Specifications require provision of either a wheelchair space on the ride or a ride seat or device designed for transfer to the ride. Access at loading and unloading areas is also addressed. Specific criteria for wheelchair spaces, ride seats designed for transfer, and transfer devices is included in ICC ANSI A117.1. Certain exceptions are provided in proposed IBC Sections 1110.6.7 for rides that are: set up temporarily, such as at a traveling carnival, designed primarily for children, controlled or operated by the rider, or not equipped with seats.

Boating Facilities: Boating facilities, such as piers and docks provided at marinas to serve recreational vessels, are covered by this proposal which addresses the minimum number of accessible boat slips required to be accessible. This number is based on a table according to the total amount of boat slips provided at a facility. The dynamic interface between land and water presents unique and significant challenges in providing access to floating facilities. Therefore, new Chapter 11 in ICC ANSI A117.1 – 2009 for gangways connecting floating facilities take these constraints into account by modifying requirements for accessible routes and ramps with exceptions to criteria for maximum rise and slope, handrail extensions, and level landings.

Fishing Piers and Platforms: ICC ANSI A117.1 contains new provisions addressing railings and edge protection located on fishing piers and platforms. Railings, guardrails, and handrails are not required by this accessibility standard. However, where they are provided, a portion (at least 25%) cannot be more than 34 inches high so that the railings do not obstruct fishing for people using wheelchairs. An exception permits the use of a guard complying with the International Building Code where required or voluntarily provided. Edge protection at least 2 inches high is also addressed to prevent the wheels of mobility aids from slipping over the edge.

Golf : Access to golf courses is typically achieved through the use of golf cars. An exception to proposed 1110.6.11.3 permits golf car passages in lieu of accessible routes throughout golf courses. To comply, courses must be designed so that golf cars can access teeing grounds and putting greens. Modified accessible routes are required to serve practice putting greens and driving ranges since they often are not located within the boundary of a course. Technical specifications are provided for golf car passages, accessible routes, teeing grounds, putting greens, and weather shelters in ICC ANSI A117.1.

Miniature Golf: At least half of the holes on a miniature golf course must be served by an accessible route. Specifications for accessible routes take into account design conventions for miniature golf courses, such as carpeted surfaces and curbs. All level areas of an accessible hole where a ball may come to rest must be within the reach of golf clubs (36 inches) from accessible routes.

Play Areas: Requirements in ICC A117.1 comprise a subsection of the new chapter on recreation facilities. They cover the number of play components required to be accessible, accessible surfacing in play areas, ramp access and transfer system access to elevated structures, and access to soft contained play structures. The guidelines address play areas typically provided at schools, parks, child care facilities (except those based in the operator's home, which are exempted by ICC ANSI A117.1 Section 1108), and other facilities.

Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities: Provisions for exercise equipment, bowling lanes, and shooting facilities are addressed in this proposal. The accessibility standards do not affect the design of exercise equipment and machines, but instead require one of each type to be on an accessible route and to provide transfer space for persons using wheelchairs. Access is also required to a portion (at least 5%) of bowling lanes and shooting facilities.

Swimming Pools and Wading Pools: Specifications are provided for various means of providing pool access, including pool lifts, sloped entries, transfer walls, transfer systems, and stairs. Access to swimming pools can be achieved by sloped entries or pool lifts. For larger pools (those with 300 or more linear feet of pool wall), a secondary means of access is proposed. Stairs, transfer systems, or transfer walls can be used instead of lifts or sloped entries for this secondary means of access. This is a reasonable provision in light of the fact that nationally recognized safety standards require two means of exit from such larger swimming pools. Specific provisions are also provided for wading pools, wave action pools and other types of pools where user access is limited to one area.

Cost Impact: This code change will increase the cost of construction. However, because these changes are harmonized with the U.S. Access Board's ADA and ABA Accessibility Guidelines, costs associated with compliance cannot be avoided once the U.S. Department of Justice adopts the guidelines as enforceable standards under the Americans with Disabilities Act. The guidelines have already been adopted as enforceable standards under the Architectural Barriers Act applicable to federally funded facilities.

ICCFILENAME:Mazz-E2-1102.1

<u>Public Hearing Results</u>

PART II- IEBC
Committee Action: Disapproved

Committee Reason: Part II was disapproved based on the committee's actions to Part I of E152-09/10.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved

Replace the proposal with the following:

605.1.15 Existing Amusement Rides. Where existing amusement rides are altered, the alteration shall comply with Section 605.1.15.1 and 605.1.15.2.

605.1.15.1 Load and Unload Areas. Where load and unload areas serving existing amusement rides are newly designed and constructed, the load and unload areas shall comply with ICC A117.1.

605.1.15.2 Minimum Number. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in the *International Building Code,* Section 1110.6.7.

Commenter's Reason: See E152-09/10, Part I, Public comment #4. The intent of this public comment is to match the provisions for existing building proposed for IBC Chapter 34 and IEBC Chapter 3. This way the provisions for existing buildings will be consistent between Chapter 3 and 6 of the IEBC.

Staff Note: E152-09/10, Part 1, Public Comment #4 was submitted including these provisions. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Public Comment 2:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved

Replace the proposal with the following:

PART II – IEBC

605.1.16 Teeing Grounds. When golf courses are being altered, teeing grounds shall comply with the *International Building Code*, Section 1110.6.11.1.1**.**

> **Exception:** In existing golf courses, the forward teeing ground shall not be required to be one of the teeing grounds on a hole designed and constructed so that a golf car can enter and exit the teeing ground where compliance is not feasible due to terrain.

Commenter's Reason: See E152-09/10, Part I, Public comment #6. The intent of this public comment is to match the provisions for existing building proposed for IBC Chapter 34 and IEBC Chapter 3. This way the provisions for existing buildings will be consistent between Chapter 3 and 6 of the IEBC.

Staff Note: E152-09/10, Part 1, Public Comment #6 was submitted including these provisions. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Public Comment 3:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved

Replace the proposal with the following:

SECTION B104
RECREATIONAL FACILITIES

B104.1 Recreational and sports facilities exceptions. Existing recreational and sports facilities required to be accessible shall be exempt from accessibility to the extent specified in this section.

B104.2 Existing Amusement Rides. Where existing amusement rides are altered, the alteration shall comply with Section B104.2.1 and B104.2.2.

B104.2.1 Load and Unload Areas. Where load and unload areas serving existing amusement rides are newly designed and constructed, the load and unload areas shall comply with ICC A117.1.

<u>**B104.2.2 Minimum Number.** Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in the *International Building Code*, Appendix E111.2.2.</u>

Commenter's Reason: See E152-09/10, Part I, Public comment #10. IBC Appendix E contains supplementary accessibility requirements and IEBC Appendix B contains supplemenetary accessibility requirements for existing buildings. If the membership votes to place amusement ride requirements in Appendix E, this public comment is needed for consistency.

Staff Note: E152-09/10, Part 1, Public Comment #10 was submitted including these provisions. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Public Comment 4:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approved

Replace the proposal with the following:

<u>**SECTION B104**</u>
<u>**RECREATIONAL FACILITIES**</u>

<u>**B104.1 Recreational and sports facilities exceptions.** Existing recreational and sports facilities required to be accessible shall be exempt from accessibility to the extent specified in this section.</u>

<u>**B104.2 Teeing Grounds.** When golf courses are being altered, teeing grounds shall comply with the *International Building Code*, Appendix E111.2.1.1</u>**.**

> <u>**Exception:** In existing golf courses, the forward teeing ground shall not be required to be one of the teeing grounds on a hole designed and constructed so that a golf car can enter and exit the teeing ground where compliance is not feasible due to terrain.</u>

Commenter's Reason: See E152-09/10, Part I, Public comment #12. IBC Appendix E contains supplementary accessibility requirements and IEBC Appendix B contains supplemenetary accessibility requirements for existing buildings. If the membership votes to place golf course requirements in Appendix E, this public comment is needed for consistency.

Staff Note: E152-09/10, Part 1, Public Comment #12 was submitted including these provisions. The proposals were split in order to follow ICC rules for voting on proposals that affect multiple part code changes.

Final Action: AS AM AMPC____ D

1102.1, 1107.2, 1107.6, 1107.6.2.2, 1107.6.3, 3411.1 (IEBC 310.1)

<u>Proposed Change as Submitted</u>

Proponent: Mark J. Mazz, AIA, representing self

PART I – IBC MEANS OF EGRESS

1. Add new definitions as follows:

1102.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

<u>**PUBLIC RIGHT OF WAY.** Public land or property, usually in interconnected corridors, that is acquired for or devoted to transportation purposes.</u>

<u>**TYPE C (Visitable) UNIT.** A dwelling unit designed and constructed for accessibility in accordance with this code and the provisions for Type C units in ICC A117.1.</u>

2. Revise as follows:

1107.2 Design. Dwelling units and sleeping units that are required to be Accessible units, Type A units<u>,</u> ~~and~~ Type B units<u>, and Type C units</u> shall comply with the applicable portions of Chapter 10 of ICC A117.1. Units required to be

Type A units are permitted to be designed and constructed as Accessible units. Units required to be Type B units are permitted to be designed and constructed as Accessible units or as Type A units. Units required to be Type C (Visitable) units are permitted to be designed and constructed as Accessible units, as Type A units, or as Type B units.

1107.6 Group R. Accessible units, Type A units, ~~and~~ Type B Units, and Type C (Visitable) units shall be provided in Group R occupancies in accordance with Sections 1107.6.1 through 1107.6.4.

1107.6.2.2 Group R-2 other than apartment houses, monasteries and convents. In Group R-2 occupancies, other than apartment houses, monasteries and convents, Accessible units, ~~and~~ Type B units, and Type C units shall be provided in accordance with Sections 1107.6.2.2.1 through ~~1107.6.2.2.2~~ 1107.6.2.2.3.

1107.6.2.2.3 Type C units. Where there are 6 or more dwelling units in a development site, at least 50 percent shall be a Type C unit. All R-2 units on a development site shall be considered to determine the total number of units and the required number of Type C units.

Exceptions: The following units are not required to be Type C units or be considered to determine the total number of units:

1. Units above other units.
2. Units without garages where the slope between the finish ground level at all unit entrances to all points along the property lines that border a public right of way are no greater than 8.33 percent.

1107.6.3 Group R-3. Type B units and Type C units shall be provided in Group R-3 occupancies in accordance with Sections 1107.6.3.1 and 1107.6.3.2.

1107.6.3.1 Type B units. In Group R-3 occupancies where there are four or more dwelling units intended to be occupied as a residence in a single structure, every dwelling unit intended to be occupied as a residence shall be a Type B unit.

Exception: The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

1107.6.3.2 Type C units. In Group R-3 occupancies, where there are 6 or more dwelling units in a development site, at least 50 percent shall be a Type C unit. All R-3 units on a development site shall be considered to determine the total number of units and the required number of Type C units.

Exceptions: The following units are not required to be Type C units or be considered to determine the total number of units

1. Units above other units.
2. Units without garages where the slope between the finish ground level at all unit entrances to all points along the property lines that border a public right of way are no greater than 8.33 percent.

1107.7.5 Design flood elevation. The required number of Type A units, Type B units, and Type C units shall not apply to a site in accordance with 1107.7.5.1 through 1107.7.5.2.

1107.7.5.1 Type A units and Type B units. The required number of Type A units and Type B units shall not apply to a site where the required elevation of the lowest floor or the lowest horizontal structural building members of nonelevator buildings are at or above the design flood elevation resulting in:

1. A difference in elevation between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15 240 mm) exceeding 30 inches (762 mm), and
2. A slope exceeding 10 percent between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15.24 m).

Where no such arrival points are within 50 feet (15.24 m) of the primary entrances, the closest arrival points shall be used.

1107.7.5.2 Type C units. The required number of Type C dwelling units shall not apply to a site where the required elevation of the lowest floor or the lowest horizontal structural building members are at or above the design flood elevation resulting in:

1. <u>A difference in elevation between the minimum required floor elevation at all unit entrances and the ground elevation at the entrance exceeds 30 inches (762 mm), or</u>
2. <u>A slope exceeding 8.33 percent between the minimum required floor elevation at all unit entrances to all points along the property lines that border a public right of way.</u>

3411.1 (IEBC 310.1) Scope. The provisions of Sections 3411.1 through 3411.9 apply to maintenance, change of occupancy, additions and alterations to existing buildings, including those identified as historic buildings.

Exception<u>s</u>:

1. Type B dwelling or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities being altered or undergoing a change of occupancy.
2. <u>Type C dwelling required by Section 1107 of this code are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.</u>

(Renumber subsequent sections)

Reason: Type C dwelling units have been added to the technical requirements in 2009 ICC/A117.1. The intent of this proposal is to scope Type C dwelling units for buildings that fall below the threshold of the Fair Housing Act Accessibility Guidelines.

1. There is a correlative change being proposed for the IBC, IRC and IEBC.
2. Type C (Visitable) units require significantly less accessibility than Type B units do. Type C units require one zero-step entrance on a circulation path (not necessarily an accessible route) from a garage, driveway, sidewalk, or street. The entrance does not have to be the front door. Therefore, an attached garage, with a floor that slopes away from a connecting door that has no step can satisfy the zero-step entrance requirement. Interior requirements for Type C units apply only to the entry level and are equally as lax as the exterior requirements.
3. Jurisdictions across the Country are adding Visitability requirements to their local codes. Neither the technical provisions nor the scoping provisions are consistent. To address the technical provisions, ICC A117.1 created Type C (Visitable) units. This proposed change to the Building Code is to make the scoping provisions consistent.
4. Because of site constraints, individual dwelling units, in-fill units, and small developments may have difficulty with providing a zero-step entrance. Therefore, this proposal limits applicability to developments with 6 or more dwelling units.
5. Other site issues, such as trees, preserving natural terrain, and local design guidelines, when coupled with zero-step entrances may increase construction costs by more than a few hundred dollars. In lieu of listing a series of exceptions, this proposal applies to only half the R-2 and R-3 dwelling units.
6. The technical requirements for Type C units are a subset of the Accessible, Type A, and Type B unit technical requirements. Therefore, requiring those units to comply with Type C units is redundant.
7. Stacked townhomes are becoming popular. The proposal only addresses the units nearest the ground. Upper unit is exempted from compliance. Lower units are exempted when the entrance level is significantly below ground.
8. Providing a zero-step entrance is more expensive on a small lot where the unit does not have a garage, particularly on sites with steeper slopes. Therefore, this proposal exempts units where the difference in grade elevation at all the entrances and the elevation along property lines that are along the public right of way slopes more than 8.33%.
9. Modifying existing structures will cost, on average, more than a few hundred dollars. Therefore, existing structures and additions are exempted.

Cost Impact: $100 to $400 per dwelling unit. See "Increasing Home Access: Designing for Visitability" by the AARP Public Policy Institute. http://assets.aarp.org/rgcenter/il/2008_14_access.pdf

ICCFILENAME:Mazz Mark-E1-1102.1

<u>Public Hearing Results</u>

PART I IBC MEANS OF EGRESS
Committee Action: Disapproved

Committee Reason: This proposal is too far reaching for just visitability. It is easy to retrofit existing one and two step entries. There is a big concern about water infiltration and a stepped entry is needed to address that.

Justification was not provided for the 50% requirement for number of units. It is unclear how this will effect construction of individual units – perhaps requiring every unit to meet Type C unit requirements. If there are Type A and Type B units on the site, there should be an allowance for consideration of those units counting towards the percentage required to meet Type C units, similar to what is currently in Section 1107.2.

There needs to be exceptions for units that are a level above grade, in flood plains, on steep sites, etc. There are areas of the country where putting in a basement might hit rock and blasting down to get the zero level entry would be too costly – these types of issues should be considered when determining percentages.
Adding another type of unit is confusing. Perhaps these minimal accessibility requirements should be incorporated into the International Residential Code.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mark J. Mazz, representing self, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

1008.1.1 Size of doors. The minimum width of each door opening shall be sufficient for the *occupant load* thereof and shall provide a clear width of 32 inches (813 mm). Clear openings of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a clear opening width of 32 inches (813 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. *Means of egress* doors in a Group I-2 occupancy used for the movement of beds shall provide a clear width not less than 411/2 inches (1054 mm). The height of door openings shall not be less than 80 inches (2032 mm).

Exceptions:

1. The minimum and maximum width shall not apply to door openings that are not part of the required *means of egress* in Group R-2 and R-3 occupancies.
2. Door openings to resident sleeping units in Group I-3 occupancies shall have a clear width of not less than 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93m2) in area shall not be limited by the minimum width.
4. Width of door leaves in revolving doors that comply with Section 1008.1.4.1 shall not be limited.
5. Door openings within a dwelling unit or sleeping unit shall not be less than 78 inches (1981 mm) in height.
6. Exterior door openings in dwelling units and sleeping units, other than the required *exit* door, shall not be less than 76 inches (1930 mm) in height.
7. In other than Group R-1 occupancies, the minimum widths shall not apply to interior egress doors within a dwelling unit or sleeping unit that is not required to ~~be an *Accessible unit*, *Type A unit* or *Type B unit*~~ comply with Section 1107.
8. Door openings required to be accessible within Type B units shall have a minimum clear width of 31.75 inches (806 mm).

1107.6.2 Group R-2. *Accessible units*, *Type A units* and *Type B units* shall be provided in Group R-2 occupancies in accordance with Sections 1107.6.2.1 and 1107.6.2.2. All other dwelling units and sleeping units shall comply with Section 1107.6.2.3.

1107.6.2.2 Group R-2 other than apartment houses, monasteries and convents. In Group R-2 occupancies, other than apartment houses, monasteries and convents, *Accessible units* and *Type B units* shall be provided in accordance with Sections 1107.6.2.2.1 and 1107.6.2.2.~~2~~3.

1107.6.2.2.1 Accessible units. *Accessible dwelling units* and *sleeping unit*s shall be provided in accordance with Table 1107.6.1.1.

1107.6.2.2.2 Type B units. Where there are four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence* in a single structure, every *dwelling unit* and every *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.2.2.3 Other Dwelling units and Sleeping Units. Dwelling units and sleeping units that are not Accessible units or Type B units shall comply with Sections 1107.6.2.3.1 through 1107.6.2.3.2.

Exceptions:

1. Dwelling units with no habitable space on the entry level to the structure that is nearest finish grade are not required to comply with this section.
2. Units without garages are not required to comply with this section when the slope between the finish ground level at all entrances to the nearest point along a property line that borders a public right of way is greater than 10 percent.
3. The number of *dwelling units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.2.2.3.1 Landings. At least one entrance door to each dwelling unit shall have a landing exterior to the unit that is not more than 11/2 inches (38 mm below the top of the threshold.

1107.6.2.2.3.2 Circulation path. A circulation path from the entrance door complying with Section 1107.6.2.2.3.1 to a garage, parking space, or public right of way shall not have any abrupt vertical changes in level greater than ½ inch (13 mm).

1107.6.3 Group R-3. ~~In~~ Group R-3 occupancies, where there are four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence* in a single structure ~~every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*.~~, shall comply with Section 1107.6.3.1. Where there are three or fewer dwelling units or sleeping units in a single structure, the dwelling units shall comply with Section 1107.6.3.2.

~~**1107.6.3 Group R-3.**~~ **1107.6.3.1. Type B Units.** Every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.3.2 Other dwelling units and sleeping units. Dwelling units that are not Type B units shall comply with Sections 1107.6.3.2.1 and 1107.6.3.2.2.

Exceptions:

1. Dwelling units with no habitable space on the entry level to the structure that is nearest finish grade are not required to comply with this section.
2. Units without garages are not required to comply with this section when the slope between the finish ground level at all entrances to the nearest point along a property line that borders a public right of way is greater than 10 percent.
3. The number of *dwelling units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.3.2.1 Landings. At least one entrance door to each dwelling unit shall have a landing exterior to the unit that is not more than 11/2 inches (38 mm) below the top of the threshold.

1107.6.3.2.2 Circulation path. A circulation path from the entrance door complying with Section 1107.6.3.2.1 to a garage, parking space, or public right of way shall not have any abrupt vertical changes in greater than ½ inch (13 mm).

1107.7 General exceptions. Where specifically permitted by Section 1107.5 or 1107.6, the required number of *Type A units* and *Type B units* is permitted to be reduced in accordance with Sections 1107.7.1 through 1107.7.5. Where specifically permitted by Section Section 1107.6.2.2.3 and 1107.6.3.2 the required number of *dwelling units* is permitted to be reduced in accordance with Sections 1107.7.6.

1107.7.5 Design flood elevation for Type A and B units. The required number of *Type A units* and *Type B units* shall not apply to a site where the required elevation of the lowest floor or the lowest horizontal structural building members of nonelevator buildings are at or above the *design flood elevation* resulting in:

1. A difference in elevation between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15 240 mm) exceeding 30 inches (762 mm), and
2. A slope exceeding 10 percent between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15.24 m).

Where no such arrival points are within 50 feet (15.24 m) of the primary entrances, the closest arrival points shall be used.

1107.7.6 Design flood elevation for other dwelling units and sleeping units. The required number of *dwelling units* specified in Section 1107.6.2.2.3 and 1107.6.3.2 shall not apply to a *site* where the required elevation of the lowest floor or the lowest horizontal structural building members are at or above the *design flood elevation* resulting in:

1. A difference in elevation between the minimum required floor elevation at all unit entrances and the ground elevation at the entrance exceeds 30 inches (762 mm), or
2. A slope exceeding 10 percent between the minimum required floor elevation at all unit entrances to the nearest points along a property line~~s~~ that borders a public right of way.

Revise as follows:

3411.1 (IEBC 310.1) Scope. The provisions of Sections 3411.1 through 3411.9 apply to maintenance, change of occupancy, additions and alterations to existing buildings, including those identified as historic buildings.

Exceptions:

1. Type B dwelling or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities being altered or undergoing a change of occupancy.
2. Dwelling units required by Sections 1107.6.2.2.3 and 1107.6.3.2 of this code are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.

Commenter's Reason: The modifications to this proposal address the Committee's concerns.

1. There is a correlative change being proposed for the IBC, IRC and IEBC.
2. Significant modifications were made to this proposal. Therefore, the underlines and strikeouts are to the IBC 2009 text, not the original Proposal text.
3. The proposed modifications delete references to ICC A117.1 Type C units. Some persons thought that Type C units required significantly more accessibility than it does. Another person expressed concern that by referencing Type C, additional accessible features would quickly creep into the Model Codes. Another concern was that some of the Type C technical requirements may be hard to achieve in many situations. Therefore, to make clear the intent of this Visitability proposal, all references to the Type C unit are deleted.
4. The Committee said that applying the requirements to only 50% of the dwelling units in a development site was more appropriately a zoning issue, not a building code issue. The proposed modifications remove those provisions and substitute more broadly written exceptions.
5. Units above or below the entry level and units with split foyers are exempted. Townhouses above garages without habitable space on the entry level are exempted. The slope exemptions are based on finish grade, not undisturbed grade. Therefore, the designer and the builder have some ability to exempt difficult sites.
6. Even though research shows that Visitability adds only $100 to $400 to the cost of a home, several persons expressed concerns about the cost. The proposed modifications strip out all the requirements except zero-step entrance and wider doors on the entry level. The proposed modifications remove the requirement for the entry level to have at least one habitable space and any powder requirements. Outside the dwelling unit, the proposed modifications removed the technical requirements for the circulation path except that no steps are permitted. Ramps are not required.

7. One person speaking in opposition worried that the Visitability provisions would apply to dwelling units above other units and to units below grade. That was never the intent. The exceptions are written more broadly to exclude any unit that does not have habitable space on the entry level to the structure.
8. There was some concern about water intrusion. This should never be an issue when the zero-step entrance is in the garage or under an overhang. Proper detailing can minimize the risk of water intrusion where the entrance door has no overhead protection. I have designed such entrances before.
9. "Of the homes built since 2000, 25% to 60% will have at least one resident with a severe, long-term mobility impairment at some point during the useful life of the structure." ("Aging and Disability: Implications for the Housing Industry and Housing Policy in the United States," Journal of the American Planning Association, Summer 2008) Therefore, the ICC should incorporate minimal accessibility into all new housing.
10. At least 11 jurisdictions have created visitability ordinances across the Country. Some require the electrical panels to be within reach. Others require 42" wide corridors. All these jurisdictions implement an arduous waiver process for exemptions. Many other jurisdictions are looking toward visitability legislation. US Representative Schakowsky from Chicago has proposed legislation in Congress to make it illegal to build new homes without Visitability features. We need to get in front of this trend so that unique waiver processes are eliminated and visitability remains a code issue and not a law or civil right.

Cost Impact: None

Final Action: AS AM AMPC____ D

E156-09/10, Part II
IEBC 605.1

Proposed Change as Submitted

Proponent: Mark J. Mazz, AIA, representing self

PART II - IEBC

Revise as follows:

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the International Building Code and ICC A117.1 unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible.

A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the International Building Code and ICC A117.1.
5. <u>Type C dwelling required by Section 1107 of the International Building Code are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.</u>

Reason: Type C dwelling units have been added to the technical requirements in 2009 ICC/A117.1. The intent of this proposal is to scope Type C dwelling units for buildings that fall below the threshold of the Fair Housing Act Accessibility Guidelines.

1. There is a correlative change being proposed for the IBC, IRC and IEBC.
2. Type C (Visitable) units require significantly less accessibility than Type B units do. Type C units require one zero-step entrance on a circulation path (not necessarily an accessible route) from a garage, driveway, sidewalk, or street. The entrance does not have to be the front door. Therefore, an attached garage, with a floor that slopes away from a connecting door that has no step can satisfy the zero-step entrance requirement. Interior requirements for Type C units apply only to the entry level and are equally as lax as the exterior requirements.
3. Jurisdictions across the Country are adding Visitability requirements to their local codes. Neither the technical provisions nor the scoping provisions are consistent. To address the technical provisions, ICC A117.1 created Type C (Visitable) units. This proposed change to the Building Code is to make the scoping provisions consistent.
4. Because of site constraints, individual dwelling units, in-fill units, and small developments may have difficulty with providing a zero-step entrance. Therefore, this proposal limits applicability to developments with 6 or more dwelling units.
5. Other site issues, such as trees, preserving natural terrain, and local design guidelines, when coupled with zero-step entrances may increase construction costs by more than a few hundred dollars. In lieu of listing a series of exceptions, this proposal applies to only half the R-2 and R-3 dwelling units.
6. The technical requirements for Type C units are a subset of the Accessible, Type A, and Type B unit technical requirements. Therefore, requiring those units to comply with Type C units is redundant.
7. Stacked townhomes are becoming popular. The proposal only addresses the units nearest the ground. Upper unit is exempted from compliance. Lower units are exempted when the entrance level is significantly below ground.
8. Providing a zero-step entrance is more expensive on a small lot where the unit does not have a garage, particularly on sites with steeper slopes. Therefore, this proposal exempts units where the difference in grade elevation at all the entrances and the elevation along property lines that are along the public right of way slopes more than 8.33%.
9. Modifying existing structures will cost, on average, more than a few hundred dollars. Therefore, existing structures and additions are exempted.

Cost Impact: $100 to $400 per dwelling unit. See "Increasing Home Access: Designing for Visitability" by the AARP Public Policy Institute. http://assets.aarp.org/rgcenter/il/2008_14_access.pdf

Committee Action: Disapproved

Committee Reason: The proposal was disapproved for consistency with the committee action on E156-09/10 Part I.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mark J. Mazz, representing self, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART II - IEBC

CHAPTER 6
ALTERATION – LEVEL I

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the International Building Code and ICC A117.1 unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible.

A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the International Building Code and ICC A117.1.

5. Dwelling units required by Sections 1107.6.2.2.3 and 1107.6.3.2 of the International Building Code are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.

Commenter's Reason: See E156-09/10, Part I. This is the same language as proposed for IBC Chapter 34 and IEBC Chapter 3 proposed in the public comment to Part I.

Final Action: AS AM AMPC____ D

E156-09/10, Part III
IRC R202, R320.2 (New)

Proposed Change as Submitted

Proponent: Mark J. Mazz, AIA, representing self

PART III – IRC BUILDING/ENERGY

Add new text as follows:

SECTION R202
DEFINITIONS

PUBLIC RIGHT OF WAY. Public land or property, usually in interconnected corridors, that is acquired for or devoted to transportation purposes.

TYPE C (Visitable) UNIT. A dwelling unit designed and constructed for accessibility in accordance with this code and the provisions for Type C units in ICC A117.1.

R320.2 Visitable (Type C) units. Where there are 6 or more dwelling in a development site, at least 50 percent shall be a Type C unit. All units on a development site shall be considered to determine the total number of units and the required number of Type C units.

Exceptions:

1. Type C units shall be permitted to be designed and constructed as Accessible units, Type A units, or Type B units in accordance with Chapter 11 of the International Building Code.
2. The following units are not required to meet Type C unit requirements or be considered to determine the total number of units:
   2.1 Units above other units.
   2.2 Units without garages where the slope between the finish ground level at all unit entrances to all points along the property lines that border a public right of way are no greater than 8.33 percent.
3. Type C dwelling are not required to be provided in additions or in existing buildings and facilities being altered or undergoing a change of occupancy.
4. The required number of Type C units shall not apply to a site where the required elevation of the lowest floor or the lowest horizontal structural building members are at or above the design flood elevation resulting in:
   4.1 A difference in elevation between the minimum required floor elevation at all unit entrances and the ground elevation at the entrance exceeds 30 inches (762 mm), or
   4.2 A slope exceeding 8.33 percent between the minimum required floor elevation at all unit entrances to all points along the property lines that border a public right of way.

Reason: Type C dwelling units have been added to the technical requirements in 2009 ICC/A117.1. The intent of this proposal is to scope Type C dwelling units for buildings that fall below the threshold of the Fair Housing Act Accessibility Guidelines.

1. There is a correlative change being proposed for the IBC, IRC and IEBC.
2. Type C (Visitable) units require significantly less accessibility than Type B units do. Type C units require one zero-step entrance on a circulation path (not necessarily an accessible route) from a garage, driveway, sidewalk, or street. The entrance does not have to be the front door. Therefore, an attached garage, with a floor that slopes away from a connecting door that has no step can satisfy the zero-step entrance requirement. Interior requirements for Type C units apply only to the entry level and are equally as lax as the exterior requirements.

3. Jurisdictions across the Country are adding Visitability requirements to their local codes. Neither the technical provisions nor the scoping provisions are consistent. To address the technical provisions, ICC A117.1 created Type C (Visitable) units. This proposed change to the Building Code is to make the scoping provisions consistent.
4. Because of site constraints, individual dwelling units, in-fill units, and small developments may have difficulty with providing a zero-step entrance. Therefore, this proposal limits applicability to developments with 6 or more dwelling units.
5. Other site issues, such as trees, preserving natural terrain, and local design guidelines, when coupled with zero-step entrances may increase construction costs by more than a few hundred dollars. In lieu of listing a series of exceptions, this proposal applies to only half the R-2 and R-3 dwelling units.
6. The technical requirements for Type C units are a subset of the Accessible, Type A, and Type B unit technical requirements. Therefore, requiring those units to comply with Type C units is redundant.
7. Stacked townhomes are becoming popular. The proposal only addresses the units nearest the ground. Upper unit is exempted from compliance. Lower units are exempted when the entrance level is significantly below ground.
8. Providing a zero-step entrance is more expensive on a small lot where the unit does not have a garage, particularly on sites with steeper slopes. Therefore, this proposal exempts units where the difference in grade elevation at all the entrances and the elevation along property lines that are along the public right of way slopes more than 8.33%.
9. Modifying existing structures will cost, on average, more than a few hundred dollars. Therefore, existing structures and additions are exempted.

Cost Impact: $100 to $400 per dwelling unit. See "Increasing Home Access: Designing for Visitability" by the AARP Public Policy Institute. http://assets.aarp.org/rgcenter/il/2008_14_access.pdf

ICCFILENAME:Mazz Mark-E1-1102.1

Public Hearing Results

PART III- IRC B/E
Committee Action: **Disapproved**

Committee Reason: The committee supports the need for visitability but is concerned about the zoning, particularly the number of units in a development. The committee suggests that it would be better if the technical requirements were placed into the code in the appropriate sections then all homes would comply and there would not be a need for Type C. There are difficulties with the definitions and they contain technical requirements.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mark J. Mazz, representing self, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

PART III – IRC

R320.1 **~~Scope.~~** **Four or more dwelling or sleeping units.** Where there are four or more *dwelling* units or sleeping units in a single structure, the provisions of Chapter 11 of the *International Building Code* for Group R-3 shall apply.

R320.2 Three or fewer dwelling units. Where there are three or fewer dwelling units in a single structure, the dwelling units shall comply with 320.2.1 through 320.2.3.

Exceptions:

1. Dwelling units with no habitable space on the entry level are not required to comply with section.
2. Units without garages are not required to comply when the slope between the finish ground level at all entrances to the nearest point along a property line that borders a public right of way is greater than 10 percent.
3. Additions, existing buildings and facilities being altered, and buildings and facilities undergoing a change of occupancy are not required to comply with this section.
4. Section R320.2 shall not apply to a *site* where the required elevation of the lowest floor or the lowest horizontal structural building members are at or above the *design flood elevation* resulting in:
   4.1. A difference in elevation between the minimum required floor elevation at all unit entrances and the ground elevation at the entrance exceeds 30 inches (762 mm), or
   4.2. A slope exceeding 10 percent between the minimum required floor elevation at all unit entrances to the nearest point along a property lines that border a public right of way.

R320.2.1 Landings. At least one entrance door to each dwelling unit shall provide a minimum clear width or 32 inches (813 mm) and have a landing exterior to the unit that is not more than 11/2 inches (38 mm) lower than the top of the threshold.

R320.2.2 Circulation path. A circulation path from the entrance door complying with Section R320.2.1 to a garage, parking space, or public right of way shall be free of any abrupt vertical changes in level that are more than ½ inch (13 mm).

R320.3 Door width. On the entry level, interior doors on the circulation path shall provide a minimum clear width of 31 3/4" inches when measured between the face of the door and the stop.

R311.2 Egress door. At least one egress door shall be provided for each *dwelling* unit. The egress door shall be side-hinged, and shall provide a minimum clear width of 32 inches (813 mm) when measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). The minimum clear height of the door opening shall not be less than 78 inches (1981 mm) in height measured from the top of the threshold to the bottom of the stop. Other doors shall not be required to comply with these minimum dimensions unless required by Section 320.2. Egress doors shall be readily openable from inside the *dwelling* without the use of a key or special knowledge or effort.

Commenter's Reason: See E156-09/10, Part I. The revision to Section 311.2 is so there is not a conflict for door width in the IRC.

Final Action: AS AM AMPC____ D

E179-09/10

1108.5 (New), Chapter 35

Proposed Change as Submitted

Proponent: Marsha K. Mazz, U.S. Architectural and Transportation Barriers Compliance Board (Access Board)

1. Add new text as follows:

1108.5 Classroom acoustics. Classrooms in Group E occupancies shall meet the acoustical performance criteria in ANSI/ASA S12.60, Part 1.

> **Exception:** Relocatable classrooms shall be permitted to comply with ANSI/ASA S12.60, Part 2.

2. Add new standard to Chapter 35 as follows:

American National Standards Institute (ANSI)
ANSI/ASA S12.60-2010/Part 1 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools, Permanent, Site-Built Schools
ANSI/ASA S12.60-2009/Part 2 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools, Relocatable Classroom Factors.

Reason: This code change proposes to reference two new standards: ANSI/ASA S12.60-2010/Part 1 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools and ANSI/ASA S12.60-200X/Part 2 Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools, Relocatable Classroom Factors.

Acoustical performance is an important consideration in the design of classrooms. The proposed standard sets specific criteria for maximum background noise (35 decibels) and reverberation time (0.6 to 0.7 seconds) for unoccupied classrooms. Research indicates that levels of background noise and reverberation little noticed by adults, who are mature and skillful listeners, adversely affect learning environments for young children, whose neurological development is incomplete until late adolescence.[1] Amplification cannot remedy poor classroom acoustics because they amplify both wanted and unwanted sound. This code change will remove educational barrier for children who have hearing loss and those who use cochlear implants. In addition, children who have temporary hearing loss, who may comprise up to 15% of the school age population according to the Centers for Disease Control (CDC), will also benefit, as will children who have speech impairments or learning disabilities and those whose home language is different. Without improvements to the listening environment, children of all backgrounds, ages, and abilities are at risk of educational delay and failure.

Background: In 1998, the U.S. Access Board joined with the **Acoustical Society of America** (ASA) to support the development of a classroom acoustics standard. This resulted in the publication of the first ANSI/ASA S12.60-2002 (R 2009) Acoustical Performance Criteria, Design Requirements and Guidelines for Schools which was reaffirmed in 2009. The standard is now being reformatted to make it more easily interpreted and enforced. Additionally, it will include a new Part 2 to better address relocatable classrooms with support from the Modular Building Institute. We understand that the new editions will be published in 2009 (Part 2) and 2010 (Part 1) in time for consideration at the Final Action Hearings.

Supporting Data: In a large study of students in London and Munich schools, classroom noise levels were related to standardized achievement scores showing that higher noise levels resulted in poorer standardized test scores.[2, 3] Similar scores were reported by Armstrong International.

Bibliography

1. Ponton, C., Eggermont, J., Kwong, B. & Don, M. (2000) Maturation of human central auditory system activity: Evidence from multi-channel evoked potentials, Clinical Neurophysiology 111, 220 – 236.

2. Shield. B and Dockrell J (2008) The effects of environmental and classroom noise on the academic attainments of primary school children, J. Acoust. Soc. Am. Volume 123, 133-144
3. Hygge, S, Evans, G W. & Bullinger, M (2002) A Prospective Study of Some Effects of Aircraft Noise on Cognitive Performance in Schoolchildren. Psychological Science 13 (5), 469-474.

Cost Impact: This code change will increase the cost of construction. Evidence obtained from the State of Connecticut where the ANSI/ASA S12.60-2002 is applicable under state law is that cost increases have been nominal even for modular construction. Data from the UK where a similar standard has been applicable over the past five years indicates an average increase of 1.5% in new school construction. We anticipate that any costs attributable to this code change would be offset by the increased availability of Federal funds through the American Recovery and Reinvestment Act. A funding bill has passed in the U.S. House of Representatives which will support school sustainability improvements, specifically including improvements to acoustical environments.

Analysis: A review of the standards proposed for inclusion in the code, ANSI/ASA S12.60-2010/Part 1 and ANSI/ASA S12.60/Part 2, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME:Mazz-E4-1108.5

Public Hearing Results

Note: The following analysis was not in the Code Change monograph but was published on the ICC website at http://www.iccsafe.org/cs/codes/Documents/2009-10cycle/ProposedChanges/Standards-Analysis.pdf :

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC staff, the standard did not comply with ICC standards criteria, Section 3.6.2.1, 3.6.2.4, 3.6.3.1.

Committee Action: Disapproved

Committee Reason: The proposed reference standard had not yet completed its revision to put requirements into mandatory language. The current standard is not in mandatory language.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Marsha K. Mazz, representing U.S. Architectural and Transportation Barriers Compliance Board (Access Board) requests Approval as Modified by this Public Comment.

1108.5 Classroom acoustics. ~~Classrooms in~~ Group E occupancies shall meet the acoustical performance criteria in ANSI/ASA S12.60, Part 1.

Exception: Relocatable classrooms shall be permitted to comply with ANSI/ASA S12.60, Part 2.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The committee disapproved this proposal because the proposed reference standard had not yet completed its revision to put the requirements in mandatory language. We anticipate that the new standards will be available by the Final Action Hearings in Dallas. The modification deletes the reference to "classrooms" in Group E occupancies because the proposed standards address which educational spaces in Group E occupancies must comply. For example, the standard exempts certain educational spaces that cannot comply because of their unique nature e.g. shops and swimming pools.

Public Comment 2:

Mr. William Ryan, representing M. Space Holdings LLC, requests Disapproval.

Commenter's Reason: I wish to support the committee action for disapproval and add the following information. Our company is a supplier of commercial modular buildings in Connecticut. We have supplied classroom buildings in compliance with ASA 12.60-2002. I object to the cost impact language in the proponent's reason which states "Evidence obtained from the State of Connecticut where the ANSI/ASA S12.60-2002 is applicable under state law is that cost increases have been nominal even for modular construction." Our experience is that costs increase by over 30% on the three classroom building which we provided.

Final Action: AS AM AMPC____ D

E187-09/10
1109.6, 1109.6.1 (New), 1109.6.2 (New)

Proposed Change as Submitted

Proponent: Don Davies, Salt Lake City Corporation, representing the Utah Chapter of ICC

1. Revise text as follows:

1109.6 Elevators. Passenger elevators on an accessible route shall be accessible and comply with Section ~~3001.3~~ <u>3001</u>.

2. Add new text as follows:

<u>**1109.6.1 Limited use limited application elevators.** Limited use limited application elevators are permitted to be a part of a required accessible route. The maximum rise of the car platform shall not exceed 25 feet (7.6 m).</u>

<u>**1109.6.2 Private Residence elevators.** Private residence elevators are permitted to be part of a required accessible route within or serving an individual dwelling unit or sleeping unit. The maximum rise of the car platform shall not exceed 50 feet (15 m).</u>

Reason: The code currently scopes the provisions for passenger elevators (Section 1109.6). A reference to Section 3001 will pick up a reference to safety standard, ASME A17.1, as well as the accessibility standard, ICC A117.1. It is unclear to those unfamiliar with ASME A17.1 that LULAs and private residence elevators are 'passenger elevators' with limited applications. The 25 feet of vertical rise for LULAs is found in ASME A17.1 Section 5.2.1.16.5. The 50 feet of vertical rise for private residence elevators is found in ASME A17.1 Section 5.3.1.10.3. Since the code is very explicit on the limitations of lifts in new construction it seems reasonable that some guidance be placed in the body of the code scoping the provisions and stating the limitations of these types of elevators.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME:Davies-E1-1109.7

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Limited Use/Limited Access (LULA) elevators and Private Residence Elevators are considered passenger elevators by ASME A17.1, so this text is not needed. ASME A17.1 should contain the limitations for use of these elevators. Repeating ASME A17.1 requirements in the IBC could lead to possible conflicts in the future.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Don Davies, Salt Lake City Corporation, representing the Utah Chapter of ICC, requests Approval as Submitted.

Commenter's Reason: It is very clear in the code what limitations are placed on lifts, but the code is totally silent on the limitations of LULA's and Private Residence elevators. Even though LULU's and Private Residence elevators are addressed in a current standard, scoping the limitations of their use makes the code a user friendly document. At a glance, code users can quickly see the limitations of these types of elevators without referencing some document they may not even have in their libraries. Very few code users have access to all the standards when all they want to know what the limitations of the use of an item are. One concern at the hearings was the possibility of the standard being changed, thus conflicting with the code. This is not likely to happen, since this limitation has been unchanged for several years, and is unlikely to change in the future, just because the code addresses the issue.

Final Action: AS AM AMPC____ D

E194-09/10, Part I
1002.1 (IFC [B] 1002.1)

NOTE: PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

Proposed Change as Submitted

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

PART I – IBC MEANS OF EGRESS

Add new definition as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

LANDING. A floor area or a designated portion of a floor area, at the top or bottom of a flight of stairs, or at the top or bottom of a ramp, or at the door of an elevator.

Reason:
(PART I) This proposal adds a definition to the IBC for "landing" which is beneficial when attempting to interpret and apply the IBC. "landing" is used in numerous locations of the IBC but is not defined.

WDMA is of the perspective than "landing" relates to the flight of stairs (or ramp) that may be near a door; and that doors, other than elevator doors, do not have "landings" necessarily associated to them. A flight of stairs, or ramp, may have a landing, and that landing may be on one side of a door. Hence there are requirements in the code for landings at doors. The proposed definition clarifies that landings are associated with stairs, ramps, or elevators.

WDMA members, as they assist their customers, have found that some jurisdictions have interpreted the exception in 1008.1.7 significantly different than the language intends.

ICCFILENAME:Woestman-E2-1008.1.7

Public Hearing Results

PART I- IBC MEANS OF EGRESS
Committee Action: Disapproved

Committee Reason: The definition does not address landings at doors where a single step is provided. There is a conflict with the definition of 'flight' which only deals with several risers. The definition is not clear for intermediate landings on stairways and ramps. There are other areas in the code that use this term, such as balconies, where this definition could be considered a conflict.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeff Inks, representing the Window and Door Manufacturers Association (WDMA) requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1002.1 (IFC [B] 1002.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in the code, have the meanings shown herein:

LANDING. A floor area or a designated portion of a floor area, at the top or bottom of a stair, stairway, flight of stairs, or ~~at the top or bottom of a~~ ramp; intermediate floor areas within the run of a stairway, flight of stairs, or ramp; or, at the door of an elevator.

Commenter's Reason: As noted in the reason statement for the original proposal, this proposal adds a definition to the IBC for "landing" which is beneficial when attempting to interpret and apply provisions in the IBC related to them. "Landing" is used in numerous locations in the codes but is not defined.

The intent of the definition is to clarify that "landing" relates to floor areas serving stairs, stairways, flight of stairs, and ramps, and that doors, other than elevator doors, do not have a "landing" unless required by the code in association with these elements. The proposed definition clarifies that.

The issue being addressed is the interpretation by some jurisdictions that have interpreted extensive level areas on the exterior of exterior doors such as a patio, as landings that doors are not permitted to swing over. The proposed definition addresses that concern and will clarify that doors are permitted to swing over such areas.

Cost Impact: The code change proposal will not increase the cost of construction.

Final Action: AS AM AMPC____ D

NOTE: PART II REPRODUCED FOR INFORMATIONAL PURPOSES ONLY- SEE ABOVE.

E194-09/10, Part II
IRC R202

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

PART II – IRC BUILDING/ENERGY

Add new definition as follows:

SECTION R202
DEFINITIONS

<u>**LANDING.** A floor area or a designated portion of a floor area, at the top or bottom of a flight of stairs, or at the top or bottom of a ramp.</u>

Reason:
(PART II) This proposal adds a definition to the IRC for "Landing" which is beneficial when attempting to interpret and apply the IRC. "Landing" is used in numerous locations in the IRC but currently is not defined.
WDMA is of the perspective than "landing" relates to the flight of stairs (or ramp) that may be near a door; and that doors do not have "landings" necessarily associated to them. A flight of stairs, or ramp, may have a landing, and that landing may be on one side of a door. Hence there are requirements in the code for landings at doors. The proposed definition clarifies that landings are associated with stairs or ramps.

Cost Impact: The code change proposal will not increase the cost of construction.

Assembly Action: **None**

PART II- IRC B/E
Committee Action: **Disapproved**

Committee Reason: The proposed definition does not address the landings at the exterior door. This should be reworked and brought to Final Action.

Assembly Action: **None**

INTERNATIONAL BUILDING CODE – GENERAL

G1-09/10
202, 419.1

Proposed Change as Submitted

Proponent: Maureen Traxler representing Washington Association of Building Officials Technical Code Development Committee

1. Add new definition as follows:

SECTION 202
DEFINITIONS

LIVE/WORK UNIT. A *dwelling unit* or *sleeping unit* in which a significant portion of the space includes a nonresidential use that is operated by the tenant. See Section 419.

2. Revise as follows:

419.1 General. A live/work unit ~~is a dwelling unit or sleeping unit in which a significant portion of the space includes a nonresidential use that is operated by the tenant and~~ shall comply with Sections 419.1 through 419.8.

> **Exception:** Dwelling or sleeping units that include an office that is less than 10 percent of the area of the dwelling unit ~~shall not be~~ ~~classified as a live/work unit~~ are permitted to be classified as dwelling units with accessory occupancies in accordance with Section 508.2.

Reason: The term live/work unit is found in several sections of the IBC, including Sections 310, 419, 508 and 1103, so the definition should be located in Chapter 2. This proposed definition of live/work unit is currently contained within 419, but not identified as a definition.
Section 419 is revised to relocate the definition of "live/work unit" to Chapter 2. The exception to Section 419.1 is revised to more clearly coordinate with the accessory occupancy provisions of Section 508.2.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: TRAXLER-G1-202

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee supported the concept of moving the definition to Chapter 2 because it is a definition that applies throughout the code, however it was felt that the wording of the definition needed to be refined. Referrals to code sections within definitions are inappropriate and only used in Chapter 2 when the definition itself is located in a different section. The committee felt that the language of the exception to Section 419.1 needed further refinement.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler representing Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 202
DEFINITIONS

LIVE/WORK UNIT. A *dwelling unit* or *sleeping unit* in which a significant portion of the space includes a nonresidential use that is operated by the tenant. ~~See Section 419.~~

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This comment moves the definition of "live/work unit" to Chapter 2, but deletes the inappropriate cross reference that was found in the original proposal. The term is used in other chapters so it should not be located in Section 419.

Final Action: AS AM AMPC____ D

G9-09/10
202 (NEW)

Proposed Change as Submitted

Proponent: Tony Crimi, A.C., Consulting Solutions Inc., representing North American Insulation Manufacturers Association

Add new text as follows:

SECTION 202
DEFINITIONS

<u>**NONCOMBUSTIBLE MATERIAL.** A material that will not ignite or burn when subjected to specified fire or heat conditions. Materials that meet the acceptance criteria of ASTM E 136 are considered noncombustible materials.</u>

Reason: There is a need for a definition of "noncombustible material" in the IBC. Several of the I-Codes have varying definitions of the term "non-combustible material", each based upon the way in which the concept of "non-combustible" is used within that Code. Throughout the ICC code system, the concept of "noncombustible material" is based on the idea that the material should not ignite or burn when subjected to fire or heat The IBC, which uses the term extensively, does not contain a specific definition.

The concept of "noncombustible materials" and "noncombustibility" in terms of types of construction is widely used throughout the International Codes. While the IRC, IMC, and IWUIC all contain definitions of the term, they are all different from each other.

In contrast, the IBC, IFC, IEBC and IFGC do not contain a separate definition, even though they use the terminology "non-combustible materials". There is a need for a consistent definition of "noncombustible material" in all ICC codes that use the term.

In common usage, the term "noncombustible" is used to denote materials which do not ignite or are not capable of sustaining combustion. The common Dictionary definitions for "noncombustible" are typically as follows:

> **Noncombustible, adj** – not capable of igniting and burning (Webster's Third New International Dictionary of the English Language, Unabridged, 2007)

In contrast to the common usage, the traditional use of the terminology and concept of "noncombustible materials" in the Codes has been based on acceptable performance when tested in accordance with ASTM E136, Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C. Materials passing the test are permitted limited flaming and other indications of combustion. However, these have traditional been acceptable. Understandably, ASTM E136 does not replicate the full spectrum of actual building fire exposure conditions. However, this test method does provide an assessment indicating those materials which do not act to aid combustion or add appreciable heat to an ambient fire.

While each of the model I-Codes which reference the term "noncombustible" do have unique additional attributes, we are in agreement with the original proponent, that these are best addressed outside of the definition. For example, section 703.4 of the IBC does provide additional requirements and acceptance criteria which are specific to its own intent and contained in Sections 602.2, 602.3, and 602.4. However, this section only describes "Noncombustibility Tests", rather than providing a definition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action: Disapproved

Committee Reason: The committee did not believe that the proposed definition of non-combustible reflected all of the various uses of the term in the code. Installing this definition could unintentionally affect application of other provisions.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tony Crimi, A.C., Consulting Solutions Inc., representing North American Insulation Manufacturers' Association (NAIMA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

NONCOMBUSTIBLE ~~MATERIAL~~ INSULATION. A material installed for thermal or acoustical purposes, that will not ignite or burn when subjected to specified fire or heat conditions. Materials that meet the acceptance criteria of ASTM E 136 or ASTM E 2652 are considered non-combustible.

2. Add new to Chapter 35 as follows:

ASTM
E 2652-09 Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C.

Commenter's Reason: There is no general definition of "noncombustible material" in the IBC. Section 703.4 identifies "Non-Combustibility Tests", but only for the purpose of providing criteria for acceptance of building materials related to types of Construction in Sections 602.2, 602.3 and 602.4 (i.e. Type I, II, III and IV construction). It further clarifies that the term "noncombustible" does not apply to the flame spread characteristics of *interior finish* or *trim* materials, and states that a material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

Several of the I-Codes have varying definitions of the term "non-combustible material", each based upon the way in which the concept of "non-combustible" is used within that Code. Throughout the ICC code system, the concept of "noncombustible material" is based on the idea that the material should not ignite or burn when subjected to fire or heat

The IBC, which uses the term extensively, does not contain a specific definition for "non-combustible material". In terms of insulation materials, there is a need to clearly delineate requirements for flame spread, foamed plastics, and non-combustible insulations.

In common usage, the term "noncombustible" is used to denote materials which do not ignite or are not capable of sustaining combustion. The common Dictionary definitions for "noncombustible" are typically as follows:

> **Noncombustible, adj** – not capable of igniting and burning (Webster's Third New International Dictionary of the English Language, Unabridged, 2007)

In the traditional use of the terminology and concept of "non-combustible" in the Codes has been based on acceptable performance when tested in accordance with ASTM E136, *Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C*. Materials passing the test are permitted limited flaming and other indications of combustion. However, these have traditional been acceptable. Understandably, ASTM E136 does not replicate the full spectrum of actual building fire exposure conditions. However, this test method does provide an assessment indicating those materials which do not act to aid combustion or add appreciable heat to an ambient fire.

ASTM has recently published another standard ASTM E2652-09, entitled *Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C*. This test method is similar to ASTM E136, and based more on the international standard (ISO) for noncombustibility. The key difference between the two standards is in the equipment. The apparatuses in this test method and in Test Method E 136 is that the furnace tube in this test method has a conical air-flow stabilizer section attached at its bottom. Both test methods use cylindrical furnace tubes. The test Standard does not include mandatory pass/fail criterion. It allows those criteria to be determined by the Codes or other users. Appendix X3 also contains a comparison of results obtained from this apparatus versus ASTM E136. The results are quite consistent.

This additional method should also now be incorporated into the IBC as an appropriate test method.

Analysis: The standard, ASTM E2562, was not reviewed or considered by the General Code Development Committee prior to the Baltimore hearings and it was not considered by the hearing attendees at the time of the code development hearings. Section 3.6.3.1 of Council Policy # 28, *Code Development,* requires that new standards be introduced in the original code change proposal, therefore, the introduction of a new standard via a public comment is not in accordance with the process required by CP # 28 for adding new standards to the code.

Final Action: AS AM AMPC____ D

G15-09/10

202, 304.1 (IFC [B] 202), 304.1.1 304.2, 422, 710.5, [F] 903.2.2, [F] 903.3.2, [F] 907.2.2, [F] 907.2.2.1 (IFC 903.2.2, 903.3.2, 907.2.2, 907.2.2.1)

Proposed Change as Submitted

Proponent: Paul K. Heilstedt, P.E., Chair, representing ICC Code Technology Committee (CTC)

1. Revise as follows:

304.1 (IFC [B] 202) Business Group B. Business Group B occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:

Ambulatory ~~health~~ care facilities
Clinic – outpatient

(Portions of list not shown remain unchanged)

~~304.1.1~~ 304.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

(Relocate definition for Ambulatory Health Care Facilities from Section 202, and revise.)

AMBULATORY ~~HEALTH~~ CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than 24-hour basis to individuals who are rendered incapable of self-preservation by the services provided.

CLINIC-OUTPATIENT. Buildings or portions thereof used to provide medical care on less than a 24-hour basis to individuals who are not rendered incapable of self-preservation by the services provided.

SECTION 422
AMBULATORY ~~HEALTH~~ CARE FACIILITIES

422.1 General. Occupancies classified as ~~Group B~~ ambulatory ~~health~~ care facilities shall comply with the provisions of Sections 422.1 through ~~422.6~~ 422.7 and other applicable provisions of this code.

422.2 Separation. Ambulatory care facilities where the potential for four or more care recipients are to be incapable of self preservation at any time, whether rendered incapable by staff or staff accepted responsibility for a care recipient already incapable, shall be separated from adjacent spaces, corridors or tenants with a fire partition installed in accordance with Section 708.

~~422.2~~ 422.3 Smoke ~~barriers~~ compartments. ~~Smoke barriers shall be provided to subdivide every~~ Where the aggregate area of one or more ambulatory ~~health~~ care facilities ~~greater than~~ exceeds 10,000 square feet on one story, the story shall be provided with a smoke barrier to subdivide the story into not less than ~~into a minimum of~~ two smoke compartments ~~per story~~. The area of any one such smoke compartment shall not exceed 22,500 square feet (2092 m^2). The travel distance from any point in a smoke compartment to a smoke barrier door shall not exceed 200 feet (60 960 mm). The smoke barrier shall be installed in accordance with Section 710 with the exception that smoke barriers shall be continuous from outside wall to an outside wall, a floor to a floor, or from a smoke barrier to a smoke barrier or a combination thereof.

~~422.3~~ 422.4 Refuge area. At least 30 net square feet (2.8 m^2) per nonambulatory ~~patient~~ care recipient shall be provided within the aggregate area of corridors, ~~patient~~ care recipient rooms, treatment rooms, lounge or dining areas and other low-hazard areas ~~on each side of each smoke barrier~~ within each smoke compartment. Each occupant of an ambulatory care facility shall be provided with access to a refuge area~~s~~ without passing through or utilizing adjacent tenant spaces.

~~422.4~~ 422.5 Independent egress. A means of egress shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of egress originated.

~~422.5~~ 422.6 Automatic Sprinkler Systems. Automatic sprinklers systems shall be provided for ambulatory care facilities in accordance with Section 903.2.2.

~~422.6~~ 422.7 Fire alarm systems. A fire alarm system shall be provided for ambulatory care facilities in accordance with Section 907.2.2.1.

710.5 Openings. Openings in a *smoke barrier* shall be protected in accordance with Section 715.

Exceptions:

1. In Group I-2 and ambulatory care facilities, where doors are installed across *corridors*, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested. The doors shall be close fitting within operational tolerances, and shall not have undercuts in excess of 3/4-inch, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and shall be automatic closing by smoke detection in accordance with Section 715.4.8.3. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Group I-2 and ambulatory care facilities, horizontal sliding doors installed in accordance with Section 1008.1.4.3 and protected in accordance with Section 715.

[F] 903.2.2 (IFC 903.2.2) ~~Group B~~ ambulatory ~~health~~ care facilities. An automatic sprinkler system shall be installed throughout all fire areas containing an ~~Group B~~ ambulatory ~~health~~ care facility ~~occupancy~~, when either of the following conditions exist at any given time:

1. Four or more care recipients are incapable of self preservation, whether rendered incapable by staff or staff have accepted responsibility for care recipients already incapable.
2. One or more care recipients that are incapable of self preservation are located at other than the level of exit discharge.

In buildings where care is provided on levels other than the level of exit discharge, an automatic sprinkler system shall be installed on the entire floor where care is provided as well as all floors below, and all floors between the level of care and the closest level of exit discharge.

[F] 903.3.2 (IFC 903.3.2) Quick-response and residential sprinklers. Where automatic sprinkler systems are required by this code, quick-response or residential automatic sprinklers shall be installed in the following areas in accordance with Section 903.3.1 and their listings:

1. Throughout all spaces within a smoke compartment containing ~~patient~~ sleeping units in Group I-2 in accordance with this code.
2. Throughout all spaces within a smoke compartment containing treatment rooms in ambulatory care facilities.
3. ~~2.~~ Dwelling units, and sleeping units in Group R and I-1 occupancies.
4. ~~3.~~ Light-hazard occupancies as defined in NFPA 13.

[F] 907.2.2 (IFC 907.2.2) Group B. A manual fire alarm system shall be installed in Group B occupancies where one of the following conditions exists:

1. The combined Group B *occupant load* of all floors is 500 or more.
2. The Group B *occupant load* is more than 100 persons above or below the lowest *level of exit discharge*.
3. The ~~Group B~~ *fire area* contains a ~~Group B~~ ambulatory ~~health~~ care facility.

   Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

[F] 907.2.2.1 (IFC 907.2.2.1) ~~Group B~~ ambulatory ~~health~~ care facilities. Fire areas containing ~~Group B~~ ambulatory ~~health~~ care facilities shall be provided with an electronically supervised automatic smoke detection system installed within the ambulatory ~~health~~ care facility and in public use areas outside of tenant spaces, including public *corridors* and elevator lobbies.

Exception: Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, provided the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as: Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Ambulatory Care Facilities, Section 422 and related sections

This public comment represents the collaborative efforts to address the more specifically concerns regarding these uses over the past several cycles.

Change modifying the existing language includes:

Remove an unneeded reference to "Health" as the definition clearly expresses that these types of facilities are related to some form or care. Also relocate the definition to Section 304.2 to align with the formatting of other Groups that provide definitions for special occupancies within that specifically related section.

Remove an unneeded reference to "Group B" whenever the term Ambulatory Health Care Facility is used.

Added Section 422.2 to require fire partition separation from adjacent spaces in facilities with greater than 4 care recipients. The intent is to subdivide the floor to allow for a reasonable level of safety for care recipients who made need assistance to evacuate, or to allow for the option of protecting in place for a limited period of time.

Modified the continuity requirements of a smoke barrier to deal with intersection or connection to adjacent tenants, and maintain the integrity and safety.

Several of these changes are mindful of existing buildings to allow for renovations without going into other tenant spaces.

Added 22,500 square foot limit to a smoke compartment, similar to Group I-2s.

For multiple tenant spaces, language is added to the area of refuge requirements to clarify that the area of refuge must be accessed without going through adjacent tenant spaces.

Correlative changes to Sections 710, 903 and 907 are bringing consistency of terminology and provision cross references.

Cost Impact: This proposal will increase the cost of construction.

ICCFILENAME: HEILSTEDT-G2-304.1.doc

Public Hearing Results

Committee Action: **Approval as Submitted**

Committee Reason: The changes clarify the regulations of the ambulatory care facilities. It will also result in the IBC requirements being more consistent with CMS standards than they are currently.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joe Pierce, Dallas Fire Department, representing Joint Fire Service Review Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

[F] 903.2.2 (IFC 903.2.2) Ambulatory care facilities. An automatic sprinkler system shall be installed throughout ~~all fire areas~~ the entire floor containing an ambulatory care facility, when either of the following conditions exist at any given time:

1. Four or more care recipients are incapable of self preservation, whether rendered incapable by staff or staff have accepted responsibility for care recipients already incapable.
2. One or more care recipients that are incapable of self preservation are located at other than the level of exit discharge.

In buildings where care is provided on levels other than the level of exit discharge, an automatic sprinkler system shall be installed on the entire floor where care is provided as well as all floors below, and all floors between the level of care and the closest level of exit discharge, including the level of exit discharge.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: Item F68-09/10 was Approval as Submitted and addresses several of the same issues as this revision in G15-09/10. Item F68 was approved as follows:

> **903.2.2 (IBC [F] 903.2.2) Group B Ambulatory health care facilities.** An *automatic sprinkler system* shall be installed throughout ~~all fire areas~~ the entire floor containing a Group B ambulatory health care facility ~~occupancy~~ and all floors between the ambulatory health care facility and the *level of exit discharge*, including the *level of exit discharge* when either of the following conditions exist at any time:
>
> 1. Four or more care recipients are incapable of self preservation.
> 2. One or more care recipients that are incapable of self preservation are located at other than the *level of exit discharge* serving such an occupancy.

As you can see, both code change proposals revised the following items:

1. Deletion of the word "occupancy"
2. Requirement to have the fire sprinkler installed from the floor of the ambulatory care facility and the level of exit discharge; however each proposal worded this in a different fashion.

G15 additionally revised the title of the facility to simply "ambulatory care facility".
F68 also required the fire sprinkler system to be installed on the entire floor, not just the fire area. G15 also requires the entire floor to sprinklered when on a floor other than the level of exit discharge.
This Public Comment combines all the revisions between the two code changes. The last phrase in the final paragraph is added to ensure that the level of exit discharge is included in the floors requiring fire sprinklers.

Final Action: AS AM AMPC____ D

G16-09/10

305.1, 305.2 (New), 305.2 (IFC [B] 202); 308.5, 308.5.1, 308.5.2 (IFC [B] 202), 310.2; [F] 903.2.6 (IFC 903.2.6); 1015.1, Table 1015.1, 1015.7 (New), 1021.2, Table 1021.2 (IFC [B] 1015.1, Table 1015.1, 1015.7 (New), 1021.2, Table 1021.2); 1103.2.12; [P] Table 2902.1, [P] 2903.1, [P] 2903.2 (IPC Table 403.1, 403.1, 403.2)

Proposed Change as Submitted

Proponent: Paul K. Heilstedt, P.E., Chair, representing ICC Code Technology Committee (CTC)

1. Revise as follows:

SECTION 305
EDUCATIONAL GROUP E

305.1 (IFC [B] 202) Educational Group E. Educational Group E occupancy includes, among others, the use of a building or structure, or a portion thereof, by six or more persons at any one time for educational purposes through the 12th grade.

> **Exception:** Religious educational rooms and religious auditoriums, which are accessory to *places of religious worship* in accordance with Section 303.1 and have *occupant loads* of less than 100, shall be classified as a Group A-3 occupancies.

305.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

(Relocated definition for Personal Care Service from Section 310.2, and revise.)

PERSONAL CARE SERVICE. The care of ~~residents~~ occupant's who do not require ~~chronic or convalescent~~ medical ~~or nursing~~ care. Personal care involves responsibility for the safety of the ~~residents~~ occupants while inside the building.

~~**305.2**~~ **305.3 (IFC [B] 202) Group E, Day care facilities.** The use of a building or structure, or portion thereof, for educational, supervision or *personal care services* or more than five children older than 2 1/2 years of age, shall be classified as a Group E occupancy.

A facility such as the above within a dwelling unit and having five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.

SECTION 308
INSTITUTIONAL GROUP I

308.5 (IFC [B] 202) Group I-4, day care facilities. This group shall include buildings and structures occupied by persons of any age who receive custodial care for less than 24 hours by individuals other than parents or guardians, relatives by blood, marriage or adoption, and in a place other than the home of the person cared for. ~~A facility such as the above five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.~~ ~~Places of worship during religious functions are not included.~~ This group shall include, but not be limited to, the following:

Adult day care
Child day care

~~**308.5.1 (IFC [B] 202) Adult care facility.** A facility that provides accommodations for less than 24 hours for more than five unrelated adults and provides supervision and custodial care shall be classified as Group I-4.~~
~~**Exception:** A facility where occupants are capable of responding to an emergency situation without physical assistance from the staff shall be classified as Group R-3.~~

~~**308.5.2 (IFC [B] 202) Child care facility.** A facility that provides supervision and custodial care on less than a 24-hour basis for more than five children 2 1/2 years of age or less shall be classified as Group I-4.~~

Exceptions:

1. A child day care facility that provides custodial care for more than five but no more than 100 children 2-1/2 years or less of age, when the rooms where such children are cared for are located on the level of exit discharge and each of these child care rooms has an exit door directly to the exterior, shall be classified as Group E.
2. Rooms and spaces within places of worship providing such care during religious functions shall be classified as part of the primary occupancy.

A facility such as the above within a dwelling unit and having five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.

[F] 903.2.6 (IFC 903.2.6) Group I. An *automatic sprinkler system* shall be provided throughout buildings with a Group I *fire area*.

Exceptions:

1. An *automatic sprinkler system* installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities.
2. An *automatic sprinkler system* is not required where day care facilities are at the *level of exit discharge* and where every room where care is provided has at least one exterior *exit* door.
3. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic sprinkler system in accordance with 903.3.1.1 shall be installed on the entire floor where care is provided as well as all floors below, and all floors between the level of care and the closest level of exit discharge.

1015.1 (IFC [B] 1015.1) Exits or exit access doorways from spaces. Two *exits* or *exit access doorways* from any space shall be provided where one of the following conditions exists:

Exception: Group I-2 occupancies shall comply with Section 1014.2.2 through 1014.2.7.

1. The *occupant load* of the space exceeds one of the values in Table 1015.1.

   Exception: In Group R-2 and R-3 occupancies, one *means of egress* is permitted within and from individual dwelling units with a maximum *occupant load* of 20 where the dwelling unit is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

2. The *common path of egress travel* exceeds one of the limitations of Section 1014.3.
3. Where required by Section 1015.3, 1015.4, 1015.5, 1015.6 ~~or~~ 1015.6.1, or 1015.7.

Where a building contains mixed occupancies, each individual occupancy shall comply with the applicable requirements for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1.

TABLE 1015.1 (IFC [B] TABLE 1015.1)
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY

OCCUPANCY	MAXIMUM OCCUPANT LOAD
A, B, E[a], F, M, U	49
H-1, H-2, H-3	3
H-4, H-5, I-1, I-3, I-4, R	10
S	29

~~a. Day care maximum occupant load is 10.~~

2. Add new text as follows:

1015.7 (IFC [B] 1015.7) Day care means of egress. Day care facilities, rooms or spaces where care is provided for more than 10 children that are 2-1/2 years of age or less, shall have access to not less than two exits or exit access doorways.

3. Revise as follows:

1021.2 (IFC [B] 1021.2) Single exits. Only one *exit* shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single *exit* in buildings otherwise required to have more than one *exit* if the areas served by the single *exit* do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single *exits* provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single *exit* shall not be located more than one *story* below *grade plane*.

TABLE 1021.2 (IFC [B] TABLE 1021.2)
STORIES WITH ONE EXIT

STORY	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE
First story or basement	A, B[d], E[e], F[d], M, U, S[d]	49 occupants and 75 feet travel distance
	H-2, H-3	3 occupants and 25 feet travel distance
	H-4, H-5, I, R	10 occupants and 75 feet travel distance
	S[a]	29 occupants and 100 feet travel distance
Second story	B[b], F, M, S[a]	29 occupants and 75 feet travel distance
	R-2	4 dwelling units and 50 feet travel distance
Third story	R-2[c]	4 dwelling units and 50 feet travel distance

For SI: 1 foot = 304.8 mm.
a. For the required number of exits for parking structures, see Section 1021.1.2.
b. For the required number of exits for air traffic control towers, see Section 412.3.
c. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1029.
d. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
~~e. Day care occupancies shall have a maximum occupant load of 10.~~

1103.2.12 Day care facilities. Where a day care facility ~~(Groups A-3, E, I-4 and R-3)~~ is part of a dwelling unit, only the portion of the structure utilized for the day care facility is required to be accessible.

[P] TABLE 2902.1 (IPC TABLE 403.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]
(See Sections 2902.2 and 2902.3)

No.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2 OF THE INTERNATIONAL PLUMBING CODE)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAINS [e, f] (SEE SECTION 410.1 OF THE INTERNATIONAL PLUMBING CODE)	OTHER
				MALE	FEMALE	MALE	FEMALE			
5	Institutional	I-4	Adult day care and child day care	1 per 15		1 per 15		1	1 per 100	1 service sink

(Portions of table not shown are unchanged.)

[P] 2903.1 (IPC 403.1) Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in ~~day care and~~ child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

[P] 2903.2 (IPC 403.2) Urinal partitions. Each urinal utilized by the public or employees shall occupy a separate area with walls or partitions to provide privacy. The walls or partitions shall begin at a height not more than 12 inches (305 mm) from and extend not less than 60 inches (1524 mm) above the finished floor surface. The walls or partitions shall extend from the wall surface at each side of the urinal a minimum of 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished back wall surface, whichever is greater.

Exceptions:

1. Urinal partitions shall not be required in a single occupant or unisex toilet room with a lockable door.
2. Toilet rooms located in ~~day care and~~ child day care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as: Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Day Care Facilities, Section 305.3 and related sections

This public comment represents the collaborative efforts of the CTC Study Group on Care to clarify the scope and intent of the code as it applies to the subject of when care is provided and what are the appropriate elements of the building code to address the risks associated with Day Care. Changes to modify the existing language include:

Changing the provisions for religious educational facilities to become an exception.

Adding a definition section for the educational group and moving the definition of personal care services from 310.2 to 305.2, clarifying the day care as a day care facility, and adding the correlation to classify that a Group E, day care facility with five or fewer is allowed in an R-3 or may be constructed per the IRC.

Adding clarifications to the I-4 Group to include both adult and child day care services, and adding an exception for such services within a place of worship, and clarifying that day care facility with five or fewer is allowed in an R-3 or may be constructed per the IRC.

Correlating the requirements for fire suppression in Chapter 9 with the provisions for day care.

Clarifying the requirement for means of egress from day care where more than 10 children receive care.

Removing the occupancy group designations from the scoping criteria in Chapter 11 as being unnecessary, C

Clarifying that the plumbing table is applicable for day care, and that the exclusion for partitions is meant to apply to child day care, not all day care.

Issues concerning the multitude of occupancies, conflicting criteria and/or confusion between the occupancies identified as "Day Care vs. Child or Adult Day Care" were the initial impetus for the study of care. The overlap and inconsistencies for all types of care were eventually included once the true scope of the issues was recognized.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: HEILSTEDT-G3-305.1.doc

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The change would leave a gap in the code for facilities where 1 to 5 people are receiving care but they are not located in a dwelling unit. The proposal appeared to not provide an occupancy classification for this size of facilities.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing the ICC Code Technology Committee (CTC), requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

305.3 (IFC [B] 202) Group E, Day care facilities. The use of a building or structure, or portion thereof, for educational, supervision or *personal care services* ~~or~~ for more than five children older than 2 1/2 years of age, shall be classified as a Group E occupancy.

305.3.1 Five or fewer children. A facility having five or fewer persons receiving such care shall be classified as part of the primary occupancy.

305.3.2 Five or fewer in a dwelling unit. A facility such as the above within a dwelling unit and having five or fewer persons receiving such care shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.

308.5 (IFC [B] 202) Group I-4, day care facilities. This group shall include buildings and structures occupied by persons of any age who receive custodial care for less than 24 hours by individuals other than parents or guardians, relatives by blood, marriage or adoption and in a place other than the home of the person cared for. This group shall include, but not be limited to, the following:

Adult day care
Child day care

Exceptions:

1. A child day care facility that provides custodial care for more than five but no more than 100 children 2-1/2 years or less of age, when the rooms where such children are cared for are located on the level of exit discharge and each of these child care rooms has an exit door directly to the exterior, shall be classified as Group E.
2. Rooms and spaces within places of worship providing such care during religious functions shall be classified as part of the primary occupancy.
3. A building or space that has more than 5 people that receive custodial care and are occupants of that building or space as their place of employment or as a volunteer.

308.5.1 Five or fewer occupants receiving care. A facility having five or fewer persons receiving such care shall be classified as part of the primary occupancy.

308.5.2 Five or fewer occupants receiving care in a dwelling unit. A facility such as the above within a dwelling unit and having five or fewer persons receiving such care shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.

[F] 903.2.6 (IFC 903.2.6) Group I. An *automatic sprinkler system* shall be provided throughout buildings with a Group I *fire area*.

Exceptions:

1. An *automatic sprinkler system* installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities.
2. An *automatic sprinkler system* is not required where day care facilities are at the *level of exit discharge* and where every room where care is provided has at least one exterior *exit* door.
3. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic sprinkler system in accordance with 903.3.1.1 shall be installed on the entire floor where care is provided ~~as well as all floors below,~~ and all floors between the level of care and the ~~closest~~ level of exit discharge, //////////????????s all floors below the level of exit discharge, other than areas classified as an open parking garage.

(Portions of proposal not shown are unchanged)

Reason: The code change committee correctly noted in Sections 305.3 and 308.5 that there are gaps where the occupants receiving care are not in a dwelling unit. This public comment maintains intent of the original proposal but clarifies that the threshold number of individuals are those receiving care and not the total occupant load of the dwelling unit. The additions of Exception 3 to Section 308.5 addresses the instance where there are people that may need or receive custodial care but are not in the building for that purpose; it is their place of employment. Examples are facilities such as Goodwill or Salvation Army that provides employment opportunities for persons that need custodial care in the course of their work day.

The proposed revisions to Exception 3 in Section 903.2.6 clarifies the application of the sprinkler system based on code parameters of “level of exit discharge”.

Public Comment 2:

Maureen Traxler City of Seattle, representing the Department of Planning & Development, requests Approval as Modified by this Public Comment.

Further modify the definition of PERSONAL CARE SERVICE as in the original proposal, and move to Chapter 2.

PERSONAL CARE SERVICE. The care of occupants who do not require medical care. Personal care involves responsibility for the safety of the occupants while inside the building.

(*Portions of proposal not shown remain unchanged.)*

Commenter's Reason: The term "personal care service" is used in several code sections (305, 308 & 310), and so belongs in Chapter 2 rather than in one of the sections of Chapter 3.

Public Comment 3:

Maureen Traxler, City of Seattle, representing the Department of Planning & Development, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

SECTION 305
EDUCATIONAL GROUP E

305.1 (IFC [B] 202) Educational Group E. Educational Group E occupancy includes, among others, the use of a building or structure, or a portion thereof, by six or more persons at any one time for educational purposes through the 12th grade.

305.1.1 Accessory to places of worship. Religious educational rooms and religious auditoriums, which are accessory to *places of religious worship* in accordance with Section 303.1 and have *occupant loads* of less than 100, shall be classified as Group A-3 occupancies.

305.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

(Relocated definition for Personal Care Service from Section 310.2, and revise.)

PERSONAL CARE SERVICE. The care of ~~residents~~ occupants who do not require ~~chronic or convalescent~~ medical ~~or nursing~~ care. Personal care involves responsibility for the safety of the ~~residents~~ occupants while inside the building.

~~305.2~~ 305.3 (IFC [B] 202) Group E, Day care facilities. This group includes buildings and structures or portions thereof occupied by more than five children older than 2-1/2 years of age who receive educational, supervision or *personal care services* for less than 24 hours per day. ~~The use of a building or structure, or portion thereof, for educational, supervision or *personal care services* or more than five children older than 2 1/2 years of age, shall be classified as a Group E occupancy.~~

305.3.1 Within places of worship. Rooms and spaces within places of worship providing such care during religious functions shall be classified as part of the primary occupancy.

305.3.2 Five or fewer children. A facility having five or fewer children receiving such care shall be classified as part of the primary occupancy.

305.3.3 Five or fewer in a dwelling unit. A facility such as the above within a dwelling unit and having five or fewer children receiving such care shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code.*

SECTION 308
INSTITUTIONAL GROUP I

308.5 (IFC [B] 202) Group I-4, day care facilities. This group shall include buildings and structures occupied by more than five persons of any age who receive custodial care for less than 24 hours per day by individuals other than parents or guardians, relatives by blood, marriage or adoption, and in a place other than the home of the person cared for. ~~A facility such as the above five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2.~~ ~~Places of worship during religious functions are not included.~~ This group shall include, but not be limited to, the following:

Adult day care
Child day care

~~**308.5.1 (IFC [B] 202) Adult care facility.** A facility that provides accommodations for less than 24 hours for more than five unrelated adults and provides supervision and custodial care shall be classified as Group I-4.~~

~~**Exception:** A facility where occupants are capable of responding to an emergency situation without physical assistance from the staff shall be classified as Group R-3.~~

~~**308.5.2 (IFC [B] 202) Child care facility.** A facility that provides supervision and custodial care on less than a 24-hour basis for more than five children 2 1/2 years of age or less shall be classified as Group I-4.~~

~~**Exception:**~~

308.5.1 Classification as Group E. A child day care facility that provides custodial care for more than five but no more than 100 children 2-1/2 years or less of age, when the rooms where such children are cared for are located on the level of exit discharge and each of these child care rooms has an exit door directly to the exterior, shall be classified as Group E.

308.5.2 Within a place of worship. Rooms and spaces within places of worship providing such care during religious functions shall be classified as part of the primary occupancy.

308.5. 3 Five or fewer occupants receiving care. A facility having five or fewer persons receiving custodial care shall be classified as part of the primary occupancy.

308.5.4 Five or fewer occupants receiving care in a dwelling unit. A facility such as the above within a dwelling unit and having five or fewer persons receiving custodial care shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code.*

Commenter's Reason: This modification carries out the intent of the original proposal in a more comprehensive, focused and coordinated manner. It focuses on clarifying the relationship between E and I day cares by using parallel charging language in Sections 305.3 and 308.5. Both E and I classifications apply where more than 5 occupants receive care for less than 24 hours per day. The differences are that Group E only applies where the occupants are children older than 2-1/2 years and they are receiving educational, supervision or personal care services and not custodial care.

First please note that this public comment provides a consistent format in Sections 305.1, 305.3 and 308.5 in which each provision that establishes an exception to the classification and places a building use into a different classification is specified in its own subsection rather than as exceptions or a sentence lost in the main occupancy section.

This public comment adds to Section 305.3 the same 'exception' that was originally proposed only for Section 308.5. The 'exception' allows areas used for care of children during religious functions to be considered part of the main occupancy.

New subsections are proposed in both Sections 305.3 and 308.5 that set forth the classification for occupancies with five or fewer people receiving care.

This public comment does not make any changes to the substantive provisions in chapters other than Chapter 3.

Final Action: AS AM AMPC____ D

Proposed Change as Submitted

Proponent: Paul K. Heilstedt, P.E., Chair, representing ICC Code Technology Committee (CTC)

Revise as follows:

308.1 (IFC [B] 202) Institutional Group I. Institutional Group I occupancy includes, among others, the use of a building or structure, or a portion thereof, in which ~~people are cared for or live in a supervised environment, having physical limitations because of health or age are harbored for medical treatment or other care or treatment, or in which people are detained for penal or correctional purposes or in which the liberty of the occupants is restricted~~ care or supervision is provided to individuals who, are or are not capable of self preservation without physical assistance or in which people are detained for penal or correctional purposes or in which the liberty of the occupants is restricted. Institutional occupancies shall be classified as Group I-1, I-2, I-3 or I-4.

308.2 1 (IFC [B] 202) Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

(Relocate revised definitions from Section 308.3.1, and revise.)

24 HOUR CARE. The actual time that a person is an occupant within a facility for the purpose of receiving care. It shall not include a facility that is open for 24 hours and is capable of providing care to someone visiting the facility during any segment of the 24 hours.

CUSTODIAL CARE. Assistance with day-to-day living tasks; such as assistance with cooking, taking medication, bathing, using toilet facilities and other tasks of daily living, usually on a long-term basis. Custodial care include occupants who evacuate at a slower rate and/or who have mental and psychiatric complications.

DETOXIFICATION FACILITIES. Facilities that ~~serve patients who are~~ provided treatment for substance abuse ~~on a 24-hour basis~~ ~~and~~ serving care recipients who are incapable of self-preservation or who are harmful to themselves or others.

~~CHILD~~ FOSTER CARE FACILITIES. Facilities that provide care ~~on a 24-hour basis~~ to more than five children, $2^1/_2$ years of age or less,

HOSPITALS AND ~~MENTAL~~ PSYCHIATRIC HOSPITALS. Facilities ~~buildings or portion thereof~~ ~~used on a 24 hour basis~~ that provides care or treatment for the medical, psychiatric, obstetrical, or surgical treatment of inpatients ~~who~~ care recipients that are incapable of self-preservation.

INCAPABLE OF SELF PRESERVATION. Persons because of age; physical limitations; mental limitations; chemical dependency; or medical treatment cannot respond as an individual to an emergency situation.

MEDICAL CARE. Care involving medical or surgical procedures, nursing or for psychiatric purposes.

NURSING HOMES. ~~Nursing homes are long-term care~~ Facilities that provide long-term care ~~on a 24-hour basis~~, including both intermediate care facilities and skilled nursing facilities, ~~serving more than five persons and~~ where any of the persons are incapable of self-preservation.

~~308.2~~ 308.3 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or portions thereof ~~housing~~ for more than 16 persons who reside on a 24 hour basis ~~who because of age, mental disability or other reasons, live~~ in a supervised ~~residential~~ environment ~~that provides *personal care services*~~ and receive custodial care. The occupants are capable of ~~responding to an emergency situation without physical assistance from staff~~ self preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Initial stage Alzheimer's facilities
Residential board and custodial care facilities
Social rehabilitation facilities

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2. A facility such as above, housing at least six and not more than 16 persons, shall be classified as Group R-4.

~~308.3~~ 308.4 (IFC [B] 202) Group I-2. This occupancy shall include buildings and structures used for medical~~, surgical, psychiatric, nursing or custodial~~ care on a 24 hour basis for more than five persons who are not capable of self-preservation. This group shall include, but not be limited to, the following:

Foster ~~Child~~ care facilities
Detoxification facilities
Hospitals
Nursing homes
~~Mental~~ Psychiatric hospitals

A facility such as the above with five or fewer residents shall be classified as Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2.

~~**308.3.1 (IFC [B] 202) Definitions.** The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.~~

(Relocate revised definitions to Section 308.2)

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the International Residential Code in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing sleeping units where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (not transient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer individuals are permitted to comply with the requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, or I, including:

Buildings that do not contain more than two dwelling units.
~~Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24-hours.~~
~~Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.~~
Care facilities as that provide accommodations for five or fewer persons
Congregate living facilities with 16 or fewer individuals**.**

~~Adult care and child~~ Care facilities for 5 or fewer individuals receiving care that are within a single-family ~~home~~ dwellings are permitted to comply with the International Residential Code.

R-4. This occupancy shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24 hour basis in a supervised residential environment and receive custodial care. The occupants are capable of self preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Initial stage Alzheimer's facilities
Residential board and custodial care facilities
Social rehabilitation facilities

~~Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.~~

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code ~~or shall comply with the *International Residential Code* provided the building is protected by an *automatic sprinkler system* installed in accordance with Section 903.2.8.~~

310.2 (IFC [B] 202) Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

BOARDING HOUSE. A building arranged or used for lodging for compensation, with or without meals, and not occupied as a single-family unit.

CONGREGATE LIVING FACILITIES. A building or part thereof that contains sleeping units where residents share bathroom and/or kitchen facilities.

DORMITORY. A space in a building where group sleeping accommodations are provided in one room, or in a series of closely associated rooms, for persons not members of the same family group, under joint occupancy and single management, as in college dormitories or fraternity houses.

<u>**GROUP HOME.** A facility for social rehabilitation, substance abuse or mental health problems that contain a group housing arrangement that provides custodial care but does not provide acute care.</u>

~~**RESIDENTIAL CARE/ASSISTED LIVING FACILITIES.** A building or part thereof housing persons on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment which provides personal care services. The occupants are capable of responding to an emergency situation without physical assistance from staff. This classification shall include, but not be limited to, the following: residential board and care facilities, assisted living facilities, halfway houses, group homes, congregate care facilities, social rehabilitation facilities, alcohol and drug abuse centers and convalescent facilities.~~

TRANSIENT. Occupancy of a *dwelling unit* or *sleeping unit* for not more than 30 days.

[F] 903.2.6 (IFC 903.2.6) Group I. An *automatic sprinkler system* shall be provided throughout buildings with a Group I *fire area*.

Exception: An *automatic sprinkler system* installed in accordance with Section 903.3.1.2 ~~or 903.3.1.3~~ shall be ~~allowed~~ <u>permitted</u> in Group I-1 facilities.

[F] 903.2.8 (IFC 903.2.8) Group R. An automatic sprinkler system installed in accordance with Section 903.3 shall be provided throughout all buildings with a Group R *fire area*.

<u>An *automatic sprinkler system* installed in accordance with 903.3.1.3 shall be permitted in congregate residences with 16 or fewer residents. An automatic sprinkler system installed in accordance with 903.3.1.3 shall be permitted in care facilities with 5 or fewer individuals a single family dwelling.</u>

[F] 903.3.1.3 (IFC 903.3.1.3) NFPA 13D sprinkler systems. *Automatic sprinkler systems* installed in one and two-family *dwellings*<u>, Group R-3 and R-4 congregate residences</u> and *townhouses* shall be permitted to be installed throughout in accordance with NFPA 13D.

[F] 903.3.2 (IFC 903.3.2) Quick-response and residential sprinklers. Where automatic sprinkler systems are required by this code, quick-response or residential automatic sprinklers shall be installed in the following areas in accordance with Section 903.3.1 and their listings:

1. Throughout all spaces within a smoke compartment containing ~~patient~~ <u>care recipient</u> sleeping units in Group I-2 in accordance with this code.
2. Dwelling units, and sleeping units in Group R and I-1 occupancies.
3. Light-hazard occupancies as defined in NFPA 13.

[F] 907.2.6 (IFC 907.2.6) Group I. A manual fire alarm system that activates the occupant notification system shall be installed in Group I occupancies. An automatic smoke detection system that activates the occupant notification system shall be provided in accordance with Sections 907.2.6.1, 907.2.6.2 and 907.2.6.3.3.

Exceptions:

1. Manual fire alarm boxes in ~~resident or~~ ~~patient~~ sleeping units of Group I-1 and I-2 occupancies shall not be required at *exits* if located at all ~~nurses'~~ care providers' control stations or other constantly attended staff locations, provided such stations are visible and continuously accessible and that travel distances required in Section 907.4.2 are not exceeded.
2. Occupant notification systems are not required to be activated where private mode signaling installed in accordance with NFPA 72 is *approved* by the fire code official.

[F] 907.2.6.2 (IFC 907.2.6.2) Group I-2. An automatic smoke detection system shall be installed in *corridors* in nursing homes, long term care facilities ~~(both intermediate care and skilled nursing facilities)~~, detoxification facilities and spaces permitted to be open to the *corridors* by Section 407.2. The system shall be activated in accordance with Section 907.5. Hospitals shall be equipped with smoke detection as required in Section 407.

Exceptions:

1. *Corridor* smoke detection is not required in smoke compartments that contain ~~patient~~ sleeping units where such units are provided with smoke detectors that comply with UL 268. Such detectors shall provide a visual display on the *corridor* side of each ~~patient~~ *sleeping unit* and shall provide an audible and visual alarm at the care provider ~~nursing~~ station attending each unit.
2. *Corridor* smoke detection is not required in smoke compartments that contain ~~patient~~ *sleeping units* where ~~patient~~ *sleeping unit* doors are equipped with automatic door-closing devices with integral smoke detectors on the unit sides installed in accordance with their listing, provided that the integral detectors perform the required alerting function.

1021.2 (IFC [B] 1021.2) Single exits. Only one *exit* shall be required from Group R-3 occupancy buildings or from stories of other buildings as indicated in Table 1021.2. Occupancies shall be permitted to have a single *exit* in buildings otherwise required to have more than one *exit* if the areas served by the single *exit* do not exceed the limitations of Table 1021.2. Mixed occupancies shall be permitted to be served by single *exits* provided each individual occupancy complies with the applicable requirements of Table 1021.2 for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. Basements with a single *exit* shall not be located more than one *story* below *grade plane*.

TABLE 1021.2 (IFC [B] TABLE 1021.2)
STORIES WITH ONE EXIT

STORY	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE
First story or basement	A, B[d], E[e], F[d], M, U, S[d]	49 occupants and 75 feet travel distance
	H-2, H-3	3 occupants and 25 feet travel distance
	H-4, H-5, I, ~~R~~ R-1, R-2, R-4	10 occupants and 75 feet travel distance
	S[a]	29 occupants and 100 feet travel distance
Second story	B[b], F, M, S[a]	29 occupants and 75 feet travel distance
	R-2	4 dwelling units and 50 feet travel distance
Third story	R-2[c]	4 dwelling units and 50 feet travel distance

For SI: 1 foot = 304.8 mm.

a. For the required number of exits for parking structures, see Section 1021.1.2.
b. For the required number of exits for air traffic control towers, see Section 412.3.
c. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1029.
d. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
e. Day care occupancies shall have a maximum occupant load of 10.

1107.5.3 Group I-2 hospitals. Accessible units and Type B units shall be provided in General-purpose hospitals, psychiatric facilities, <u>and</u> detoxification facilities ~~and residential care/assisted living facilities~~ of Group I-2 occupancies in accordance with Sections 1107.5.3.1 and 1107.5.3.2.

(Portions of table not shown remain unchanged.)

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Care Facilities". The scope of the activity is noted as:

Study issues associated with Day Care/Adult Care, Ambulatory Health Care and Assisted Living facilities with an emphasis on the number of occupants in relation to the supervision, and the determination of the resident's capability of responding to an emergency situation without physical assistance from the facility's supervision.

The Code Technology Committee Study Group on Care Facilities has conducted a comprehensive review of current building and fire codes, federal regulations and prior code change proposals dealing with the provision of "care". "Care" as it relates to the scope of this work relates to an occupant of a building who is compromised (mentally or physically) and receives some type of support (care). These facilities encompass a full spectrum of acuity and span a wide range of occupancy types including Groups B, E, I and R. On the lower end of the spectrum, occupants may be aged and receive occasional day living assistance such as cooking and cleaning. On the opposite end of the spectrum, occupants may be completely bedridden and dependant on medical gases and emergency power to maintain life.

The proposed changes provide clear direction for design and construction by using terms and concepts consistently and clearly identifying thresholds related to the condition of an occupant. Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements. It is not the intent of these changes to address licensing or operational issues. We do believe that the proposed changes will provide consistent and correlated language between these multiple sources of regulations that will help design and code professionals address the needs of care recipients in the many different types of facilities.

A major goal is to provide clarity and consistency of terminology. New definitions are added to specifically describe each type of care or facility and identify the distinct differences in these. Some terms are consolidated to be more descriptive of a group of occupants, yet generic enough to be used interchangeably. For example: a "Patient" is now identified as a "care recipient" and "nurse" is now "care provider". People receive care of varying types but they are not always referred to as "patients". They receive care from a wide range of persons with different technical abilities, not just a "nurse" or "staff". Other definitions address existing terms not defined within current code. The study group believes that these changes bring a practical response to the recent developments within the healthcare delivery system.

Group I-1, I-2, R-4; Section 308 and related correlations

Change modifying the existing language includes:

A modification is proposed to the general charging language of Group I to more clearly express the various types of occupancy conditions found within Group I.

Consolidate the definitions from Section 308.3.1 and 308.1 to create a definition Section 308.2 for all of Group I, consistent with current format within the code. Some of the definitions have been modified to add clarity; others are new to remove confusion of meaning and intent.

Modified the general language of specific use occupancies within Group I and R to reflect the new definitions proposed and be more current with industry and licensing descriptions, but not the provisions.

Modifications or additions have been made to the example listings of uses and correlate the terminology for a consistency of application. The threshold of more than 5 persons was added to the first paragraph of Group I-2 and the last sentence was added after the example listing to allow for families to care for person without becoming an I-2 use. This also correlates how the occupancies with less than 5 persons are handled in the other care facilities.

The definition of Child Care Facilities has been to Foster Care Facilities and the provision of 24 hours was removed as it is redundant to the general language of an I-2 use. Foster Care for more than 5, children 2 ½ years of age or less is still an I-2 use. Facilities providing care to 6 to 16 children greater than 2 ½ years of age, is an R-4 and facilities for greater than 16 children it will be an I-1. Additionally, this will eliminate the confusion between day care and 24 hour care facilities.

In Section 903.2.6 it is proposed to delete the option for the NFPA13D sprinkler system for Group I-1 because a NFPA 13D system is not permitted based on the threshold for Group I-1 being greater than 16 occupants. The sprinkler requirements for Group R is generic and currently not clear for facilities such as small congregate residences. As a small assisted living facility, the NFPA 13D sprinkler system is appropriate permitted in Group R-4 (see the revisions to Section 903.2.8) as well as other congregate residences with 16 or fewer occupants. Indicating the used in Section 903.1.3 clarifies that congregate residences with 16 or fewer occupants, while not single family dwellings, are permitted to use NFPA 13D systems. This is consistent with NFPA13D requirements. This was permitted specifically for Group R-4 in the 2000 IBC. This would also be consistent with Fair Housing Act court cases based on non-discrimination for group homes.

Changes proposed beyond Chapter 3 are correlative in nature to reflect the new definitions or provisions previously allowed under chapter 3 provisions but not correlated for ease of use.

Cost Impact: This proposal will not increase the cost of construction.

ICCFILENAME: HEILSTEDT-G5-308.1.doc

Public Hearing Results

Committee Action: Approved as Modified

Modify the proposal as follows:

308.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

DETOXIFICATION FACILITIES. Facilities that ~~provided~~ <u>provide</u> treatment for substance abuse serving care recipients who are incapable of self-preservation or who are harmful to themselves or others.

HOSPITALS AND PSYCHIATRIC HOSPITALS. Facilities that ~~provides~~ <u>provide</u> care or treatment for the medical, psychiatric, obstetrical, or surgical treatment of inpatients care recipients that are incapable of self-preservation.

[F] 903.2.8 (IFC 903.2.8) Group R. An automatic sprinkler system installed in accordance with Section 903.3 shall be provided throughout all buildings with a Group R *fire area*.

An *automatic sprinkler system* installed in accordance with 903.3.1.3 shall be permitted in congregate residences with 16 or fewer residents. An automatic sprinkler system installed in accordance with 903.3.1.3 shall be permitted in care facilities with 5 or fewer individuals <u>in</u> a single family dwelling.

(Portions of proposal not shown remain unchanged)

Committee Reason: The change reflects a collaborative effort to refine and clarify the various care occupancies. The committee remains concerned about the definition of foster care and its relationship to various state laws. In addition there was concern regarding undefined terms introduced by the change, specifically "Initial stage Alzheimer's" and 'long term care'. The committee acknowledged that this is not the same as the various state regulations, but provided a better framework for states to coordinate their regulations. On balance, the change improves the code and the committee hopes to see public comments to clarify the definitions.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, Hon. AIA, Chair, representing ICC Code Technology Committee (CTC), requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

308.2 (IFC [B] 202) Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

CUSTODIAL CARE. Assistance with day-to-day living tasks; such as assistance with cooking, taking medication, bathing, using toilet facilities and other tasks of daily living, ~~usually on a long-term basis~~. Custodial care include occupants who evacuate at a slower rate and/or who have mental and psychiatric complications<u>.</u>

NURSING HOMES. Facilities that provide ~~long-term~~ care, including both intermediate care facilities and skilled nursing facilities, where any of the persons are incapable of self-preservation.

308.3 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or portions thereof for more than 16 persons who reside on a 24 hour basis in a supervised environment and receive custodial care. The occupants are capable of self preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
~~Initial stage Alzheimer's facilities~~
Residential board and custodial care facilities
Social rehabilitation facilities

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2. A facility such as above, housing at least six and not more than 16 persons <u>receiving such care</u>, shall be classified as Group R-4.

[F] 903.2.8 (IFC 903.2.8) Group R. An automatic sprinkler system installed in accordance with Section 903.3 shall be provided throughout all buildings with a Group R *fire area*.

An *automatic sprinkler system* installed in accordance with 903.3.1.3 shall be permitted in congregate residences with 16 or fewer residents. An automatic sprinkler system installed in accordance with 903.3.1.3 shall be permitted in care facilities with 5 or fewer individuals <u>in</u> a single family dwelling.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: While the code committee agreed that the code change clarifies various care occupancies, they noted in there reason for As Modified the concern over vague terminology, specifically in regards to "long term care" and "Initial stage Alzheimer's". The CTC agrees and submits this public comment in order to rectify those concerns and correlate the language "receiving such care" in Section 308.3 to that added in G16 -09/10.

Public Comment 2:

Ed Altizer, Virginia State Fire Marshall's Office, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

1. Add definition to 308.2 (IFC [B] 202)

<u>**ASSISTED LIVING FACILITIES**. Custodial care congregate residential settings that provide or coordinate personal and health care services, 24-hour supervision, and assistance (scheduled and unscheduled) for the maintenance or care of adults who are aged, infirm or disabled and who are cared for in a primarily residential setting. Maintenance or care means the protection, general supervision and oversight of the physical and mental well-being of an aged, infirm or disabled individual. Residents may or may not need assistance to evacuate.</u>

2. Revise as follows:

308.3 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or portions thereof housing for more than 16 persons who reside on a 24 hour basis who because of age, mental disability or other reasons, live in a supervised residential environment that provides *personal care services* and receive custodial care. The occupants are capable of self preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities <u>with residents capable of self preservation</u>
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Initial stage Alzheimer's facilities
Residential board and custodial care facilities
Social rehabilitation facilities

308.4 (IFC [B] 202) Group I-2. This occupancy shall include buildings and structures used for medical or <u>custodial</u> care on a 24 hour basis for more than five persons who are not capable of self-preservation. This group shall include, but not be limited to, the following:

<u>Assisted living facilities with residents incapable of self preservation</u>
Foster Child care facilities
Detoxification facilities
Hospitals
Nursing homes
Psychiatric hospitals

A facility such as the above with five or fewer residents shall be classified as Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: Requesting further modification to G20-09/10. The current proposal in G20-09/10 limits I-2 to only medical care facilities which in itself would be in conflict with foster child care facilities. There are many facilities housing residents incapable of self preservation that are not medical facilities by state definitions. As an example, assisted living facilities are a group in Virginia that are not medical facilities but are licensed care facilities and can house residents incapable of self preservation. The term assisted living facility is also used in the I-1 laundry list but G20 removes the definition. This proposal to modify G20 would add a definition of assisted living facilities and include them as well as other care facilities in the I-2 use group.

Public Comment 3:

Joe Pierce, Chairman - Joint Fire Service Review Committee, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

308.4 (IFC [B] 202) Group I-2. This occupancy shall include buildings and structures used for medical care on a 24 hour basis for more than five persons who are not capable of self-preservation. This group shall include, but not be limited to, the following:

Child care facilities
Detoxification facilities
Hospitals
Nursing homes
Psychiatric hospitals

A facility such as the above with five or fewer residents shall be classified as Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2 <u>provided an automatic sprinkler system is installed in accordance with Section 903.3.1.3 or *International Residential Code* Section P2904</u>.

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the International Residential Code in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing sleeping units where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (not transient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer individuals are permitted to comply with the requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, or I, including:

Buildings that do not contain more than two dwelling units.
Care facilities ~~as~~ that provide accommodations for five or fewer persons
Congregate living facilities with 16 or fewer individuals**.**

Care facilities for 5 or fewer individuals receiving care that are within a single-family dwellings are permitted to comply with the *International Residential Code* <u>provided an automatic sprinkler system is installed in accordance with Section 903.3.1.3 or *International Residential Code* Section P2904</u>.

R-4 This occupancy shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24 hour basis in a supervised residential environment and receive custodial care. The occupants are capable of self preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities

Group homes
Halfway houses
Initial stage Alzheimer's facilities
Residential board and custodial care facilities
Social rehabilitation facilities

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This Public Comment revises the reference to construct small I-2 facilities and care facilities housed in a dwelling constructed under the IRC. This Public Comment will continue to allow the smaller facilities to be constructed either as an R-3, or under the IRC. When the IBC is used to construct an R-3, the facility will be equipped with fire sprinklers. And if the option is exercised to build the facility under the IRC, the facility must also be equipped with fire sprinklers. These revisions specify that even though the IRC is used, the facility must still be equipped with fire sprinklers. These occupancies, even though housing less than six occupants, still have the same clientele as the larger occupancy.

In the IBC, the reference to 903.3.1.3 is the appropriate reference and sends the user to NFPA 13D. In the IRC, Section P2904 is the appropriate reference, and Section P2904 can be used to design the fire sprinkler system or it also provides the option to use NFPA 13D.

If a new structure is built, it will be required to be sprinklered. A new facility can be constructed either as an R-3 under the IBC which will require a fire sprinkler system, or as a one-family dwelling under the IRC which will also require a fire sprinkler system is installed. However, many congregate care facilities open and occupy an existing structure. This revision will require that when an existing single family home is used as a small congregate care facility, it will also be sprinklered.

Public Comment 4:

Joe Pierce, Chair, representing Joint Fire Service Review Committee, requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

308.3 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or parts thereof for more than 16 *persons* who reside on a 24-hour basis in a supervised environment and receive custodial care. The occupants are capable of self-preservation. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Initial stage Alzheimer's facilities
Residential board and custodial care facilities
Social rehabilitation facilities

A facility such as the above with five or fewer ~~*persons*~~ <u>residents</u> shall be classified as Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2 <u>provided an automatic sprinkler system is installed in accordance with Section 903.3.1.3 or *International Residential Code* Section P2904</u>.

A facility such as above, housing at least six and not more than 16 *persons*, shall be classified as Group R-4.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This Public Comment revises the reference to construct small I-1 facilities constructed under the IRC. This Public Comment will continue to allow the smaller congregate care facilities to be constructed either as an R-3, or under the IRC.

When the IBC is used to construct an R-3, the facility will be equipped with fire sprinklers. And if the option is exercised to build the facility under the IRC, the facility must also be equipped with fire sprinklers. These revisions specify that even though the IRC is used, the facility must still be equipped with fire sprinklers. These occupancies, even though housing less than six occupants, still have the same clientele as the I-1 occupancy. The facility is still a Group Home, a Congregate Care Facility, or an Assisted Living Facility, etc.

In the IBC, the reference to 903.3.1.3 is the appropriate reference and sends the user to NFPA 13D. In the IRC, Section P2904 is the appropriate reference, and Section P2904 can be used to design the fire sprinkler system or it also provides the option to use NFPA 13D.

If a new structure is built, it will be required to be sprinklered. A new facility can be constructed either as an R-3 under the IBC which will require a fire sprinkler system, or as a one-family dwelling under the IRC which will also require a fire sprinkler system is installed. However, many congregate care facilities open and occupy an existing structure. This revision will require that when an existing single family home is used as a small congregate care facility, it will also be sprinklered.

In the first line of the paragraph the term "persons" is replaced with the term "residents". This is consistent with the revision in the charging paragraph which refers to the number of persons who reside in the facility. This would not include daytime employees for example.

Public Comment 5:

Joe Pierce, Chairman - Joint Fire Service Review Committee, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

[F] 903.2.8 (IFC 903.2.8) Group R. An automatic sprinkler system installed in accordance with Section 903.3 shall be provided throughout all buildings with a Group R fire area.

An automatic sprinkler system installed in accordance with 903.3.1.3 shall be permitted in <u>Group R-3 or R-4</u> congregate residences with 16 or fewer residents. An automatic sprinkler system installed in accordance with 903.3.1.3 shall be permitted in care facilities with 5 or fewer individuals a <u>in</u> single family dwelling.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This code change currently allows all Group R buildings to be protected with a fire sprinkler system design according to Section 903.3.1.3, which is NFPA 13D. The approved code change allowed all congregate residences to use NFPA 13D as the design standard. This Public Comment will limit the application of NFPA 13D fire sprinkler systems to congregate residences when classified as Group R-3 or R-4.

The NFPA 13D standard is only applicable to one- and two-family dwellings. A one- and two-family dwelling is what you will find within the classification of Group R-3 or R-4. The other R occupancies such as R-1 and R-2 cannot be protected with a fire sprinkler system designed according to NFPA 13D.

This Public Comment will allow the reference to appropriately apply to R-3 and R-4 occupancies.

Final Action: AS AM AMPC____ D

<u>Proposed Change as Submitted</u>

Proponent: Daniel Purgiel, LRS Architects Inc.

1. Revise as follows:

308.2 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or parts thereof housing more than ~~16~~ <u>five</u> persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. <u>The occupants require physical assistance with evacuation in responding to an emergency situation.</u> ~~The occupants are capable of responding to an emergency situation without physical assistance from staff.~~ This group shall include, but not be limited to, the following:

Alcohol and drug centers
<u>Alzheimer's facilities</u>
Assisted living facilities
~~Congregate care facilities~~
Convalescent facilities
Group homes
~~Halfway houses~~
Residential board and care facilities
~~Social rehabilitation facilities~~

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2. A facility such as above, housing at least six and not more than 16 persons, ~~shall be classified as Group R-4.~~ <u>shall meet the requirements for construction as defined for Group R-3, except as otherwise provided in this code or shall comply with the *International Residential Code*, provided the building complies with Section 903.2.6. A facility such as above, where occupants are capable of responding to an emergency situation without physical assistance, shall be classified as Group R-4.</u>

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (not transient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as R-1, R-2, R-4 or I including:

Buildings do not contain more than two dwelling units.
Adult facilities that that provide accommodations for five or fewer persons of any age for less than 24 hours.
Child care facilities that that provide accommodations for five or fewer persons of any age for less than 24 hours.
Congregate living facilities with 16 or fewer persons.
Adult and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*.

R-4 ~~Residential occupancies shall include buildings, arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.~~ Residential occupancies located in buildings or portions thereof housing more than five persons, excluding staff, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. The occupants are capable of responding to an emergency situation without physical assistance. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Residential board and care facilities
Social rehabilitation facilities

Group R-4 occupancies housing 16 or fewer persons, shall meet the requirements for construction as defined for Group R-3 except as otherwise provided for in this code, or shall comply with the *International Residential Code* provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.7.

310.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

RESIDENTIAL CARE/ASSISTED LIVING FACILITIES. A building or part thereof housing persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment which provides personal care services. ~~The occupants are capable of responding to an emergency situation without physical~~

~~assistance from staff.~~ The occupants are not bedridden, except during temporary sickness. Occupancy classification is based on the ability of occupants to respond to an emergency situation with or without physical assistance. ~~This classification~~ Residential care/ assisted living facilities shall include, but not be limited to, the following: residential board and care facilities, assisted living facilities, halfway houses, group homes, congregate care facilities, social rehabilitation facilities, alcohol and drug abuse centers and convalescent facilities.

(Definitions not shown are unchanged.)

SECTION 420
GROUPS I-I~~, R-1, R-2, R-3~~ and R

420.1 General. Occupancies in Groups I-1~~, R-1, R-2 R-3~~ and R shall comply with the provisions of this section and other applicable provisions of this code.

420.2 Separation walls. Walls separating dwelling units in the same building, walls separating sleeping units in the same building and walls separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as fire partitions in accordance with Section 709.

Exception: Walls separating dwelling units and sleeping units within Groups I-1 and R-4 occupancies, housing 16 or fewer persons are not required to be constructed as fire partitions.

420.3 Horizontal separation. Floor assemblies separating dwelling units in the same buildings, floor assemblies separating sleeping units in the same building and floor assemblies separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as horizontal assemblies in accordance with Section 712.

2. Add new text as follows:

420.4 Groups I-1 Smoke barriers. Group I-1 occupancies housing more than 16 residents shall be provided with smoke barriers in accordance with Section 710. Smoke barriers shall subdivide every story used by residents for sleeping or treatment into at least two smoke compartments. Each smoke compartment shall have a maximum of 16 sleeping rooms, or 10,500 square feet (976 m^2), whichever is less, and the travel distance from any point in a smoke compartment to a smoke barrier door shall not exceed 150 feet (60 960 mm).

420.4.1 Refuge area. At least 6 net square feet (0.56 m^2) of refuge area per resident shall be provided within the aggregate area of corridors, treatment rooms, or other low hazard common space rooms on each side of each smoke barrier.

420.4.2 Independent egress. A means of egress shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of egress originated.

420.4.3 Horizontal assemblies. Horizontal assemblies supporting smoke barriers required by this section shall be designated to resist the movement of smoke and shall comply with Section 712.9.

420.5 Group I-1 corridors. Group I-1 occupancies shall have an exit access door from dwelling units or sleeping rooms leading directly to a corridor. Corridors in Group I-1 shall be continuous to the exits and separated from other areas in accordance with Section 1018, except areas conforming to Section 420.5.1

Exception: Sleeping rooms and dwelling units with exit doors opening directly to the exterior at ground level shall not be required to have an exit access door leading directly to a corridor.

420.5.1 Group I-1 multipurpose areas. Multipurpose areas directly adjacent to sleeping rooms that are not part of a dwelling unit shall be permitted to be open to the corridor where the following criteria are met:

1. The area shall be under continuous 24 hour supervision by the facility staff;
2. The area is not used as an exit access for more than 16 sleeping rooms;
3. Travel distance within the smoke compartment, where the sleeping rooms and multipurpose areas are located, shall not exceed 75 feet (30 480 mm);
4. The area shall have direct access to an exit or shall exit into a fire-resistance rated corridor in accordance with Section 1018;
5. The area is arranged so as not to obstruct any access to the required exits;

6. The area is equipped with an automatic fire detection system installed in accordance with Section 907.2;
7. The walls and ceilings of the area outside the sleeping rooms are constructed as required for corridors;
8. The area shall be separated from incidental accessory occupancies in accordance with Section 508.2.5; and
9. Doors from the sleeping rooms opening into the area shall not have a required protection rating and shall not be required to be equipped with self-closing or automatic closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted.

3. Revised text as follows:

TABLE 503
ALLOWABLE HEIGHT AND BUILDING AREAS
Height limitations shown as stories and feet above grade plane.
Area limitations as determined by the definition of "Area, building," per floor

		TYPE OF CONSTRUCTION								
		TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
		A	B	A	B	A	B	HT	A	B
GROUP	HEIGHT (feet) HEIGHT (s)	UL	160	65	55	65	55	65	50	40
I-1[e]	S A	UL UL	~~9~~ 6 55,000	~~4~~ 2 19,000	~~3~~ 1 10,000	~~4~~ 1 16,500	~~3~~ 1 10,000	~~4~~ 1 18,000	~~3~~ 1 10,500	~~2~~ NP ~~4,500~~ NP
R-4	S A	UL UL	~~11~~ 9 ~~UL~~ 55,000	4 ~~24,000~~ 19,000	~~4~~ 3 ~~16,000~~ 10,000	4 ~~24,000~~ 16,500	~~4~~ 3 ~~16,000~~ 10,000	4 ~~20,500~~ 18,000	3 ~~12,000~~ 10,500	2 ~~7,000~~ 4,500

(Portions of Table and footnotes not shown remain unchanged)

504.2 Automatic sprinkler system increase. Where a building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, the value specified in Table 503 for maximum *building height* is increased by 20 feet (6096 mm) and the maximum number of *stories* is increased by one. These increases are permitted in addition to the *building area* increase in accordance with Sections 506.2 and 506.3. For Group R buildings equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.2, the value specified in Table 503 for maximum *building height* is increased by 20 feet (6096 mm) and the maximum number of *stories* is increased by one, but shall not exceed 60 feet (18 288 mm)or four *stories*, respectively.

Exceptions:

1. Buildings or portions of buildings, classified as a Group I-1 occupancy, specifically designated or licensed by a state to house residents with Alzheimer's disease in Types IIB, III, IV, or V construction.

~~1.~~ 2. Buildings or portions of buildings, classified as a Group I-2 occupancy of Type IIB, II, IV or V construction.

~~2.~~ 3. Buildings or portions of buildings, classified as a Group H-1, H-2, H-3 or H-5 occupancy.

~~3.~~ 4. Fire resistance rating substitution in accordance with Table 601, Note d.

508.2.4 Separation of occupancies. No separation is required between accessory occupancies and the main occupancy.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Incidental accessory occupancies required to be separated or protected by Section 508.2.5.
3. Group ~~I-1,~~ R-1, R-2 and R-3 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.
4. Groups I-1 and R-4 occupancies with more than 16 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.

508.3.3 Separation. No separation is required between nonseparated occupancies.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Group ~~I-1,~~ R-1, R-2 and R-3 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.
3. Groups I-1 and R-4 occupancies with more than 16 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.

Table 706.4
FIRE WALL FIRE RESISTANCE RATINGS

F-1, H-3[b], H-5, M, S-1	3
H-1, H-2	4[b]
F-2, S-2, R-3, ~~R-4~~	2

(Footnotes not shown, remain unchanged)

710.5 Openings. Openings in a smoke barrier shall be protected in accordance with Section 715.

Exceptions:

1. In Groups I-1 and I-2, where such doors are installed across corridors, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested. The doors shall be close fitting within operational tolerances, and shall not have undercuts in excess of ¾- inch, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and shall be automatic-closing by smoke detection in accordance with Section 715.4.8.3. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Groups I-1 and I-2, horizontal sliding doors installed in accordance with Section 1008.1.4.3 and protected in accordance with Section 715.

[F] 903.2.6 (IFC 903.2.6) Group I. An automatic sprinkler system shall be provided throughout buildings with Group I fire area.

Exception: An automatic sprinkler system installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities, housing 16 or fewer persons.

[F] 907.2.6.1 (IFC 907.2.6.1) Group I-1. An automatic smoke detection system shall be installed in *corridors,* waiting areas open to *corridors* and *habitable spaces* other than *sleeping units* and kitchens. The system shall be activated in accordance with Section 907.5.

Exception~~s~~:

~~1. Smoke detection in habitable spaces is not required where the facility is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.~~

~~2.~~1. Smoke detection is not required for exterior balconies.

[F] 907.5.2.3.3 (IFC 907.5.2.3.3) Groups I-1, ~~and~~ R-1, and R-4. Groups I-1, ~~and~~ R-1, and R-4 dwelling units or sleeping units in accordance with Table 907.5.2.3.3 shall be provided with a visible alarm notification appliance, activated by both the in-room smoke alarm and the building fire alarm system.

Exception: Visible alarm notification appliances are not required in Groups I-1 and R-4 occupancies, housing 16 or fewer persons.

1006.1 (IFC [B] 1006.1) Illumination required. The means of egress, including the exit discharge, shall be illuminated at all times the building space served by the means of egress is occupied.

Exceptions:

1. Occupancies in Group U.

2. Aisle accessways in Group A.
3. Dwelling units and sleeping units in Groups R-1, R-2, ~~and~~ R-3 and R-4.
4. Dwelling units and s~~S~~leeping units of Group I occupancies.

1107.6.4 Group R-4. Accessible Units and Type B units shall be provided in Group R-4 occupancies shall be provided in accordance with Sections 1107.6.4.1 and 1107.6.4.2.

1107.6.4.1 Accessible units. At least 4 percent but not less than one of the dwelling or sleeping units shall be an Accessible unit.

1107.6.4.2 Type B units. In structures with four or more dwelling or sleeping units or sleeping units intended to be occupied as a residence, every dwelling and sleeping unit intended to be occupied as a residence shall be a Type B unit.

Exception: The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

Reason: IBC PERSONAL CARE OCCUPANCY REVISIONS: SUMMARY OVERVIEW OF THE ISSUE

This proposal revises Group I-1 to allow not capable of self preservation residents in facilities that provide personal care services. This reflects the actual conditions that currently occur across the country as is now indicated in a referenced national study. This proposal keeps all not capable of self preservation occupants in the Group I occupancy. The study also shows that there are capable of self preservation personal care uses. This proposal moves the current capable Groups I-1 and R-4 uses exclusively to the R-4. This makes Group R for overnight residential and personal care uses that are capable of self preservation. The smaller 6-16 resident personal care uses (current R-4), and their five current "exceptions" due to size, are now proposed to be made by "exceptions" in the new proposed I-1 and R-4, instead of by a separate occupancy classification.

This following Summary Overview provides background information required to understand why these revisions are proposed. More detailed background information is provided in attachment G- Additional Detailed Substantiation and the other referenced attachments in *(parenthesis and italics).*

Issue:

The IBC Groups I-1 and R-4 are the occupancy designations for personal care. The resident profile requirement in Section 308.2 states that the "occupants are capable of responding to an emergency situation without physical assistance from staff."

The IBC statement above about the types of residents in personal care assisted living, is a central point of reference in the findings of a 130 page national analysis conducted by the State of Hawaii in 2007. The analysis is entitled "Assisted Living Analysis of All State Regulations Relative to Building Codes and Life Safety Codes," hereafter referred to as the study or analysis. Attachments A, B, and D are from the Hawaii analysis. This national review of assisted living resident types and related protection features was conducted to give recommendations to Hawaii on how it should regulate its assisted living. The findings included in the study are also used here to help substantiate the reasons for the proposed changes to the IBC.

The Hawaii Study Is The Only Known In Depth National Review of Assisted Living Relative to These Subjects.

The analysis indicates that assisted living facilities and Alzheimer's facilities have the largest populations in personal care service occupancies. There are approximately 35,000 assisted living facilities in the United States. They are licensed by state governments under similar assisted living licenses in all 50 states, each with their own unique licensure regulations.

The study shows that the current resident profile requirements in the IBC I-1 and R-4 occupancies are exclusively applicable in just 4 states, relative to assisted living. *(See Attachment A-All State Summary Table.)*

The study finds that 51 of the 89 total assisted living categories in all 50 states have residents that require physical assistance with evacuation. The IBC does not currently allow non capable types of residents in its I-1 or R-4 personal care assisted living occupancies, and personal care is not listed in the I-2 occupancy.

The study recommends that the IBC personal care occupancies should be revised to include personal care service assisted living with its actual resident types, while adding more I-2 protection requirements.

It recommends that personal care assisted living not incorporate numerous other I-2 requirements and exceptions for reasons stated later in this summary.

The recommendations in the study also allow for personal care occupancies having capable of self preservation residents as is currently found in the I-1 and R-4 occupancies, closely matching the current R-2 requirements.

The IBC revisions proposed here follow concepts from the Hawaii recommendations and three other states that have created statewide amendments to the IBC, for the same reasons found in the Hawaii study.

Both Federal and Individual State Licensing Requirements Override Current IBC Personal Care Criteria and Requirements

The study shows that approximately 36 states allow Federal Medicaid waivers to allow Medicaid reimbursement to residents in their state's assisted living facilities, bringing other Federal requirements to personal care assisted living. *(See Attachment A-All State Summary Table).* Most of these states and other individual state licensing regulations then add other life safety protection requirements not currently covered in the IBC personal care I-1 and R-4 occupancies. (*See Attachment G-Additional Detailed Substantiation-Protection Feature Sampling of Recent Projects).* The Federal Centers for Medicare and Medicaid Services (CMS) enforce these requirements in many states, similar to what occurs in nursing facilities. This majority of states across the country, under additional enforcement of life safety, allow residents who need evacuation assistance, now further limit wood frame stories, and require full coverage commercial sprinklers and smoke barriers. *(See Attachment C-IBC Revision Summary Table.)*

The current lack of coordination with a majority of state licensing regulations life safety requirements, Federal CMS regulations, and the lack of classification of actual conditions in assisted living in the IBC, cause inconsistent application of the IBC across the country. Assisted living with residents of the same capabilities, and the same number of residents and stories, may be wood frame, have residential sprinklers with no smoke barriers in one city; and be required to be steel frame, have full coverage commercial sprinklers, and have smoke barriers in a nearby city. *(See Attachment G-Additional Detailed Substantiation.)*

Proposal Includes a Broad Spectrum National Approach

Finally, this proposal takes a broad spectrum national approach to personal care service uses, while not emphasizing preferences of one or a few states**.** It deals with the issue that each state has numerous types of these personal care uses and that each state regulates them differently.

This proposal realigns the personal care occupancies to match the actual conditions and variations of occupant capabilities across the country. It will help eliminate the current inconsistent application of the IBC and make the code more consistent with other Federal and state enforced regulations. Once incorporated, the proposed revisions in the IBC will cover the full spectrum of the different types of personal care uses. *(See Attachment B-Elder Care Resident Profile Guide and C-IBC Revision Summary Table.)*

SUMMARY OF CONCEPTS & PROPOSED REVISIONS

A. Proposed Not Capable of Self Preservation Personal Care Requiring Similar Protection Found in Nursing

Most actual personal care assisted living have residents that may not be capable of self evacuation. This revision concept makes the Group I occupancy for those who are not capable of responding to emergencies on their own, and makes the R occupancy for those who are capable of responding on their own. The revision allows the non capable personal care resident type in the I-1. It then revises the I-1 to have similar protection features found in I-2 nursing. This is versus the current I-1 closely matching the current the R-2 resident capability and protection features. The remaining personal care uses that have residents that are capable of evacuation are proposed to be moved to the R-4 occupancy. *(See Attachment C-IBC Revision Summary Table, E-Current IBC Occupancy Requirements Comparison Table, and F- Proposed IBC Occupancy Requirements Comparison Table.)*

These revisions:

Allow residents that may need assistance with evacuation in the I-1 occupancy. (Matching current CMS and a majority of state assisted living regulations.)

Keep the current IBC "personal care" definition the same: Personal care is care of residents that do not require chronic nursing care etc.

Adds the three main applicable protection features from I-2 into the I-1: Further story limitations on wood framing, full sprinklerization (NFPA 13 versus the current NFPA 13R), and smoke barriers providing compartmentalization. (Matching current CMS and a majority of state regulation concepts.)

Changes the I-1 from housing more than 16 to housing over five persons, and then includes “exceptions” for 6 to 16 occupant facilities, instead of making a separate occupancy classification for them.

Includes specially designated Alzheimer’s facilities in I-1 while providing exceptions for corridors and story limitations in the proposed Chapters 4 and 5 for Alzheimer’s facilities. (Aligning with current CMS concepts, matching 47 states that allow Alzheimer’s facilities under assisted living licenses, and matching a majority of state licensing regulations.)

B. **Proposed Not Capable of Self Preservation Personal Care Requiring More Stringent Protection than Nursing**

The State of Hawaii review of all 50 states assisted living regulations showed that personal care assisted living is different from I-2 nursing care. *(See Attachment A-All State Summary Table and G-Additional Detailed Substantiation)*

It showed that all states limit assisted living care to not include nursing care beyond intermittent care which is also consistent with the current IBC personal care definition. All states regulate nursing as another higher level of care not allowed in assisted living.

All states do not allow bedridden residents in personal care assisted living, except due to short term sickness. Residents who are bedridden beyond temporary sickness, or require beyond intermittent nursing care from temporary sickness, are required to be discharged to a nursing facility in all states assisted living regulations.

Assisted living residents are required to participate in fire drills and eventually disperse to a point of safety in case of an emergency in the fire code, in state assisted living regulations, and by most CMS enforced regulations. Nursing facilities are "protect in place," meaning residents are instructed to stay in their rooms and wait for rescue as needed.

Assisted living has generally less required staff to resident ratios than nursing due to assisted living residents generally being more capable of evacuation than nursing residents.

These four criteria differentiate personal care services in assisted living from nursing care, substantiating why it is and should continue to be classified as a different occupancy. These differences then require personal care service occupancies to have some different protection features that the I-2 nursing occupancy does not require. *(See Attachment G-Additional Detailed Substantiation)*

These proposed IBC revisions:

Make corridors in I-1 and R-4 more stringent than in I-2 nursing. The current requirement for protected rated corridors in I-1 and R-4 is maintained in most cases. This is more stringent than the unprotected corridor openings and spaces open to corridors allowed in I-2 nursing in the IBC Chapter 4. Having protected corridors in personal care service assisted living is appropriate because they are not "protect in place" and they have lower staff to resident ratios.

Make smoke barriers in I-1 more stringent than in I-2 nursing. The proposal requires the smoke barrier "compartments" to be smaller in size versus what is allowed in nursing. This effectively reduces travel distance and travel time to reach a point of safety, taking into account slower residents than the general public and less staff than found in nursing.

C. Proposed Capable of Self Preservation Personal Care Requiring Similar Protection Found in Residential Occupancies

The proposed IBC revisions moves current personal care service uses with occupants capable of exiting on their own without physical assistance, to Group R-4. This makes Group R for overnight uses for those that are considered generally capable of self preservation except for short term sickness. This proposal accomplishes the following:

Makes R-4 as fully capable personal care: It moves the current I-1 and R-4 personal care uses that have all residents that can evacuate on their own to the R-4 occupancy. It changes the current R-4 from housing 6 to 16 to housing over five persons. It then includes “exceptions” for 6 to 16 occupant facilities in other sections, instead of making a whole occupancy classification for them. There are only five exceptions for differentiating the current I-1 from the R-4, so combining the two resident counts into one-occupancy is appropriate.

The detailed analysis of the current I-1, R-2 and R-4 shows essentially the same protection features between these occupancies. *(See the Attachment E Current IBC Occupancy Requirements Comparison Table)* The only differences currently between I-1 and R-2 are minor Chapter 5 and 9 differences. There are also currently no differences between the R-2 and R-4 allowable areas and stories. So moving personal care uses that have residents capable of self evacuation such as boarding homes, halfway houses, social rehab, and some assisted living to the general Group R and specifically Group R-4 is appropriate.

D. Proposal Offers Conceptual Differentiation Between Two Letter Group Occupancies

This proposal creates a true conceptual difference between the Group I and R occupancies. It also eliminates the splitting of personal care uses between the Group I (I-1) and Group R (R-4) occupancies, based solely on the number of occupants. That current condition of changing an occupancy letter group (I and R) solely for the number of residents, only occurs in these two occupancies in the code. This proposal changes this previous “number only” split, and now provides a definitive user capability difference between Groups I and R. It makes the general Group I for persons most likely depending on others to exit a building. It creates a capability level order in Group I from limited capability to fully detained occupants:

Group I-1 is revised for non bedridden conscious persons needing limited assistance in exiting a building.

Group I-2 is maintained as a “protect in place” occupancy and for persons who may require full assistance to exit a building, including bedridden and unconscious patients.

Group I-3 is maintained for persons under restraint or security.

Group I-4 is maintained as more of an exception to typical 24 hour Group I, but who’s occupants still most likely require assistance with evacuation.

The proposal then keeps the R for overnight sleeping occupancies for persons generally capable of self preservation. It keeps transient and non transient differences in R, while now also including only capable of self preservation personal care uses.

E. **Other Proposed Assisted Living Substantiations**

The proposed IBC revisions maintain assisted living as I-1 and R-4. It keeps other non-related nursing protection features and exceptions out of these personal care service occupancies. The revisions also more closely match CMS and a majority of states existing additional building protection requirements, while having little or no cost effect.

This proposal accomplishes the following:

Keep sole I-2 requirements in I-2: It keeps exclusive I-2 requirements that are not applicable to personal care, only in I-2 and not in I-1 or R-4 personal care. They include a shorter 200’ general allowable travel distance in the I-2 in Chapter 10, which is offset by the proposed smaller smoke compartment area in the I-1. There are numerous egress width differences required in the I-2 occupancy i.e. 8' corridor, 44" door, .3 egress width, that are all related to bed movement of bedridden occupants in I-2. Bedridden residents are not allowed in personal care assisted living, so those requirements are not applicable to personal care and thus are not proposed here. There is also a structural redundancy requirement for I-2 because it is a protect in place occupancy, which is also not applicable to assisted living personal care. *(See Attachment G-Additional Detailed Substantiation)*

These proposed personal care revised resident type and associated requirements closely match approximately 40 states current state regulations and CMS regulations. Also note that last three editions of the CMS enforced life safety regulations for personal care, used in over half the states, have removed the timing of the resident formulas used in older editions that resulted in over complexity of determining capability of residents. This removal of timing is now just referenced as a guide but is not a determinate of its occupancy classification system anymore. The lack of timing of residents and other proposed changes in the IBC for personal care assisted living are consistent with the requirements already in existence in approximately 29 states through current CMS and other state licensing requirements: allowing assistance with evacuation in a non I-2 type occupancy, NFPA 13 sprinklers, further wood framing story limitations, and smoke barriers. The proposed revisions are also similar with 11 other states current licensing requirements for a total of about 40 states that already include the concepts proposed here. This continuity of requirements create national consistency similar to what already occurs between CMS life safety regulations in nursing and the IBC I-2 requirements. *(See Attachment C-IBC Revision Summary Table and G-Additional Detailed Substantiation)*

Proposal allows occupancy classification options for the variations of personal care around the country: The proposal allows assisted living in the 46 or so states that exclusively have assistance with evacuation or both assistance and no assistance categories, to use all the new appropriately categorized occupancies of I-1 and R-4, versus the current lack of applicable occupancy classifications. This then effectively eliminates the discussions that must now occur as to what IBC occupancy is to be used between the building official, fire marshal, state licensing department, and applicant, when not capable residents are proposed as often occurs.

- The proposal allows the 4 or so states that do not allow assistance with evacuation in personal care assisted living, to keep their regulations essentially the same, and now be classified as a Group R-4 occupancy.
- The 5 or so states assisted licensing regulations that currently require essentially I-2 assisted living exclusively, can continue doing that through their licensing regulations (as currently occurs) or update them to the proposed new IBC format and/ or current similar CMS regulations. It also allows the 10 or so states to have multiple assisted living classifications in the revised IBC due to requiring older CMS regulations or other licensing regulations.
- This seemingly complex issue of personal care occupancy classification is now made simpler for the building code plans reviewer compared to the lack of clarity that often now occurs. These classifications are revised and based on only whether the residents are capable or not capable of evacuation: The permit applicant must still confirm the state licensing agency resident type category and comply with their regulations (usually the Department of Human Services or Department of Health).
- The applicant will initially propose an assumed classification of I-1 or R-4. The submitted set of plans to the building department should also indicate the state license agency category, to confirm in writing that the occupancy classification is correct relative to resident counts and capabilities as defined by the state regulations. The applicant should state on the permit application drawings whether the resident type proposed are capable or not capable of self preservation. The Building Official then makes the final determination of the occupancy classification based on the applicant’s statement, and/or state licensing information provided to the building official. The applicant can also be requested by the building department to quote state licensing requirements of the state licensing regulation definitions on the drawings as now often occurs. This can be accomplished because numerous states write in their regulations whether the residents are capable or not capable of self preservation. If not shown in state licensing definitions, other parts of state licensing criteria indicate capability of residents including but not limited to: the types of facilities allowed, admissions and discharge criteria, or referenced CMS enforced life safety code and their resident capability classifications. This can help prove to the Building Official whether the I-1 or R-4 is the appropriate classification.

Keeps personal care out of I-2. There are advocates for moving personal care to the I-2 occupancy. This is misdirected due to the numerous reasons indicated in the above overview including: assisted living having less than the nursing level of care residents, having less staff to resident ratios, not being protect in place, and nursing having numerous non applicable exceptions and additional protection requirements due to being a protect in place occupancy.

- The major difference though is having less staff to resident ratios in assisted living. Higher staff ratios allows nursing and hospitals to be protect in place and exempt corridor protections, while also adding additional structural redundancy requirements.
- These I-2 advocates also do not recognize that moving non capable personal care to I-2 would cause a non justified increase in construction costs with no relative increased occupant protection: A majority of assisted living facilities are constructed of protected wood frame and many are over one story. Wood frame costs are generally in the $100 to $130 per square foot range for these facilities. Steel frame costs up to 5 stories, are generally in the $130 to $160 per square foot range for the limited number of these facilities built this way. Changing these personal care facilities to I-2 would cause a majority of facilities to be steel frame (I-2 limits

wood frame to 1 story) for little if any protection increases in comparison to the other protection features included in this proposal. This potential construction cost increase of 20% would be an undue burden on the industry. Keeping them in the new proposed I-1 (2 story wood) and R-4 (4 story wood) will have little if any affect on construction costs, especially in the majority of states under current CMS and state regulations with similar story and protection requirements matching this proposal.

Other options for including both capable and non capable personal care, with their different requirements, cause as many or more revised sections to the IBC, but create or do not solve other issues. Keeping personal care in the I-1 and R-4, while delineating capability differences between these two occupancies is the most appropriate occupancy designation solution for dealing with personal care. The following are summaries of numerous options for revising personal care. All the revision options below assume including both capable and non capable personal care while adding new requirements to non capable uses, similar to what is in this proposal. The following summary concludes that this proposal option in this submittal is the best overall long term solution to match actual conditions across the country.

- This proposal option:
  - (+) Makes conceptual I and R use differences with I as not capable and R as capable.
  - (+) Ads new requirements in the revised I-1.
  - (+) Removes the number only split of the current I-1 and R-4.
  - (+) Best long term conceptual revision.
  - (+/-) 22 sections revised.
- Option for making I-1 and R-4 not capable personal care, keeping current number split, and adding capable personal care to R-2:
  - (+) Leaves current I-1 and R-4 mostly in tact with just revising resident type, while adding new requirements.
  - (-) Adds capable personal care list to R-2 and mixes the use with R-2.
  - (-) Leaves the number only split of the current I-1 and R-4.
  - (+) Requires 10-15 revised sections.
- Option for keeping the current capable I-1 and R-4, and adding not capable personal care to I-2:
  - (+) Leaves current I-1 and R-4 in tact.
  - (-) Adds not capable personal care list to I-2 and adds various exceptions for non bed, not protect in place, and lower staff ratio personal care requirements and exceptions to I-2.
  - (-) Limits not capable personal care to one story wood, increasing construction costs.
  - (-) Leaves the number only split of the current I-1 and R-4.
  - (+/-)Requires 15-20 revised sections.
- Option for adding a new not capable personal care occupancy designation number in either I or R (R-5?):
  - (-) Creates a new occupancy
  - (-) Requires 40+ revised sections plus major IFC revisions.

ITEMIZED IBC SECTION REASONS

Section 308.2 is revised to allow residents in Group I-1 that require assistance with evacuation. Residential care/assisted living facilities and other personal care uses that are allowed by individual state licensing regulations to have these types of residents remain in this revised Group I-1.

The previous reference of "assistance from staff" is removed, since assistance can be from staff as was previously mentioned in this section, or from other residents, or from first responders, such as fire department personal. The proposed reference of just "assistance" assumes that assistance with evacuation can be from anyone. Assistance from anyone then places a resident in this category.

The term "not capable of self preservation" is not included as part of the personal care occupancy descriptions since the term is not currently defined in the IBC. The term is currently used in the I-2 and is generally accepted as meaning that an occupant is not capable of self preservation when they are incapable of responding to an emergency situation on their own to exit a building without physical assistance. The current I-1 Section 308.2 clarifies what the implied definition of capable of self preservation is by stating that occupants are capable of responding to an emergency situation on their own without physical assistance. This approach of stating the implied definition versus using the term itself is maintained in the proposed I-1 and R-4 occupancy resident type descriptions to clarify the intent without referencing a definition. The statements in the current I-1 and both the proposed I-1 and R-4, then definitively delineate resident capability classification.

Alzheimer's facilities are also specifically itemized since the Hawaii study showed that 47 states allow these facilities under assisted living licenses. *(See Attachment A-All State Summary Table).* Current CMS regulations also allow these facilities in their non nursing health care regulations. Alzheimer's facilities have additional requirements in the proposed Chapter 5 story limitation revisions. There is also a corridor protection exception to allow the current common "neighborhood" designs for Alzheimer's facilities in the proposed Chapter 4. See those section's "Reasons" for substantiation.

Some other types of uses are removed from the current I-1 list because none of those uses are considered to have occupants that are not capable of self preservation.

Group I-1 is also changed from housing more than 16 to housing over five persons, matching the current I-2 resident count. The "exceptions" for 6 to 16 occupant facilities are listed in other revised sections under I-1, instead of making a separate occupancy classification. The facilities that have residents capable of self evacuation are moved from the current I-1 category to the R-4 category since there are currently only minor differences between the I-1, R-2, and R-4 occupancies. The categories moved to the R-4 include the complete list of uses from the current I-1, since some or all of these types of facilities have residents that are capable of self preservation. They include: Alcohol and drug centers, congregate care facilities, convalescent facilities, group homes, halfway houses, social rehabilitation facilities, and the limited types of assisted living and residential care facilities that require full capability. Clarification of the differences between the I-1 and I-2 is that I-1 facilities only provide "personal care service" as appropriately defined in the current IBC. Personal care services (I-1, R-4) do not provide "chronic convalescent, health, medical or surgical care." The Group I-2 occupancy is the appropriate facility to provide those types of services. *(See Attachment C-IBC Revision Summary Table)*

The last paragraph of this section continues cross-referencing other related occupancies, which now include adding cross-referencing R-3, and referring capable personal care to the R-4 occupancy. Exceptions for complying with construction requirements for R-3 are maintained for facilities with 6-16 residents, including requiring added compliance with Section 903.2.6 (sprinklers), written in the same format as the current R-4 last paragraph description.

Section 310.1 Group R-4 is revised to include personal care facilities, all of which have residents that do not require physical assistance with evacuation, similar to the current I-1. The whole section is re-written to match the current I-1 description. These types of facilities that have residents that are capable of self evacuation are moved from the current I-1 category to the R-4 category since there are currently only minor differences between the I-1, R-2, and R-4 occupancies. The categories moved to the R-4 include the complete list of uses from the current I-1, since some or all of these types of personal care service facilities have residents that are capable of self preservation. They include: Alcohol and drug centers, congregate care facilities, convalescent facilities, group homes, halfway houses, social rehabilitation facilities, and the limited types of assisted living and residential care facilities that require full capability by certain individual state licensing regulations. *(See Attachment A-All State Summary Table)*. *(See Attachment C-IBC Revision Summary Table)*

The number of residents is revised from the current 6-16 to more than five residents. The "exceptions" for 6 to 16 occupant facilities are listed in other revised sections under R-4, instead of making a separate occupancy classification. The last paragraph of this section continues cross-referencing other related occupancies, which now include adding cross-referencing R-3.

Section 310.2 The "Residential Care/Assisted Living" definition is revised to delete the previous resident capability limitation. The revised definition states that occupancy classification is based on the ability of occupants to respond to an emergency situation with or without assistance. The limitation on not allowing assistance with evacuation is now only written into the R-4 occupancy description. The Group I-1 occupancies are revised to allow assistance with evacuation. The definition further adds text that the occupants are non bedridden persons, except during temporary common sicknesses that occur in the general public. This is added to clarify the limitation of personal care versus I-2 nursing care. It is consistent with the current "personal care" definition and current assisted living regulations across the country. See the Summary Overview substantiating the concept reasons for the change. Other aspects of the current definitions remain unchanged, since they reflect current common distinctions in the personal care service industry.

Section 420.1 Group R-4 is added since it is now proposed to be similar to the current I-1 in terms of resident types. The new R-4 requirements mostly parallel the current I-1 requirements.

Section 420.2 The exceptions for 6 to 16 occupant facilities are listed here matching current requirements, instead of making a separate occupancy classification.

Section 420.4 Smoke barriers are added as a requirement in Group I-1 occupancies with over 16 residents. They are added to I-1 due to the abilities of the new proposed resident type allowed and to match already existing CMS and state licensing regulations in a majority of states.

The section utilizes similar language and format from the current I-2 Section 407 for smoke barriers. This proposed section provides smoke barrier size and travel distance requirements that are more restrictive than the Group I-2 requirements. These limits, compared to I-2 smoke compartment size, are proposed because of the probability of less staff in personal care occupancies to assist in evacuation when compared to nursing. Smaller smoke compartments and shorter travel distance assumes less time to reach a point of safety from the compartment of origination. The proposed revisions limit the size of smoke compartments to 16 sleeping rooms, or 10,500 square feet, whichever is less, versus the 22,500 square feet allowed in I-2. The proposed limit is taken from the basic Group I-1 exceptions for over 16 occupant criteria throughout the code, or 10,500 square feet, the basic allowable area allowed in the I-1 occupancy. There are four states that have statewide amendments to the IBC for personal care implementing the overall concepts in this proposal. The State of Oregon and Hawaii statewide building code amendments reduce smoke compartment size in their non capable personal care occupancies to the approximately the size proposed here. Oregon has over a twenty year history of amendments for personal care occupancies with residents who are not capable of self preservation, including reduced smoke compartment size.

The use of the term "sleeping room" is included so not to mix the more limiting Chapter 10 occupant load calculations into this requirement. The concept is that actual sleeping rooms will be counted. The travel distance will additionally control the size. The reduction from the I-2 travel distance of 200' is reduced in the I-1 by 25 percent to 150'. This reduction is also based on the probability of less staff to assist residents in personal care during evacuation.

(See Attachment C-IBC Revision Summary Table)

Section 420.4.1 The added refuge area requirement utilizes wording matching the current I-2 Section 407.4.1.

Section 420.4.2 The added Independent egress requirement utilizes wording matching the current I-2 Section 407.4.2.

Section 420.4.3 The added Horizontal assembly requirement utilizes wording matching the current I-2 Section 407.4.3.

Section 420.5 is added to confirm that corridors are required in I-1 occupancies and to provide a scoping statement for the multipurpose areas next to sleeping room exception in lieu of corridors proposed in the new following Section 420.5.1. The language in this Section 420.5 is derived from the same scoping language requiring corridors in I-2 in Section 1014.2.2, then introducing the "suite" exception in the next Section 1014.2.3.

Section 420.5.1 is added to allow "neighborhood designs" often seen in many Alzheimer's facilities. These designs often have 10 to 16 sleeping rooms open into a common shared living, activity, and dining area. Many facilities currently using this design layout use the accessory provisions allowed in the exit access intervening room requirements in Chapter 10, or use Section 407 exceptions if classified as the I-2 occupancy. These proposed provisions utilize concepts and wording from the spaces open to corridor provisions for nursing in found Section 407.2.3.

The intent here is to allow these neighborhood designs when there are only sleeping rooms that open into the spaces as found in Alzheimer's facilities. Typical assisted living units that have their own bathroom, kitchenette, and living rooms, are dwelling units so they are excluded from utilizing this exception. They are not included in this exception due to a self contained dwelling unit not requiring a common shared living, eating and activity area just outside a sleeping room. The key controlling requirement of this exception to corridor protection is the size of the compartment by the further limiting travel distance to 75' within that smoke compartment. This affectively limits travel time before reaching the required protection areas outside the compartment. The 16 sleeping room limit is derived from the maximum number of sleeping rooms allowed in a smoke compartment in the proposed Section 419.4. Other controlling features are from Section 407.2.3.

Table 503 IBC Table 503 is proposed to be revised to reflect changes to the definitions and resident type in the revised Group I-1 occupancy:

The proposed I-1 basic allowable areas remain with the same limits as the current I-1.

There are revised limitations on the number of stories allowed that reflect current Federal CMS limits on these occupancies. *(See Attachment D Areas & Height Table)*

Approximately 36 states reference Federal CMS regulations for their assisted living occupancies, so general continuity between CMS enforced regulations and the IBC should occur. The revisions to the story limitations show a variance from one to three stories. The two story limitation in Type VA construction, also match California's IBC statewide amendments to the story limitations for its similar occupancy. California's state amendments also match other key protection features of CMS board and care regulations. *(See Attachment C-IBC Revision Summary Table)*

The two story limitation for up to one hour wood protection matches current CMS requirements and is appropriate for this occupancy due to the type of residents. These occupants are expected to be able to evacuate the building with or without assistance in case of emergencies. They are not bedridden as in I-2 nursing, (with one story limits), and with the I-2 occupants that may stay in place during emergencies in a "protect in place" occupancy. This further substantiates the difference in Group I-1 two-stories versus the Group I-2 one story. There are already numerous existing two story wood frame assisted living facilities. This will allow these existing facilities to continue to be in compliance.

Type IIA with fire sprinklers allows three stories. This matches the Federal CMS limits.

Type IB is allowed seven stories with fire sprinklers, half way in between the current I-1 and I-2 limits, with two more stories than the current I-2 limits. Type IB construction contains the most differences between various versions of CMS and other state enforced regulations. This proposal is an average of the difference between Federal CMS regulations and Group I-2.

Table 503 is revised for the new Group R-4 to match the current Group I-1, being that the current I-1 is essentially moved to the new R-4. The revisions here are more clerical revisions than actual revisions because of moving the current I-1 occupancy to the R-4.

Section 504.2 Exceptions. Most Group I-1 and all Group R-4 occupancies are still allowed the sprinkler increase of one story and 20 feet in height from Table 503 by the base scoping language of the unrevised Section 504.2. Group I-1 occupancies with specifically designated Alzheimer's facilities are added to the exceptions for not being allowed the sprinkler story and height increases in Type IIB, III, IV, or V construction, similar to the current I-2 exception. The wording of the phrase includes the text "specifically designated or licensed by a state" to clarify that these are specially designated facilities licensed by most state Department of Human Services or Department of Health. This text is included to exclude applying the exception to assisted living facilities that may have some residents with dementia and early Alzheimer's disease as occurs in many assisted living facilities. The exception is only intended for exclusively designated Alzheimer's facilities, due to the likelihood of all residents not being capable of self preservation.

This is an additional requirement for these facilities matching the story limitations of wood frame construction of the I-2, which most jurisdictions have categorized Alzheimer's facilities in the past. The revision affectively keeps Alzheimer's facilities with all the appropriate I-2 protection features except for non applicable protect in place and bedridden requirements. This is a practical exception versus placing these facilities in the I-2 occupancy, which would cause additional exceptions for Alzheimer's facilities due to the additional and reduced protection features required in the I-2 as stated in the Summary Overview. The State of Hawaii study also shows that Alzheimer's facilities are allowed with a special license in 47 state assisted living regulations. So keeping them in the same I-1 occupancy with the additional I-2 protection features, making them almost equivalent to I-2 protection, is appropriate.

The limitation of occurring on the first story in combustible and non protected construction is proposed because numerous state assisted living regulations and states using older CMS life safety codes limit these facilities to the first story in these construction types. (The last three editions of CMS enforced life safety code does allow two stories though.) The first story limitation is appropriate though mostly due to the likelihood that few if any of an exclusive Alzheimer's facility's residents have the capability of responding to an emergency on their own. This is compared to non Alzheimer's assisted living facilities proposed to be allowed to be two stories in height. These proposed two story types of assisted living facilities have fewer to substantially fewer occupants requiring assistance with evacuation.

Section 508.2.4 is revised to reflect the revisions to the I-1 and R-4 occupancies, now incorporating more than 5 residents. Group I-1 and R-4 are moved to number 4 of this section to cover the 16 resident exceptions for both occupancies. The exception for 16 and under residents in I-1 and R-4 occupancies is added to maintain current requirements found in the similar current R-4. This is proposed versus making a whole new occupancy classification based only on the number of residents. The revisions here are more clerical revisions than actual revisions because of revising resident counts in the I-1 and R-4.

Section 508.3.3 is revised to reflect the revisions to the I-1 and R-4 occupancies now incorporating more than 5 residents. Group I-1 and R-4 are moved to number 4 of this section to cover the 16 resident exceptions for both occupancies. The exception for 16 and under residents in I-1 and R-4 occupancies is added to maintain current requirements found in the similar current R-4. This is proposed versus making a whole new occupancy classification based only on the number of residents. The revisions here are more clerical revisions than actual revisions because of revising resident counts in the I-1 and R-4.

Table 706.4 is revised to reflect the revisions to the R-4 occupancy, being that the current I-1 is essentially moved to the new R-4 while now incorporating more than 5 residents. The revisions here are more clerical revisions than actual revisions because of essentially moving the I-1 to the R-4.

Section 710.5 is revised to include cross corridor doors in the new required smoke barriers in Group I-1, matching the same exceptions allowed for I-2. This exception matches current CMS requirements.

Section 903.2.6 is revised to require full NFPA 13 sprinkler coverage in the I-1 occupancy when housing over 16 residents. This is proposed to reflect that the new I-1 residents may require physical assistance to evacuate. The exception is revised to allow NFPA 13R in smaller facilities versus creating a whole new occupancy classification for them for the few exceptions. The requirements also match current CMS and state assisted living regulations in a majority of states. *(See Attachment A-All State Summary Table and C-IBC Revision Summary Table)*

Section 907.2.6.1 is revised to eliminate the exception for eliminating automatic smoke detection when sprinklers are provided. This proposal requires smoke detection even with sprinkler exceptions to reflect that the new less capable I-1 resident type.

Section 907.5.2.3.3 is revised to match the current I-1 and current R-4 requirements. Group R-4 is added because it is now proposed to match the current I-1 in resident capability but not in resident counts. The exception is added to match current R-4 not requiring visible alarms when there are 16 or less residents. The exception for 16 and under residents in I-1 and R-4 occupancies is added to maintain current requirements found in the similar current R-4. This is proposed versus making a whole new occupancy classification based only on the number of residents. The revisions here are more clerical revisions versus technical requirement changes solely due to moving the current I-1 to the new R-4 occupancy and changing resident counts in the occupancies.

Section 1006.1 is revised to match the current I-1 and new R-4 requirements. Group R-4 is added because it is essentially moved from the current I-1. Dwelling units are added in Group I because some I-1 uses have dwelling units, making them consistently exempt.

Section 1107.6.4 is revised to match the current I-1 with the new R-4 requirements. The revisions are clerical revisions versus technical requirement changes solely due to moving the current I-1 to the new R-4 occupancy and changing resident counts in the occupancies.

Cost Impact: The code change proposal will not increase the cost of construction due to current enforcement of similar requirements by other regulations such as CMS and state licensing regulations.

1. If no Assisted licensing category exists in a particular State, the closest category is listed. See more detailed description in "Assisted Living Occupancy Criteria Analysis by State."
2. **(M)** Indicates Medicaid Waiver is allowed in State.
3. **AEA:** Assistance with Evacuation Allowed is specifically stated. **NCOSP:** (Not) Capable of Self Preservation
4. **Y:** NFPA resident criteria allowed with its wood construction and limitation on wood stories. No limitation of location of residents on first floor when requiring assistance with evacuation is stated.
5. **X:** Self evacuation or nursing design is required, or location of residents on first floor is required when requiring assistance with evacuation is stated.
6. **IBC**: International Building Code, **NFPA:** National Fire Protection Association, **IFC:** International Fire Code.
7. Assumed base IBC Occupancy classification as determined by this analysis without any individual State amendments or interpretations.
   If "unable to evacuate" is a criteria for discharge, then IBC I-1 (Assisted Living) is the assumed IBC classification under this analysis.
   If "unable to evacuate" is not a criteria for discharge, and assistance with evacuation is allowed, only when noted, then the interpretation by this analysis under the IBC is that the occupancy classification would be I-2 (Nursing "not capable of self preservation" i.e. resident cannot get out on their own).
   If continuous nursing is allowed, and unable to evacuate are not marked, then it is assumed that all facilities would fit into the I-2 occupancy under this analysis.
   If Alzheimer's care is allowed then I-2 occupancy is the assumed designation under this analysis.
   If NFPA Residential Board and Care is referenced, then "prompt" is assumed to be I-1, and "slow" and "impractical" are assumed as I-2.
   <u>Assumed</u> IBC occupancy is stated because the personal care/ assisted living occupancy is not listed as part of the IBC I-2 occupancy.
8. Where noted, most likely 2 occupancies are assumed to be used in the State dependent on "Level of Care," or whether Alzheimer's residents allowed in special licensed units.

ATTACHMENT B (From the State of Hawaii Analysis)

ELDER CARE RESIDENT PROFILE GUIDE TABLE [1]				
Retirement/ Apartments	**Assisted Living**			**Skilled Nursing**
Independent	**Minimum Assistance**	**Standby Assistance**	**Hands-on Assistance**	**Total Assistance**
IBC: R-2 [2]	**IBC: I-1 [2]**	**IBC: I-2 [2]**	**IBC: I-2 [2]**	**IBC: I-2 [2]**
NFPA: Apartments[2]	**NFPA: Board & Care[2]**	**NFPA: Board & Care[2]**	**NFPA: Board & Care[2]**	**NFPA: Health Care[2]**
Able to respond independently in an emergency	Able to respond in an emergency	May need assistance in an emergency	Needs assistance in an emergency	Needs supervision and hands-on assistance in an emergency
Able to negotiate stairs in an emergency and exit the building	Walks/transfers independently - infrequent falls	Transfers - Standby assistance may be needed	Transfers- 1 person assist usually needed, and fall risk	Transfers - 2 person assist may be needed/Mechanical lift/bedfast
ADL (Acts of Daily Living)- Resident is able to accomplish all without assistance from staff	ADL - Independent to verbal reminders	ADL - Reminders to giving verbal cues	ADL - Verbal cues and/or hands-on assistance	ADL - Hands-on assistance
Transfer & ambulate. Eats and takes medications	Independent with medications & Dr. appointments	Medication reminders and management	Medication management	Medication adjustments and behavior management
Capable of own toileting and personal hygiene	Continent of bowel and bladder	Occasional incontinence assistance	Incontinence management	Incontinence management
Bathes, dresses, grooms	Independent in bathing	Bathing set up and monitoring	Bathing assistance	Bathing assistance
Meals/housekeeping, provide if chosen. No personal care assistance or monitoring	Meals, nutrition and housekeeping assistance is helpful	Meals, nutrition and housekeeping assistance is helpful	Meals, nutrition and housekeeping assistance is helpful	Verbal cues and hands-on assistance to eat
Would benefit from socialization and activities with minor encouragement	Able to independently plan and participate in social activities	Reminders and encouragement to participate in activities	Encourage and escort to participate inactivities	Encourage and escort to activities
No memory impairment	Little memory impairment	Mild memory impairment - sometimes disoriented	Impaired memory, poor orientation and mild confusion	Needs 24 hour nursing supervision or skilled services such as physical, occupational and/or speech therapy
Capacity for decision-making and understanding consequences	Some decline in capacity for self care and understanding consequences of actions	Declining capacity for self care and understanding consequences	Limited capacity and inability to understand consequences of actions	Limited or no capacity for self care and understanding of consequences of actions
Family does not "need" to move	Family "slightly concerned"	Family "concerned"	Family "very concerned" -"Have to do something"	Family must do something

1. Based on and edited from Nevada Elder Care Assisted Living Guidelines.
2. This analysis assumed occupancy designations from the 2006 IBC and 2003 NFPA 101.

(From the State of Hawaii Analysis)

Specific Criteria of Self-Preservation:
There are very specific details of the ability of occupants of a building to be “capable of self-preservation.” NFPA and its codes and guides outline very specific details of this topic. The NFPA 101A Guide on Alternative Approaches to Life Safety (2001 Edition) is referenced and summarized here to underscore the many details of self-preservation.

Chapter 6 of the NFPA defines variations of capabilities of occupants for Residential Board and Care occupancies. This is the most important aspect of determining if a building should have additional life safety elements incorporated into its design, therefore the topic is discussed in detail here. This NFPA Chapter 6 reviews capability and then offers calculation tables to determine occupant's ability of self-preservation. The review below summarizes some specific points of this NFPA Chapter 6. It then assumes the determination of self-preservation at the end of each category in *italics.*

Risk of Resistance

Some residents may resist leaving the building during an emergency situation. "Minimal risk" indicates that there is no specific evidence to suggest that the resident might resist an evacuation.

"Mild resistance" indicates that there is specific evidence that the resident had previously resisted instructions from staff or may have hidden from the staff and then might resist leaving the building in a situation similar enough to a fire emergency. "Strong resistance" includes resistance by the resident who necessitates the full attention of one or more staff members. The resident may have struggled vigorously, refused to cooperate, or has hidden in similar fire situations to predict that behavior recurring in an actual emergency.

Residents who show mild and strong resistance are considered not capable of self-preservation.

Impaired Mobility

The resident is rated according to how easily he can leave a building "given the presence of factors such as physical barriers that hinder movement (e.g. stairs), the resident's ability to get out of bed, or the chairs normally used. The resident should be given credit for being able to use devices that aid movement (e.g., wheelchairs, walkers, crutches, and leg braces) only if those devices are always available in an emergency situation….Guiding or directing the resident by giving gentle pushes or leading by the hand is not considered requiring physical assistance."

"Self starting" means a resident is physically able to start and complete an evacuation without physical assistance.

"Slow" is when the resident prepares to leave and travels to the exit or area of refuge at a speed significantly slower than the general population. The NFPA classifies the general
population as "prompt," meaning they can reach an exit (point of safety or area of refuge) within approximately 3 minutes. The NFPA categorizes a resident as being "slow" if it takes the resident more than 90 or 180 seconds to travel from a sleeping room to an exit, point of safety, or area of refuge. NFPA describes "very slow" as requiring over 150 seconds to reach an exit.

Residents who are self starting and slow or very slow are considered being capable of self-preservation. Residents who are not self starting and are considered beyond slow are not capable of self-preservation.

"Needs limited assistance" means "that the resident might need some initial or brief intermittent assistance but can accomplish most of the evacuation without assistance." The residents may require help getting into a wheelchair, descending stairs, getting out of bed, or opening a door, for example.

"Needs full assistance" means the resident either needs physical assistance from a staff member during most of the evacuation or must be assisted by staff by being carried from the facility, helped into the wheelchair and wheeled out of the facility, or helped into leg braces and helped to descend stairs.

Residents who require limited and full assistance are considered not capable of self-preservation.

Impaired Consciousness

The resident has experienced seconds or minutes of temporary impairment of consciousness over six times during the previous three months. The resident is only classified this way if the impairment would significantly interfere with his or her ability to exit the building. Temporary medical problems are also not counted in this definition. "Partially" impaired consciousness means the resident is still able to participate in an evacuation to some degree. "Totally" impaired consciousness means the resident needs full assistance by at least one staff member to evacuate out of a building.

Residents who are partially or totally impaired are considered not capable of self-preservation.

Need for Extra Help

The resident may need assistance in various circumstances from more than one staff to egress a building, whether to initially get out of bed or other individual actions or if the resident requires assistance during the duration of exiting the building.

Response to Instructions

This is the resident's ability to receive, comprehend and follow through with simple instructions during a self directed evacuation. Residents may require non constant "supervision, considerable attention, or might not respond during an evacuation."

Residents who need extra help or require supervision, considerable attention, or might not respond during an evacuation are considered not capable of self -preservation.

Waking Response to Alarm

Buildings with non-centralized alarm systems, residents who are on medication that inhibits responses to alarms, residents who have apparent hearing impairment (unless they are in a room with visual alarms), or if hearing aids are removed during the night, or residents who are exceptionally sound sleepers are all considered as "response not probable" to responding to an alarm.

Residents who are not probable to responding to an alarm are considered not capable of self-preservation.

ICCFILENAME: Purgiel-G1-308.1.doc

Public Hearing Results

Committee Action: Disapproved

Committee Reason: The committee acknowledged the proponent's effort to provide clarity to these regulations, but felt that the restructuring of the Group I-1, I-2 and R-4 occupancies to be unclear. There was concern that the resulting reductions in Table 503 were not justified. They found the additional provisions proposed in Section 420 to be confusing as to how they would be applied. The proposed smoke compartments are small and did not seem coordinated with other portions of the proposal.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Daniel Purgiel, LRS Architects Inc. and Tom Jaeger, Jaeger & Associates, LLC, representing American Health Care Association (AHC), American Association of Homes & Services for the Elderly (AAHSA), requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

1. Revise as follows:

308.2 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or portions thereof housing more than 16 persons on a 24 hour basis who because of age, mental disability or other reasons, live in a supervised environment that provides *personal care services* ~~The occupants are capable of responding to an emergency situation without physical assistance from staff.~~ Occupants are either capable or incapable of self preservation.

I-1 A facility with occupants receiving personal care that are capable of self preservation, ~~This group~~ shall include, but not be limited to, the following:

Alcohol and drug centers
~~Assisted living facilities~~
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
~~Residential board and care facilities~~
Social rehabilitation facilities

I-1 Incapable. A facility with occupants receiving personal care that are incapable of self preservation, shall be classified as a Group I-1 Incapable condition and shall comply with the additional requirements of Group I-Incapable. This group shall include, but not be limited to, the following:

Assisted living facilities
Residential board and care facilities

A facility such as the above with five or fewer persons shall be classified as a Group R-3 or shall comply with the International Residential Code in accordance with Section 101.2. A facility such as above, housing at least six and not more than 16 persons, shall be classified as Group R-4.

2. Add new text as follows*:*

308.3.1 (IFC [B] 202) Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

INCAPABLE OF SELF PRESERVATION. Persons because of age, physical limitations, mental limitations, chemical dependency or medical treatment cannot respond as an individual to an emergency situation.

(Definitions not shown are unchanged.)

3. Revise as follows:

310.2 (IFC [B] 202) Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

RESIDENTIAL CARE/ASSISTED LIVING FACILITIES. A building or part thereof housing persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment which provides personal care services. The occupants are either capable or incapable of self preservation. ~~of responding to an emergency situation without physical assistance from staff.~~ This classification shall include, but not be limited to, the following: residential board and care facilities, assisted living facilities, halfway houses, group homes, congregate care facilities, social rehabilitation facilities, alcohol and drug abuse centers and convalescent facilities.

(Definitions not shown are unchanged.)

SECTION 420
GROUPS I-I, R-1, R-2, R-3

420.1 General. Occupancies in Groups I-1, R-1, R-2, and R-3 shall comply with the provisions of this section and other applicable provisions of this code.

420.2 Separation walls. Walls separating dwelling units in the same building, walls separating sleeping units in the same building and walls separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as fire partitions in accordance with Section 709.

420.3 Horizontal separation. Floor assemblies separating dwelling units in the same buildings, floor assemblies separating sleeping units in the same building and floor assemblies separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as horizontal assemblies in accordance with Section 712.

420.4 Smoke barriers in Group I-1 Incapable. Smoke barriers shall be provided in Group I-1 Incapable facilities to subdivide every story used by occupants receiving care into a minimum of two smoke compartments. Such stories shall be divided into smoke compartments with an area of not more than 22,000 square feet (2092 m^2) and the travel distance from any point in a smoke compartment to a smoke barrier door shall not exceed 200 feet (60 960 mm). The smoke barrier shall be in accordance with Section 710.

420.4.1 Smoke compartment areas. Smoke compartment areas shall be used for relocation of occupants as part of building evacuation in a fire emergency. At least 15 net square feet (1.4 m^2) shall be provided per occupant receiving care within the aggregate area of corridors, lounge or dining areas and other low hazard areas on each side of each smoke barrier, for the total number of occupants in adjoining smoke compartments.

420.4.2 Independent egress. A means of egress shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of egress originated.

420.4.3 Horizontal assemblies. Horizontal assemblies supporting smoke barriers required by this section shall be designated to resist the movement of smoke and shall comply with Section 712.9.

504.2 Automatic sprinkler system increase. Where a building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, the value specified in Table 503 for maximum *building height* is increased by 20 feet (6096 mm) and the maximum number of *stories* is increased by one. These increases are permitted in addition to the *building area* increase in accordance with Sections 506.2 and 506.3. For Group R buildings equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.2, the value specified in Table 503 for maximum *building height* is increased by 20 feet (6096 mm) and the maximum number of *stories* is increased by one, but shall not exceed 60 feet (18 288 mm)or four *stories*, respectively.

Exceptions:

1. Buildings or portions of buildings, classified as a Group I-1 Incapable or I-2 occupancy of Type IIB, III, IV or V construction.
2. Buildings or portions of buildings, classified as a Group H-1, H-2, H-3 or H-5 occupancy.
3. Fire resistance rating substitution in accordance with Table 601, Note d.

710.5 Openings. Openings in a smoke barrier shall be protected in accordance with Section 715.

Exceptions:

1. In Group I-1 Incapable and Group I-2, where such doors are installed across corridors, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested. The doors shall be close fitting within operational tolerances, and shall not have undercuts in excess of ¾- inch, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and shall be automatic-closing by smoke detection in accordance with Section 715.4.8.3. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Group I-1 Incapable, and Group I-2, horizontal sliding doors installed in accordance with Section 1008.1.4.3 and protected in accordance with Section 715.

[F] 903.2.6 (IFC 903.2.6) Group I. An automatic sprinkler system shall be provided throughout buildings with Group I fire areas.

Exception: An automatic sprinkler system installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities, other than those classified as Group I-1 Incapable.

[F] 907.2.6.1 (IFC 907.2.6.1) Group I-1. An automatic smoke detection system shall be installed in *corridors,* waiting areas open to *corridors* and *habitable spaces* other than *sleeping units* and kitchens of Group I-1 occupancies. The system shall be activated in accordance with Section 907.5.

Exception~~s~~:

1. For buildings other than those classified as Group I-1 Incapable, s ~~S~~moke detection in habitable spaces is not required where the facility is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Smoke detection is not required for exterior balconies.

Commenter's Reason: GENERAL SUMMARY OF G21 SUBSTITUTION & MODIFICATION:
This modified and simplified G21 completely substitutes the original G21. It reflects the actual resident types that currently occur nationally and creates associated requirements already enforced across much of the country by individual state regulations. This background information and substantiation was referenced in the original G21 proposal. The modified G21 will bring more consistency to enforcement of the variety of Group I-1 uses.

The revised G21 is a response to the Baltimore hearings committee and public comments to the original G21 proposal. This revised proposal simplifies the original G21 substantially:

It leaves the number counts unrevised: I-1: >16/ R-4: 6-16 occupants.

It revises Group I-1 to allow both capable and incapable occupants versus the current only capable occupants.

It adds only to a new Group I-1 Incapable occupancy condition four more restrictive requirements: smoke barriers, story limitations, increased NFPA 13 sprinkler protection, and additional smoke detection.

The Group R-4 use definition is changed to allow either capable or incapable occupants. Group R-4 still matches what most states currently enforce even with capable and incapable residents in protection, story, and sprinkler requirements.

The modified G21 can also align and mix easily with the relative proposed revisions in the G20 if both are approved, since only three of the G21 sections would require integration with the correlating G20 sections.

This proposal also shows that the new Group I-1 Incapable categorization is appropriately more protective than having the use in the Group I-2 occupancy as some prefer.

It shows in the following table analysis that this revised Group I-1 Incapable still has appropriate corridor protections, smoke detection, and smoke alarms, which Group I-2 does not include. It shows that there are seven sections in the new Group I-1 that are more stringent than I-2, versus only three IBC sections in Group I-2 that are more stringent than the proposed I-1 Incapable requirements.

It also shows that I-1 assisted living normally have less staff to resident ratios than Group I-2, which is why assisted living requires a higher level of safety to compensate for these lower staff levels.

The new "Group I-1 Incapable" condition includes smoke barriers which provide an additional protective separation for occupants from a fire event. They provide temporary protection for occupants that require assistance from others to eventually reach an exit in an emergency. These Group I-1 facilities still complete building evacuation and residents participate in fire drills, which is consistent with the current International Fire Code. This is versus the "defend in place" concept of Group I-2.

The table below shows the differences of the two occupant types, staffing ratios and compares protection features based on those similarities and differences. The table is based on the original G21 referenced national Hawaii study on assisted living.

G21: INCAPABLE Personal Care to Health Care Comparisons LEGEND: (+ +) = New G21 Change or Requirement / Grey Fill = MORE Protection Required		
I-1 Incapable-Personal Care-Assisted Living **I-1: >16 Slower / Incapable** **R-4: 6-16 Slower / Incapable** **Conscious/ Evacuate with Assistance**		**I-2 Health Care-Nursing** **I-2: >5 Incapable** **Incapable/ Bedridden/ Life Support** **Defend in Place**
38,000 facilities regulated in 50 states under individual state regulations **-51 of 89 Categories Incapable** > 5 residents. (Some states have up to 3 categories). +/- 32 states have both Capable and Incapable categories. +/- 14 states categorize all facilities as Incapable. +/- 4 states require all their facilities to be Capable. **Bedridden NOT allowed** except to allow for typical short term illnesses ranging from 7-14 days in 21 states. **Nursing Care generally only allowed or only limited** intermittent in all 50 states. If allowed only when the facility can provide services for short term illness. Night time staff to resident ratio:+/- 1:20 to 1:35		**17,000 facilities** regulated in all 50 states under federal regulations. **All facilities are considered Incapable.** **Bedridden allowed and common.** **Nursing care allowed and common.** Night time staff to res. Ratio: +/- 1:8 to 1:15.
(+ +) Ch 4: SMOKE BARRIERS for Incapable only.. **Ch 4: NO OPEN SPACE** to corridor exceptions. (Less staff) **CH 4: NO EXCEPTIONS** for corridor and door rating**.** **Ch 4: FIRE PARTITIONS** between units.		**Ch 4: Smoke Barriers** required. **Ch 4:** Open space to corridor allowed. (More staff and Protect In Place) **CH 4: NO** corridor and door rating by exception**.** (More staff.) **Ch 4: NO** Fire Partitions between units.
Ch 5: (+ +) NO SPRINKLER STORY INCREASE ALLOWED 3 stories Type VA, 4 stories Type IIA for I-1 For Incapable only.		**Ch 5: No sprinkler story increase allowed** 1 story Type VA, 3 in Type IIA
(+ +) Ch 9: NFPA 13 SPRINKLERS For I-1 Incapable only. 13R/ D for others and R-4 **(+ +) CH 9: SMOKE DETECTION** In common spaces for Incapable only. **No exception**. (Less staff) **CH 9: SMOKE ALARMS** required. (Less staff)		**Ch 9: NFPA 13 sprinklers** **CH 9: NO** Smoke detection by exception allowed in common spaces. (More staff.) **CH 9: NO** smoke alarms required. (More staff)
CH 10: NO SUITE exception to corridor protection allowed. (Less staff) **Ch 10: RATED CORRIDORS & DOORS .** (Less staff) **CH 10:** No bedridden corridor width. (No bedridden/ life support)		**CH 10: Suites allowed.** (More staff) **Ch 10: NO rated corridor and doors.** (More staff) **CH 10:** Bedridden corridor width. (Bedridden/ life support)
Ch 16: No structural redundancy (No bedridden/ life support)		**Ch 16:** Structural redundancy required >50. (Bedridden/ life support)

ITEMIZED IBC SECTION REASONS:

Section 308.2 The G21 is modified to allow both capable and incapable of self preservation occupants in Group I-1. Currently nearly all state licensing agencies allow a majority of their assisted living classifications to have incapable residents according to the original G21 referenced Hawaii study. The general Group I-1 section is revised to be formatted similar to the Chapter 3 Group A format to cover both the capable and incapable conditions. The "condition" concept for Group I-1 is also used in the Group I detention occupancy.

Group I-1: The modified G21 maintains all current Group I-1 (capable of self preservation) facilities to remain as they are currently classified with the same associated requirements thru ought the code. Labeling Group I-1 without the "capable" condition heading maintains consistency with the past labeling of Group I-1 permits and classifications. The G21 then adds a new additional "incapable" condition:

Group I-1 Incapable: Both assisted living and residential board and care uses are relocated under the new heading "Group I-1 Incapable" condition, since the Hawaii study shows that a majority of these uses allow incapable occupants. This change will require most assisted living to conform to Group I-1 Incapable requirements. The revised G21 then confirms that Group I-1 Incapable will meet the basic Group I-1 requirements and "additional requirements of Group I-1 Incapable" in four areas of the code. This type of "in addition" charging statement is also used in Chapter 4 requirements. A majority of state licensing agencies already implement similar protection requirements, since they enforce either NFPA 101 for new buildings or include state amendments to the IBC. The "Incapable" occupancy condition keeps an obvious permit record to show the resident capability type.

Section 308.3.1 is added to introduce the term incapable if self preservation. This term is required to correspond to the modification of Section 308.2. This is the term introduced for its use in the Group I-1 charging statement. The revised G21 purposely matches the term and definition from the G20, in case both proposals are approved.

Section 310.2 The modified G21 revises the "Residential Care/Assisted Living" definition to allow either capable or incapable of self preservation occupants similar to the G21 Group I-1 changes. The modified G21 does not propose any other changes to the Group R-4 protection requirements for the following reasons:

Most state licensing agencies already allow the incapable resident type in these smaller 6-16 facilities. The reason for this is that three quarters of the state licensing agencies enforce NFPA 101 in their small facilities for 6-16 residents. All versions of NFPA 101 allow both capable and incapable residents in their small 6-16 category. The current IBC R-4 (capable) and correlating NFPA 101 Small (6-16) (incapable) Residential Board and Care facility requirements have essentially the same requirements. The key matching protection feature in both codes for these small facilities is the requirement of residential sprinklers. They both allow up to four stories in combustible construction. Other detailed protection requirements match each other. Both codes do not add smoke barriers since they are only required in facilities with over 16 residents (Group I-1 and NFPA Large). The smaller size of these facilities means travel time and possible exposure is less.

If the R-4 occupant type was not changed in the G21, those R-4 incapable uses would continue to not be specifically classified or be classified as Group I-2. Group I-2 classification for these small facilities requires excessive protection and cost such as NFPA 13 sprinklers, one story wood frame limitation, and hard conduit.

Section 420.4 Smoke barriers are modified in the G21 as a requirement in the Group I-1 Incapable condition. The heading is per heading formats currently found in other Chapter 4 sections and Section 1017. Smoke barriers are added due to new proposed resident type allowed and to match already existing state licensing regulations in a majority of states. The section utilizes and matches technical requirements, language and format from the current I-2 Section 407 for smoke barriers. The smaller smoke compartment size from the previous original G21 is removed and the current size requirements from the current Group I-2 are implemented.

Section 420.4.1 The modified G21 added "smoke compartment area" requirement utilizes similar current text from Section 422 Ambulatory Health Care Facilities and I-2 Section 407.4.1. The 15 square feet per occupant matches the non bed occupant area requirements of the current corresponding NFPA 101 Residential Board and Care requirements enforced over its last three editions. This 15 square foot requirement is already required by state assisted living licensing agencies in approximately 20 states. The area proposed is half the current bed and litter requirement but more than double the 6 square feet for non bed and litter areas in the Group I-2. Treatment rooms are purposely omitted from this I-1 version compared to the I-2, since occupants in personal care are not considered patients and thus do not receive treatment. Patient rooms are purposely omitted from this I-1 version compared to the I-2 for the same term reason and resident rooms are generally not a place where these types of residents are instructed to temporarily go to before exiting in emergency drills.

The charging statement is purposely different than the Group I-2 "Refuge Area" description and intent. The charging statement provides that smoke compartment areas are "for relocation of occupants as part of building evacuation in a fire emergency." This concept is different than the "defend in place" concept of the refuge area of the Group I-2 section 407.4.1. The Group I-2 defend in place concept assumes higher staff levels capable of assisting mostly incapable occupants, with some bedridden and some occupants on life support systems. Group I-1 incapable occupants, by not being bedridden or on life support, have typically less staff to resident ratios assisting residents than Group I-2. Less staff makes Group I-1 less of a viable option for the "defend in place" concept. For this reason the G21 Group I-1 Incapable "smoke compartments areas" only provide an additional temporary protection area for occupants. These occupants with assistance from others are trained through fire drills, to still eventually reach an exit in an emergency.

This emergency evacuation concept proposed is consistent with the current International Fire Code that states that Group I-1 residential care assisted living facilities shall include eventual complete building evacuation and that residents participate in fire drills. Residents are also still active participants in the required fire drills versus Group I-2 occupants. The Group I-1 Incapable residents still practice evacuation during fire drills to a "selected assembly point and shall provide experience in exiting through all required exits" as stated in the Fire Code. That practice evacuation assembly point is assumed to not require full building evacuation during fire drills due to impractical and unsafe weather but to train residents in evacuation drills to eventually reach an exit in a real emergency with assistance as needed.

Section 420.4.2 The independent egress requirement remains as is from the original G21 proposal and utilizes exact wording matching the current I-2 Section 407.4.2 for smoke barriers.

Section 420.4.3 The horizontal assembly requirement remains as is from the original G21 proposal and utilizes exact wording matching the current I-2 Section 407.4.3 for smoke barriers.

Section 504.2. The modified G21 requires that the new Group I-1 Incapable condition not be allowed to use sprinklers for story increases in Type IIB, III, IV, or V construction. The limitation is proposed due to the new incapable resident type allowed. It is also because about 30 states already limit their incapable assisted living facilities to less than the four stories that are currently allowed in Group I-1 in the combustible construction types. The three story limitation for the most commonly utilized Type VA construction is a "middle ground" of current enforcement across the 50 states. The four stories in Type VA are still allowed in this new G-21 for only Group I-1 capable facilities. Below is an approximate tally of the varying story requirements enforced by states licensing agencies that allow incapable occupants in their assisted living facilities. It is derived from the Hawaii study and compares the three different story requirements enforced by limited state IBC amendments and various editions of NFPA 101 that most states currently enforce.

- About 15-20 state licensing agencies limit incapable assisted living Type VA wood frame to 4 stories: They use older NFPA 101 1998 and prior editions for their "Slow" incapable category. The largest percentage of assisted are considered "Slow," which allows 3-13 minutes with assistance to reach a point of safety, including the state of Washington incapable R-2 (I-1) IBC amendments.
- About 15-20 state licensing agencies limit incapable assisted living Type VA wood frame to 2 stories: They use current NFPA 101 2003 and 2006 editions which eliminate the "Prompt," "Slow" and "Impractical" timing categories and assume incapable occupants. This tally also includes the older NFPA 101 1998 and prior editions "Impractical" categorization alternate means with horizontal exits with smoke barriers, and include incapable I-1 state of California and Hawaii IBC amendments.
- Less than 10 state licensing agencies limit incapable assisted living Type VA wood frame to 1 story: This is because those state licensing agencies use the most restrictive NFPA 101 2000 edition and they only allow the "Impractical" category, which is the most stringent NFPA category. About five of these states require that all of their incapable assisted living categories be limited to being classified as NFPA 101

2000 “Impractical” one story Type VA limit with no “Slow” categorization allowed: NJ, ID, SC, OK, TX. (<u>NFPA itself has eliminated this categorization in its last three more current editions.)</u>

Section 710.5 is modified in the G21 to include cross corridor doors in the new required smoke barriers in Group I-1 Incapable condition, matching the same exceptions allowed for I-2.

Section 903.2.6 is modified in the G21 to require full NFPA 13 sprinkler coverage in the Group I-1 Incapable condition facility fire areas. The NFPA 13 requirement is added due to the new proposed resident type allowed. Currently over half the states licensing agencies already require NFPA 13 sprinklers in their assisted living facilities with incapable occupants. This is due to their requiring various versions of NFPA 101 or by their state amendments to the IBC. The exception is revised to allow NFPA 13R in other capable of self preservation I-1 facilities, maintaining the current exception for the current capable Group I-1 uses.

Section 907.2.6.1 is revised in the modified G21 to eliminate the smoke detection exception only in Group I-1 Incapable condition buildings when sprinklers are provided. Currently over half the states licensing agencies already require smoke detection in their assisted living facilities with incapable occupants. This is due to their requiring various versions of NFPA 101 or by their state amendments to the IBC. This proposal still allows the exception to be applied to other Group I-1 when all residents are capable of self preservation within a building as defined by fire walls or exterior walls.

Cost Impact: The code change proposal will not increase the cost of construction due to current enforcement of similar requirements by other regulations such as state licensing regulations enforced in about three quarters of the states.

Final Action: AS AM AMPC____ D

G24-09/10
308.2 (IFC [B] 202)

<u>Proposed Change as Submitted</u>

Proponent: Tom Lariviere, Chairman, representing Joint Fire Service Review Committee

Revise as follows:

308.2 (IFC [B] 202) Group I-1. This occupancy shall include buildings, structures or parts thereof housing more than 16 persons, on a 24-hour basis, who because of age, mental disability or other reasons, live in a supervised residential environment that provides personal care services. The occupants are capable of responding to an emergency situation without physical assistance from staff. This group shall include, but not be limited to, the following:

Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Convalescent facilities
Group homes
Halfway houses
Residential board and care facilities
Social rehabilitation facilities

A facility such as the above ~~with~~ <u>housing</u> five or fewer persons shall be classified as Group R-3 or shall comply with the *International Residential Code* in accordance with Section 101.2, <u>provided the building is protected by an automatic sprinkler system installed in accordance with Section 903.2.8</u>. A facility such as above, housing at least six and not more than 16 persons, shall be classified as Group R-4.

Reason: This proposal will continue to allow the smaller congregate care facilities to be constructed either as an R-3, or under the IRC. But when the IRC is used for this facility, the facility must be sprinklered.

If a new structure is built, it will be required to be sprinklered. A new facility can be constructed either as an R-3 under the IBC which will require a fire sprinkler system, or as a one-family dwelling under the IRC which will also require a fire sprinkler system is installed. However, many congregate care facilities open and occupy an existing structure. This revision will require that when an existing single family home is used as a small congregate care facility, it will also be sprinklered.

These occupancies, even though housing less than six occupants, still have the same clientele as the I-1 occupancy. The facility is still a Group Home, a Congregate Care Facility, or an Assisted Living Facility, etc. Many of the occupants in these facilities have limited capability or delayed response for self-preservation in an emergency.

This proposed wording in this proposal was approved in Item G36 07-08 for R-4 occupancies where a similar concept applies. The sprinkler system provides the desired level of life safety regardless of whether the facility houses 5 or 6 occupants.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME: LARIVIERE-G1-308.2

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: The IRC has its own sprinkler requirements and the IBC should not be used to specify sprinkler requirements in buildings subject to the IRC. In addition it would set up a conflict between the sprinkler systems allowed by the IRC and those that would be required under this change.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joe Pierce, Chairman, representing Joint Fire Service Review Committee, requests Approval as Submitted.

Commenter's Reason: This proposal was Disapproved at the Code Development Hearing because it was felt that this is not consistent language with the I-Codes. However, Section 310.1 contains identical language for referring an R-4 to the IRC for construction.

The IBC governs construction for commercial purposes, and a Congregate Residence is a commercial facility. The IBC also allows construction of the Congregate Residence under the IRC provided that the building is equipped with a fire sprinkler system.

The references in the IBC assume that the building constructed under the IRC will be sprinklered, and it is important to maintain this requirement. This revision is the same as is currently required for an R-4 occupancy, and is only more critical in these facilities since they are classified as Group I occupancies.

Final Action: AS AM AMPC____ D

G28-09/10 Part I
310.1(IFC [B] 202), 310.2

Proposed Change as Submitted

Proponent: Maureen Traxler, City of Seattle, Seattle Dept of Planning & Development

PART I - IBC

1. Revise as follows:

310.1 (IFC [B] 202) Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing *sleeping units* where the occupants are primarily transient in nature, including:

Boarding houses (transient)
Hotels (transient)
<u>Lodging houses with more than 5 guest rooms</u>
Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

Apartment houses
Boarding houses (nontransient)
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two *dwelling units*.
Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Congregate living facilities with 16 or fewer persons.
<u>Lodging houses with 5 or fewer guest rooms</u>

Adult care and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*.
<u>Lodging houses with five or fewer guest rooms are permitted to comply with the *International Residential Code*.</u>

R-4 Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code or shall comply with the *International Residential Code* provided the building is protected by an *automatic sprinkler system* installed in accordance with Section 903.2.7.

2. Add new definitions as follows:

310.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

<u>**GUEST ROOM.** Any room or rooms used or intended to be used by one or more guests for living or sleeping purposes.</u>

<u>**LODGING HOUSE.** A dwelling occupied as a single-family unit where rent is paid for guest rooms.</u>

Reason: This proposal allows small bed and breakfasts to be constructed according to the International Residential Code. Currently, the IRC does not address whether nightly rentals are allowed, so jurisdictions across the country are applying the code differently. We chose to add a definition of "lodging house" to generally encompass rental lodging within dwelling units, distinct from hotels and boarding houses which are "not occupied as a single-family unit." We are proposing a general term rather than the more common term "bed and breakfast" partly because that term would imply that the building official would monitor what meals were served at the lodging.

Cost Impact: The code change will not increase the cost of construction.

ICCFILENAME: Traxler-G10-310.doc

<u>Public Hearing Results</u>

PART I- IBC GENERAL

Committee Action: **Disapproved**

Committee Reason: The proposal would set up a potential conflict with the already defined term of 'sleeping unit' and therefore the application of Chapter 11 would be unclear. There would also be a need to address this use in Chapter 29 regarding plumbing fixture requirements.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler City of Seattle representing the Department of Planning and Development, requests Approval as Modified by this Public Comment for Part I.

Replace the proposal as follows:

310.1 Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

(no change to R-1 and R-2)

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two *dwelling units*.
Adult care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
Congregate living facilities with 16 or fewer persons.
Owner-occupied bed-and-breakfasts with 5 or fewer guest bedrooms

Adult care and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*.

Owner-occupied bed-and-breakfasts with 5 or fewer guest bedrooms are permitted to comply with the *International Residential Code*.

Commenter's Reason: This proposal is a coordinated attempt to revise the IBC and IRC to allow small bed and breakfasts to be classified as Group R-3 or comply with the IRC. The proposal for the IRC was approved with a modification on a floor vote at the committee hearings in Baltimore, and the IBC proposal was disapproved. This public comment will coordinate the IBC with the IRC provision by stating that bed and breakfasts with 5 or fewer guest bedrooms may comply with the IRC, and by making 5 guest bedrooms the maximum allowed as R-3 occupancies. This modified proposal also requires the bed and breakfast to be owner-occupied, for consistency with the IRC, and for consistency with the charging language in Section 310.1 which says that Group R-3 includes "Residential occupancies where the occupants are primarily permanent in nature…." While the guests are not permanent, the owner-occupants are permanent and familiar with the home. This comment deletes the original proposal's provision for classifying homes with more than 5 as R-1 because we believe they would be classified that way using the current language.

Final Action: AS AM AMPC____ D

G28-09/10 Part II
R101.2, R202

Proposed Change as Submitted

Proponent: Maureen Traxler, City of Seattle, representing the Department of Planning & Development

PART II – IRC BUILDING AND ENERGY

1. Revise as follows:

R101.2 Scope. The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures*.

Exceptions:

1. Live/work units complying with the requirements of Section 419 of the *International Building Code* shall be permitted to be built as one- and two-family *dwellings* or townhouses. Fire suppression required by Section 419.5 of the *International Building Code* when constructed under the *International Residential Code for One- and Two-family Dwellings* shall conform to Section 903.3.1.3 of the *International Building Code*.

2. Lodging houses with five or fewer guest rooms shall be permitted to be constructed in accordance with the *International Residential Code for One- and Two-family Dwellings.*

2. Add new definitions as follows:

SECTION R202
DEFINITIONS

GUEST ROOM is any room or rooms used or intended to be used by one or more guests for living or sleeping purposes.

LODGING HOUSE is a one-family dwelling where one or more occupants are primarily permanent in nature, and rent is paid for guest rooms.

Reason: This proposal allows small bed and breakfasts to be constructed according to the International Residential Code. Currently, the IRC does not address whether nightly rentals are allowed, so jurisdictions across the country are applying the code differently. We chose to add a definition of "lodging house" to generally encompass rental lodging within dwelling units, distinct from hotels and boarding houses which are "not occupied as a single-family unit." We are proposing a general term rather than the more common term "bed and breakfast" partly because that term would imply that the building official would monitor what meals were served at the lodging.

Cost Impact: The code change will not increase the cost of construction.

ICCFILENAME: Traxler-G10-310.doc

Public Hearing Results

This item is on the agenda for individual consideration because an Assembly Action was different than the Committee Action.

Staff Note: There was an error in the way G28-Part II was shown in the Report of Public Hearings. The text at the end of Exception 2 was added by the Assembly Action, but did not appear in the Report of Hearings.

PART II – IRC – B/E

Committee Action: Disapproved

Committee Reason: The committee feels this is a good change but it needs more work. The term "to be constructed" implies new construction and renovations need to be addressed. Also, some of the distinctions would be better suited in the Zoning Code rather than the IRC.

Assembly Action: Approved as Modified

R101.2 Scope. The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures*.

Exceptions:
1. Live/work units complying with the requirements of Section 419 of the *International Building Code* shall be permitted to be built as one- and two-family *dwellings* or townhouses. Fire suppression required by Section 419.5 of the *International Building Code* when constructed under the *International Residential Code for One- and Two-family Dwellings* shall conform to Section P2904 ~~903.3.1.3 of the *International Building Code*~~.
2. Owner occupied lodging houses with five or fewer guest rooms shall be permitted to be constructed in accordance with the *International Residential Code for One- and Two-family Dwellings* when equipped with a fire sprinkler system complying with Section P2904.

(Portions of proposal not shown remain unchanged)

Reason for modification: The modification adds the term "owner occupied" and would aid the misinterpretation about accessibility. The modification also will assure these units will be sprinklered.

ICCFILENAME: Traxler-G10-310.doc

Proposed Change as Submitted

Proponent: Sarah A. Rice, C.B.O., representing self

1. Add new text as follows:

402.2.1 Open mall building perimeter line. For the purpose of this code, a perimeter line shall be established. The perimeter line shall encircle all buildings and structures which comprise the open mall building, and shall encompass any open-air interior walkways, open-air courtyards or similar open-air spaces. The perimeter line shall define the extent of the open mall building. Anchor buildings shall be outside of the perimeter line and are not considered as part of the open mall building.

2. Revise text as follows:

402.3 Lease plan. Each ~~*covered mall building*~~ owner of a covered mall building or of an open mall building shall provide both the building and fire departments with a lease plan showing the location of each occupancy and its exits after the certificate of occupancy has been issued. No modifications or changes in occupancy or use shall be made from that shown on the lease plan without prior approval of the *building official*.

402.4 Means of egress. ~~Each tenant space and the~~ *Covered mall buildings, open mall buildings and each tenant space within a mall building* shall be provided with *means of egress* as required by this section and this code. Where there is a conflict between the requirements of this code and the requirements of ~~this section~~ Sections 402.4.1 through 402.4.6, the requirements of ~~this section~~ Sections 402.4.1 through 402.4.6 shall apply.

402.4.1 Determination of occupant load. The *occupant load* permitted in any individual tenant space in a *covered or open mall building* shall be determined as required by this code. *Means of egress* requirements for individual tenant spaces shall be based on the *occupant load* thus determined.

402.4.1.1 Occupant formula. In determining required *means of egress* of the mall, the number of occupants for whom *means of egress* are to be provided shall be based on gross leasable area of the *covered or open mall building* (excluding *anchor buildings*) and the *occupant load* factor as determined by the following equation.

OLF = (0.00007) (GLA) + 25 **(Equation 4-1)**

where:
OLF = The *occupant load* factor (square feet per person).
GLA = The gross leasable area (square feet).

Exception: Tenant spaces attached to a *covered or open mall building* but with a *means of egress* system that is totally independent of the open mall of an open mall building or of ~~the~~ a *covered mall building* shall not be considered as gross leasable area for determining the required *means of egress* for the *covered mall building*.

402.4.1.2 OLF range. *(No change to text.)*

402.4.1.3 Anchor buildings. *(No change to text.)*

402.4.1.4 Food courts. The *occupant load* of a food court shall be determined in accordance with Section 1004. For the purposes of determining the *means of egress* requirements for the mall, the food court *occupant load* shall be added to the *occupant load* of the *covered or open mall building* as calculated above.

402.4.2 Number of means of egress. *(No change to text.)*

402.4.3 Arrangements of means of egress. Assembly occupancies with an *occupant load* of 500 or more within a covered mall building shall be so located in the *covered mall building* that their entrance will be immediately adjacent to a principal entrance to the mall and shall have not less than one-half of their required *means of egress* opening directly to the exterior of the *covered mall building*. Assembly occupancies with an occupant load of 300 or more within an open mall building shall be permitted to have their main exit open to the open mall.

402.4.3.1 Anchor building means of egress.*(No change to text)*

402.4.4 Distance to exits. Within each individual tenant space in a *covered or open mall building*, the maximum distance of travel from any point to an *exit* or entrance to the mall shall not exceed 200 feet (60 960 mm).

The maximum distance of travel from any point within a mall of a covered mall building to an *exit* shall not exceed 200 feet (60 960 mm). The maximum distance of travel from any point within an open mall to the perimeter line of the open mall building shall not exceed 200 feet.

402.4.5 Access to exits. Where more than one *exit* is required, they shall be so arranged that it is possible to travel in either direction from any point in a mall of a covered mall building to separate *exits* or from any point in an open mall to two separate locations on the perimeter line of an open mall building. The minimum width of an *exit passageway* or *corridor* from a mall shall be 66 inches (1676 mm).

Exception: Dead ends not exceeding a length equal to twice the width of the mall measured at the narrowest location within the dead-end portion of the mall.

402.4.5.1 Exit passageways.*(No change to text.)*

402.4.6 Service areas fronting on exit passageways.*(No change to text.)*

402.5 Mall width. For the purpose of providing required egress, malls are permitted to be considered as *corridors* but need not comply with the requirements of Section 1005.1 of this code where the width of the mall is as specified in this section.

402.5.1 Minimum width The ~~minimum~~ aggregate clear egress width of the mall in either a covered or open mall building shall be a minimum of 20 feet (6096 mm). The mall width shall be sufficient to accommodate the *occupant load* served. ~~There shall be a minimum of 10 feet (3048 mm) clear exit width~~ No portion of the minimum required aggregate egress width of shall be less than 10 feet measured to a height of 8 feet (2438 mm) between any projection of a tenant space bordering the mall and the nearest kiosk, vending machine, bench, display opening, food court or other obstruction to *means of egress* travel.

402.6 ~~402.5.2~~ ~~Minimum width~~ Open malls. Floor assemblies in, and roof assemblies over the mall of an open mall buildings shall be open for a minimum of 20 feet, measured perpendicular from the face of the tenant spaces on the lowest level, from edge of balcony to edge of balcony on upper floors or from edge of roof line to edge of roof line. The opening, or the unroofed area shall extend from the lowest/grade level of the mall to the sky above the roof. Balconies on upper levels of the mall shall not project into the required width. ~~The minimum floor and roof opening width above grade shall be 20 feet (9096 mm) in open malls.~~

Exception: Interior pedestrian bridges connecting balconies shall be permitted in the required width.

~~402.6~~ 402.7 Types of construction. The building area of any *covered mall or open building*, including *anchor buildings*, of Types I, II, III and IV construction, shall not be limited provided the *covered mall building* or open mall building, and ~~attached~~ adjoining *anchor buildings* and parking garages are surrounded on all sides by a permanent open space of not less than 60 feet (18 288 mm) and the *anchor buildings* do not exceed three *stories above grade plane*. For open mall buildings, the width of the permanent open space shall be measured from the perimeter line established by Section 402.2.1.

The type of construction allowable building height and building area of *anchor buildings* greater than three *stories above grade plane* shall comply with Section 503, as modified by Sections 504 and 506. The construction type of *open parking garages* and enclosed parking garages shall comply with Sections 406.3 and 406.4, respectively.

~~402.6.1~~ 402.7.1 Reduced open space. The permanent open space of 60 feet (18 288 mm) shall be permitted to be reduced to not less than 40 feet (12 192 mm), provided the following requirements are met:

1. The reduced open space shall not be allowed for more than 75 percent of the perimeter of the *covered or open mall building* and *anchor buildings*.
2. The *exterior wall* facing the reduced open space shall have a minimum *fire-resistance rating* of 3 hours.
3. Openings in the *exterior wall* facing the reduced open space shall have opening protectives with a minimum *fire protection rating* of 3 hours.
4. Group E, H, I or R occupancies are not within the *covered or open mall building* or *anchor stores*.

~~402.7~~ 402.8 Fire-resistance-rated separation. Fire-resistance-rated separation is not required between tenant spaces and the mall. Fire-resistance-rated separation is not required between a food court and adjacent tenant spaces or the mall.

~~402.7.1~~ 402.8.1 Attached garage. An attached garage for the storage of passenger vehicles having a capacity of not more than nine persons and *open parking garages* shall be considered as a separate building where it is separated from the *covered or open mall building* by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both.

> **Exception:** Where an *open parking garage* or enclosed parking garage is separated from the *covered or open mall building* or *anchor building* a distance greater than 10 feet (3048 mm), the provisions of Table 602 shall apply. Pedestrian walkways and tunnels that attach the *open parking garage* or enclosed parking garage to the *covered or open mall building* or *anchor building* shall be constructed in accordance with Section 3104.

~~402.7.2~~ 402.8.2 Tenant separations.
(No change to text.)

~~402.7.3~~ 402.8.3 Anchor building separation. An *anchor building* shall be separated from the *covered or open mall building* by *fire walls* complying with Section 706.

Exceptions:

1. *Anchor buildings* of not more than three *stories above grade plane* that have an occupancy classification the same as that permitted for tenants of the ~~*covered*~~ *mall building* shall be separated by 2-hour fire-resistive *fire barriers* complying with Section 707.

2. The exterior walls of anchor buildings separated from an open mall building by an open mall shall comply with Table 602.

~~402.7.3.1~~ 402.8.3.1 Openings between anchor building and mall.
(No change to text.)

~~402.8~~ 402.9 Interior finish. *Interior wall* and *ceiling finishes* within the mall of a covered mall and within the *exits* of covered or open mall buildings shall have a minimum *flame spread index* and smoke-developed index of Class B in accordance with Chapter 8. *Interior floor finishes* shall meet the requirements of Section 804.

[F] ~~402.9~~ 402.10 Automatic sprinkler system. ~~The~~ *Covered and open mall* ~~*building*~~ *buildings* and buildings connected shall be ~~equipped~~ protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, which shall comply with the all of the following:

1. The *automatic sprinkler system* shall be complete and operative throughout occupied space in the ~~*covered*~~ *mall building* prior to occupancy of any of the tenant spaces. Unoccupied tenant spaces shall be similarly protected unless provided with *approved* alternative protection.
2. Sprinkler protection for the mall of a covered mall building shall be independent from that provided for tenant spaces or ~~anchors~~ anchor buildings.
3. Sprinkler protection for the tenant spaces of an open mall building shall be independent from that provided for anchor buildings.
4. Sprinkler protection shall be provided beneath exterior circulation balconies located adjacent to an open mall.
5. Where tenant spaces are supplied by the same system, they shall be independently controlled.

> **Exception:** An *automatic sprinkler system* shall not be required in spaces or areas of *open parking garages* separated from the covered or open mall in accordance with Section 402.7.1 and constructed in accordance with Section 406.3.

~~402.9.1~~ [F] 402.11 Standpipe system. *(No change to text.)*

~~402.10~~ 402.12 Smoke control. *(No change to text.)*

~~402.11~~ 402.13 Kiosks. Kiosks and similar structures (temporary or permanent) located within the mall of a covered mall building or within the perimeter line of an open mall building shall meet the following requirements:

1. Combustible kiosks or other structures shall not be located within ~~the~~ a covered or open mall unless constructed of any of the following materials:

(Text not shown remains unchanged.)

~~402.12~~ 402.14 Children's playground structures. Where located within the mall of a covered mall or within the perimeter line of an open mall building, structures intended as children's playgrounds that exceed 10 feet (3048 mm) in height and 150 square feet (14 m^2) in area shall comply with Sections 402.12.1 through 402.12.4.

~~402.12.1~~ 402.14.1 Materials. *(No change to text.)*

~~402.12.2~~ 402.14.2 Fire protection. Children's playground structures located within ~~the~~ a mall or open mall shall be provided with the same level of *approved* fire suppression and detection devices required for kiosks and similar structures.

~~402.12.3~~ 402.14.3 Separation. Children's playground structures shall have a minimum horizontal separation from other structures within ~~the~~ a mall or open mall of 20 feet (6090 mm).

~~402.12.4~~ 402.14.4 Area limits. *(No change to text.)*

~~402.13~~ 402.15 Security grilles and doors. *(No change to text.)*

~~402.14~~ [F] 402.16 Standby power. *Covered mall buildings* exceeding 50,000 square feet (4645 m^2) and open mall buildings exceeding 50,000 square feet within the established perimeter line shall be provided with standby power systems that are capable of operating the emergency voice/alarm communication system.

~~402.15~~ [F] 402.17 Emergency voice/alarm communication system. ~~*Covered mall buildings* exceeding 50,000 square feet (4645 m^2) in total floor area shall be provided with an emergency voice/alarm communication system.~~ Where the total floor area exceeds 50,000 square feet within either a covered mall building or within the perimeter line of an open mall building, an emergency voice/alarm communication system shall be provided.

Emergency voice/alarm communication systems serving a mall, required or otherwise, shall be accessible to the fire department. The system shall be provided in accordance with Section 907.5.2.2.

~~402.16~~ 402.18 Plastic signs. Plastic signs affixed to the storefront of any tenant space facing ~~the~~ a mall or open mall shall be limited as specified in Sections ~~402.16.1 through 402.16.5.2~~ 402.17.1 through 402.17.5.2.

(Text not shown remains unchanged.)

~~402.17~~ [F] 402.19 Fire department access to equipment. (No change to text.)

[F] 905.3.3 (IFC 905.3.3) Covered and open mall buildings. ~~A~~ *Covered mall ~~building~~ and open mall buildings* shall be equipped throughout with a standpipe system where required by Section 905.3.1. *~~Covered~~ Mall buildings* not required to be equipped with a standpipe system by Section 905.3.1 shall be equipped with Class I hose connections connected to the *automatic sprinkler system* sized to deliver water at 250 gallons per minute (946.4 L/min) at the most hydraulically remote hose connection while concurrently supplying the *automatic sprinkler system* demand. The standpipe system shall be designed not to exceed a 50 pounds per square inch (psi) (345 kPa) residual pressure loss with a flow of 250 gallons per minute (946.4 L/min) from the fire department connection to the hydraulically most remote hose connection. Hose connections shall be provided at each of the following locations:

1. Within the mall at the entrance to each *exit* passageway or *corridor*.
2. At each floor-level landing within enclosed stairways opening directly on the mall.
3. At exterior public entrances to the mall of a covered mall building
4. At public entrances at the perimeter line of an open mall building.

<u>5.</u> At other locations as necessary so that the distance to reach all portions of a tenant space does not exceed 200 feet (60 960 mm) from a hose connection.

[F] 905.4 (IFC 905.4) Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1 through 3.*(No change in text.)*

4. In covered <u>and open </u>mall buildings, adjacent to each exterior public entrance to ~~the~~ <u>a covered </u>mall<u>, adjacent to each public entrance at the perimeter line of an open mall</u> and adjacent to each entrance from an *exit* passageway or *exit corridor* to the <u>covered </u>mall<u> or an open mall</u>.

5. and 6 *(No change in text.)*

Reason: The 2009 IBC was amended to allow an open mall to be built under the Covered Mall provisions of Section 402. However, the change was minimal in that it defined an open mall and open mall building and provided some specificity about the openness of the mall from the ground to the sky, but it did not address how each of the requirements within Section 402 would be applied to an open mall situation. For example, measuring the travel distance from a tenant space within a mall to an exit is unclear when the whole mall is 'exterior' to the buildings. This proposal goes through each section and revises each to clarify application to open malls. In general this required adding 'and open mall' or 'and open mall building' in various locations. Other locations the existing text stating application to a 'mall' was sufficient to allow application to both covered and open mall situations. Without providing revisions of this sort, the application of Section 402 will result in inconsistent interpretation from designer to designer and from jurisdiction to jurisdiction.

The intent of the 2009 change was to allow an open mall building to enjoy all of the benefits of being considered one unlimited area building with various tenants and occupancies. The key difference is that instead of the mall being covered, it is open to the sky. One then can begin wondering if the mall is 'exterior' to the building and therefore needs to be treated as exit discharge and the walls of the tenant spaces as exterior walls facing an assumed property line, or is it simply a covered mall building without a roof. The balance of this proposal takes the latter position, that the open mall building is simply a covered mall building without a roof.

Sec. 402.2.1. Only one new concept is established by the proposal – 'open mall building perimiter line'. The premise is that the designer establishes a boundary between what is considered to be part of the open mall building and what is outside of the building. This allows determination of the equivalent of exit travel distance for an exterior mall similar to a covered mall without there being a physical separation between the 'mall' and what is outside of the mall.

Sec. 402.3. Editorially revised to address owners of both types of malls and the required lease plan.

Sec. 402.4. Editorially revised to make it clear the egress provisions apply to covered and open malls. "This section' is replaced in two places with the specific section numbers for clarity of reference.

Sec. 402.4.1. Editorially revised in 3 subsections to clarify application of occupant load determinations.

Sec. 402.4.3. This is substantive change for open malls compared to covered mall buildings. Currently assembly occupancies with an occupant load over 500 needs to be located so that the entrance to the occupancy is adjacent to the mall entrance and 50% of the egress capacity goes directly outdoors. This proposal limits the application of this existing section to covered mall buildings. It then goes on to permit the open mall to be used as the discharge location for a main exit for assembly spaces over 300. There are many examples of this arrangement around the country including the theaters on the City walk open mall at Universal City in the Los Angeles area.

Sec.402.4.4 and 4.5. These sections use the open mall perimiter line as a substitute for the exterior wall of a covered mall to determine when means of egress transitions from 'within' the mall to 'outside' of the mall.

Sec. 402.5.1 The proposal makes section 402.5.1 generic for both types of malls. There is no intent to make a substantive change here.

Sec. 402.5.2. The existing code is currently in the wrong place –the requirement for 20 foot open is not related to egress but rather to the need for floor and roof assemblies in the mall portion of an open mall building to be open. There is no intent to make a substantive change here only to move to be a separate unique criteria.

Sec. 402.6. Since the concept of an open mall building is that there are many detached buildings, this provision of indicating the 60 foot open perimeter was around the attached buildings needed to be fixed to address that the anchor buildings next to an open mall building may not be physically attached.

Sec. 402.7.3. In an open mall building design, it is likely that the anchor buildings won't actually be attached. Therefore neither the fire wall nor fire barrier concept is appropriate. Therefore an exception is provided to treat such walls as exterior walls. But Section 402.7.3.1 will still apply and the openings in the wall need not be rated.

Sec. 402.8. This section currently requires wall and ceilings of the covered mall to meet specified flame spread of interior finishes. This applies to the mall itself. Tenant spaces need to comply with Chapter 8 independently. However, the walls of the open mall are not interior walls but actually exterior walls, which makes application of Chapter 8 inappropriate in most cases. The added language would still apply to any enclosed exits in an open mall building as well as the exits in a covered mall building.

Sec. 402.9. Since the open mall is open, without roof, there would be no requirement to provide sprinkler protection in the 'mall'. However, this proposal would still require sprinkler protection under exterior balconies which are providing circulation in the open mall. The concept here is there could be a multilevel open mall building with pedestrian walkways paralleling the front of the upper tenant spaces or bridges crossing the open mall. This would require sprinkler protection under such walkways.

Sec. 402.9.1 is changed to 402.10. This section refers to the standpipe requirements in Chapter 9. It is not a subset of sprinklers as is implied by the current numbering. This proposal moves it to its own equal section. Section 402 could use a reformatting of the sections similar to that provided to the 403 Highrise provisions in the 2009 code.

Sec. 402.11 Kiosks and 402.12 Children's play structures. This proposal treats those within the established perimiter line of an open mall building as if they were 'within' the mall.

Sec. 402.14 Standby power and 402.15 Emergency Communication. These would use the open mall building perimiter line to determine when the 50,000 square foot threshold was reached.

Sec. 402.16 Signs. The consistent approach of this proposal is to treat the 'open mall' as if it were interior facades along a mall which will have lots of occupants that are in restricted pathways until there get outside of the perimiter line. Therefore the limitation on signs should apply to those facing the open mall as well.

Sec. 905.3.3 and 905.4. These sections state the requirement for standpipes in a mall building and requires placement near the exits. As the open mall doesn't have 'exits' per se between the mall and the outside, the building perimiter line is used in lieu of the exits to specify the standpipe locations.

Other locations. The term 'covered mall building' is also used in the following sections of the IBC: 507.12, 709.1, 709.4, 716.5.4, Table 903.2.11.6, 907.2.7, 907.2.14, 2702.2.14, 2902.3.2, 2902.3.3 and 3412.6.19. In most of these locations the code should be editorially revised for consistency with this proposal. In most of these sections it will be sufficient to change 'covered mall building to 'covered and open mall buildings'.

Cost Impact: The code change proposal to the extent that it clarifies the application of the code in various situations may result in an increase the cost of construction where otherwise a designer or building official may have not thought that a provision of Section 402 applied.

Analysis: If this change is approved, staff can provide editorial revisions to the balance of the code and to the other I-Codes to be consistent with the intent of this proposal.

ICCFILENAME: RICE-G6-503.1.4.doc

Public Hearing Results

Committee Action: Disapproved

Committee Reason: The committee acknowledged the effort to clarify the application of the covered mall provisions to the open mall concept. The proposal needs additional refinements. Of specific concern is the lack of clarity regarding balconies and bridges and the extent to which they could 'cover'' the open mall; the relationship of the perimeter line to the anchor buildings and to the required open area around the open mall building; the relationship of the perimeter line with exit discharge as it would appear to permit exit access to dead end where a perimeter line adjoined an anchor building.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Sarah A. Rice, CBO, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

402.2.1 Open mall building perimeter line. For the purpose of this code, a perimeter line shall be established. The perimeter line shall encircle all buildings and structures which comprise the open mall building, and shall encompass any open-air interior walkways, open-air courtyards or similar open-air spaces. The perimeter line shall define the extent of the open mall building. Anchor buildings and parking structures shall be outside of the perimeter line and are not considered as part of the open mall building.

402.4.3 Arrangements of means of egress. Assembly occupancies with an *occupant load* of 500 or more located within a covered mall building shall be so located ~~in the *covered mall building*~~ such that their entrance will be immediately adjacent to a principal entrance to the mall and shall have not less than one-half of their required *means of egress* opening directly to the exterior of the *covered mall building*. Assembly occupancies ~~with an occupant load of 300 or more~~ located within the perimeter line of an open mall building shall be permitted to have their main exit open onto the open mall.

402.4.5 Access to exits. Where more than one *exit* is required, they shall be so arranged that it is possible to travel in either direction from any point in a mall of a covered mall building to separate *exits,* or from any point in an open mall of a open mall building to two separate locations on the perimeter line ~~of an open mall building~~, provided neither location is an exterior wall of an anchor building or parking garage. The minimum width of an *exit passageway* or *corridor* from a mall or open mall shall be 66 inches (1676 mm).

> **Exception:** Dead ends not exceeding a length equal to twice the width of the mall measured at the narrowest location within the dead-end portion of the mall.

402.6 Open malls. Floor assemblies in, and roof assemblies over, the open mall of an open mall ~~buildings~~ building shall be open to the atmosphere for a minimum of 20 feet, measured perpendicular from the face of the tenant spaces on the lowest level, from edge of balcony to edge of balcony on upper floors ~~or~~ and from edge of roof line to edge of roof line. The opening within, or the unroofed area of, an open mall shall extend from the lowest/grade level of the open mall through ~~to the atmosphere sky above~~ the entire roof assembly. Balconies on upper levels of the mall shall not project into the required width of the opening.

402.6.1 Pedestrian walkways. ~~**Exception:**~~ ~~Interior~~ Pedestrian walkways ~~bridges~~ connecting balconies in an open mall shall shall be located not less than 20 feet from any other pedestrian walkway ~~be permitted in the required width~~.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: The fundamental intent of this proposal is to bring some design refinements to the relatively new code concept of an "open mall building." While these types of structures have been and are being constructed, the code has not had language that literally recognized the concept. With the introduction of the term "open mall building" in the 2009 IBC these designs were not recognized, but the code lacked the design details. This proposal is intended to give the code user those details.

The Committees fundamental reason for disapproving this code change was the need for "additional refinement." They were concerned by the following:

the lack of clarity regarding balconies and bridges and the extent to which they could 'cover'' the open mall;

the relationship of the perimeter line to the anchor buildings and to the required open area around the open mall building;

the relationship of the perimeter line with exit discharge as it would appear to permit exit access to dead end where a perimeter line adjoined an anchor building.

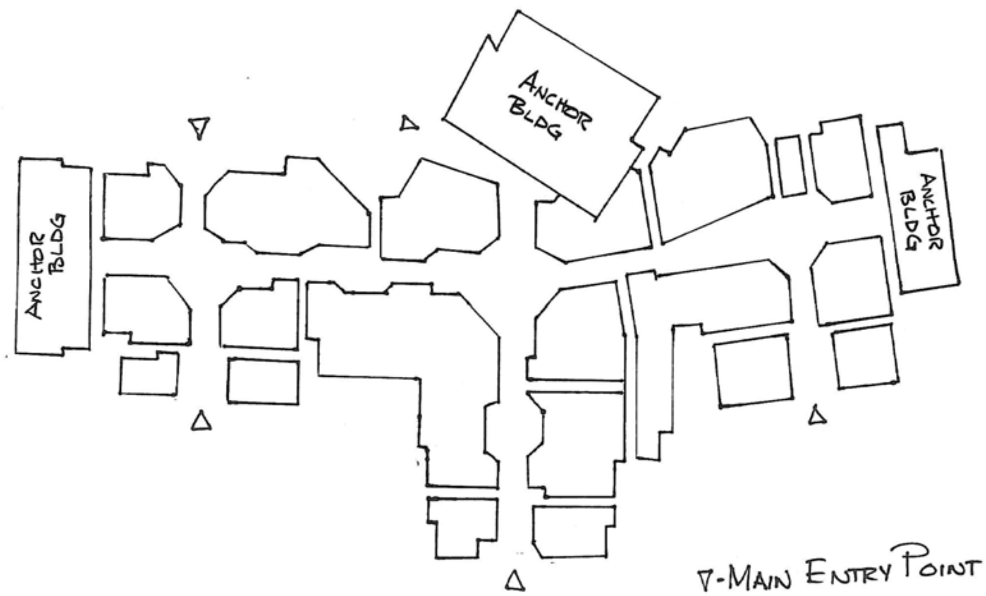
To bring clarity to the new provisions for open mall buildings and in response to the committee's comments the following revisions have been made:

In Section 402.4.3 the redundant language has been addressed.

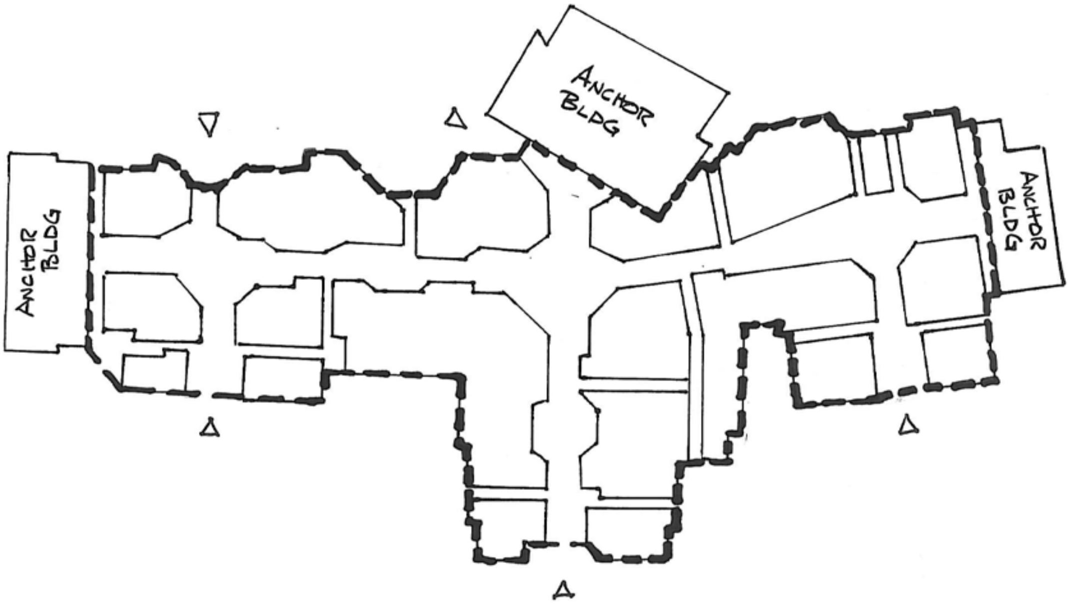
In Section 402.4.5 the language has been revised to clarify how the exit access travel distance in the open mall will be measured and that it cannot terminate at an exterior wall of an anchor building.

In Section 402.6 the language has been revised to clarify the sizing of the openings that must be in place for a structure to qualify as an open mall building. It also makes the Exception now a limitation on how pedestrian walkways are to be located in an open mall.

While not noted in the committee reason, there was some concern on where the "perimeter line" would be located. While each open mall building will be unique, the diagrams shown below is an example of how the various structures that typically make up an open mall building would be laid out, and then how the "perimeter line" would be situated around the structures. The designer will have the discretion as to the relative location of the "perimeter line," similar to the discretion they have to place an imaginary line for purposes of determining the "fire separation distance" when two buildings are located on the same lot. But even with that discretion, it is anticipated that the "perimeter line" created for an open mall building will in essence enclose the same space as exterior walls would in a covered mall building.



Open Mall Building
Without "Perimeter Line"



Open Mall Building
Example of where the "Perimeter Line" would be located.

Final Action: AS AM AMPC____ D

G41-09/10

403.2.4, Table 403.2.4

Proposed Change as Submitted

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC) and Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International

Delete without substitution as follows:

~~**403.2.4 Sprayed fire-resistive materials (SFRM).** The bond strength of the SFRM installed throughout the building shall be in accordance with Table 403.2.4.~~

~~**TABLE 403.2.4**~~
~~**MINIMUM BOND STRENGTH**~~

~~**HEIGHT OF BUILDING**~~ [a]	~~**SFRM MINIMUM BOND STRENGTH**~~
~~Up to 420 feet~~	~~430 psf~~
~~Greater than 420 feet~~	~~1,000 psf~~

~~For SI: 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kW/m²~~

~~a. Above the lowest level of fire department vehicle access~~

Reason: Heilstedt - The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public

This proposed change is a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:
