

ICC – Leading the World in Building Safety

The International Code Council now offers its diverse services, skills and experience to Australia and New Zealand to help promote building safety, provide sound solutions for practitioners who work in the building sector and collaborate with local organisations in looking to address issues that are common to the sector internationally.

As the leading global source of building safety solutions, the International Code Council offers product testing and certification, model building codes and international standards. The International Code Council's solutions are used to ensure safe, affordable, and sustainable buildings worldwide.

What We Do

Our experts can assist you with your building safety initiatives. The localization of ICC Oceania enables us to understand the unique needs of each partner, user or client, where expert advice takes into account local building requirements. We offer the following resources:

- **The International Codes (I-Codes)** – The International Code Council is the developer and publisher of the most globally recognized and adopted model building codes. They have been adapted for use around the world. The I-Codes offer prescriptive solutions that in Australia and New Zealand can be used as input to the development, respectively of a Performance/ Alternative Solution.
- **ICC standards** – The International Code Council develops niche building standards for subjects such as off-site construction, tiny houses and embodied carbon. These may also be considered for use in the development of Performance / Alternative Solutions or for broader use in collaboration with industry and regulators.
- **Building Products Certification** – ICC Evaluation Service (ICC-ES) maintains accreditation for product certification to Australian and New Zealand building codes in our scope of services. Evaluation Service Appraisal Reports produced by ICC-ES can be used as evidence of compliance to the National Construction Code Code of Australia and the New Zealand Building Code.
- **WaterMark Certification** – The ICC-ES Plumbing, Mechanical and Fuel Gas (PMG) program is accredited by JASANZ to provide plumbing product certification for WaterMark under the Plumbing Code of Australia. This also includes WaterMark lead-free accreditation.
- **Carbon Footprint Attestation** – As an accredited Environmental Product Declarations (EPD) program operator, ICC-ES can facilitate the verification of EPDs that quantify the environmental attributes of a product across its life cycle, allowing for transparency and marrying with product evaluations to address multiple Performance Requirements.
- **Testing and Evaluation** – Through the facilities and services provided by ICC-ES accredited labs, ICC-ES offers product testing, inspection, design review and evaluation for plumbing and building products, including for off-site/modular construction.
- **Accreditation** – The International Code Council's International Accreditation Service verifies the technical competence and processes of bodies such as building departments, professional membership-based organisations and quality assurance processes to ISO standards.
