ICC INTERNATIONAL Code COUNCIL®

The International Code Council introduces ICC Code Connect API

The software integration allows enterprise organizations to digitally leverage and access the Code Council's codes and standards through their platforms

Washington, D.C. – As part of the International Code Council's digital transformation strategy, a new software intermediary, *ICC Code Connect API*, has been created to empower organizations with instant, digital access to the latest building code requirements within their existing workflow applications. This software establishes a direct connection to the Code Council's codes and standards from within the user organization's workflow tool via the application programming interface (API).

ICC Code Connect API provides organizations seamless command over the Code Council's Code Content Integration in a convenient and efficient way. The software contains simplified search tools, the latest code content, confidence in accuracy and the ability to streamline common code references within existing workflow tools. There are currently seven pilots with software providers underway and integration with the Code Council's CDS Online Permitting Software, Municity®.

"With the increased need for more efficient online and digital services for building safety professionals, the development of ICC Code Connect API comes as an innovative solution to save organizations time and money," said Joan O'Neil, International Code Council Chief Knowledge Officer. "We will continue to enhance our digital products and solutions to better serve customers, members and the building community."

ICC Code Connect API also integrates with General Code's municipal online codes (eCode360®). The eCode360 API provides a reliable live connection to municipal codes housed on the eCode360 platform.
